The social construction of the wolf

A case study of news media's role in sustainable wildlife conservation in regards to the wolf in Sweden

Author: Agnes Geijer

Lund University International Master Programme in Environmental Studies and Sustainability Science
Submitted May 15th
Supervisor: Dr. Elsa Coimbra

Abstract

The wolf has been considered functionally and genetically extinct in Sweden for a hundred years, but since the 1970's there has been a gradual revival of the species. This reintroduction of the wolf into the Swedish society has been teemed with great tensions and bad sentiments. This research takes the normative position that news media has a responsibility in communicating the complexities associated with socio-ecological systems and promote dialogue that strife towards mutual understanding and convergence in order to promote sustainable wildlife conservation. Furthermore, in order to emphasise the social construction of knowledge this research also argues that journalists should practice self-reflexivity, instead of only relying on the representation of different stakeholders when attempting to provide with objective information. By looking at newspaper articles and conducting interviews with journalists this research came to the conclusion that the coverage of the wolf is teemed with polarizing language, anthropocentric framing, and political/managerial discourses that provides with a simplistic account for sustainable wildlife conservation.

Key Words: Sustainable Wildlife Conservation, Wolf, News media, Complexity, Convergence, Discourse, Self-reflexivity, Environmental journalism

Acknowledgments

A big thanks to my beloved husband and most ardent academic critic and to all my friends and family who keep me going all the way!

I also want to direct a big thanks to my supervisor Elsa who has been a great source of support and inspiration!

1. Introduction

I believe that I am one of many who start my day by scrolling through news websites in order to keep updated on what is going on in the world. I often use that same information when discussing nature or environment related issues with others around me. In Sweden, the prerequisites to consume news have increased drastically as a result of increased media output (Färdigh et al. 2008: 301). The morning papers are the most widespread source of news, but in later years news consumption from Internet have been on the rise (*ibid*: 302). According to a statement by the Swedish parliament the role of mass media in contemporary society is to provide the necessary information required in order for citizens to be able to take a position on societal issues. Moreover, the statement include that mass media shall act independently or as a spokesperson (*språkrör*) to societal interests (Fichttelius: 2008: 32).

The idea is that the ‘social contract’ is fulfilled when citizens are provided with the information they need in order to make informed decisions and the government in turn is provided with the information it needs to make decisions in the common interest that is responsive to public sentiments (Fichttelius: 2008: : 32). Another important function is that media should act as an arena for public discussion and as a watchdog against abuse of power (Strömbäck: 2005: 332). In this sense media is acting to scrutinize power and inform people of how that power is used or abused. This is the reason for why media is often referred to as ‘the fourth estate’ of power and a crucial element of a democratic society (Schultz 1998: 1).

Accordingly, media is the major source from where information is communicated and it provides a central public arena through which we become aware of environmental issues (Hansen 2011: 9). It creates the forum in which environmental issues are addressed, contested and possibly resolved (*ibid*: 9). Consequently, communication is central in regards to how we as citizens come to know, and to know about, the environment and the environmental issues that are deemed relevant at a specific moment in time. However, even though we may forget it, accounts of nature in media follow the same path as other genres presented in public forums, meaning they are affected by inter-contextual discourses and are as such the result of conscious or unconscious ideologically charged stories about nature and animals just as with gender, economy or politics (Ganetz 2012: 10). As viewers we are disposed to believe that we are watching “objective facts” when we are actually observing *representations* of nature or animals (*ibid*: 10). As such, media does not only report everyday events but also constructs realities by manufacturing knowledge. Different media outlets are governed by different conditions and these conditions in turn affect how information is

conveyed. To put it simply, media is endowed with great power as one of the main constructors of our discursive realities. This means that we need to remain critical to what we are being told and be humble to the socially constructed nature of knowledge production.

On a global scale, top predators are diminishing at a rapid pace. Still, although top predators are the type of species that are most rapidly declining they are also the type of species that are most frequently reintroduced to society (Hayward et al 2009: 3). With this reintroduction there is an increasing risk for human-wildlife conflicts. Although the term indicates that the conflict is between wildlife and humans, it frequently involves human-to-human conflicts based on factors such as differences in goals, attitudes, values, feelings, levels of empowerment, and wealth (Madden: 2001: 250). It is between people with historical wounds, cultural misunderstandings, and socio-economic needs, but also about gaps in trust and communication over how to conserve wildlife at the same time as the wellbeing of humans is ensured (Madden: 2001: 250).

A topic that has received extensive news media coverage in Sweden is the wolf and the wolf's impact on society. The wolf is not only a target for protection but also deemed as a source for conflict between rural and urban inhabitants as well as different interest groups (Darpö 2011:1). The Crime Prevention Agency (hereafter BRÅ) released a report which states that despite the fact wolves are relatively few in numbers they represent an un-proportional amount of news material (2007). According to a research conducted in 2012, the debate associated with the wolf outweighs that of the bear, even though the bear recurrently have caused human casualties (Öhlund 2012). The question that emerges is what image news media conveys in regards to wildlife conservation when producing news articles about the wolf, and can the way that news media frames the situation help us to understand the complexities associated with wildlife conservation?

This research assumes that what is currently lacking in the Swedish wildlife conservation discourse in regards to the wolf, is a platform for dialogue where mutual understanding can arise. In this regard, media is privileged in being the communication forum from where people receive their daily dose of information and accordingly has the ability to affect how citizens (or general readers) perceive certain issues. With this privilege, however, comes a responsibility to communicate the complexities associated with wildlife conservation, provide depth and avoid defragmentation of information, polarisation and simplistic accounts of nature.

The normative argument is that media has a responsibility to provide people with information, knowledge and communication that can help to perceive nature in a more multifaceted way. It also entail that journalists declare their role as producers of a constructed reality by practicing self-

reflexivity. Accordingly, I believe that if we want to accomplish sustainable wildlife conservation that is founded on peaceful coexistence between humans and animals, we need to try and reach a level of convergence and mutual understanding.

1.1 Disposition

This paper consists of seven chapters. The first chapter presents introduction, justification for the research, purpose statement and research question, definitions and limitations. The second chapter provides with background of the wolf in Sweden. The third chapter provides with a detailed description of the theoretical framework employed by this research as well as the normative frame from which it assesses environmental journalism. The fourth chapter covers method and methodology, including research design, data collection, method of selection, data analysis, ethical considerations, trustworthiness and discourse analysis method. The fifth chapter presents the results interwoven with analysis based on the aforementioned theoretical framework ending with a discussion. Chapter six summarizes the findings as well as provides with an answer to the research question. The last chapter also makes recommendations for future research.

1.2 Justification

Few topics are able to cause such extensive media coverage in Sweden, as that of the wolves return to the Scandinavian Peninsula. However, despite the extensive attention that this topic has received, the polarisation of the debate has increased and people's faith in the government's ability to handle the situation appears to be limited (SOU: 2013:60). Thus, this research departs from the notion that governance associated with wildlife conservation goes beyond biology conservation know-how since it also includes social management (Stöhr et al. 2013: 14). Cultural perceptions that are continuously being moulded and altered due to continuous social construction and interaction are as important (or maybe even more so) than different levels of governance arrangements (*ibid*: 14). This can be further illustrated by the fact that Sweden has a relatively small number of wolves per capita, albeit still has one of the fiercest debates concerning its maintenance (Stöhr et al. 2013: 13).

The current state of limited faith in administrative measures to handle the situation of human-wolf co-existence seem to be contributing to an increase in illegal poaching activities aimed at eradicating the wolf from the Scandinavian Peninsula (BRÅ 2007). Current figures indicate that at least 20% of the wolves that die are killed through illegal poaching (Darpö: 2011: 2). Although the punishment for illegally killing wolves is harsh, people are still willing to go to great lengths to

accomplish their goal (BRÅ 2007) and the SGT phenomenon (Skjut, gräv och tig- Shoot, dig and keep quite) can itself serve as an indicator that there is something very unsustainable with the current state of wildlife conservation in Sweden in regards to the wolf.

According to the government's proposition "A sustainable politics of predators" (En hållbar rovdjurspolitik- Prop.2012/13:191), one way to accomplish the overarching and long-term goal is to delegate decision-making power to the different county administrative boards and to allow protective hunting in order to avoid damages while at the same time upholding viable populations in accord to the Habitat Directive (Prop.2012/13:191). I believe, however, that how we phrase and communicate our relationship with 'the wild' is an intrinsic part of the social construction of nature and thus has great implications on the sustainable management of wildlife conservation and our attitudes towards it. Hence, it is my understanding that the Swedish society is in need of redefining what role 'nature' ought to have in contemporary society in order to be able to reach a level of convergence regarding what we want to accomplish with sustainable wildlife conservation in regards to the wolf.

