22nd Annual Meeting of the EAA

31st August - 4th September 2016 Vilnius

www.eaavilnius2016.lt
COMMITTEES OF EAA VILNIUS 2016

SCIENTIFIC COMMITTEE

The chair
Prof. dr. Albinas Kuncavičius, Vilnius University

The members
Audronė Bičiūnienė, Klaipėda University
Rimantas Jankauskas, Vilnius University
Rimvydas Laužikas, Vilnius University
Gytis Pličiauskas, Lithuanian Institute of History
Alessandro Vanzetti, EAA representative
Nurcan Yalman, EAA representative
Maria Gurova, EAA representative
Margaret Gowen, EAA representative
Gitte Hansen, MERC representative

LOCAL ORGANIZING COMMITTEE

Povilas Blaževičius, National Museum – Palace of the Grand Dukes of Lithuania
Agnė Čivilytė, Lithuanian Institute of History
Lauryne Kūniška, Lithuanian Institute of History
Giedrius Motuzaitė-Matuzevičiūtė, Vilnius University
Elena Pranckėnaitė, Klaipėda University
Valdys Stepinskas, National Museum of Lithuania
Vykintas Vaitkevičius, Klaipėda University
Gintautas Zabiela, Klaipėda University
Agnė Žilinskaitė, Academy of Cultural Heritage

Archaeological material remains and archaeological records of the past are the main sources of archaeological research. Growing ranges of methodological tools now help to interpret that record. The way in which we use these methods to define and decode the past predetermines the way in which the scientific goals of our research agendas are achieved. New research questions in archaeology go far beyond those posed using traditional methods of analysis and treatment of material cultural remains. An absence of evidence is no longer considered evidence of absence. Research now seeks to identify the potential cultural ‘presence’ behind absence in the record. Using new techniques, new analytical equipment and new procedures, in appropriate theoretical frameworks and contextual proxies, archaeological research continues to refine its interpretation of the past.

This theme is inviting sessions dealing with technology, survey, typology, statistics, ethnarchaeology, geoarchaeology and other scientific applications to the research of archaeological evidence and artefacts. It is also a call for papers that address new questions to the technological records now available to research. What is sought is a diachronic perspective that reflects new methods of decision-making in research strategies and our understanding of social agency in archaeology. This theme seeks to address our cognitive abilities that humans can never dream of – for example flying. This alone makes them one of the salient targets of sociocultural meaning and conceptualisation.

Archaeology – despite having entered the ‘age of symmetry’ and ‘post-humanism’ and regardless of paradigmatic shifts and re-orientations such as the ‘animal turn’ – has so far largely ignored birds and their contributions to human lifeways. This session is dedicated to fill that void. It aims to trace the construction of human-bird interfaces through prehistory and early history in order to re-assess the changing role of birds in human societies. Although birds – qua animals – are increasingly regarded as historical agents in their own right, the focus of the session lies on the intricate interplay of bird and human lifeworlds and behaviours. Through a diachronic approach the session hopes to explore how different modes of human existence are reflected in the nature of human-bird interfaces, and in particular how different forms of human society and spatiality as well as different characteristics of bird behaviour and appearance imprint themselves in the materiality of human-bird relationships.

Since the intersection of human and bird activities can be expected to differ severely from that of humans and other animals – for example mammals – the investigation of the human-bird interface ultimately provides a fresh angle to expose new and so far unexplored aspects of past human earthly dwelling.

The session invites scholars from different fields and any specialisation to contribute to this debate (and the many additional questions that will probably arise along its path) and thus to take first steps towards an archaeology of human-bird relationships – Archaeo-Ornithology. We welcome theoretical contributions, review-papers as well as case studies.

TH1-01
ARCHAEO-ORNITHOLOGY: FIGURATIONS OF HUMAN-BIRD INTERFACES IN PREHISTORY AND EARLY HISTORY
Thursday, 1 September 2016, 09:00–18:00
Faculty of Philosophy, Room 214p
Author: Kost, Catrin, Munich University, Munich, Germany (Presenting author)
Co-author(s): Hussain, Shumon, Faculty of Archaeology, Leiden, Netherlands
Keywords: animal turn, archaeo-ornithology, human-bird interfaces
Presentation Preference: Regular session

Birds are exceptional beings. Present in almost every environment, they are often visually and/or auditorily prominent and have abilities that humans can never dream of – for example flying. This alone makes them one of the salient targets of sociocultural meaning and conceptualisation.

Archaeology – despite having entered the ‘age of symmetry’ and ‘post-humanism’ and regardless of paradigmatic shifts and re-orientations such as the ‘animal turn’ – has so far largely ignored birds and their contributions to human lifeways. This session is dedicated to fill that void. It aims to trace the construction of human-bird interfaces through prehistory and early history in order to re-assess the changing role of birds in human societies. Although birds – qua animals – are increasingly regarded as historical agents in their own right, the focus of the session lies on the intricate interplay of bird and human lifeworlds and behaviours. Through a diachronic approach the session hopes to explore how different modes of human existence are reflected in the nature of human-bird interfaces, and in particular how different forms of human society and spatiality as well as different characteristics of bird behaviour and appearance imprint themselves in the materiality of human-bird relationships.

Since the intersection of human and bird activities can be expected to differ severely from that of humans and other animals – for example mammals – the investigation of the human-bird interface ultimately provides a fresh angle to expose new and so far unexplored aspects of past human earthly dwelling.

The session invites scholars from different fields and any specialisation to contribute to this debate (and the many additional questions that will probably arise along its path) and thus to take first steps towards an archaeology of human-bird relationships – Archaeo-Ornithology. We welcome theoretical contributions, review-papers as well as case studies.

TH1-01 Abstract 01
Introductory remarks: the study of human-bird interfaces as archaeo-ornithology

Author: M.A. Hussain, Shumon T., Universiteit Leiden, Leiden, Netherlands (Presenting author)
Co-author(s): Dr. Kost, Catrin, LMU Munich, Munich, Germany
Keywords: human-bird interfaces, ontology, symmetry
Presentation Preference: Oral

This paper situates the study of human-bird interfaces within current theoretical frameworks and perspectives provided by the spatial turn/landscape theory, the animal turn, the ontological turn, symmetrical archaeologies/post-humanism and speculative realism. We delineate the potential and significance of studying the human-bird intersection in past archaeological contexts.

TH1-01 Abstract 02
Gazing at owls? Strigiformes as important parts of East-Central European Gravettian lifeworlds

Author: M.A. Hussain, Shumon T., Universiteit Leiden, Leiden, Netherlands (Presenting author)
Keywords: Gravettian, human-bird interfaces, owls
Presentation Preference: Oral

The East-Central European Gravettian is known for its distinct regional profile. Its archaeological record is rich in organic materials and artefacts as well as in so called non-utilitarian objects, and features large-scale open air sites with evidence for permanent structures and reduced settlement mobility. Among the numerous theriomorphic representations, owls and owl-like creatures occupy a prominent position in the reservoir of motifs and ideas that defines this regional entity within the wider Gravettian phenomenon.

This paper argues that the figuration of owls appears to directly reflect the structure of the human-owl intersection in this particular spatiotemporal setting. Depicting owls and owl-like beings must therefore be understood as an expression of negotiating the human-owl interface and consequently as an indication of meaningful and highly significant human-owl relations in this part of the Gravettian world. By drawing together available evidence for the specifics of the various environmental, climatic, vegetational, faunal and...
TH1-01 Abstract 03
Spirit Birds at Neolithic çatalhöyük
Author - Prof. Russell, Nerissa, Cornell University, Ithaca, NY, United States of America (Presenting author)
Keywords: Anatolia, Neolithic, zooarchaeology
Presentation Preference - Oral
As they soar into the air and dive below the water's surface, birds inspire awe for their superhuman capacity to pass among earth, air, and water. They are often seen as belonging to the spirit world, or at least as messengers to and from that world. Whereas at earlier sites in the region birds made a significant contribution to human diet, at Neolithic çatalhöyük in Central Anatolia their nutritional significance is small. Body part distributions suggest that for the most part feathers were more important than meat. Bird remains, mainly the feathery parts of wings, appear in a number of special deposits at çatalhöyük. Together with artistic representations, these deposits suggest that cranes and vultures played key roles in life cycle transitions and were invoked mimetically through dance. Additionally, waterbirds, particularly in association with newborn human infants, may have mediated between human and spirit worlds. Although there is little indication that çatalhöyük residents made much use of brightly colored feathers, bird wing deposits do attest to the importance of color symbolism at the site. Thus bird remains offer material evidence of aspects of Neolithic cosmology and ontology.

