The Conceptualisation of Body Shape

1. Introduction

The issues of body shape and living up to an ideal is a topic not only commonly discussed in the media but also a subject occupying many peoples’ minds on an everyday basis. Eating disorders are common and obesity is an increasing topic for discussion. The media shows images of tall and increasingly slim models while statistics indicate that the average person is gaining weight over time. Dictionaries state that being skinny is a negative term describing a person that is too thin and who needs to eat more (Cambridge Dictionary 2011). At the same time, people around the world dream about becoming slimmer. With a Cognitive Linguistic approach and a modern corpus driven method this essay will operationalise the concept of body shape. It will aim to go beyond both the media and statistics in order to illustrate the actual opinions and thoughts of individual people. In the process of doing this, different dialects and their cultures will be discussed and dictionary meanings will be questioned and set in relation to speakers’ actual conceptualisation of body related linguistic terms.

2. Method

Cognitive linguists aim to examine how a speakers’ language reflects that persons’ way of thinking (Wierzbicka, 1998). By collecting data from different corpora which represent different groups of people, parallels can be drawn and differences can be examined. The method used in this research, although in a small scale, enables the many complexities of language to be closely examined and quantified. These results, in turn, enable generalisations and assumptions about a broad group of speakers and the cultures where they live.

In order to reach adequate results, data have been collected from several different corpora involving 600 examples altogether. In order to achieve a
broad approach to the concept of body shape, three lexemes have been analysed; fat, slim and skinny. Each example shows the chosen lexeme in its semantic environment with enough context to reveal linguistic forms, meanings and context. The examples have been taken from four different corpuses; two of them represent British speakers and two of them American speakers. Within the different dialects the examples represent both magazines and personal diaries.

The personal diaries, representing both British- and American English, were published online by individual writers in the year 2005. Additionally, the research involves 85 examples from the British National Corpus which were published in the 1980s. TIME Magazine represents American English and includes several examples from every lexeme from every decade from the 1920s onwards. Examples from different decades enable a diachronic approach and can, in combination with other variables, indicate speakers’ attitudes over time.

Attitudes towards the different linguistic concepts are a central point in this study and can be determined by analysing the axiology of the examples. With the lexeme in focus it is decided whether the sentence is positive, negative or neutral. When this information has been analysed for recurring combinations, and combined with other variables, a generalisation about attitudes towards different body shapes can be made.

Slim, skinny and fat are adjectives which are commonly combined with other adjectives or adverbs in order to broaden or strengthen the description of the referent. In the search for recurring patterns the adjectives and adverbs in this research have been analysed and tested in combination with the different lexemes.

What or who the referent is proves vital in a linguistic analysis of this kind. The referent will indicate important factors of the context in which the lexeme is used. Once referent types have been determined they can be analysed together with other variables to reveal the main tendencies. In this analysis the combination between noun and dialect will prove to be critical in indicating how language tends to reveal the culture in which it is spoken.

3. Analysis

Following methods are developed by Gries (2006), Divjak (2006) and Glynn (2009). The first step in the process of this corpus-driven research was to determine which lexemes were to be operationalised in order to cover an interesting spectrum of words to describe body shape. Initially this
analysis was going to be based solely on the word *skinny* because it is an exceptionally semantically complex term. Early on it was discovered that in order to give the research a stronger foundation and a wider approach two additional lexemes were analysed: *slim* and *fat*. With these three words, different attitudes could be distinguished and compared to each other.

Once the lexemes had been selected, the search for examples of sentences began. The 600 examples were taken from corpora and personal diaries available online. Mark Davis has a website with corpuses open for anyone who creates an account (Davis). By choosing a relevant corpus and possibly a decade for your search, examples appear which can then be copied and saved. Before the texts can be analysed, inadequate examples with insufficient information need to be removed from the database. Once they had been cleaned the remaining examples were run through a search and replace engine in Microsoft Word in order to change the font of the lexeme to bold and to the colour red. In this way the lexeme could be easily distinguished from the surrounding words. When this had been done the examples were transferred into a Microsoft Excel document under the header *Example*. When all the relevant examples were collected in excel, the variables from which the lexemes were to be analysed needed to be decided. Below the most influential variables are mentioned and explained.