1.3 Purpose Statement and Research question

The purpose of this study is to engender understanding regarding the role of news media towards sustainable wildlife conservation in regard to the case of the Swedish wolf. This is accomplished by looking at news media and how the wolf is represented in certain selected news media outlets in order to comprehend how they convey the complexities surrounding wolf conservation in Sweden. Accordingly, this research attempts to answer the question:

How can we understand the role of news media towards sustainable wildlife conservation in regard to the case of the wolf in Sweden?

1. What are the most prominent representations in news media discourse regarding wolves in the wild in Sweden?
2. To what extent is Swedish news media conveying the complexities of wildlife conservation in regard to the wolf?

1.4 Definitions

When I am referring to the ability to convey complexity, I am referring to the ability to be able to appreciate and explain the interrelationship between different aspects that make up an issue,

such as sustainable wildlife conservation. In other words complexity entails a study of a phenomenon that emerges from a collection of interacting objects (Johnson 2007). As we all live in a complex world with a complex nature we are also in need of complex thought (Neef 2005: 14). That means avoiding defragmentation of knowledge and break with the assumption that “nature can be described, analysed and controlled in simple terms that correlate with a traditional linear logic” (ibid: 14). I believe that communicating complexity is essential if we are to understand the dynamics of evolving coupled socio-ecological systems (Perrings: 2007)

1.5 Limitations

When I was searching for suitable newspapers I wanted to find representatives from both the private and the public sector. The truth is, however, that Swedish Public Service provides their information, primarily in the form of TV and Radio, which were two media forums that I did not incorporate in this research. Looking at the difference between public and private news media could have provided with greater analytical edge. However, due to time and space constraints this research chose to primarily focus on news articles published on three different newspaper's online versions during a period of three years. Perhaps this research could set the foundation for other media forms like TV and radio to be followed up in order to incorporate the whole media spectrum regarding the issue at hand. I excluded articles that covered wolves in zoos and wolves that where hit by traffic as I believe that they are not as representative for looking at wildlife conservation. Lastly I also made the decision to exclude debate articles, since I was more interested to look at the journalistic characteristics of news reporting. However, this does not include debate editorials written by journalists.

2 Background

2.1 History of the Wolf in Sweden

The wolf is believed to have wandered to the Scandinavian Peninsula as the ice retreated 10,000 years ago, about the same time as humans started to settle in the land (Rovdjurscentret 2004a). However, the expansion of human activities gradually led to wolves and humans crossing paths. Records show that during 1200's, the Swedish county laws stated that farmers where ordained to participate in hunting of wolves (Vargskall) and those who rejected where accordingly fined. In 1647 the monarchy implemented so called “skottpengar” which is the term for rewards for shooting beast or pests (ibid: 2004a). One important cause for the detrimental human impact on the Scandinavian wolf tribes was in 1789 when farmers received the legal right to hunt on their own

lands for a determined time each year. This caused a great decline in the wolves natural prey of moose and deer (ibid 2004a). This in turn increased attacks on domestic animals, again increasing resentment of wolves among herders and farmers. The result contributed to a successive shooting of wolves that eventually caused the wolf to become both functionally and genetically extinct (Darpö: 2011: 1).

During many years people learned to live and conduct rural activities with only memories of the wolf. No one knows how many wolves that have been in the forests during this time, but they have not been enough to have any noticeable ‘impact’ on human activities. However, since 1964 new social attitudes towards wildlife and conservation developed (Stöhr et al. 2011: 1) and consequently the wolf has since been labelled an endangered animal under national law, EU law and International law (Darpö 2011: 1). By the late 1970’s, a number of wolves most likely migrated from the Finnish Russian populations and settled in the northernmost part of Sweden leading to successful reproduction of the tribe (Stöhr et al 2011: 2). The continuous migration of wolves, have led to a steady increase in wolf numbers and consequently range expansion (ibid: 2).

In 1967 Sweden established the Swedish Environmental Protection Agency, in Swedish Naturvårdsverket (hereafter SEPA), which is an institution under the national government whose job is to survey how environmental work is proceeding (Naturvårdsverket 2014a). Since 2002 they manage the hunting register and administer the national hunting license (Naturvårdsverket 2014b). The official position of SEPA is that the wolf is a part of the Swedish fauna and that it should be preserved in “viable populations”. However what constitutes a viable population is a complex topic and researchers and NGO’s alike have repeatedly contested SEPA’s definition. The aim of biodiversity management, according to SEPA, is to preserve biological diversity and to ensure that species exist in long-term viable populations with sufficient genetic variation, while at the same time humans should have access to good nature and cultural environments with rich biological diversity as a foundation for health, quality of life and welfare (Naturvårdsverket 2014d). It is these two goals that sometimes appear to contradict each other, as common arguments against the wolf include that their presence destroy people’s quality of life in the rural areas.

When Sweden joined the EU in 1995 the wolf received protected status under the EU Habitat directive (Council Directive 92/43/EEC on the Conservation of natural habitats and of wild fauna and flora), again under the premise of biodiversity. The main purpose of the Directive is to maintain or recreate favourable conservation status for the species and habitats that are listed in the directive and it is the member states that have the obligation to fulfil these requirements (SOU 2013:60). As such, the Swedish government have to conduct their conservation management under the EU

framework. However, the EU and the SEPA have frequently been at odds after a number of ENGO's accused the Swedish government for violating the Habitat Directive. This happened in January 2010 when for the first time Sweden allowed licensed hunting of wolves in accord to proposition 2008/09:210.

The permission for the licensed hunt of 27 wolves in 2010, was based on the argument that sick wolves should be taken out so that new DNA could be introduced by importing new wolves from Finland or Russia, thus combatting the problem of inbreeding as well as to increase acceptance for the wolf from the ones who are most frustrated with its presence (SR 2011). The decision, however, was highly controversial and caused extensive debate, leading up to the involvement of the EU. The result was that the Swedish government eventually had to change licensed hunting to protective hunting. This means that wolves might be shot if they attack domestic animals or cattle or if there is an estimated threat that a wolf in the future may cause harm on humans or animals. Individuals can thus petition for permission to hunt the wolf as a pre-emptive measure (Regeringskansliet 2011).

Currently it is estimated that around 380 wolves reside in Scandinavia (SOU: 2013:60), however, asking the number of wolves that reside in the Swedish forests is very much a political question as the answer can vary depending on whom you ask (Palmqvist et al. 2004: 2). Regardless of the expected increase, the problem is that the genetic base of the population is extremely small and inbreeding coefficients are very high (Darpö: 2011: 2). DNA analysis shows that most of the wolves that currently exist in Sweden are the result of a natural re-colonisation from the neighbouring Finnish/ Russian populations in Karelia and the hope is that individuals from these areas can bring new DNA to the Swedish packs (*ibid*: 2).

2.2 Opposition to the wolf

Sweden has a long history of portraying the wolf as a threat and as a source of insecurity and fear (Palmqvist et al 2004: 2). As a child my grandfather used to tell me stories from the Norse mythology, where the Fenrisulv, the son of Loki and the giant Angerboda was a wolf so big he scared all the Aesirs in Valhalla. During Ragnarök, the Fenrisulv eats Odin, the king of the Aesirs and in turn gets slain by his son Vidar. That being said, the wolf has also had a positive role in Norse mythology, as two loyal wolves called Gere and Freke always accompany Odin. Later cultural representations can be found in more contemporary literature, such as Selma Lagerlöf's "Gösta Berling's Saga" from 1821, where a sled ride gets terrorized by a pack of wolves. The book describes the wolves as grey creatures howling of bloodlust, with glowing eyes ready to devour human flesh (Lagerlöf 1956: 61).

The reason why the wolf goes by so many names in the Swedish language is the old belief that calling the wolf by its real name would act as summon. Therefore “noanames” were used to trick the animal (Palmqvist et al 2004: 4). This type of practice was common to ward off different creatures, including the devil. It is however the wolf that has the highest number of noanames (Ekblom et al 2008: 13). Different names used to refer to the wolf include “Gråben” (Grey leg/bone), “Den Grå” (the Grey), “Gråbuse” (Grey trickster) and “Tasse” (Paws). The contemporary Swedish name for wolf “Varg” is itself a noaname for the original name “Ulv” (ibid: 13). These noanames still occur in the coverage of the wolf by contemporary news media (Ekblom et al 2008: 65).

In regards to the contemporary situation where the wolf is seen as a cause for both political tensions as well as tensions between different interest groups, there is a visible distinction in regards to urban and rural demographics (Darpö 2011: 2). In the rural areas, the situation is considered to be particularly problematic as the wolf population grows in numbers. For the indigenous Samish population, the wolf is deemed to threaten their cultural way of life with reindeer herding (ibid: 2). Sheep farmers and cattle owners have also voiced their critique. However, for many this has been resolved through pro-active measures such as electric fencing (ibid: 2).