TH1-01 Abstract 04
The Human-Bird Interfaces in the Enolithic period from Balkans
Author - Dr. Lazar, Catalin, National History Museum of Romania, Bucharest, Romania (Presenting author)
Co-author(s) - Balascu, Adrián, National History Museum of Romania, Bucharest, Romania
Keywords: Balkans, Birds figurines, Enolithic
Presentation Preference - Oral
The aim of this paper is to explore the complex interaction between humans and birds in the Kogălnimean-Gumelești-Karanovo VI communities (ca. 4500-3800 BC) from the Balkans (Romania and Bulgaria).
Thus, our investigation will cover the bird figurines iconography study from some key-sites in the target area (e.g. Maruța, Sultana, Vlăneni, Yunatata, etc.), in correlation with the zooaarchaeological analyses, in order to identify the significance of avian species in the Enolithic societies, both symbolically and economically. A special attention will be granted to some hybrid type of figurines that combines the anthropomorphic and zoomorphic elements of humans and birds because it reflects the best interface between both species, and it may help to decipher the particular biographies of those past communities. This approach brings a whole new perspective on the construction of human-bird interfaces in prehistory, and how some specific artifacts (the hybrid human-bird figurines) have the potential to redefine the role of birds in the human societies. This research is funded by a grant of the Romanian National Authority for Scientific Research, CNCS – UEFISCDI, project numbers PN-II-ID-PCE-2011-3-1015.

TH1-01 Abstract 05
Birds in the cave painting during the recent Prehistory in the south of the Iberian Peninsula
Author - Prof.essora Lazarich, Maria, Universidad de Cadiz, Cadiz, Spain (Presenting author)
Co-author(s) - Ramos-Gil, Antonio, Universidad de Cadiz, Cadiz, Spain
Co-author(s) - Gonzalez, Juan Luis, Universidad de Cadiz, Cadiz, Spain
Co-author(s) - Mallá, Manuela, Universidad de Cadiz, Cadiz, Spain
Co-author(s) - Cruz, Maria Jose, Universidad de Cadiz, Cadiz, Spain
Keywords: birds rock painting, megalithic tombs, Recent Prehistory
Presentation Preference - Oral
Birds were not one of the favourite issues in order to be used for rock paintings in the Iberian Peninsula. In spite of that, in the southern end of Spain it is focussed the greatest amount of this kind of artistic manifestations. We are referring to the shelter of Tajo de las Figuras (Benalup-Casas Viejas, Cadiz), which represents the 99.94% of the total bird representations of postpalaeolithic rock paintings in the Iberian Peninsula. In 17 square meters of wall surface 962 pictograms are represented, of which 208 are birds. In it, social groups in the Recent Prehistory capture the rich ecosystem of the former Laguna de la Janda and where birds had a leading role. Our research group has recently made a detailed investigation of these paintings, in which we have been able to ascertain the existence of very diverse species and scenes of ethology of these birds and an analysis of its biodiversity, as a whole. Other scenes, even though they could be related to waterbird hunting, it is also possible that they have a shamanic ritual significance, in connection with life and death.
By the same token, systematic prospecting works in the surroundings allow us confirm the existence of a spatial pattern, where shelters with rock paintings are demarcated in the territory in close liaison with settlements, necropoli, communication routes and catchment areas. Of special interest is the megalithic necropolis, located at the foot of the shelters (Necropolis del Cañam), due to its complex exchange of intervisuality between shelters with paintings (Arco and Tajo de las Figuras) and megalithic tombs.

TH1-01 Abstract 06
Omniient or just omnipresent?
The perceived role of birds in Early Iron Age Slovenia
Author - Frie, Adrienne, University of Wisconsin-Milwaukee, Milwaukee, United States of America (Presenting author)
Keywords: Birds, Iconography, Iron Age
Presentation Preference - Oral
Human-bird relationships in Early Iron Age Slovenia are marked by apparent contradictions – remains of birds are extremely rare in the zooarchaeological record as a whole, and completely absent from mortuary contexts that are otherwise notable for the deposition of animal remains. Yet birds are the most commonly represented animal in Early Iron Age art, and artifacts decorated in the local Situla Art style depict birds in almost every scene. Experience of birds would have been relatively constant – birds are almost always present, yet human relationships with them were likely based more on observation than direct interaction. The distinction of these animals was drawn upon and reinforced in local artistic representations, cementing their place as ideologically significant and set apart from domesticates and other wild animals. In this case study, depictions of birds from the Dobrovoljka Halstatt culture of southeastern Slovenia will be presented in the context of local human-bird interactions, and modes of depiction as well as contextual associations of avian imagery will be presented to elucidate how Dobrovoljka Halstatt experience and ideologies. It is proposed that not only were birds considered important observers of human action, but in addition birds may have played an important role in ritual, mediating between humans and other animals as well as between humans and extra-human forces.

TH1-01 Abstract 07
The sociocultural meaning of ostriches and eggs
Author - Dr. Gönster, Yvonne, Wuppertal, Germany (Presenting author)
Co-author(s) - Dr. Hodors, Tamir, University of Bristol, Department of Archaeology and Anthropology, Bristol, United Kingdom
Co-author(s) - Dr. Fletcher, Alexandra, The British Museum, Middle East Department, London, United Kingdom
Co-author(s) - Dr. Caroline Cartwright, The British Museum, Department of Science, London, United Kingdom
Keywords: Iron Age, Mediterranean region, ostrich eggshells
Presentation Preference - Oral
As this quotation of Xenophon (Anabasis 1, 5) suggests, ostriches were the ultimate free-ranging animal during the Iron Age (c. 1200-300 BC). Their Mediterranean habitats covered North Africa, Egypt, Anatolia and further east.
Their cultural significance is already well documented in the Bronze Age. Egyptian and Libyan pre-Iron Age rock art depict ostrich hunts. The ostrich was connected to the Babylonian goddess Tiamat, and in Egyptian mythology Maat, goddess of truth and justice, wears an ostrich feather. Wall paintings and inscriptions show offerings of feathers and eggs to various Egyptian Pharaohs, and numerous archaeological finds demonstrate that ostrich eggs were used as votive offerings in temples; ostrich eggs were also among the cargo of the Uluburun shipwreck. The shells were manufactured as amulets or beads for necklaces and earrings, or reworked into containers, flasks, cups and other vessels. During the Iron Age engraved or painted ostrich egg shells were a luxury item shared between many Mediterranean civilisations, from Asylyia, Egypt, Greece, Ethiopia and beyond. From noting them in funerary and dedicatory contexts, no research to date has sought to understand their trade mechanisms.
Iron Age Asyryan iconography depicts ostriches as wild beasts conquered only by the king/hero, and ostrich bones are rarely found in excavated Iron Age sites. This suggests ostrich eggs were obtained from the wild, only achievable if nest sites are known. The quantity of surviving ostrich eggs suggests lively Iron Age Mediterranean-wide trade. Could that demand be met solely from wild acquisition? Restless of Asyryan Ion hunts show that wild lions were penned and hunts staged. Could the reality of ostrich egg acquisition have involved captive birds rather than opportunistic retrieval? Did this luxury trade therefore...
Human-Bird interfaces in Han-dynasty China as displayed through kingfisher-ornaments in graves

**Author:** Dr. Kost, Catrin, Munich University, Graduate School “Distant Worlds”, Munich, Germany (Presenting author)

**Keywords:** China, human-bird interfaces, kingfisher

**Presentation Preference:** Oral

Kingfishers feature prominently in Chinese art. They are a common topic in medieval poetry and their brilliant plumage – a symbol of beauty – was used to adorn headaddresses, combs, fans and screens. Clearly mentioned as creatures living in regions to the south or in the south of the Chinese empire, historical records suggest that already during the 2nd century BCE local groups sent kingfisher feathers and sometimes even live birds to the imperial court as tribute. Even though kingfishers seem to have been known throughout a larger part of ancient China, this talk focuses on depictions that stem from regions forming part of the natural habitat of the various species of Alcedinidae – namely the modern-day provinces of Sichuan, Guizhou, Yunnan and Guangxi. Dating to the times of the Western Han (206 BCE-9 AD) and Eastern Han (25-220 AD) dynasties, graves uncovered there contain small kingfisher-figures made of clay and metal as well as depictions of the birds on tomb tiles. These representations thus provide the opportunity to reflect upon the construction of kingfisher-human interfaces as motivated through close contact and observation. The analysis of how kingfisher-ornaments were used in the funerary context further allows for conclusions about the possible meanings assigned to these animals. Ultimately, these findings can be contrasted with the modes of exploitation and usage of kingfishers in other regions of ancient China.

Symbolic side of human-bird interfaces in the Late Iron Age (800-1200/1250 AD) Eastern Baltic

**Author:** Kuroso, Tuuk, ZBBA/Titania University, Schleswig, Germany (Presenting author)

**Keywords:** Eastern Baltic, Late Iron Age, pendants

**Presentation Preference:** Oral

The aim of this paper is to discuss bird-related pendants in the Late Iron Age (800-1200/1250 AD) Eastern Baltic. The symbolic side of the human-bird relationship is usually approached through folklore, as much as the influence of a Baltic-Finnic creation song in which the world is formed of eggs laid by a bird. In order to expand the current scope of interpretations, we should focus on archaeological materials and find contexts. Bird-related pendants are the most direct evidence in the material culture that indicate the special role of birds in these peoples’ worldview. Most of these pendants are cast alloy specimens that vary in style and probably depict several species. The rest of the pendants were made from wing bones and claws. They have been interpreted as pendants, amulets, and jewelry, including emblems of status. To interpret these pendants in their broader cultural context, we need to consider the broader symbolic significance of birds in the Late Iron Age Baltic. The discusson will be contextualized within the broader Baltic region, taking into account a variety of regional traditions.