### 3.1 Lexeme

The data for this research includes 289 examples with the lexeme *skinny*, 167 with *fat* and 145 with *slim*. The lexeme *skinny* was initially the main lexeme and therefore has more example sentences than the other two. In order to broaden the study *fat* and *slim* were added, although they consist of fewer examples they play an equally important role as the first one.

### 3.2 Corpus

The examples were collected from four different corpora. There was a total of 605 examples. Out of the total, 357 were from TIME Magazine, 84 of them from the British National Corpus, 82 were from British diaries and 78 from American diaries. The corpora are all available online and provide examples of the search word in its semantic environment.
3.3 Time

The column for time reveals when the sentence was published. All the personal diaries were published in 2005, TIME Magazine enables users to search for lexemes by decade and the BNC comprises words from the 1980s.

3.4 Register

The category of register determines whether the lexeme has occurred in a personal diary or in a formally published text. The language commonly varies depending on the intention of the text and depending on who is the referent. In order to analyse this context assumptions can be made about the role of formality regarding the different lexemes.

3.5 Dialect

Two of the corpora that were used were American and two of them were British, by distinguishing the dialect, differences between American- and British English could be determined. Moreover, by determining a difference in dialect, an assumption about the cultures where they are spoken can made.

3.6 Axiology

Axiology was added in order to analyse attitudes towards the lexemes. Whether the lexeme is used in a positive, negative or neutral manner proves to be an interesting and important component in the analyses of the conceptualisation of body shape.

3.7 Word class

In order to analyse the grammar of the lexemes word class was added. All three lexemes are adjectives; it was determined whether the lexeme was predicative or attributive. In order to further analyse the grammar, Subjecthood and Polarity were added. In this particular research, the
analysis of grammar wasn’t used to the same degree as the above mentioned features. They did, however, play an important role in confirming that theories about other features were indeed reliable.

3.8 Referent

The category of referent determines what or who the lexeme refers to. In order to make the categories interesting to analyse different categories of the referent were added. It was decided whether the referent was animate or inanimate, whether it was male, female or neutral, whether it was abstract or concrete and whether it was specific or generic.

3.9 Noun

By analysing the noun, parallels could be drawn between the lexeme itself and the category of referent it commonly is associated with. Different granularity of the noun deepened the analysis and made it possible to combine a large amount of variations in the logistic regression.

3.10 Adjective and Adverbs

Adjectives and Adverbs were added as individual features in search for semantic patterns of these modifiers. In order to make the plots perspicuous the two features were combined into one and then divided into grades of different granulation. *Small* and *little* were, for example, combined into *small*.

3.11 Theme

A category of *Theme* was added as well as a verb variable with different granularities. This feature was, however, not used in the analyses below as the process of categorisation is both complex and subjective. Along with the process of coding, additional variables that appeared interesting were added. Two examples were the element of jealousy and another which reveals who said something to whom. Although the results of these features
were fascinating, unfortunately the examples that represented them proved too few to provide reliable results.

3.12 Coding completion

The following step on the way to results was to complete the coding and correct spelling mistakes and blank spaces. Completing the coding was a long and advanced process which demanded both patience and determination. With a total of 40 variables, there was a total of 24,000 cells to be filled in. Some columns took less time than others, but the entire process of completing the data and clearing it from errors lasted for several weeks. Even when it was all clean there was more to add and to adjust once the analysis had begun.

After the examples had been processed certain conclusions could be drawn determined only from the excel sheet. In order to analyse them properly in term of semantic and sociolinguistic features they did, however, need to be processed in a statistical tool. The program used for this is called R and is used below for Correspondence Analyses where it enables the identification of linguistic patterns and conversion of them into graphic images. In the following section, these images will be presented and described.

4. Results

4.1 Axiology versus Lexeme

According to Cambridge Advanced Learners Dictionary (2011), the definition of fat is having a lot of flesh on the body, the definition of slim is being attractively thin and the definition of skinny is mainly disapproving, very thin”. According to these definitions, the word fat is described in a literal way without a generalisation of attitude, slim and skinny on the other hand are described with an expression of attitude towards the words. Slim is associated with the positive word attractive and skinny is described as disapprovingly thin. In the hope of shedding light on peoples’ opinion and judgements associated with these words, Figure 1 shows how axiology is associated with the different lexemes.
Figure 1 shows the results of a correspondence analysis of *Lexeme* and *Axiology*. A correspondence analysis reveals semantic variation by placing highly associated features close to each other and dissociated features far apart (Glynn 2010). This plot shows a clear semantic difference in which lexeme is associated with a particular attitude of judgement. On the right, *slim* is positioned on the outside of the word positive, indicating that it is the only lexeme of the three highly associated with a positive attitude.