The main objection against wolves comes from the hunting community (Darpö 2011: 2). One common argument is that increased number of wolves causes a decrease in the number of prey, especially moose and deer. However, wolf predation on dogs is also a topic of great media attention and can be seen as a result of common hunting practices where loose dogs are used. Although many believe that with increased number of wolves comes an increase in attacks, statistics actually state the opposite (Agria 2011). According to several animal insurance companies, it appears that hunters have taken greater precautions causing a decrease in the number of dogs that die as a result of wolf attacks (ibid 2011).

There is also the fear for personal safety, especially fearing for children and other vulnerable members of society. While there may be a general fear for attacks on cattle and other domestic animals, it is important to know that there has not been any known wolf attack *in the wild* on humans since Gysingevargen in 1821 (Rovdjurscentrum 2004a). Gysingevargen was a domesticated wolf that killed nine children after having been released into the wild (ibid 2004a). Some use this case to argue that the wolf is prone to attack people, while others argue that the cause of the behaviour can be attributed to the fact that the wolf was raised by humans and later let out in the wild without being socialized by a wolf tribe. There have been fatal attacks on humans by wolves in captivity; however, this research argues that one has to make a distinction between attacks by wild wolves and wolves that are raised alongside humans.

Another cause for resentment of the wolf is the perception that the management of the wolf is associated with a symbolic loss of impact on decision-making, as decisions concerning hunting and the size of the wolf population are mostly taken in the urban areas (BRÅ 2007). It is this symbolic loss that is often associated with increased illegal hunting activities and poaching in the rural areas (*ibid* 2007). It is common to see debate editorials and different organisations who are critical to the wolf, to use arguments that Stockholm or Brussels should not have any saying on what is going on the Swedish countryside.

3 Theoretical Framework

3.1 Environmental Communication

When communicating environmental challenges there is a level of complexity to account for. Besides accounting for the complexities associated with socio-ecological systems, there is also the dilemma of “Who has the right to speak for nature and who should define the interest of society in relation to the natural world?” (Cox 2006: xviii). It is in the domain of public debates that the public can mediate among all the different voices that attempts to define how society should relate to the natural domain (*ibid*: xviii). So what does communication have to do with nature or the study of environmental problems? According to Robert Cox “... whatever else “nature” and the “environment” may be they are also words and therefore *ideas* and ideas have consequences” (2006: 16). This statement becomes relevant when looking at the polarized perceptions of the wolf that often is highlighted in popular news media (BRÅ 2007, Cinque 2003). However, even though nature may create impressions and forge ideas within us, nature itself is ethically and politically silent (Cox 2006: 165). It is we who place it in certain meanings and contexts.

This research assumes that communication can transform destructive perceptions and activities to constructive ones, given the ‘right tools’ and facilitate mutual understanding. As such, it is not necessarily a matter of speaking on behalf of ‘nature’ but more a matter of not giving ‘nature’ a voice that limits our understanding of its complexity. It is important to remember that news media does not only act as producers of information or voices in their own coverage of specific issues, but also as conduits for other voices (Cox 2006: 28). The agenda setting role of media is thus not only about selling what the public should focus on, but also what lenses the public use when they view it.

3.2 Environmental Journalism

There are some similarities between scientific research, especially regarding natural science, and journalism considering that both seeks to account for some level of ‘objective reality’. The

difference is how the pursuit of this is operationalized. Within most forms of news reporting there is little space for declaring methodology, epistemology or other practices associated with academic research. Brian Cooper from the BBC once stated the following: "Science values detail, precision, the impersonal, the technical, the lasting, facts, numbers and being right. Journalism values brevity, approximation, the personal, the colloquial, the immediate, stories, words and being right now. There are going to be tensions" (The Independent 2011). However, I do not agree with that it needs to be this way.

This research assumes that scientific journalism is *essential* in order to make scientific research available to a greater number of people, including those with limited experience of the subject. David Dickson argues that both journalists as well as other types of science communicators all face the task of providing readers with facts that empower them to engage properly in matters that involves scientific research in order to "ensure that decisions emerging from such dialogue are taken in a way that is both appropriately democratic and informed" (2005). I believe that this is not only essential in order to avoid technocracy of scientific research, but that it can also benefit scientific research to include the general public. Furthermore, it is an essential aspect of media's responsibility of acting both informative and empowering.

In order to explicitly account for complex scientific research in regards to the environment, one can employ environmental journalism. Environmental journalism can thus act as one of many conduits for environmental communication (Cox 2006: 28). Just like with scientific journalism there are many different perceptions and opinion regarding what environmental journalism should entail. This research argues that environmental journalism should act like scientific journalism but with an extra twist:

- Just like scientific journalism there should be an attempt to make complexity comprehensible by communicating scientific research, especially in regards to socio-ecological systems. This includes providing with a holistic perception of how different aspects relate to each other.
- It should practice some degree of environmental advocacy by questioning anthropocentric accounts of nature. This is part of the 'Critical Rhetoric', which can be defined as "questioning or denunciation of a behaviour, policy, societal value or ideology" (Cox 2006: 248).
- Lastly it should pursue a degree of convergence, both in regards to how we relate to the world around us as well as the world within our society, in order to avoid sentiments of conflict and polarity when covering controversial topics.

3.2.1 Objectivity, Self-reflexivity and Convergence

Reporters of environmental journalism have a particular struggle to maintain genuine objectivity (Cox 2006: 181). Some critics state that what passes for objectivity “is merely the prevailing consensus about what is real in a given time and society” (*ibid*: 181). “Objective consensus” is a notion that argues that consensus belongs to those with the power to define objectivity (*ibid*: 181). A common way to attempt to provide with objectivity is to interview the different sides of a story and let them account for their own discursive reality, also known as “a balancing of opposing viewpoints” (Cox 2006: 182). This approach, however, has received criticism as this perception of objectivity does little to challenge already existing discourses, but instead may serve to perpetuate or legitimate already existing power distributions (Palen 1998). One hypothetical example being that media’s choice of representations of stakeholders frames the climate change discourse as being dominated by environmentalists and oil companies, thus excluding the voices of people caught in between. The objectivity-advocacy debate challenges this approach, calling for journalists to “... evaluate competing arguments in an environmental controversy” (Cox 2006: 182). A journalist skilled in sustainability issues could problematize assumptions, thus question concept that we often take for granted.

This research is interested in avoiding simplistic or anthropocentric perceptions of valuing non-human entities. One way of accomplishing this is to act in self-reflective manner. Here, self-reflexivity is defined as the conscious turning of the individual towards her/himself while simultaneously being the observing subject and the observed object, “a process that includes both self-knowledge and self-monitoring” (Mead 1934, Rosenberg 1979, Gecas and Burke 1995 from Pagis 2009: 255). By practicing self-reflexivity, one can arguably provide with greater transparency, as the subjective nature of knowledge production is made visible. It could also help us to reach a greater understanding regarding how sentiments of fear, frustration and conflict emerge.

The story of nature conservation is largely a story about nature’s place in the normative order of modern societies (Haila 2001: 30). There is, however, a level of complexity associated with the knowledge of nature that differs from knowledge of society. Nature conservation requires specification in regards to what is to be preserved and for what specific purpose (Haila 2001: 37). Here, the pursuit of convergence could act as a conscious strategy to avoid polarity and conflict. Convergence is the gradual and on-going path towards reaching some level of shared norms in regards to the normative relationship to nature. Arguably, if we want to have wildlife conservation

and biodiversity protection we need to re-evaluate our relationship with the ‘natural domain’ inter-subjectively.

3.3 Discourse Theory

In order to determine what are the most prominent representations in the media regarding wildlife conservation and to determine to what extent media is conveying the complexities of wildlife conservation, this research use a discourse analysis approach. This means that this research explores the discursive practices “through which text and talk are produced, consumed or interpreted” (Fairclough 1998: 145 from Jørgensen et al. 2002: 67). The reason being that media is the forum where culture is reproduced at the same time as they are a site where various social groups, institutions and ideologies struggle over the definition and construction of social reality (Gamson et al. 1989: 3).

One crucial element of this research is the assumption that different actors sometimes try to promote different ways of organising society by employing different discourses combined with the fact that sometimes certain social practices appears to us as so natural that we fail to see the alternatives. Jørgensen and Phillips state that: “Discursive change takes place when discursive elements are articulated in new ways” (2002: 76). So meaning is thus fluid and all discourses are contingent and in this context the perception of objectivity is what masks this contingency. The threat is thus that this hides alternative possibilities that otherwise could have become visible to us (Jørgensen et al. 2002: 37).