---

Toward an Archaeo-Omnithology of the Bering Sea Region

**Author:** Prof. Hill, Erica, University of Alaska Southeast, Juneau, United States of America (Presenting author)

**Keywords:** Bering Sea, birds, human-animal relations

**Presentation Preference:** Oral

Archaeological evidence from the Bering Sea region of the North Pacific indicates that prehistoric human inhabitants possessed a broad and sophisticated knowledge of birds and their behaviors. Reconstructing human relations with birds requires integration of multiple lines of evidence, including imagery, narrative, and human and animal remains. In this presentation, I discuss the archaeological evidence that human groups used images to acquire or invert the abilities and physical attributes of some birds, such as long legs and short wings. Human burials as early as the 9th century AD contained bird figurines and other representations of birds. These findings expand our understanding of human-bird interactions in the Bering Sea region and provide new insights into the development of human identities in the Arctic. The presentation will be contextualized within the broader context of human-bird interactions in the North Pacific region.

Beyond the bones: a multi-strand approach to past perceptions of avian associations

**Author:** Pitt, Jacqueline, Bournemouth University, Bournemouth, United Kingdom (Presenting author)

**Co-author(s):** Feider, Michael, Bournemouth University, Bournemouth, United Kingdom

**Keywords:** Avian Archaeology, Islands, Seabirds

**Presentation Preference:** Oral

Birds were a small but often important component of diet and economy in the past, particularly in islands, as a diverse range of birds, especially aquatic birds, thrived in coastal and island locations. Large colonies of gregariously breeding seabirds would have provided past populations of these locations with a concentrated resource base that could be targeted seasonally for meat, eggs, oil and fat. Bird use in the North Atlantic islands is therefore integral to fully understanding life, diet and resource use in these settings. This paper presents results from a large-scale investigation of Meaolithc to Post-Medieval bird use in the North Atlantic islands that involved collecting pre-existing avian data and combining it with new, in-depth analyses. The archaeological dataset is considered alongside modern species profiles, and contextualised within the wider historically documented tradition of falconry. The zooarchaeological dataset reveals that whilst many birds were sourced locally, others required specific foraging trips to more distant areas of the landscape. Several key species exploited through time and space (such as gannet and guillemot) would have been acquired from dangerous areas of terrain such as cliffs. These targeted avian species demonstrate that falconry was part of a wider picture of mobility and interconnectivity in marine resource use that involved moving around the seascape and to different island landscapes. Changes are seen in the exploitation of locally sourced taxa resulting from preference, seasonality, and species populations (including sustainability issues as evidenced in the great auk’s decline and extinction). The creation of unique foraging profiles responding to specific needs (e.g. netting of waders in winter to supplement the diet) indicates a degree of innovation in these landscapes. Historically documented case studies such as the forlorn of St Kilda characterise the duality of isolation and connection in these island locations and their human resource networks.
Changes in goose and duck use from the early Roman period until the post-medieval period in Britain

Author - Poland, Ged, The University of Sheffield, Sheffield, United Kingdom (Presenting author)
Co-author(s) - Dr. Grau Sologeas, Idoia, The University of Sheffield, Sheffield, United Kingdom

Keywords - Britain, Duck, Goose

This paper discusses the changing use of these birds from the early Roman period until the post-medieval period in Britain by comparing osteological assemblages from several sites, including a range of different site types and geographical locations. Key changes in the use of these birds will be discussed using four main proxies: differences in taxa frequencies, the relative frequency of immature bones, variation in butchery practice, and changes in size through time. Taxon identification was achieved using recently developed morphometric criteria at the University of Sheffield. This paper was possible due to combining results from two post-doctoral projects and one PhD project at the University of Sheffield.

Food for the Dead or Symbol of Rebirth?
Culinary offerings and incubated eggs from a Roman cemetery

Author - Sichert, Benjamin, Universities of Basel (Switzerland) and Freiburg (Germany) (Presenting author)

Keywords - antiquity, archaeozoology, eggshell

Presentation Preference - Oral

This poster explores examples of depiction and use of birds and value its symbolic role in the Iberian Culture.
Processes of consolidation and structuring, in nature or in culture, in space or in time – which lead to something more permanent, trans-generational or even ‘eternal’ can be called petrification. This can be observed in material culture when more durable, heavier, and inorganic materials are used, but also in societies when social relations become more stable, hierarchical and predefined. For this session we suggest studying parallel petrification processes in different spheres of material culture as well as in human interaction. The change from wood to stone in architecture and the replacement of organic containers by ceramic vessels could indicate a more sedentary and consolidated lifestyle. A standardisation of shapes, the development of a ‘classic style’, and the harmonisation of ritual and feasting practices can be an attempt to unify belief systems and social structures.

However, what if the change occurs only in, for example, grave architecture or affects economic structures without a matching transformation in social structure? Is inconsistency and discrepancy in such processes what Clifford Geertz called the ‘simultanely of the non-simultaneous’, ‘thus leading to social tension’? Moreover, how adaptable to change and thus resilient is a highly petrified society? Are there turning points or ‘points of no return’ within processes of petrification?

We would like to invite speakers to investigate across all periods how processes of consolidation or petrification occur and whether parallel developments can be observed in the natural environment in different spheres of material culture and in aspects of social relations and practices.

Abstract 01
Petrification: a concrete comprehensive diachronic concept for past process comparison

Author: Dr. Hueglin, Sophie, Newcastle University, Basel, Switzerland (Presenting author)
Keywords: early medieval stone building, materialism, theory
Presentation Preference - Oral

The moment we want to describe, quantify and compare processes over large distances, from different periods and in diverse material cultures, we need abstract concepts. To do this in a highly materialistic subject like Archaeology, a concept will have to be as concrete and measurable as possible. At the same time, it must be transferable to the intangible as well as to the – in our conception – magical minds of the people we study. Such a seemingly simple concept is petrification. Apart from its obviously Christian roots (Apolline Petrov) it describes increasing durability, weight and regularity in objects and processes.

My personal approach to petrification comes from the study of the reintroduction of stone architecture in the medieval period. This – according to M. Shapland – conscious choice of stone over wood as building material especially for churches, town walls and funerary monuments is connected with other phenomena like the attempt to normalise calendars, the transition from oral to written communication – a.g. the production of books and especially of histori- and hagiography in the Roman tradition. The introduction of Rome-centred Christianity probably also led to deforestation, parcelling of the land and hierarchisation of oral to written in communication – e.g. the production of books and especially of histori- and hagiography in the Roman tradition. The moment we want to describe, quantify and compare processes over large distances, from different periods and in diverse material cultures, we need abstract concepts. To do this in a highly materialistic subject like Archaeology, a concept will have to be as concrete and measurable as possible. At the same time, it must be transferable to the intangible as well as to the – in our conception – magical minds of the people we study. Such a seemingly simple concept is petrification. Apart from its obviously Christian roots (Apolline Petrov) it describes increasing durability, weight and regularity in objects and processes.

The approach has a further dimension when applied to past research: To which extent do the preserved ‘petrified’ monuments and social concepts trigger a stereotype academic approach to ancient Egyptian societies and their remains? The contribution will present a selection of sources exemplifying these issues.

Abstract 03
When did eternity end?
The so-called downfall of Linear Pottery culture

Author: Dr. Biermann, Eric, Köln/Cologne, Germany (Presenting author)
Keywords: Ancient Egypt, Historiography, Petrification
Presentation Preference - Oral

Ancient Egypt is renowned for its monumental pyramids, temples, and tombs as well as the stability of its kingship concepts, and the continuity of artistic display. Though perishable materials and transient traits are studied as well, stone features and long-term standards remain the major attraction in antiquity as well as today. Ancient Egypt therefore provides an exemplary case to study the potential of the concept of petrification. It not only stresses the need to differentiate between ‘active’ and ‘passive’ petrification, but also of a direct – i.e. building for eternity in stone – vs. a more figurative meaning of the concept: the ‘petrification’ of ancient concepts and techniques to promote their perdurability. In addition, the approach encourages the question to which extent this undeniably inherent characteristic is only one side of ancient Egyptian society and its cultural output. It strongly highlights the discrepancy between contexts aiming at imperishability and others in which the concept is irrelevant or perhaps even revoked: even for the royal sphere, every-day life in ancient Egypt has to be reconstructed to a large extent from sacral and funeral sources. Is this due to lack of preservation or the deliberate usage of unenduring materials for finite aspects of life?

The approach has a further dimension when applied to post research: To which extent do the preserved ‘petrified’ monuments and social concepts trigger a stereotype academic approach to ancient Egyptian societies and their remains? The contribution will present a selection of sources exemplifying these issues.