*Figure 1. Interaction of Axiology and Lexeme. Correspondence Analysis.*

(1) a. Tall, slim and disarmingly natural, she laughs freely and talks frankly. (Slim + Positive)

The lexeme *fat* is positioned in the top left part of the plot, close to the feature *negative*. This indicates that the concept of being fat is highly associated with a negative attitude.

b. I was just like Tommy: fat, unpopular, short, I had glasses, everything seemed wrong with me. (Fat + Negative)
Skinny is positioned on the inside of neutral, with a small association to both positive and negative, it is much more associated with a neutral attitude than with a positive or negative attitude.

c. First place went to a skinny, 145-lb. Swedish store clerk named Karl-Erik Aastrm. (Skinny + Neutral)

In contrast to the dictionary definition which claims a disapproving attitude towards being skinny, many people associate skinny with something positive and describe it as something that they aspire to be.

d.) my legs are fucking skinny; be jealous bitches, this is what I get for walking every day. (Skinny + Positive)

The attitude towards skinny and the concept of the word will be further analysed in Figure 2.

4.2 Skinny versus Time

Figure 3 shows the results of a correspondence analysis of the lexeme skinny, in correlation with time and axiology. The data that have been used in this analysis is taken from TIME Magazine only, and represents several examples of both female and male referents from every decade from the 1920s and forward. The reason that personal diaries were left out is that they were all published in 2005 and could therefore not represent diachronic results. Furthermore, TIME is an American magazine and because this plot was to be compared to American figures and statistics, data from the BNC were also left out. Despite the fact that this is a small study, the results of this plot can be put into a historical perspective and several parallels can be drawn to attitude and changes portrayed in the mass media during the 20th century. In order to simplify the below discussion, labels with the mean BMI of Americans aged 20-74 have been added along with the names and BMI of iconic models over the decades.

The results in Figure 2 indicate that in the 1920s, 1940s and the 1950s skinny was discussed in a neutral manner. By 1960, however, the attitude shifted towards negative and the 1970 placed in the lower right corner indicates that the attitudes were at that time distinctly associated with negativity.
(2) a. He had an undernourished clown’s face, an indeterminately skinny body, and a sophistication that he wore with uncertainty—even in his white tie. (1970 + Negative)

Figure 2. Interaction of Skinny, Axiology and Time

In an attempt to explain these highly differentiated results, a comparison to the mean body weight of American citizens could be made, as well as one to the BMI of models and other women in the mass media. According to Sheldon and Stevens (1942), a skinny body was in the 1940s perceived by others as a negative feature associated with a nervous, submissive and socially withdrawn individual. By the late 1980s, this attitude had shifted and research showed that a very thin body had become something to aspire towards and the body type that was considered most sexually attractive (Spillman & Everington 1989). According to this research, the attitude towards the conception of being skinny should become gradually positive in the period from the 1940s until the 1980s. This plot, however, indicates that attitudes changed in completely the opposite direction. In the same manner as the BMI of both American men and women has steadily increased over time from 24.9 for women in 1960, 25.1 in 1970 and 28.8 in 2000. Why then, are the 1960s and 1970s so strongly connected with
negativity? One explanation could be the realisation of, and a reaction against, how badly affected women could become of the image of the unnaturally skinny body. According to Garner (1980), the ideal figure for a woman in the 1960s and 1970s became non-curved and models bust-to-waist measurements shrunk significantly.