The overall idea of discourse theory is that when it comes to social phenomenon it is an on-going process that never truly finishes and that meaning can never truly be ultimately fixed (Jørgensen et al. 2002: 24). This opens up for constant social struggles about definitions of society and identity. This process has continuous social effects. The task of a discourse analyst is to plot the course of these struggles. The aim is to explore the meaning at all levels of the social (*ibid*: 24). Consequently, the aim of a discourse analysis is not to uncover an objective reality but instead to explore how we create this reality so that it appears to be *objective* and *natural* to us (Jørgensen et al. 2002: 33).

3.3.1 Interdiscursivity

When different discourses are affecting each other or are articulated together in a communicative event it is called *interdiscursivity* (Jørgensen et al. 2002: 73). This can be illustrated by

i.e. when the media discourse is influenced by the scientific discourse or the political discourse and vice versa. An intertextual chain is a series of texts where texts incorporate elements from other texts, i.e. scientific report. In the case of the media, the implication of this is that certain discourses tend to have more influence on the production of news than others. As such there is an underlying hierarchy of what discourse have the most influence in society and the production of texts.

3.3.2 Ideological Standpoints

Ideology is not only an overarching aspect of a text but it also influences the “selection and representation of objects, actors, the language, and the discursive strategies employed in a text” (Carvalho 2002: 25). This, however, does not entail that defining the ideological standpoint in a text is a straightforward task. Carvalho argues that in the field of environment “ideology has essentially to do with normative and political standpoints on the relation between man (woman) and nature” (2000: 25). I believe that this is of great relevance when attempting to determine what are the most prominent representations in news media regarding the wolf and to determine to what extent media is conveying the complexities of wildlife conservation.

4 Method and Methodology

4.1 Research Design

The epistemological foundation of this research is social constructivism, thus rejecting a purely positivist research outlook. Applying a philosophical standpoint that embraces the ontology of multiple perceptions of reality as well as the notion that knowledge is created within the scope of inter-subjective frameworks helps this research find an epistemological context (Moses et al. 2007: 194). Following Alvin Goldman’s definitions, knowledge here is too be understood as simply what is believed, or what beliefs are “institutionalized” in a specific community or cultural context (Goldman 1999: 7). The community can be deemed as both the journalistic community as well as the society in general, as they are both producers and absorbers of information, interchangeably. Accordingly, knowledge is thus subjective, constructed and based on shared signs and symbols that are recognized by members of a specific culture (Grbich 2007:8).

This research employs a qualitative approach using the case study of news coverage of the wolf in three newspapers during three years of publications. Data was constituted through the process of collecting newspaper articles, which are sorted and presented in the form of a Matrix in the Appendix. This information was then complemented with three semi-structured interviews. I found a qualitative approach to be suitable in order to be able to put the collected data in wider

cultural context and generate proper understanding by conducting in-depth examination of a specific case (Ragin et al. 2011: 111). As I am studying written material, a qualitative research strategy helped me to bring meaning to the collected data “in terms of the meaning people bring to them” (Denzin et al. 2005: 3). By looking at news media’s role in wildlife conservation in regards to the Swedish wolf, I believe that have been able to appreciate the complexity of the issue by taking into consideration people’s perceptions, attitudes, experiences, beliefs, opinions and values.

This research relies on the method of retrodiction, that an entails interplay of induction and deduction (Ragin et al. 2011: 76). At the initial stage this research employed an inductive approach as data was collected and compared to the research questions, making it possible to define patterns and themes (Mikkelsen 2005: 169). This meant that theory had limited influence on the data collection process (Bryman 2012: 27). The result, however, was then applied deductively by being compared to already existing theoretical paradigms. The continuation was a further analysis and data review, including conducting semi-structures interviews in order to bring further insight to the collected data. Consequently, the result was a continuous moving between data and ideas, and accordingly induction and deduction. By moving between induction and deduction the research received flexibility in regards to linking data and theory in a dynamic process (Ragin et al 2011: 176).

4.2 Data Collection

Newspaper articles that have been deemed to encompass a greater variety of context from where the news has been produced, both regional and national newspapers, are used as source material. Additionally, in regards to the national newspapers one paper represents Sweden’s most popular tabloid newspaper, namely Aftonbladet, and the other is Sweden’s most popular morning paper, namely Dagens Nyheter (hereafter DN) (SCB 2011). The last newspaper is Värmlands Folkblad (hereafter VF), which is a local newspaper from one of the areas where the wolf discussion has been most inflamed.

By typing in the word “varg” (wolf) in each respective search engine, I collected end listed news articles published between 2010.01.01-2012.12.31. All in all it became 576 news articles, however, the amount of articles published in each newspaper varied a lot with the most published in DN, the second VF and the least in Aftonbladet. The news articles where collected in an excel format and organised under the headings: “Social actors”, “Experts”, “Themes” and “Sub themes”. The research also incorporated framing or phrasing that I found relevant for the research question. Columns and Editorials where read but only incorporated if they were able to provide with input that

provided with some new angle or challenged the themes in the news articles. The relevant editorials and columns are presented in the bibliography.

In order to find out what kind of professional or academic background that exists among the different editorial staff, brief interviews were conducted with journalists covering the wolf. This was done by calling directly to the different news bureaus and asking who would be a suitable candidate for my questions. Since I had already collected the articles I could see who were the most frequent writers on the topic. However, many had changed departments or where no longer employed at the specific news bureau, so I had to rely on whom the staff found could answer my questions. Receiving some information regarding what expertise that exists among the staff I believe is crucial in order to get a deeper understanding regarding the prerequisites to provide with news material that correspond to my stated normative position, as well as to determine to what extent this topic is prioritized. The interviews were very brief and conducted in the form of semi-structured. Semi structured interviewing entails that I can keep more of an open mind about the contours regarding what I need to know about as I have the flexibility to follow up with further questions if deemed appropriate (Bryman: 2012: 212).

4.3 Method of Selection

In order to attempt a good level of representation, data was collected from both national as well as one regional newspaper. The two national newspapers constituted two of the most well read newspapers in Sweden during the time that the data collection began 2010 (SCB 2011). In order to avoid data that could skew the results away from wildlife conservation in Sweden, articles that covered foreign events, road accidents and wolves in zoos (assuming that they were unrelated to strategies to plant pups from zoos into the wild which then fell under wildlife conservation management) were excluded. Additional information, such as phrasings and framings were noted down so that they could be presented separately. This included polarizing value-laden language, such as i.e. “wolf lovers/ wolf haters” and in what way the wolf was described as being of value (what context and what language was used to describe it). Moreover, I also looked at whether anthropocentric framing was used and to what extent there was a clear journalistic voice commenting on the events, including statements made by different social actors.

4.4 Ethical Considerations

When conducting the interviews I made the participants aware of the fact that I am conducting a research at Lund’s University. I let them know what the research is about and what its purpose is

(Bryman 2012: 153). I also let them know that their participation is voluntary and that they can be anonymous. The only thing that is disclosed is their employment and title.

4.5 Trustworthiness

Since this research is calling for a level of self-reflexivity in journalism, it may be prudent to disclose my own predispositions conducting this research. I want to disclose that I am myself a product of my geographical upbringing. I was raised in a town in the Southern part of Sweden that never had any open discussions regarding the wolf. Most of the people I knew had a positive outlook on the wolf's return to Sweden. I should also point out that I have no experiences of journalism but merely a regular consumer of newspaper articles. Prior to this research, I have frequently read both DN and Aftonbladet, but not VF since Värmland is a region far away from where I grew up. Baring this in mind, the collected data has been triangulated with interviews as well as already existing bodies of research regarding the issue at hand. My contribution to this particular field of research is that I take a normative position in regards to media having a responsibility in providing people with information, knowledge and communication that can help to perceive nature in a more multifaceted way and that journalists declare their role as producers of a constructed reality.

4.6 Discourse Analysis Method

4.6.1 Social Actors

This research focuses primarily on which actor/ actors are active in a specific article. This means who are actively speaking in the article. By defining which actors are being heard this research attempts to illustrate the community that is active in framing the discourse. Actors are accordingly divided in Hunters, Politicians, Members of ENGO's, Civilians, Police/ Law Enforcement Agency, Business Community, Academia, Zoo Personal, Public Institutions (i.e. SEPA and the Local Administrative Boards), as well as other possible actors that are prominent in the discourse. There have been some problematic aspects associated with defining the groups of certain actors as one actor can belong to two groups at the same time, i.e politician and hunter. When that happens the actor is defined in regards to the context. In what role is the actor speaking in, i.e. is she/ he speaking on behalf of a hunter or a politician.