Abstract 05
The hardness and the eternal: petrification of human images and social contradiction

Author: Dr. Marina Gallinaro, Marina, Rome, Italy (Presenting author)
Co-author(s) - Vanazzi, Alessandro, University of Rome “La Sapienza”, Rome, Italy
Keywords: Human figurines, Society, Trans-Mediterranean perspective
Presentation Preference - Oral

The formalization of human images as figurines can be seen as a relevant act of self-representation, reflecting an idea of the human being and possibly of the sacred. In fact, as we may be experiencing even today, iconic attitudes are important in allowing, or denying, space for peculiar representations, and the human one is a core problem in that sense. Anyway, when we can observe human representation to take place, we can easily recognize differences in materials implied, and in the size and context of the representation.
The quantitative analysis of the observable materials can suggest different attention was played in setting figures in connection with concepts like durability and social transmission of messages. Anyway, other formation processes of the archaeological record are relevant, too: factors of preservation of different materials should bring more caution in evaluating presence/absence of less durable materials as used in the production of figures and statues. The use of different materials can also underline different strategies of dissemination of information, of its personal use and of “democratization” of the impact of the underlying message. The case can be raised with contradictions in the social context of message transmission.

The theoretical situation and a model of analysis will be explained through cases involving a trans-Mediterranean perspective (i.e. both in Africa and in the Near East in Mediterranean Europe), during the Neolithic and up to the Bronze Age.

TH1-02 Abstract 06
The temporality of stone: communities and early sculptural traditions in late prehistoric Iberia

Author - Dr. Díaz-Guardamino Uribe, María, University of Southampton, Southampton, United Kingdom (Presenting author)
Keywords: Iberia, Later Prehistory, Sculpture
Presentation Preference - Oral

Stone is regarded as ‘external’ in many cultures, past and present, across the globe. It appears to be frequently linked to monumentality and ancestor worship, phenomena that are seemingly universal. When investigating stone in the context of human-related events and processes, its durability instantly turns into a central issue in the articulation of social, cultural, and historical narratives. In this context, stone is considered to play a key role in the so-called ‘petrification’ or ‘lithification’ of social structures and institutions. Indeed, if compared to human temporality, stone has the potential to work across much longer-lasting temporal frames. However, while stone persists it is not eternal neither static nor stable. Stones are in constant flux. They transform as they interact with a broad variety of agents, from air, water, and acids, to living organisms, including microorganisms, animals, or people. And as they interact, stones engage in the crafting of complex meshes of social relationships with varying temporalities (and spatialities).

This paper seeks to explore the temporality of stone and its role in the late prehistoric communities of western Iberia through the analysis of their sculptural traditions. Western Iberia is home to an extraordinary collection of stone stelae and statue-menhirs that were placed in the landscape and represent life-size human bodies decorated with weapons and elements of dress and adornment.

Much attention has been given to the classification and cultural affiliation of stelae and statue-menhirs based on their iconographies. Less attention, however, has been put on the very nature of these stones as monuments, on their persistence and the role of this property in the fashioning of iconographic standardization, the long-term crafting of these sculptural traditions and, ultimately, the social reproduction of the communities associated with them. This paper will address these issues while also taking into account the variability and constant changeability of these stones, their workings within short-term temporalities and in the framework comprising woodlands, pastures, streams and peaks. Huts are exploited by the herders for different types of activities, corrals and byres are used to stable the animals, and cellars for cheese-maturing. Most of these structures are made of stone or timber posts leaning on a stone basement. Recent archaeological projects shed new light on human colonisation of landscape texture and building of landscape structures has “petrified”, stabilised and structured specific social relations. I will explore the relations between landscape and social order, focus on questions of inertia and long term stability, but also change, resistance and creative improvisation in such landscapes.

TH1-02 Abstract 07
Genetics, Migrations and Language Dispersals: Re-theorizing mobility and the formation of culture and language among the Corded Ware Cultures in Europe

Author - Prof. Kristiansen, Kristian, University of Gothenburg, Göteborg, Sweden (Presenting author)
Presentation Preference - Oral

We are now finally in a position where migrations can be documented rather than debated. This has lifted an interpretative burden from archaeology, in much the same way as C14 dating did when it was introduced. The new freedom can instead be invested in properly theorising and interpreting local processes of migration, integration and assimilation, which has been an underdeveloped field of research. By integrating recent results from archaeology, isotopic tracing and historical linguistics this will in turn allow us to formulate better-founded models for the interaction of intruding and settled groups, the formation of a new material culture, and consequently also for language dispersals and language change. In this paper I forward a theoretical model that accounts for the formation of Corded Ware cultures as a result of local adaptations and interaction of migrant U backed populations with still existing Neolithic cultures.

---

TH1-02 Abstract 08
Tracking “petrification” in prehistoric architectural processes

Author - Dr. Romankiewicz, Tanja, University of Edinburgh, Edinburgh, United Kingdom (Presenting author)
Keywords: architectural analysis, prehistoric architecture, Scottish roundhouses
Presentation Preference - Oral

Even ephemeral archaeological remains of prehistoric buildings can be studied as evidence for architectural processes. In this definition, these processes started with thinking and shaping prehistoric spaces via a structure, but did not stop once this structure was built. Prehistoric architecture was also transformed by unplanned events during construction, use and abandonment of the buildings. Architectural analysis reads these deliberate and fortuitous processes from pits and postholes, wear patterns and structural remains. In this way, the creating, shaping and sheltering of prehistoric life can be traced, as well as any changes in architectural practice.

The proposed paper will focus on such changes, specifically from fluid to more solid concepts of later prehistoric architecture, described in this session as “petrification”. It starts with recent work on Bronze Age timber roundhouses in northeast Scotland. This identified reactive, shape-shifting architectures responding to the activities and energies produced by prehistoric social forms, however, unrelated to the building materials as such practices can also be recognised in roughly contemporary Scottish stone houses. Yet by the Iron Age, external shape and form seemingly had solidified. The paper will map such developments of architectural concepts through time and space, from organic and dissolved plans to more rigid structural shells. Drawing on later prehistoric and early medieval evidence from Britain, Scandinavia and the continent for comparison, architectural analysis will trace such patterns of “petrification” within the domestic sphere.
activity in the alpine uplands (suggested mainly by palaeoenvironmental proxy data), as if the earliest pastoral groups exploited much more ephemeral shelters. This observation opens a series of interpretative questions: What triggered the construction of these permanent structures during the Bronze and Iron Age? Was it just for functional reasons or was it also a way to facilitate ‘possession’ of this ‘marginal’ environment? In this paper the origin of dry-stone pastoral structures in the Alps will be investigated. The available archaeological data will be revisited, to assess the chronology of their diffusion and to find structural similarities that might mirror functional and cultural aspects. Insights from recent ethnoarchaeological investigations will enabled the role of these structures within the upland landscapes to be inferred.

**TH1-02 Abstract 11**

**Set in stone? The influence of petrification on Mediterranean urbanism (c. 700-300 BCE)**

**Author:** Dr. Maschek, Dominik, Department of Classics, Ancient History & Archaeology, University of Birmingham, Birmingham, United Kingdom (Presenting author)

**Keywords:** archaeology of urban centres, Greek colonization, urbanism

**Presentation Preference:** Oral

Research on pre-modern cities has mainly focused on two aspects of the ancient Greek polis: On the one hand, the polis has been seen as the substrate for urban culture based on a politically active class of citizens. On the other hand, many scholars have emphasized the ‘straight’ qualities of ancient Greek cities: In this view, the ‘petrified’ shapes of public buildings and meeting places have been taken as direct indicators for social and cultural ideas. However, recent urban studies in sociology and classical studies tend to contradict such a straightforward separation between materiality and semantics of ancient cities. First of all, the meaning of public urban spaces as well as their basic definition and ideal-typical description were constantly changing both in time and due to human agency. Urban designs which were theoretically conceptualized for future generations could be fundamentally transformed by changing courses of real-life-cycles, losing their historical eminence in the process. Especially in the Greek colonies throughout the central Mediterranean, processes of petrification played an important role in the formation of urban communities. Archaeological evidence allows for the conceptualization of petrification as combining both resource management and social negotiation amongst the inhabitants of newly defined urban centres. Furthermore, our written sources need to be put into perspective using the results of archaeological investigations. Literary descriptions from the 5th century BCE onwards stand against ample archaeological evidence for a high degree of regional diversity in both centre and periphery of the Greek world. The present paper thus aims at comparing the different sets of sources and their respective interpretative potential. In a second step, the concept of public space in Greek cities shall tentatively be defined by looking at discontinuities and interactions between ‘petrified’ urban fabric, social space and normative discourses.