The following decade, 1979-1988, more than 60% of both Playboy models and Miss America contestants weighed 15% or more below the expected weight of their age and height category (Garner 1980). Garner, moreover, explains that a remaining body weight of below 15% of the expected is classed as anorexia nervosa. Whether this association between bad health and skinniness was the reason for the negative attitude towards it during the 1960s and 1970s cannot be determined from this study alone but could be a theory worth further investigation.

b. She has ordained that all her models and sales personnel must be at least a size 16. "We never show our clothes on skinny models, " she says. " If the models are a size 10 or 12, how am I to know how it will look on me?" (1970 + Negative)

In the 1980s, the concept of supermodels became prominent and images of skinny models with low body mass index were published in everything from commercials to high fashion magazines. In the 1990s, Kate Moss started the trend of the waif look with a BMI of 16. Meanwhile the American mean weight for women between 20 and 74 years old was 28.1 (Cynthia L 2004). According to the plot above the attitude towards a skinny body remained significantly negative until the 2000 when a distinguished change is revealed. The 2000s are highly associated with a positive attitude.

c. Everyone said they'd rather be skinny, because if you're fat, you never go anywhere. (2000 + Positive)

d. Skinny and delicately handsome, he looks even younger than he is. (2000 + Positive)

e. My skinny body and quick reflexes made me a popular choice for serious teams. (2000 + Positive)

The above examples indicate that the negative attitude expressed towards skinny people in the 40s, when being skinny was associated with being socially withdrawn, have been exchanged for a positive attitude connecting skinny with positive qualities like handsome and popular.
4.3. Dialect versus Noun and Pronoun

Cognitive linguists believe that there is a strong relationship between language and mind. Wierzbicka (1998) explains that the way people use their native language has a strong impact on the way they think and perceive the world. Additionally, she supports Sapir in that language even goes beyond that, and holds the potential of reflecting an entirely different culture (1949). In the following section, corpus data is used as a method to highlight potential differences in British and American culture when it comes to the conception of body shape.

Figure 3. Interaction of Noun/Pronoun and Dialect

The plot in Figure 3 captures how different categories of nouns and pronouns correlate with the two dialects of British and American English. The nouns have been granulated into appropriate categories. All three lexemes were included in this plot. However, in order to prove legibility upon the plot each lexeme was in addition tested individually. Although there is a slight variation in the pattern for the different lexemes, the main dispersion is maintained indicating that this study is not only quantifiable for individual lexemes, but for terms related to body shape in general.

The fact that there is a distinct spatial distance between the factor for the UK and for the USA in the plot indicates that there is a semantic difference between the American and the British use of fat, slim and skinny. Insult
falls exactly in between the dialects and is equally associated with them both.

(3) a. That skinny wanker was stretched out on the bench across from us, using his jacket as a pillow, and snoring like a damned foghorn. (USA + Insult)

b. Just look at the death of Harold Bishop. This funny fat fool, this symbol of old-style decency was drowned at sea the other day. (UK + Insult)

In a similar manner, *people, clothes* and *body parts* correlate to both dialects. Boys and girls are positioned somewhere in between UK and USA whilst the collective term of *child* is distinct and highly associated with American English.

c. then manager of the Brooklyn Dodgers, took a quick look at a skinny little kid who claimed to be a shortstop. (USA + child)

To associate body shape with profession appears to be a distinctly American tendency. The American Dream is a widespread expression describing material success and the self-made man. Education has played a great part in making America the place on earth where people can best realise their ambitions (Lunden & Srigley 1992). Although success should not necessarily be combined with body shape, this research shows tendencies towards distinct values associated with different types of figures. As the following data exemplifies, one theory could be that body shape lexemes are added as modifiers to provide an indirect attitude towards the profession in question.

d. Rapidly, methodically, the khaki-clad figures handed their green passbooks to a slim officer in the uniform of the Royal Navy. (USA + Profession)

e. The plot is furthered by a gunshot on a Pullman car, causing the fat comic to poke crude fun at a little girl who is travelling with her mother. (USA + Profession)

Furthermore, *age* and *nationality* are highly associated with American English.
f. Casually, without taking his attention from the food, the skinny seven-year-old answered a few questions. There was no need for him to concentrate (USA + Age)

g. Two shining steel rails creep northward under a round bonfire sun into the desert where skinny Mongolians pile up the sand to support them... northward into frozen ground (USA + Nationality)

Several pronouns are clustered around the factor for British English. For instance I is placed on the left side of UK indicating that it is highly and distinctly associated with British English. Britain is well-known for its sarcastic, self-deprecative and self-ironic humour which might explain this sociolinguistic factor.