4.6.2 Experts

Media produce knowledge by adhering to the socio-cultural context where they target their readers. As such the people that a specific newspaper refers to as "experts" are mapped out in order

to determine their context and contribution to the discourse. This is done in order to establish “framing power” (Carvalho 2000: 22), meaning what power they have to influence a discourse. In this research, the definition of expert is narrowed down to only incorporate those who are explicitly referred to as “experts” in the text. This is to avoid speculating whether an individual is framed as an expert or not. This also means that an expert does not have to be a part of a certain discipline, but can be anyone that the different newspapers have labelled so. However, the background of the expert is still of interest as it can provide us with some insight regarding what inter-discursive activities define the way the wolf is framed in the media. As such, two or three most influential “experts” (that is the most frequently used individuals) is further explored in order to find which context the newspaper receive/ produce information.

4.6.3 Discursive Strategy

Carvalho defines discursive strategies as “a form of discursive manipulation of reality by social actors including journalists” (2000: 23). This entails a degree of intervention of a constructed reality in order to achieve certain effect or goal. This activity is not necessarily a conscious action, but can be result of the context that the information is produced. This is a way to make complicated issues more tangible. This conduct is an important part of the act of “framing a certain reality” (Carvalho 2000: 24). Carvalho states “Positioning is a discursive strategy that involves constructing social actors into a certain relationship with others” (2000: 24). This may or may not entitle these actors to act in certain ways. Positioning may also be considered as “a wider process of constitution of the identity of the subject through discourse” (ibid: 24). This is also connected to the concept of legitimization as this consists of justifying and sanctioning certain actions/ power on the basis of i.e. normative reasons (ibid: 24). Accordingly, the same can be used as a method to de-legitimize something.

In this context, this research looks at whether actors are represented in a way that makes them the sole providers of a discursive reality. A way of doing this is i.e. when an actor gets to speak freely without being questioned by the journalist him/ herself. A common way for journalists to give the impression of being objective or neutral is to allow one actor to speak and then another actor to question the statements made by the first actor. However, the problem is that this does not necessarily provide with a nuanced description of “reality”, but may just act to further reinforce polarity since the only representation of information already comes from two opposing sides. It is primarily the approach of not questioning or problematizing problematic statements that is looked at.

4.6.4 Framing

According to Carvalho there are three ways of looking at framing. The first way of looking at frame emphasise perceptions and views frames “as patterns for organizing our cognition of reality” (Carvalho 2000: 7). This has to do with our disposition to resort to different frames in order to make sense of an otherwise complex reality. As we absorb information from the world around us, our mind interprets these in a context that makes sense to us. The second way of viewing frame is linked to the structuration of a discourse. In this way frames are viewed as structures that are present in discourse: “A frame is, in this sense, an underlying idea that directs the construction of texts” (ibid: 7). In the production of texts, this act involves selection in the form of inclusion and exclusion of facts opinions and value judgements and composition, which is the arrangement of these elements with the purpose of producing a certain meaning (ibid: 7). Framing devices can include metaphors, catchphrases and depictions as well as different forms of reasoning devices such as appealing to moral principles.

One thing that is looked upon is whether the journalist or actor is using polarizing phrases that reinforce a sense of polarity without problematizing it. Another thing that is looked at is how the wolf is framed. How is the wolf valued, and how is it being described? In what framework is the wolf acting and what words or concepts are associated with it? The research also looks at harsh language like i.e. whether there is a use of language that act to make the information comprehensible by comparing it to something else.

4.6.5 Themes

Since nature conservation is a topic that is highly complex and involves many dimensions, I believe that it is important to investigate what choices are made in regards to what aspect of a story the author has chosen to portray, as sometimes what has not been said tells us more than what things have been said. Accordingly, this research is looking at different topics or themes. Objects of discourse are not always obvious and as such it is not always easy to identify them. However, if properly done it constitutes an important step towards deconstructing and understanding the role of discourses (Carvalho 2000: 22). Broader objects can be matters of politics, ecology or economics while the more specific ones can be threats associated with the management of the wolf or ecological impact of the wolf. Carvalho also suggests looking at how the broader object relate to the specific ones.

Since this research attempts to investigate the level of complexity, specific attention is put to information that highlight original and novel input, that is, information that is not often repeated in

the discourse and whether the journalist or actor problematizes common perceptions or common made statement and assumptions.

5 Results and Analysis

5.1 Who frames wildlife conservation in news media?

5.1.1 Social Actors Representation

The most commonly employed actors in all newspapers where representatives from public institutions, most often the different county administrative boards, SEPA and less frequently different veterinarians assisting the management plan (Appendix I). This group is represented in red in the figures below titles "Civil Servants". When issues relating to the wolf were covered in different news articles the trend was to interview representative from the administrative boards from the region where the particular event had occurred. The same actors were also vocal in administrative discussions, such as where to plant pups with different genetic structures or whether a certain individual ought to be moved to another area. Hunters on the other hand, where active in regards to individual testimonies on experiences relating to hunting and as individuals impacted by wolf attacks as well as politically active interest groups (particularly the National Hunting Association (hereafter the NCA). Hunters where also vocal as protesters, and sometimes as recipients of different types of threats.

The group that often were placed in opposition to hunters were different ENGO's, most often the Swedish Society for Nature Conservation (hereafter the SSNC) and the National Predator Association (hereafter the NPA). They were vocal when the article referred to either political decisions on management such as defining the number of individuals to constitute a viable population, how many wolves that should be targeted for hunting, and in particular the occurrences surrounding the reporting of the Swedish government's wolf politics to the EU for violating the Habitat Directive. They were often placed as 'spokespersons' for the wolves interest, still, their argumentation often surround what possible impacts different decisions has on the genetic qualities of the wolf tribes and whether the government's decision do or do not comply to EU standards.

Source: Appendix I

What I found interesting is that it was very common, if not the rule, that the stakeholders or social actors was given free room to speak without being questioned or having their arguments problematized by the journalist. This led to some odd statements being put forward as uncontroversial accounts of an event (these types of statements will be further delved into later in the research). Another interesting aspect was that it was common to put two different stakeholders in opposition to one another, making the two argue for their own particular discursive reality without being challenged by a journalistic voice. Having two opposing sides representing their position on the issue does not constitute objectivity, but only serves to perpetuate the notion that the discourse is made up by two polar opposites. This way of presenting the different actors may only serve to reinforce the perception that the wolf debate is defined by two polar opposites in continuous struggle against each other. Öhlund came to a similar conclusion in her research from 2012, stating

that media's portrayal of the debate gives the impression that some interests are more dominant than others. She also found that the way that the different sides were represented indicates a polarization of the different viewpoints that do not necessarily represent reality (Öhlund 2012).

5.1.2 Themes

In order to make sense of the themes as visible in Appendix II it is important to emphasize the surrounding occurrences that inspired the articles. In the beginning of 2010 the government initiated licensed hunting of wolves for the first time since the wolf received protective status. As such, many articles covered the event, often from different hunter's perspective as several individuals were given the opportunity to give their personal account for the occurrences surrounding the hunt. Since the decision to allow the licensed hunting of wolves was a controversial one, news coverage also include political and opinionated articles.

In the beginning of 2011 there was another licensed hunt, however, in this hunt there were fewer wolves to be targeted and the novelty of the first hunt had ceased. In-between these events, most frequent coverage included sightings, attacks on domestic animals and cattle/ sheep, calls for protective hunt, management plans including how to improve the genetics of the Swedish wolf tribe and where to place individual wolves within the country, politics surrounding how different politicians want to manage wolves, opinions, protests and occasionally threats directed at either hunters, wolf activist, politicians or civil servants (Appendix II).

What I found noteworthy throughout the data collection was the absence of diversity of themes, as the majority of the news articles covered management, politics, hunting, genetics and so on. The impression thus became that the way the wolf was covered was a reflection of the political discourse of the wolf. Other themes such as sightings or wolf attacks served more as 'islands of information' where the information was brief and often involved emotional responses and again, comments on political decisions taken on the issue. Overall, the information remained shallow as little context or problematization was offered.

A further limitation of depth in the news articles was the ocean of news articles that only covered one specific event at a time, many being merely paragraph-sized. What struck me is that if a person is trying to get a deeper understanding of the complexities associated with the wolf, they risk getting lost in short stories with limited space for information. I thus came to the conclusion that what is provided, in regards to depth and content is more a matter of quantity than quality.