**TH1-03 Abstract 01**

**Medieval Play and Archaeology: an Introduction and a Challenge**

**Author:** Dr. Wilmsen, Annemarieke, National Museum of Antiquities, Leiden, Netherlands (Presenting author)

**Co-author(s):** Hall, Mark A., Perth & Uitsa, Perth, Scotland, United Kingdom

**Keywords:** Archaeology, Games, Objects

**Presentation Preference:** Regular session

Ever since Huizinga’s Homo ludens, a need has been felt for an archaeological perspective on play in the context of Medieval Europe. Who played at what, where, when, and why, and how is this reflected in the archaeological record? This session will explore the diversity and significance of play in human society, from the widest European and Mediterranean perspective. It will draw on material evidence for play, both portable objects and excavated structures, in the context of other types of sources including written records and depictions in art. Approaches are encouraged from any angle: types of play (including board games, sports, drama, hunting, music, and toys); spaces and places for play (public and private, including hunting parks, long galleries, tournaments, mazes, stages, grounds, auditoriums and the informal possession of other spaces); gender and performance of play; children and adults at play and questions of ritual and identity (including associations with death and funerary rites). The question of play is particularly resonant with the conference theme of Archaeology Without Borders, but is of course also about interpreting the archaeological record. The session is keen to attract contributions that deal with play as performance and movement, play (and playthings) on the move, and play as cultural exchange (including colonialism). We are interested in play and mobility across time and generations, across or within social hierarchies and across the space of geographical and political boundaries. Play can articulate identity, both then and now. Also welcomed are contributions that focus on today’s play (including board games, computer games and cinema) where it clearly draws on the archaeological past, and on visions of how play (including role-play) can facilitate archaeological interpretation of and public engagement with the past.

**Playing the Heroic Hunter: The Role of Play in the Design and Utilization of Medieval British Parks**

**Author:** Dr. Malloy, Kevin, University of Wyoming, Saint Paul, United States of America (Presenting author)

**Keywords:** Nature, Play, Performance, Scotland, Parks, Medieval

**Presentation Preference:** Oral

Medieval British park landscapes are often discussed in terms of aristocratic leisure and the prestige associated with ownership and use of such impressive feats of monumental architecture. As hunting grounds, these enclosures offered social venues for...
Ludic space in the late Middle Ages cities on the south Baltic coast

Author: Dr. Romanowicz, Paulina, Center for Medieval Archaeology of the Baltic Region IAE PAS, Szczecin, Poland (Presenting author)

Keywords: amusement, space, toys

Presentation Preference: Oral

There are no any written sources left that could tell us anything about how and where people living in the cities situated on the south Baltic coast used their so called free time. Archaeological sources rarely found in these places are the only evidence of the amusement present there. The aim of this paper is to present the model of the ludic space in those cities constructed on the basis of archaeological finds of toys and play accessories. There is visible difference on how was treated public and private space, so this will be the main categories used in this model.

Theatrical hunting displays carried out within park confines is representative of an effective form of medieval play that centered around the symbolism of domination over nature, war, and the mythic hero, subsequently reinforcing signals of power. Thus, the theatrical hunting displays carried out within park confines is representative of an effective form of medieval play that centered around the symbolism of domination over nature, war, and the mythic hero, subsequently reinforcing signals of power.
This paper concerns Scandinavian gaming pieces from the Vendel and Viking periods (c. 550-1050 CE). The main focus is on the raw materials used but also on questions of chronology, typology, and distribution. The raw materials used in gaming pieces can be seen in the light of a colonization of new landscapes in the search for new and exotic raw materials, which would also like to address in the discussion.

TH1-03 Abstract 09
Early medieval Sandomierz Chess Set: confrontation of old and new excavations results
Author - master Stempień, Agnieszka, Poznań Archaeological Museum, Poznań, Poland (Presenting author)

The chess defined as “Sandomierskie” were unearthed on the stand no 7 in Sandomierz on the Old Town Hill. According to the tradition passed over by Jan Długosz (polish chronicler: 1415-1480), this place is considered to be the oldest part of this town. From the year 1958 on through the period of 10 consecutive years systematic archaeological works were carried out on some other parts of the Hill. On October 9,1962 in the south-western corner of the homestead some unique find was uncovered, namely, an almost complete set of chess with only three pawns missing, made of antlers in the Arabic style, now known as “The Chess of Sandomierz”. This is definitely not only one of the most interesting discoveries of the Early Middle Ages chess pieces on the territory of Poland but has also a considerable influence in the context of the appearance of the Chess of Sandomierz in this area. During the two research seasons (2014-2015) many artefacts connected with the elite culture were registered within the area the hut occupied. The exclusive character of the items uncovered both in the hut with the chess and its neighbourhood seems to confirm the above mentioned interpretation of this context as a unique scene of a house rather than an ordinary dwelling place. The discovery of a vast homestead or a manor house which was burnt down around the mid-13th century and which might have been the seat of the local elite was very surprising. This offers a new opportunity of interpreting the mysterious presence of The Chess of Sandomierz in this place.

TH1-03 Abstract 10
Medieval game pieces with a square base from Central Europe – interpretations

Author - Wlochola, Ewa, Inowroclaw, Poland (Presenting author)

Keywords: board games, game pieces, medieval games

Presentation Preference – Poster

Game pieces in the shape of a low pyramid with a square or almost square base, with surfaces often ornamented or marked with punched or drilled dots and incised lines, are found in numerous archaeological sites in Central Europe. These small objects, made mostly of bone, are dated between the 12th and 19th centuries and are generally identified as board game pieces, but it’s unknown how exactly and in which types of games they were used. The following poster presents new interpretations of their function based not only on their physical characteristics, but also on their archaeological context and on the current knowledge about medieval games.
TH1-04 Abstract 02
Changing world changing creativity?
Human mobility dynamics and late Paleolithic handicrafts

Author: Iovino, Maria Rosa, Istituto Italiano Paleontologia Umana, Rome, Italy (Presenting author)
Co-author(s): ZAMPETTI, D., Istituto Italiano Paleontologia Umana, Rome, Italy

Keywords: material imagination, mobility dynamics, traditions

Presentation Preference: Oral

Italy territory (peninsula as well as nearby islands) is a very peculiar area where to carry on research for past and also recent human migration events.

By interdisciplinary analysis on engraved and painted signs on stones of sites from Italian territory we try to reconsider people movement and human-environment interaction around 12.000-10.000 BP. The analysis of decorative technologies (e.g.: engraving, pitting, piercing, painting, sticking) helps to understand and to trace styles/traditions, methods and ability, the analysis of mineral and of organic materials used as decorative medium help to explore and to trace substance provenience and to better focus in what is a “local” tradition about the use of a substance and what is not.

In this paper, we mainly focus on sites from southern Italy (Puglia, Calabria and Sicily) in comparison with other site from Italian territory and from wider Mediterranean and Alpine contexts, to discuss the insight of human creativity and perception and to evaluate human mobility dynamics in relationship with their potential original ethnicity, the raising of new creativity and the ways of making material imagination.

TH1-04 Abstract 03
Migration or Acculturation? The Mesolithic-Neolithic conundrum

Author: Templer, Michael, Neuchâtel University, Enges, Switzerland (Presenting author)

Keywords: Mesolithic, Neolithic, Transition

Presentation Preference: Oral

Archaeology is often governed by national boundaries or focussed on particular cultures. The evolution of the Neolithic is seen as a multifarious process occurring over many millennia in several formative zones of Anatolia, the Levant and Cyprus, and its study is only partially governed by national boundaries. The spread westward of the Neolithic is imperfectly understood, with numerous archaeologists attempting to draw the ‘big picture’, often supplying or endorsing one or several ‘models’ to explain the process. The spread of the Neolithic into Western Anatolia and Europe occurred over several millennia, involving migrants as well as local players. The reasons for the spread are complex, as are the manner in which the spread occurred. In the Central Mediterranean Basin, the first archaeological evidence for Neolithic attributes goes back to 9000 BC in the Aegean Basin, and at the head of the Adriatic the Transition to the Neolithic is completed by 4500 BC in the Trentino-Alto Adige. Why so early and why so late? What happened in between in time and space? Who were the players?

If archaeology is the means by which to write prehistoric history, we need to visualise the players in their environment, and try to understand their lifeways, motivations and evolution over many generations to pretend to grasp the extent of the Transition from a life lived in symbiosis with nature to one in which nature is controlled, and which, unbelievable to the players, heralded the legacy of explosive demographic growth.

In this paper I will present some of the possible reasons for the spread of the Neolithic, and how some of the autochthonous populations responded, using a few case studies from the Aegean and Adriatic Basins. Sicily and the Balkans, from which we can glean an insight into the highly complex human behaviour and response, when faced with the phenomenon.

TH1-04 Abstract 04
Pioneer interactions. Contacts between Lake Onega and South-Eastern Finland during colonization

Author: Tarasov, Aleksey, IWP KRC of RAS / ILHM KRC of RAS, Petrozavodsk, Russian Federation (Presenting author)
Co-author(s): Manninen, Mikael, University of Oulu, Museum of Cultural History, Department of Archaeology, Oulu, Norway
Co-author(s): Haikala, Pasi, University of Helsinki, Department of Geosciences and Geography, Helsinki, Finland
Co-author(s): Anttonen, Niko, National Board of Antiquities, Archaeological Field Services, Helsinki, Finland
Co-author(s): Pasonen, Petri, National Board of Antiquities, Archaeological Field Services, Helsinki, Finland
Co-author(s): Zobkov, Mikhail, Institute of Northern Water Problems, Karelian Research Centre of RAS, Petrozavodsk, Russian Federation
Co-author(s): Poiatkin, Maxim, Institute of Northern Water Problems, Karelian Research Centre of RAS, Petrozavodsk, Russian Federation

Keywords: Eastern Fennoscandia, Finland, Karelia, Lake Onega, Idtile, contacts, Preboreal, colonization

Presentation Preference: Oral

Since the discovery of a row of Late Preboreal sites in Finland and the Ladoga Lake area during the last two decades, up to this moment the Lake Onega region and other eastern and northern parts of Karelia remained a “white spot” on the map of the earliest human colonization of Eastern Fennoscandia. The Late Preboreal habitation close to Lake Onega could be suspected, but was not supported by solid evidence.