h. I ate so much last night.. bleh. So I am officially fat AND spotty. All I need now is glasses and greasy hair and I'd officially be classed... (UK + I)

e. He was tall, slim and dignified, and showed no anger even when provoked. (UK + He)

f. I put something long on and from the back Russell said you look skinny he says, when you turn round and you see that Yeah. Yeah. (UK + You)

In a correspondence analysis, data are transferred into patterns and thereby made easier to interpret. However, in order to confirm that those patterns represent more than just a small number of users, a confirmatory statistical technique called Logistic Regression can be used (Glynn 2010). Logistic Regression analyses the data and attempts to predict a result based on other features than the one in question. In order to confirm the results of the Correspondence Analysis, American and British English, dialect were modelled against other variables in the coding schema. If an accurate result could be predicted that is an indication that the analysis represents actual usage.

In the above table, the column on the left indicates which features were put into the analysis. The stars on the far right are added to simplify the reading of the column next to it which reveals the statistical significance of each feature. Stars indicate that the feature is significant; three stars indicate the highest possible significance. By looking at the statistical significance, it can be determined how likely it is that a new analysis would show the same or better results (Glynn 2010).

Once interesting results have been discovered, the column on the left provides further information about their importance. When that figure is negative, that means that the probability of that feature, in this Logistic Regression, leans towards British English. When it is positive, it leans towards American English. Judging from the above analysis, the top line and the lexeme skinny are mainly probable to lean towards British English whilst the remaining features lean towards American English.

Furthermore, judging from this analysis, the modelled features are all of value and together indicate that there is a definite difference in the way body shape is discussed in American respective to British English. To further confirm this theory, the C value of this analysis shows a figure of 0.775. This figure is not a very strong indication, but it does indicate that this particular analysis would generate the same results 50% more often than by chance. That the R2 shows a figure just below 3 also increases the probability of the results. For a study of this size, although the figures could be more substantial, they still show clear results that there is a high probability of the results being reproduced if a larger study was conducted.
4.4 Lexeme versus Adjective and Adverb

This research has previously shown that the three lexemes *fat*, *slim* and *skinny* are strongly associated with different attitudes. In the plot below, the lexemes have been analysed together with adjective and adverbs in order to discover semantic patterns in their relation.

*Figure 4. Interaction of Lexeme and Adjective/Adverb*

In the above correspondence analysis between Lexeme and adjectives and adverbs, labels have been added in order to make the plot easier to read. That the lexemes are spread over the plot in this way, indicates that there is a difference in how certain words are commonly used in the same sentence.

*Slim* is positioned in the top left of the plot with three adjectives above it. The position of *fit* and *attractive* shows that they are distinctly associated with the word *slim*. Clustered together just below *slim* are the words *dark*, *elegant* and *clever*. The selection of adjectives surrounding *slim* appears to confirm what was shown in Figure 1. *Slim* proved to be the most positive of the three lexemes and is here closely correlated with other positive adjectives. It is interesting to note that *dark* and *blond*, are both used in semantic combination with this positive lexeme indicating that hair colour, whether it is dark or light, is an important characteristic in describing what a person finds attractive.
(4) a. Ruth Hale is slim, dark, vivid, eager. She writes moving picture criticisms and book reviews (Slim + Dark)

According to the result in Figure 1, fat is associated with negativity. This plot indicates that fat is highly associated with short and big. Close to fat, in the direction of the lexeme skinny, are bald and stupid, both of which are words with a negative association.

b. Time was, not so long ago, when to be fat, balding, unmarried and in your late 30s was to be scorned by strangers. (Fat + Bald)

Ugly and old are also perceived as negative and distinctly associated with fat. However, in contrast to these negative associations the positive word happy is closely associated with being fat. Several examples connected happiness with fat comedians, but a selection of data also indicated that the thought of being fat goes hand in hand with liberty and a loss of social pressure.

c. In Gal Land the women will all be fat and happy, and no one will bother to shave her legs. (Fat + Happy)

Skinny is distinctly and highly associated with the adjectives small and little which have here been grouped together into the category of small. In the data examples small appears to be used in a complimentary yet neutral way.

d. He comes first in all his races. Oh him. Yeah. The skinny little chap. Him. Oh he's a fast runner. (Skinny + Small)