5.1.3 Scientific Representation

In regards to representation from academia the articles provided with a variety of fields of research¹. Even though the extent of the material was more than what I previously thought it would be, the representations of the different fields of research did not depart significantly from the themes previously mentioned. The themes of discussion still constituted genetics and other topics that did little to add anything that challenged the political or natural science discourse (Appendix III). Several references were made to research conducted by the research institution SKANDULV. SKANDULV is the Scandinavian wolf research project and is referred to by both media and politicians (Prop. 2012/13:191). The main purpose of the research conducted by SKANDULV is to investigate population dynamics, geographical expansion of the population and genetics, social behaviour and predation as well as human dimensions wolf ecology. This includes depredation and human attitudes (SKANDULV 2014a). However, looking through the publications released on their webpage as well as statements made in the selected article, I again struggled to find any noticeable deeper discussions regarding anything besides genetics, ecology and institutional management (SKANDULV 2014b).

In both DN and Aftonbladet the most common sited expert was Olof Liberg- programme coordinator from SKANDULV (often simply referred to as ‘Varg expert’: wolf expert). Another expert was Gunnar Glöersen: predator expert at the National Hunting Association (hereafter the NHA). In VF, the most frequently sited expert was Lars Furulund from the county administrative board (Appendix III). Common subject of discussion included providing information that relates to the management plan, i.e. inform, critique or discuss current political decisions made on whether or not to allow licensed or protective hunt, how many wolves to hunt, how many to preserve, whether to move wolves within the country, import wolves from other countries, plant puppies in the wild from zoos and so on.

The following quote was taken from Aftonbladet in the beginning of 2010, and it is Olof Liberg that is interviewed in regards to the licensed hunting of wolves that took place at the time:

“I love all of nature and most of all the wolf which I am researching on. It is a marvellous animal, exiting and impressive. But everyone has to understand that not everyone thinks that way and that wolves actually cause serious problems. The romantics have to realize that it actually is that way otherwise the debate becomes skewed. It would be like the

Scientific Journal of Evolutionary Biology”, “Scientific Journal of Biological Conservation”, “Animal Conservation”, Proceedings of the Royal Society”, the “European Journal of Wildlife research” as well as the database of “Public Library of Science” (Appendix III).

rural inhabitants would have opinions regarding road tolls in Stockholm... Nature is no longer so natural. Humans are everywhere. To let the wolf tribe free would be a disaster. The wolf is an extremely smart animal and a great predator and they would go closer to human habitation. In a modern civilized society you cannot let a predator tribe free. We have hunted predators throughout all time and must continue to do so" (Olof Liberg Aft.2010.01.04).

The statement is unquestioned by the reporter and I believe it serves to reinforce the perception that the wolf's existence is a matter of institutional management comparable to decisions on road tax in urban areas. I find it problematic that an expert defines wildlife as something in contrast to 'human civilization', as I would prefer that he instead bring up the complexities associated with socio-ecological relationships instead of again reinforcing the perception that there is a dichotomy between the two. He also reinforces the perception that there is a polarity in the way that wolf is talked about, referring to some actors as "romantics". The title of "expert" grants a person with a certain kind of legitimacy in speaking about a particular topic and although I do not doubt that Olof Liberg knows a lot about the field of his research, it appears that his contribution to reaching a level of convergence is limited.

5.2 Pursuing Convergence

5.2.1 The War in the Forest

One method to make a story comprehensible is to use game or war rhetoric as a way to illustrate the harsh sentiments and to emphasise drama (BRÅ 2007). There are several articles using game or war related methods to illustrate the story. One story covering the political activities leading up to the decision to allow licensed hunting for the first time, emphasises how different ideological convictions (manifested in hunter vs. non-hunter) affects the decision-making. The article makes it clear that Andreas Carlgren (then environmental minister) is not a hunter, but Eskil Erlandsson agricultural minister on the other hand is. He is accordingly referred to as the "hunting minister" due to his influence to ensure that the licensed hunting of wolves truly became a reality (Aft.2010:01.13). The article states that:

"Eskil Erlandsson became the victor of the battle. The environmental minister accepted a roof of 210 wolves" (Journalist Aft.2010:01.13).

BRÅ came up with a similar result in their report from 2007, were they covered how the wolf was framed in regional press. The report stated that a lot of game and war rhetoric has been used like “The Samish are on the warpath” and “the hunters organization victorious” and so on (2007). The authors of the study concluded the picture provided lacks nuance and combined with increased media coverage there is a possibility that this forum can affect both public opinions and the reader’s perception of reality (BRÅ 2007). One can argue that using language that hints towards war and conflict is a problematic way to initiate a public constructive dialogue on wildlife conservation, as it appeals to people’s sense of drama and flare instead of understanding.

“The war in the forest” (Titel Aft.2011.01.14)

“EU takes up the fight against Swedish wolf hunt” (Titel Aft.2011.01.27)

“THE WOLF IS THE WINNER” (Titel Aft. 2011.02.14)

“Life threatened for his resistance” (Titel Aft.2010.01.05).

“The wolves won” (Titel Aft.2011.01.16)

5.2.2 Polarizing Language

There are several examples of using polarized language (wolf haters vs. Wolf lovers) that also serve to paint a picture of unquestioned division of sentiments towards the issue. Although these phrases were primarily used by different interviewed actors, there were also instances when the same phrases were used by the journalist him/ herself. That arguably does little to convey the complexities surrounding wildlife conservation as it divides the discussant or active actors in two opposing groups, as well as determining the same actor’s relationship with the wolf as either an object of hate or affection.

“The debate has been hot since the licensed hunting of wolves initiated: In one corner the hunt mongers and in the other the Wolf friends” (Journalist Aft.2010.01.04).

“Wolf lovers mapped out on the Internet” (Title Aft.2011.11.08).

“...the division appears more likely to be increasing between wolf friends and wolf antagonists” (Journalist DN.2011.01.23).

"I would prefer to not talk about the wolf problem. The person who says something negative about the wolf becomes in the eyes of many a wolf hater. Wolf with a natural behaviour should stay. But problem wolves that walk in amongst the houses should be taken away" (Hunter Aft.2012.04.04).

5.3 Communicating Complexities

5.3.1 ‘The problem-wolf’

The latter quote points towards another problematic concept, namely the phrase “problem wolf”. Here the journalist makes no attempt to try and ask what we define as a “problem wolf”. It becomes a “natural” phrase that is used many times. A wolf that cannot “integrate” or “stay natural” should be taken away. Very little questions are made regarding our behaviour and whether our society is “natural” or “problematic”. This approach becomes awkward considering the fact that wolf attacks on domestic animals is a re-current phenomenon. One man that was interviewed in relation to a dog being attacked by a wolf stated that:

"When they start to attack domestic animals I believe that it has gone too far. Last autumn a dog was taken in the yard. That is not normal wolf behaviour" (Dog owner Aft.2012.04.08)

Even the public institutions themselves use the same rhetoric. The person responsible for predator issues at the county administrative board in Halland stated the following:

"As long as the animal is calm and acts rationally we will not plan anything, if not, it can be possible that we will try to sedate it" (County Administrative Board DN.2011.04.15)

What constitutes a wolf “acting rationally” is neither defined nor problematized by the actor himself nor the journalist but accepted as unproblematic statement. Another example is when wolves that wander close to human habitation are regarded as being “lost” or “confused”. The wolf’s place is thus made clear and that is that they should remain separate from the human sphere. If they do not comply then they are accordingly “lost”:

"The drama with a lost wolf in central Helsingborg ended happily with a natural nap in the forest" (Journalist DN.2011.04.11)

"The hunt of the confused/strayed wolf in Helsingborg has been stopped. The wolf has been reported to go into the woods to rest. So now the police and the county

administrative board abort their attempts to capture the beast" (Journalist Aft.2011.04.11)

"Lost wolf wandered to Halland" (Title DN.2011.04.15)

The perception that the wolf somehow is lost if it moves to other territories can be associated with the fact that the current management plan often involves force-moving wolves in order to minimise their impact on cattle and to ensure that "genetically important" animals have territories in areas where they have a greater chance to have genetically viable offspring. Moving wolves within Sweden is a costly and controversial affair that is frequently covered in news media. This is thus reflected as common theme including wolves migrating to areas where they are not supposed to be, resulting in the sedation and relocation of the animal. However, wolves are territorial, making it difficult to force a wolf to stay in an area pre-determined by the government (Rovdjurscenter 2014b). The selected news media outlets do cover the potential unsustainability of this approach, but again, mostly in the matter of the financial costs.

5.3.2 'The Cunning wolf'

It is common to refer to the wolf as intelligent and cunning, especially when the hunters struggle to fill the quota of wolves that are targeted for hunting:

"We are out hunting. But I guess you can say that the wolf is in the lead" (Hunter Aft.2011.02.13)

"If the wolves got the way they wanted we would have a mild winter with bare land. Then it would be much more difficult to find them" (Hunter DN 2011.01.15)

"The wolf can hunt all year around and we can only hunt a few weeks during autumn" (Hunter DN.2010.01.05).