This evidence was obtained in 2015 after dating a number of calcined animal bones from Mesolithic sites located on the highest hypsometric positions on the northern shore of the Onega Lake. Two of the dates testify human presence in this area in the Late Preboreal and at the turn from the Preboreal to the Boreal period. These dates, as well as paleogeographical data, confirm that the Lake Onega area was also included in the early migrational processes in Eastern Fennoscandia.

Recent finds from the earliest Mesolithic site in Finland - Jykkiväri 1, which is located some 250 kilometres west of the western shore of Lake Onega, reveal one interesting aspect of the earliest colonization of the region. The excavation assemblage contains artefacts made of a rock most closely resembling idtilde - a low grade metamorphosed siliceous sedimentary rock. In northeastern Europe deposits of this rare rock type can be found only on the north-western shores of Lake Onega in Russia. Investigation of these samples with the aid of a variety of petrological/laboratory methods suggest an origin of this material in the Lake Onega Idtlde deposits. Maintenance of contacts between the first colonizers of Eastern Fennoscandia with the southern core areas is evidenced by the presence of first artefacts in the majority of the earliest sites, and this aspect has already pointed out by many researchers. Our new findings show that resources of the recently inhabited territories were also involved in the flow of materials within the appearing interaction networks.

The paper was prepared with the support of the Russian Scientific Fund (grant 14-17-00766) and the North Karelia Fund of the Finnish Cultural Foundation.

TH1-04 Abstract 05
Keep on walking: Linearbandkeramik migrations beyond colonisation

Author: Dr. Hofmann, Daniela, Hamburg University, Hamburg, Germany (Presenting author)
Keywords: LBK, migration, Neolithic

Presentation Preference: Oral

Archaeogenetic evidence has now established the importance of large-scale population movements in the spread of the central European Linearbandkeramik culture, while continued individual mobility (in terms of patriotism after marriage, or perhaps while herding cattle) is strongly suggested by isotopic analyses. What has not yet been fully explored is the possible continued importance of group mobility and migration after the initial phase of expansion. This paper argues that far from being a one-off event, movements of larger groups continued to be practiced. As a longer-term cultural behaviour, these migration events had a lasting impact on some aspects of LBK worldview. They could also form another alternative means of identity creation and social competition, helping to counter-balance rigid models of lineage status argued on the basis of isotopic evidence.

TH1-04 Abstract 06
Deciphering cords: a case study in Bulgarian Early Bronze Age

Author: Semmoto, Masao, Ancient Orient Museum, Isehara, Japan (Presenting author)
Keywords: Bulgaria, Early Bronze Age, Pottery with cord decoration

Presentation Preference: Oral

Pottery with cord decoration dated into the late 4th millennium BC to the 3rd millennium BC from the southeastern Europe has been regarded as one of the most representative components of Yamnaya cultural block, which was formed in the North Pontic-Caspian area (Mallory 1991, Harrison and Heyd 2007). While this kind of statements have been often made in terms of topics of
migration by nomad-herders. Little efforts have been put into the interdisciplinary studies of the pottery with cord decoration. This presentation aims at examining characteristics of the pottery with cord decoration in the Balkan Peninsula and their temporal and spatial distribution, and explaining how Yamnaya groups and their descendants migrated from the North Pontic area to the Balkan Peninsula.

In this presentation, I deal with two points. The first is to make the integrated analysis in Typology and pottery provenance analysis of the northeastern Upper Thracian (South Bulgaria) as a case study. The second is to compare the pottery with cord decoration from the Upper Thracian with that from the eastern part of the Peninsula.

Firstly, I focus on the pottery with cord decoration from two tell-settlements Ezero and Dyadyova with favorable stratigraphic contexts to the southern parts of the Upper Thracian and carry out typological and pottery provenance analyses. The former addresses not only the shape and ornamentation of the pottery with cord decoration, but also the decoration technique. Regarding the latter, I will take two different approaches. The first is petrographic analysis, which identifies kinds of rock and mineral in the pottery paste using the polarized microscope. The second is chemical analysis, which measures the chemical components of the matrix of the pottery using EDXRF by a fundamental parameter (FP) method. As a result of these analyses, the pottery with cord decoration, as well as plain pottery and pottery with the other types of decorations, in both tell settlements will be classified into local and non-local types. Adding the chronological view to them, the analyses indicate transition and variety of the pottery with cord decoration in the Upper Thracian.

Secondly, I compare the findings in the Upper Thracian with the typological characteristics of the pottery with cord decoration from the southern and eastern Romania, the remaining parts of Bulgaria and the northern Greece. Referring to the spatial distribution of Kurgans there, I examine the origin in the northeastern Upper Thracian and the following migration events to the south and the west.

In conclusion, I point out two things in order to understand mobility of the bearer of the cord decoration. Firstly, I will demonstrate a different form of migration in the following stage after the introduction of the cord decoration into the northeastern Upper Thracian, which spread to the southeastern Upper Thracian, the western Upper Thracian and the northern Greece, where no Kurgans were erected. Secondly, the provenance of the cord decoration from the Upper Thracian was presumably connected with that from the eastern Romania, other than the real provenance area, supposedly the northeastern Pontic Peninsula.

**TH1-04 Abstract 07**

**Signs of migration in the megalithic graves of Western Sweden?**

Author: - Dr. Svensson, Emma, Upsalla University, Upsalla, Sweden (Presenting author)

Co-author(s): - Blank Bäcklund, Malou, Göteborgs Universitet, Göteborg, Sweden

Co-author(s): - Simoes, Luciana, Upsalla University, Upsalla, Sweden

Co-author(s): - Munters, Arielle, Upsalla University, Upsalla, Sweden

Co-author(s): - Storå, Jan, Stockholms Universitet, Stockholm, Sweden

Co-author(s): - Jakobsson, Mattias, Upsalla University, Upsalla, Sweden

Keywords: ancient DNA, isotopes, Neolithic

Presentation Preference: Oral

During the Neolithic period in Scandinaivia the Funnel Beaker complex gave way to the Battle Axe complex, which was later replaced by the more homogeneous Late Neolithic complex. This culture produced the finest flint work in Scandinavian Prehistory and the last megalithic tombs.

Immigration from various regions has been proposed as an explanation for the geographic distribution of megalithic burials in western Sweden, another alternative is that the tombs were used by populations from large areas. However, osteological and archaeological research suggests that the graves were used by local family groups. Earlier research suggests that 25% of the males in the megalithic tombs were non-local birth. However, in the Late Neolithic there was an increase in human mobility and about 60% of the buried individuals were non-locals. It is interesting to investigate the genetics over time in this area. Are there any traces of population shifts while still maintaining the same burial practices?

In this presentation, I will explore the potential that osteoarchaeology and ancient DNA can provide us with insights into human mobility and migration. The research is based on osteological analyses of a megalithic tomb from western Sweden, which is located in the county of Skåne. The tomb is dated to the Late Neolithic period and contains the remains of at least 12 individuals. The remains have been preserved in good condition, allowing for detailed osteological examinations and genetic analyses.

The focus of the research will be on the identification of potential indicators of mobility and migration. This will involve examining the osseous traits, dental remains and bone chemistry, as well as conducting ancient DNA analyses on the skeletal remains. The osteological and genetic data will be compared to existing archaeological and historical records to gain a better understanding of the demographic changes that took place during the Late Neolithic period in western Sweden.

**TH1-04 Abstract 08**

**Adriatic Seafarers. Mobility and Social Practices at the End of the 3rd Millennium BCE**

Author: - Dr. Gori, Maia, University of Heidelberg, Heidelberg, Germany (Presenting author)

Co-author(s): - Recchia, Giulia, University of Foggia, Foggia, Italy

Keywords: Adriatic, Early Bronze Age, Mobility

Presentation Preference: Oral

The diffusion of Cetina pottery is a well-recognized phenomenon interpreted as the material traces of migration of small groups on the move from the Dalmatian coast to Italy, Greece, and Malta. This migration is connected to the spread of pottery styles, funerary structures and practices, and prestige items. The so-called Cetina culture is, indeed, an indicator for mobility of the communities inhabiting eastern Mediterranean at the end of the 3rd millennium BCE. It is difficult to understand the exact nature of the “Cetina phenomenon” and the “directions” of these contacts, it is evident, however, that in the northeastern Mediterranean there existed a lively and “international” cultural network. Through the analysis of Cetina features and their contexts, this paper will explore different types of mobility and their influence on societal and cultural change.