It is, however, also highly associated with madly which is a name for a category of adverbs that are used to add a negative attitude to the word skinny.

e. ...model, but when she showed up for the cover shoot, she was weirdly skinny in her baggy pants and a little tomboyish. (Skinny + Madly)

In addition to this, unpleasant, sad, and unattractive fall close to skinny in the direction of fat. Additionally, being young is highly associated with being skinny indicating that the conception of, and dream to become very
thin, could be associated with either modern society alone or with youth. Although it cannot be proven from this research, it seems reasonable easy to draw associations between these adjectives and low self esteem. As many of the examples have shown, from personal journals above all, people tend to live with a dream of changing the shape of their body to something thinner. Many people wrote that they wanted to eat less to become skinny whilst other people live in poverty and may not have the privilege of eating plenty of food. Both of these concepts could be perceived as sad and make people describe themselves or others as both unpleasant and unattractive.

f. stumble along roads and streets, talking to themselves, gesturing vaguely with sad, skinny hands. People who see them wonder what tiny, bright pictures of the past (Skinny + Sad)

Falling exactly in between the data points are natural, too and very. Too and very are common modifiers and the fact that they are equally associated with all three lexemes comes as no surprise.

5. Summary

To summarise this corpus-driven analysis about the conceptualisation of body shape, there is a strong case that there is a discrepancy between the way different body shapes are described in the dictionary and the way they are perceived by the individual person. Research indicates that the three lexemes are highly associated with different attitudes; slim with a positive attitude, fat with a negative attitude and skinny with a neutral attitude. They are, furthermore, commonly semantically combined and enhanced with adjective and adverbs associated with the same attitudes as the lexemes. A diachronic analysis on the word skinny has indicated that the attitudes towards being skinny have changed over the 20th century. It has, however, not followed the changing shape and size of models, nor the average American’s body mass index. In fact, as being slim has become more valued by society, people have grown more obese as indicated by the BMI readings. The possible reasons for this have been discussed but a larger research study would be required in order to confirm these theories. Finally, a linguistic difference between American and British English, when it comes to body shape, has been distinguished and proved by the
data. The differences have been suggested to be not only linguistic, but also to be a reflection of the culture in which the different dialects are spoken.

Many patterns have been analysed and quantified. Hypotheses explaining these patterns have been suggested but cannot be confirmed by this research alone. In order to explore the topic further, with a cognitive linguistic corpus-based approach, this data, along with new and more comprehensive data must be analysed on a deeper level over a longer period of time. The more corpora that is used, the broader the database can become and the more valid the results become. It is also important to note that additional researchers working together on the topic would decrease the element of subjectivity and further enhance the reliability of the study.

get at least one half in the single attacker role. Frank did not look to fat -- I guess it's more a question of some people -- looking fat -- even though they contrast we meet Piggy. "He was shorter than the fair boy and very fat. He came forward, searching out safe lodgements for his feet, and then "skinny's" who refused to be served by Joy. She wasn't that fat, compared to others anyway. Half and Joy had been working at Applecross Café. Know, when I was a young boy, I was just like Tommy: fat, unpopular, short, I had glasses, everything seemed wrong with me, that he needed to sell himself. If he'd told your mum he was fat and 48 with a failed marriage behind him, she might have binned his request into laughter as Mr Trotter plodded away into the distance. "What an old fat pig he is," commented and the boys shrieked with laughter. In his of the time. Just look at the death of Harold Bishop. This funny fat fool, this symbol of old-style decency was drowned at sea the other day just's it's a different name for Karate. It's aerobics for fat people. Ah. cos it's very bad for fat people to jump up they were either going to be friends or enemies. Piggy was described as a fat boy with glasses and asthma. His glasses were the main symbol for sight and 7-1/7-2 to shelf weds in a mel sterland testimonial (I think it was for fat mel) Sean Anyone on the list who was at the infamous away games at view parallels to Piggy and Simon in a different light. If one girl was 7-1/7-2 to shef weds in a mel sterland testimonial (I think it was for fat French guy at bay. I thought Deano played well with really no service. "I expect we'll want to know all their names," said the fat boy, "and make a list. We ought to have a meeting. One woman told how her husband constantly berated her, calling her "a fat bitch" when she weighed 51/2st. The Princess groaned in horror. Another by about half its length.