"...smart wolves fled to Norway" (Journalist DN.2011.01.16)

These types of phrasings relate to another issue that appear to be common in contemporary news media's way of communicating about issues relating to non-human entities and that is by employing anthropomorphism. The term anthropomorphism can be defined in many ways, but in this context I am referring to the act of ascribing human qualities to animal behaviours. Mitchell et al. defines it as subjects' providing a ranking of a particular psychological state for an animal that is

similar to that of a human (1997: 178). What I find problematic with employing anthropomorphic descriptions is that it may serve to illustrate the wolf as having human like mentality. So the wolf becomes almost like a human and can thus receive humanlike judgements and their behaviour accordingly appears ‘irrational’ or ‘cruel’ in human standards. This kind of formulation arguably does little to increase our perception of the complexities associated with wildlife conservation. Instead it reinforces the perception that the wolf has a consciousness that is akin to how humans relate to the world around them. A perception that corresponds to the expectation that wolves act “normal” and “rationally” and that these qualities is what determines whether they have a right to live or not.

5.3.3 The Genetically Valuable Wolf

The wolf as a part of an ecosystem, or as a creature with intrinsic value is rarely emphasized. In fact, the most common way to determine the wolf’s worth is through its genetics:

“The wolf has clawed (rivit) several reindeers in the area around Gällivare and since it is deemed as genetically valuable, the SEPA wanted to move it instead of shooting it”
(Journalist DN.2011.04.09)

“The Nature Observer from the county administrative board felled the wolf by Kölåsen, around 25 km west of Lofsdalen. The wolf is of Scandinavian descent and is regarded as genetically valuable for the Swedish wolf tribe” (Journalist Aft.2012.11.13)

“The father of the puppies is deemed to be genetically very valuable for the inbred Swedish tribe since he is the son to a wolf of Finnish-Russian origin of the so called Galven territory of Hälsingland” (Journalist DN.2010.05.13).

“It is the third time in one year that the wolf is moved away from the reindeer area. The wolf that has Finnish-Russian descent is important from a genetic point of view for the Swedish wolf tribe” (Journalist DN.2012.02.27).

5.3.4 The Nationalized Wolf

It may seem odd that the wolf’s nationality is of importance when writing about the wolf, but it is often used as a way to highlight genetic qualities. Still, emphasising that the wolf is Norwegian, Finnish, Russian or Swedish does again emphasise the perception that animals somehow have a nationality and that their legal status is associated with this nationality. This could for example be

seen when wolves fled to Norway during the wolf hunt or when people claim that the wolves do not belong here because they are not really ‘Swedish’.

“Finnish and Russian wolves soon among the Swedish” (Titel DN.2011.02.21)

“Proposal: Adopt wolves from Russia” (Titel Aft.2010.11.14)

The wolves are not only defined in terms of nationality but also in term of which region they are from

“Jämtlandish wolf moved to Örebro” (Title DN.2011.03.21)

“Gällivarewolf moved to Dalarna” (Title DN.2011.04.09)

“Scaniawolf sighted outside of Halmstad” (Title DN 2011.04.16)

5.3.5 The Individualized Wolf

More than being referred to in accord to genetic quality or nationality, sometime individual wolf’s fate is followed in newspapers even naming the individual wolf. This aspect can be related back to the use of anthropomorphic framing. The names are also a result of the area where they are located. The Kynna wolf was a wolf that migrated from Norway in order to come to Sweden where she attacked sheep and accordingly became the target for protective hunting. Her story was followed in several articles where she was described as “taunting” the hunters (DN 2011:10:13). The leader of the hunting team was quoted as saying “It is cunning predator that is more intelligent than us” (*ibid*). The articles are often short and serve more as an update on her status and her whereabouts. The article covering her death stated that:

“The so-called Kynna wolf has wandered on to the hunting grounds of the beyond (De sälla jaktmarkerna). At around 15:30 Saturday, a hunting team from Älmhult shot the she wolf according to the county administrative board from Kronoberg. During the three weeks long protective hunt she managed to escape. On Thursday the SEPA gave permission to prolonged protective hunt and this time the hunters where more effective” (Journalist DN.2011.11.12).

Her story even continued after her death

"The Norwegian wolf Kynna, who last autumn was shot in Southern Småland after a three week long protective hunt, is soon back in her former hunting grounds... The wolf pelt is now to be stuffed in order to become one of the main attractions in a permanent exhibition at Huseby bruk" (DN 2012.04.21)

5.4 The Editorial Climate

One journalist at DN stated that there is a great interest in having a deeper normative discussion in regard to sustainable nature conservation in the context of the wolf, but the standard format in traditional news articles make it difficult to go into greater depth on this issue (Interview 2). During the later years since 2000's there have been a number of economic cut backs and the staff is now smaller than before. Normative discussions and complexities associated with issues such as biodiversity are usually held in debate forums, editorial columns and in scientific editorials. The reason why biodiversity is often depicted in a political context is because political decisions are very important as it affects how nature conservation is conducted, but it is also relatable for a wider audience (Interview 2). As previously stated, it is a way to make the topic relevant to a greater number of people who may not have any direct experiences of the wolf.

The interviewee also stated that there are no principal hindrances in news media against taking up the issue of biodiversity in a more complex manner, but that a general "hindrance" is the journalistic dramaturgy, which needs clear conflict and preferably black and white connections. In later years another hindrance are the dwindling resources that entail that very few journalists have time to delve deeper in a way that would be required (Interview 2). One representative from VF stated that they do not have the resources necessary and that reporting of wolves are primarily a journalistic affair and not the job of specific experts (Interview 1). In regards to Aftonbladet, when I raised the issue of existing competencies among their editorial staff it is noteworthy that the answer I received was "We do not really have anyone with particular expertise on that topic" (interview 3).

5.5 Columns and Editorials

5.5.1 Wolves and Xenophobia

Overall it can be stated again that a lot of the editorials and column featured the political aspect, conflict and opinions. However, there were some interesting alternative points that were brought up. One chronicler (in a debate editorial) wrote: "The wolves are the Muslims of the forest. The Muslims have become the wolves of the suburbs" (Ezpeleta 2010) Again the theme of the article was political; however, the point was that there is xenophobia in politics that is now also

incorporating groups that want to completely eradicate the wolf. He states that the problem is lack of knowledge, fear of loss of culture and prejudices that can be equated to the current problem of fear of “islamisation” (*ibid* 2010). Cinque stated that in her research the different debate forums discussing the wolf, people expressed fear of losing their own history and the values as contemporary society keep changing (Cinque 2003). Although the argument may not have been straightforward I find it interesting to compare solutions to wildlife conservation be compared to perceptions of “integration” on behalf of rising xenophobia. This can relate back to the practice of stating individual wolves different ‘nationalities’. Is this perhaps again a way in which the wolf becomes ‘humanized’ and adopted into the social structure of human society? I found phrasings that further illustrated this in the following news article: “The wolf seeks protection in Norway” (Title DN.2011.01.16).

5.5.2 Wildlife Conservation and Biodiversity Preservation

One editorial confronts the news media discourse of the wolf by primarily stating that the wolf does not care about nationality (Kazmierska 2011). However, the same chronicle has some problematic aspects as it uses polarizing language such as “wolf huggers” and makes the assumption that a “natural” co-existence with wolves automatically necessitates hunting, arguing that natural symbiosis means treating wolves as hunters themselves. She problematize perceptions of wildlife conservation associated with ‘stewardship mentality’ by stating that the current debate involves ‘uncomfortable’ ways of referring to the wolf as being like a small child in need of human cares. She also questions the concept of ecological equilibrium stating that we have yet to have defined what we mean by this, as this balance have been altered many times before (Kazmierska 2011).

There are a number of voices that bring up the fact that there appear to be an underlying confusion in regards to what biodiversity protection really should be. Another editorial in DN questions the concept of biodiversity, emphasising that it is itself a human concept (Brynfolf 2011). In another column in DN the question was posed whether it is futile to protect a number of “charismatic” species whilst ignoring the greater number of less famous, albeit perhaps more important, ones (Jewert 2010). I believe that it is important that wildlife conservation and biodiversity protections as concepts are problematized, but again the discussions were often held under the guise of political or managerial themes that often neglected to strive towards any level of reach convergence. The trend was rather to further play on people’s emotions using harsh language and conflict related phrasing.

6 Discussion

6.1 A Silent Voice

I find it to be problematic that the journalistic voice is often silent; leading to information being presented without problematization. Here is where self-reflexivity could have served well to emphasize that the occurrences surrounding the wolf is something that requires inter-subjective dialogue, as regardless of the intent of promoting objectivity, news account will always entail social construction. Historically, Sweden has gone from being a poor agricultural to an industrial country with a highly institutionalized system that is internationally famous. It may be presumptuous to draw a correlation between Swedish exceptional faith in public institutions and the way we relate and perceive the natural domain, but as a reader of popular news media it does not appear to be that far-fetched.