**TH1-04 Abstract 09**

**Invisible traces of the exogamous mobility in Late Bronze Age? Interpreting Urnfield cemeteries**

Author: - Skvor Jernejcic, Brina, Freie Universität Berlin, Berlin, Germany (Presenting author)

Keywords: cemeteries, exogamous mobility, Urnfield culture

Presentation Preference: Oral

In the contribution we would like to present the results of a comparative analysis made on the grave-goods, attires and burial practices from Late Bronze Age (Bd - D - Ha) cemeteries from south eastern Alpine region and Northern Carpathian area. In the end of Middel and in the beginning of the Late Bronze Age, first cremated graves were documented in the south-eastern Alpine region (excluding the graves from Copper age). We know of some other individual graves or smaller cemeteries containing several tens of graves. On this basis, we presume that these cemeteries were intended only for certain deceased members of particular Bronze Age communities. Additionally, the numerous simultaneous metal hoards from Slovenia, which are similar in composition as the rich male graves in the territory of north eastern Pannonia and Slovakia, could also be in part interpreted as testimonies to the same phenomenon. Cemeteries from Northern Carpathian area are in this period on the other hand more numerous and they contain some hundreds of graves.

According to our analysis we can state that the best analogies for several grave-goods from the cemetery in Ljubljana (Slovenia) can be found in the objects (specially urns) from distant archaeological sites, pertaining to Pitynos and Scupi de Sus culture in the northern Carpathian basin. These analogies, not only in grave-goods, but also in burial rite (cremation in an urn), grave stone constructions and social practices (hording of special objects in a special manner) point to very intensive, probably direct contacts between the two regions in the beginning of the Late Bronze Age. Taking into account that urns, which contained the ashes of the deceased, acted as representations of the human body, it is interesting to emphasize that in both research areas special types of vessels (jugs, cups) were use as urns only in female and children graves. Besides the similarities in the archaeological finds between two research areas, we observe also the similarities in the stone grave constructions. Both in Ljubljana and in Radzovica a grave construction made out of one stone slab were documented. Likewise, the graves containing only cremated bones placed on the stone plate were found on both sites.

According to archaeological and anthropological data, intercultural contacts between the southeastern Alpine region and the northern Carpathian area can be observed mostly from the archaeological finds contributed to female sphere. Having in mind the fact that most of these object are totally absent in the territories between two research work areas (Transdanubia, Middle Danubian Urnfield Culture), we can argue, that we cannot interpret these similarities in the archaeological record as simple result of contact or exchange. According to the data, we can presume, that they reflect directions of the migration of individuals or smaller groups. Which were the motives and mechanisms for these intensive contacts in this particular period? How can we interpret this archaeological data - as traces of an exogamous mobility of women in Late Bronze Age? 
The visibility of the invisibles: and material interactions of the indigenous Sicilian community of Monte Finocchito with the Greeks.

Combination with the archaeological and anthropological methods, is a successful method to understand the social, ideological local fabrics within a given chronological horizon. In this specific archaeological context, the application of archaeometry, in the cultural material, in order to understand the technology of pottery production and the possible coexistence of imported and BC new pottery types, evoking and imitating Greek models, appear in indigenous Sicilian graves as a consequence of these understanding the complex relationship between indigenous Sicilians and Greek migrants. During the end of the eighth century of Sicily and in particular from the indigenous habitation site of Monte Finocchito. The site is a critically important case study to disciplinary approach was adopted. This paper focuses on the archaeological analysis of materials discovered in southeastern cultural contacts and the relationships established between indigenous Sicilians and Greek during this specific period, a multi-cultural and ethnic identities through the careful selection of cultural features. In order to develop more comprehensive models of cultural interactions are more complex and can incorporate not only a two-way process but also enable the maintenance of distinct culture, with little influence traveling in the opposite direction. However, recent socio-anthropological studies claim that such populations came into contact with ancient Greek settlers during the eighth and the seventh centuries B.C. Historically, it is this study attempts to identify and analyse processes of cultural transformation in south-eastern Sicily when indigenous populations came into contact with ancient Greek settlers during the eighth and the seventh centuries B.C. Historically, it is a crucial moment for Sicily because it initiated an irreversible process of modification of the original indigenous culture. This event brought profound and significant changes to the material culture of the indigenous communities. Earlier studies explain this revolution in material culture as the result of "Hellenaisation", a seemingly one-way process of adopting the "superior" Greek culture, with little influence traveling in the opposite direction. However, recent socio-anthropological studies claim that such cultural interactions are more complex and can incorporate not only a two-way process but also enable the maintenance of distinct cultural and ethnic identities through the careful selection of cultural features. In order to develop more comprehensive models of cultural contacts and the relationships established between indigenous Sicilians and Greek during this specific period, a multi-disciplinary approach was adopted. This paper focuses on the archaeological analysis of materials discovered in southeastern of Sicily and in particular from the indigenous habitation site of Monte Finocchito. The site is a critically important case study to understanding the complex relationship between indigenous Sicilians and Greek migrants. During the end of the eighth century BC new pottery types, evoking and imitating Greek models, appear in indigenous Sicilian graves as a consequence of these cultural changes. The archaeometric analysis allows us to recognize different clay fabrics, to distinguish Greek imports, Sicilian copies and adapted designs as well as entirely new Sicilian forms. The archaeological method permits us to recognise different cultural material objects. The results will be extremely advantageous in tracking indigenous activities, adaptation and adoption and elucidate how the Greek immigration impacted Sicilian societies and local culture. The goal of this study is also to look beyond the cultural material, in order to understand the technology of pottery production and the possible coexistence of imported and local fabrics within a given chronological horizon. In this specific archaeological context, the application of archaeometry, in combination with the archaeogenetic and anthropological methods, is a successful method to understand the sociological, ideological and material interactions of the indigenous Sicilian community of Monte Finocchito with the Greeks.
The Avellino event: a volcanic eruption and mass migration in South Lazio during the Bronze Age?

Author: Dr. Doorenbosch, Marieke, University of Leiden, Leiden, Netherlands (Presenting author)
Co-author(s): Alessandro, L., University of Groningen, Groningen, Netherlands

Presentation Preference - Poster

During the Early Bronze Age, a giant eruption of Mount Vesuvius (Italy) buried a flourishing landscape of villages and fields in the plains to the north and east of the volcano under more than a meter of ash. Inhabitants of the closest sites such as Nola (‘the Bronze Age Pompeii’) could barely escape with their lives. Italian archaeological research since the 1980s has conclusively shown that the population of the Campanian plain did not fully recover for several centuries after this so-called ‘Avellino Event’. Given the topography of central-southern Italy, the most likely refuge area will have been to the north, in the wetland coastal plains of Latium Vetus: the Fondi basin and the Pontine Plain. In these areas, long-standing Dutch research programs have recently been able to find the Avellino volcanic ash layer, which can be used as a chronological marker. This means that archaeological and palaeoecological observations of the necessary high chronological resolution and quality can be made to identify changes occurring immediately after the eruption. A joint research program between Groningen and Leiden universities, in collaboration with Italian geologists and archaeologists, aims to demonstrate and document any significant impacts that would result from the presence of the postulated Early Bronze Age refugee population in South Lazio. Because we feel that only the combination of different data can provide reliable answers, a careful design strategy has been built. This includes a detailed landscape and environmental reconstruction, by means of geological and palaeoecological core, an archaeological investigation of the differences and similarities in ceramic typology between Latium Vetus and Campania, petrographic and isotope analysis. The first results of landscape reconstruction and potential excavation sites will be presented in the poster.

Keywords: Avellino, Vesuvius, Italian Bronze Age, landscape reconstruction, palaeoecology, geology, archaeology

New monuments of Sintashta period in the Southern Pre-Ural as an indication of population migrations

Author: PhD Evgenyev, Andrey, Orenburg State Pedagogical University, Orenburg, Russian Federation (Presenting author)
Co-author(s): Attema, P.A.J., University of Groningen, Groningen, Netherlands

Presentation Preference - Poster

One of the most controversial problems of the boundary of the Late Bronze Age archaeology is interaction of the population during the Sintashta period. Sintashta culture was allocated on the monuments of South Ural (Chelyabinsk region), and the most well-studied in this region. The settlements (Arkaim, Sintashta, Ustye I, Kamenny Ambar, Kuyak, etc.) and burial grounds (Sintashta, Krivoe Ozero, Kamenny Ambar, Stepnoe VII, Bolshekaragansky etc.) are investigated here. In the steppes of the Southern Pre-Ural region (Orenburg region) monuments of Sintashta period are few. Meanwhile, the region is of interest in connection with a problem of population migrations, especially of interaction between Sintashta and Potapovka cultures. In 1970-1990s Sintashta complexes were investigated in the burial grounds of New Kumak, Ishkinovka II, Gerasimovka II, Bulanovo cemetery (Berezovaya mountain). New monuments of the beginning of 2nd millennium BC were studied in recent years by Orenburg archaeological expedition. In 2012 the multilayered settlement Maloyuldashevo I was investigated. The materials of excavations contained the triple burial, accompanied by numerous metal implements and pottery. The funeral ceremony (not typical for the Late Bronze Age position of the buried, the subordination of the two forcibly sacrificed people to the “main” skeleton) reflects the interaction of different cultural traditions - Yamnaya and Catacomb cultures, Sintashta culture and monuments of the Potapovka type. Pottery has many analogies in the Sintashta ceramics. The original rectangular vessel is an indicator of preservation of Catacomb traditions in Sintashta society. Metal artifacts such as knife, bracelets, rings, awls, beads are typical for Sintashta culture.