People's generalizations about language are made on the basis of the discourse they participate in. However, this discourse is then in turn affected by the application of this knowledge when maintaining/ creating a new discourse (Johnstone: 2008: 3). This dialectal relationship thus affects how people interpret information, and people who are interpreting information in turn reproduce the same kind of information and on it goes. I believe that what happens when news media attempts to inform people of the occurrences surrounding wildlife conservation in regard to the wolf is that they define sustainable wildlife conservation as the government defines it, namely as a matter of genetics, location and viable populations. This is then what is told to the people, who again reflect the same perceptions back on news media. When academia was present it was mostly in terms of natural science. Although I believe that knowledge is always good, I believe it is time that this discourse takes us beyond knowing in order to instead generate understanding (Neef 2005: 15)

It is important to emphasise that this is not a matter of critiquing individual news papers since they themselves are caught up in how society defines the issues they cover. According to Focault, power is knowledge and knowledge is power and consequently power (just as discourses) spreads across different social agents i.e. social groups, structures, or other actors with particular interests (Phillips et al. 2002). This further indicates the importance that the journalists themselves should carry a certain level of knowledge and expertise regarding the complexities associated with sustainable wildlife conservation since they have the ability to challenge the discourse that different stakeholders reproduce. As such, when stating that journalists have the responsibility to question existing power relations that also includes questioning the discourses themselves. Still news media frames the wolf not only as a problem to human activities but also as a problematic species that has a hard time integrating to Swedish society.

6.2 The Market Mechanism

It would be difficult to discuss media's choice of framing and discursive strategies, without mentioning the underlying market mechanisms. Like the journalist from DN mentioned, their department had been affected by economic cutbacks, which had impact on who got to report on issues relating to the wolf. He/ She also mentioned that the format does not allow them to go into further depth on the issue, and that the dramaturgy and political framing are all part of making news relatable to a wider audience and thus facilitate the consumption of news. Just as the value of wolves can be socially defined by its genetic makeup, News-worthiness can be measured by its ability to attract readers or viewers (Cox 2006: 175). The question is whether news media is doomed to only provide with shallow account of intricate and complex issues in the world that citizens need to be informed about in order to make enlightened decisions in the society they live in?

Is everything in the end a matter of financial resources or about public attitudes? After all, news articles that covers different sports events and different individual athletes has in many newspapers its very own section. Imagine if people where that engaged in sustainability issues and biodiversity management. Imagine if people where that eager to consume and challenge that type of information. Since the relationship between media and readers is a two way street, the way we consume media can affect what they in turn serve us. Accordingly, if we wanted it they would have an incentive to produce it.

On the topic "The Journalist responsibility" Kerstin Brunnberg argues that it is every editorial leader's responsibility to nurture knowledge and competence among the co-workers. She believes that the answer to the question regarding how media can be relevant, credible and popular is purely a matter of competence, as critical questioning requires extensive knowledge (Brunnberg 2006: 65). What I find interesting is that she states that what is worrisome with contemporary media is not what goes wrong when reporting, but what does not get published (*ibid*: 73). I argue that media is obliged to not only 'give us what we want' but to let us know what we can have. Consequently I believe that there are few things in this world as worth having as a harmonious relationship within our community and with our natural surroundings.

7 Conclusion

This research set out to investigate news media's role in sustainable wildlife conservation in regards to the Swedish wolf. The intent was to explore how the wolf has been framed and presented in contemporary news media, by looking at the representation of social actors, whether polarizing

language or conflict related dramaturgy was used, as well as to look in what way the wolf is considered to have a value in itself. The research's normative position in regards to news media was that they have a responsibility to equip citizens/ readers with the necessary tools in order to make informed decisions in a democratic society. By looking at environmental communication and environmental journalism, this research defined three features necessary to accomplish this, namely 1) communicating complexity, 2) avoiding anthropocentric framing, and 3) encouraging the pursuit of social convergence. This research also argues that by practicing self-reflexivity journalists can move beyond simplistic notions of objectivity and declare their role as producers of a constructed reality.

The research was conducted by looking at two of Sweden's most popular news papers, as well as a regional news paper from one of the most affected areas in regards to the wolf's presence and the ensuing debate. The result showed that the most prominent stakeholders were from public institutions, politicians and different interest groups. The reporting of the wolf was often in context of political or institutional decision-making, including occurrences surrounding licensed or protective hunting and disagreements between the government and the EU. Other contexts included individual sightings, threats, protests and so on. Polarizing language was often used, such as "wolf huggers" and "wolf haters" and conflict related rhetoric was also used for dramatic effect. Stakeholders were often presented, either holding a monologue or placed in contrast to an opposing stakeholder. The journalistic voice was primarily silent, causing the stakeholders to be the primary providers of the discursive reality.

Anthropocentric and anthropomorphic framing and rhetoric was used, often referring the wolf as "lost", "irrational" or "cunning", again without any problematization of these concepts by the journalist. Furthermore, the scientific interdiscursivity employed remained within the domain of either natural science or governance, thus again reinforcing the already existing discourse, regarding wildlife conservation being a matter of natural science research or politics. Since the journalistic voice was mostly silent there was no level of self-reflexivity active in the news reporting.

The research came to the conclusion that news media's perception of wildlife conservation in regards to the wolf is a reflection of how the issue is framed by the political establishment and the domain of natural science. The way discourse is created however, is not a one-way street. Society affects media, media affects society, politics affect society, and so forth. As such, the society can express their desires for news reporting that deals with nature conservation with more depth through consumer power, but due to media's responsibility to equip citizens with the necessary tools to be able to make enlightened decisions, I conclude that media has the primary responsibility to be the front runners by questioning existing discourses on wildlife conservation.

This research focused on what messages are reproduced by news media outlets and could therefore not incorporate how exactly their wider public defines the same topic. Therefore, suggestions for further research would be to look at debate forums to see how people who are active in the debate view and frame the issue. It would also be interesting to explore in more depth how wildlife conservation is perceived and discussed in different political settings, in order to determine to what extent the concept is problematized in higher decision-making entities.

Appendix IV

1 Interview 1

Journalist from Värmlands folkblad

Date: 2014-04-14

KI 10:30

Question: Is there anyone in your department that specialises in issues relating to nature conservation that actively writes about the wolf?

Answer: No. The expertise varies, but most of the reporting relating to the wolf is done purely by journalists from the northern parts that are primarily engaged in making observations in i.e. Wolf attacks. We do not have the resources. Other news accounts related to the wolf we receive from other newspapers.

2 Interview 2

Dagens nyheter

KI 11:20

Question: Is there anyone in your department that specialises in issues relating to nature conservation that actively writes about the wolf?

Answer: We have had one expert who was specialized in climate change and similar environmental issues, however we do not have any particular expertise regarding sustainable wildlife conservation in regards to the wolf at the moment. There is a great interest in having a deeper normative discussion in regard to sustainable nature conservation in the context of the wolf, but the format in traditional news articles make it difficult to go into greater depth on this issue.

Question: Why are there fewer people in the staff with specialization?

Answer: During the later years since 2000's there have been a number of economic cut backs and the staff is now smaller than before.

Question: What do you believe to be the greatest hindrance in conveying information regarding sustainability issues in wildlife conservation in regards to the wolf, within traditional news reporting?

Answer: There is no principle hindrance in news media regarding raising the issue of biodiversity in a more complex way, but a general "hindrance" is the journalistic dramaturgy that requires clear conflicts and preferably black and white connections. In later years the shrinking resources have constituted a hindrance that entail that many journalists do not have the time to delve into an issue in a way that would be necessary. The reason why biodiversity is often depicted in a political context is because political decisions are very important as it affect how nature conservation is conducted, but it is also relatable for a wider audience.

Question: If I would want to get a deeper and more complex account of wildlife conservation in regard to the wolf in your newspaper, where should I go?

Answer: Normative discussions and complexities associated with issues such as biodiversity are usually held in debate forums, editorial columns and in scientific editorials.

3 Interview 3

Aftonbladet

Date: 2014-04-29-2014-05.14

I called the department and was directed to several different journalists but none considered themselves to be suitable to answer my questions. I have been calling frequently for three months without being able to reach any particular journalist who where willing to talk to me. What I found noteworthy is that when I was asking for anyone with specific expertise, especially relating to complexity and socio-ecological systems or something similar, working on covering the wolf, the person exclaimed "We do not really have anyone with particular expertise on that topic".