Maloyuldashevo settlement and burial are not only monuments of Sintashta period studied in recent years. During excavations in 2013 of Nizhnebahtiyarovo burial ground the fragment of bone disc cheek-piece typical for Sintashta period was found. In 2015 at the Krasikovo burial ground of Yamnaya (Pit-grave) culture the joint burials of Sintashta period with ceramics with bronze bracelets were studied. Thus, the Southern Urals steppe at the beginning of the 2nd millennium BC was the region of active culture genesis. Orenburg region is located far from the main Sintashta area, at the territory between the Sintashta and Potapovka areas. New researches of the Sintashta monuments with application of radio-carbon dating and methods of a soil science will provide new important data about the population of South Ural steppe at the beginning of 2nd millennium BC.
TH1-05 Abstract 01

Is it gold that matters? The role of sumptuous burials of women in Bronze and Iron Age Europe

Author - Prof. Dr. Metzner-Nebelsieck, Carola, LMU Munich, Munich, Germany (Presenting author)

Keywords: sumptuous burials of women Bronze Age Iron Age

Presentation Preference - Oral

Ostentatious burials are often exclusively seen within a close type-chronological framework in time-space related cultural units. Thus archaeologists often analyze sumptuous graves in relation to burials of seemingly lesser importance. In addition, the focus of this session is to consider alternative methodological frameworks and methodologies that have great potential to tease out more nuanced information regarding the mortuary practices from Western Europe to the Eurasian steppe. In particular, we are interested in combinations of vibrant thematic frameworks and robust methodologies, including analyses such as isotopic, metallographic, GIS-based, ceramic, and multivariate statistics. Rather we encourage session participants to more critically interrogate how these formulations are arrived at and what new information can be gleaned from burials and grave goods that have already been excavated and analyzed.

TH1-05 Abstract 02

Scarcity and dearness: an obvious link? Elite graves (1300-300 BC) in north-alpine world

Author - Dr. Trémaud, Caroline, UMR 8215 Trajectoires, LYON, France (Presenting author)

Keywords: Bronze and Iron Ages, Hierarchies, Methods

Presentation Preference - Oral

During the Late Bronze Age to La Tène, in north-alpine societies, we see a multiplication of elite’s graves. These ones, characterized by an impressive funerary hoarding and so called ‘princely graves’ ask a lot of questions about hierarchisation, status of those individuals and social structures. These questions are supported by a key issue: how deal with the funerary data to express the wealth notion? Such an approach needs to take into account the difficulties to estimates values. In preliterate societies, emic approach is not possible; the etic approach is the only one. Thus we need to develop methodological tools in order to class graves against each other.

The focus of my presentation will be to present a methodology developed during my PhD of ranking funerary data, so as to detect social structures. This work is based on a database from more than 1000 graves with 721 elite’s graves, from Late Bronze Age to La Tène B, spread over north-eastern France, southern Germany, Switzerland, Austria and Bohemia, which allows multivariate statistics.

The ranking approach depends on a method of weighting graves, to reveal wealth and characterize graves to each other. This method necessitates estimating value of each grave (grave good but also architecture and location), and so applying an etic framework to funerary data. I want to have a critical look of this analysis grid used to value graves, in order to see the validity and the impact on multivariate statistics developed after.

In fact this method shows possibilities for looking beyond the binary understanding of societies (elite vs. non elite). These more forensic, qualitative approaches make it possible especially to develop a gender approach and a characterization of social structures and their evolution on a long term perspective.

TH1-05 Abstract 03

Sumptuous burials of the Low Countries

Author - Dr. Schumann, Robert, University of Hamburg, Hamburg, Germany (Presenting author)

Keywords: Early Iron Age, Low Countries, Sumptuous Graves

Presentation Preference - Oral

The emergence of the lavish burials known as Hallstatt chieftains’ or princely graves reflects one of the most noteworthy developments in Early Iron Age Europe. These elaborate elite burials of the Hallstatt C period contain beautiful weaponry, bronze vessels and elaborately decorated wagons and horse-gear and are found primarily in Southern Germany and Bohemia. There is, however, also a small cluster of these burials in the Low Countries. These Dutch and Belgian burials contain many of the same objects, all imports from the Hallstatt Culture in Central Europe. New finds and research, including the comprehensive study of all the Dutch and Belgian burials offer new insights into those graves. The elite burials of the Low Countries not only contain far more Central European ‘princely’ paraphernalia than thought, they also appear to contain elements which challenge the established interpretation of these burials being feebie derivatives. These imported items, however, appear to have been re-contextualized in a regionally specific manner through a destructive burials practice which involved the transformation of both the dead and their grave goods through fire, manipulation and fragmentation.

While the burial rituals seem to differ between the Hallstatt Culture and the Low Countries, detailed examination of rituals in both areas shows similarities as well. The objects interred in these sumptuous graves of the early Hallstatt Period in the Low Countries and those of the early Hallstatt Culture in southern Germany, western Austria and Bohemia also testify large-scale contacts as well as a potentially increasing social differentiation (or at least its representation in burials). The relationships that must have existed between these and other areas in the early Hallstatt period can be addressed and considered on a large scale.

In this paper we present the possibilities of analyses by looking at the ostentatious burials from the Low Countries both from the regional and the international perspective, an approach that leads to a much better understanding of the performance of those exceptional burials.

TH1-05 Abstract 04

New Approaches to the Princely Burials of the Hallstatt Culture of the Heuneburg (Southwest Germany)

Author - Dipl.-Rest. Ettinger-Riot, Nicole, Landesamt für Denkmalpflege, Esslingen, Germany (Presenting author)

Keywords: Burials of change, modern excavation, Sumptuous Burial

Presentation Preference - Oral

The Heuneburg on the upper Danube is among the best-researched (intensely investigated) settlement centres of the Hallstatt culture in Central Europe. While the research regarding the settlement structures of the Heuneburg and the surrounding area has been a key element in German Early Iron Age research since the 1950s, contemporary exploration of the apparent princely graves at the Heuneburg has been relatively neglected in the last 70 years. The targeted excavation of a richly endowed child’s burial site, and of a site in which princesses were interred, south of the Heuneburg, has given powerful testimony to the fragmentary state of our knowledge of the sociopolitical processes and structures of the 6th century BC. The presentation offers an exemplary look into the manner in which
single ceremonial tomb discovery, and the related research, has employed modern methods of excavation and analysis to decisively update our previous sociohistorical interpretation models and chronological theories.

**TH1-05 Abstract 05**

**The Grave Is a Not-So-Private Place: Elite Multiple Burials in Early Iron Age West-Central Europe**

Author: Prof. Arnold, Bettina, University of Wisconsin-Milwaukee, Shorewood WI, United States of America (Co-author(s): Fernandez Goetzel, Manuel, University of Edinburgh, Edinburgh, Unidad Kingdom (Presenting author))

**Keywords:** Iron Age, mortuary analysis, multiple burials

Presentation Preference - Oral

In his 1984 survey of multiple burials in prehistoric Europe Claus Oestiger noted that burials containing more than one individual are frequently found in high status or in richly furnished chamber graves. The sample of multiple burials has expanded significantly in the intervening years and it may be time to revisit this mortuary category in light of new evidence. While most multiple burials contain two adults, often a female and a male, male/male, female/female and male/child or female/child combinations are also known. These configurations have traditionally been interpreted as reflecting familial relationships but recently excavated burials indicate that more complex associations for this category of burial are likely. We argue that the early Iron Age elite multiple burial category should be re-evaluated with reference to ethnographic analogy, archaeological evidence from other areas of west-central Europe, and recent burials excavated in the vicinity of the early Iron Age Heuneburg Hilfort.

**TH1-05 Abstract 06**

**Discernable Traces in Textil Archaeology**

Author: - Dr. Band-Burgess, Johanna, Landesamt für Denkmalpflege, Esslingen, Germany (Presenting author)

**Keywords:** mortuary ceremonies, princely grave Hochdorf-Eberdingen, Textile Archaeology

Presentation Preference - Oral

The uniqueness of the late Hallstatt-period textile assemblage from the princely grave at Eberdingen-Hochdorf (SW-Germany) is not limited to its highlighting textile manufacturing as an economic focus in this region, providing differentiated insights into burial customs, the sequences of mortuary ceremonies or insights into concepts about the afterlife it is relevant that this finds assemblage demonstrates that textiles can only function as indicators of socio-economic structures when they are considered within their archaeological context. This means that conclusions, based on isolated observations of details of manufacturing technique but disregarding the context, remain of limited value with regard to contents and may even be questionable. Deriving from the function of the textiles in the grave the question is not only for what and with which intention this function was assigned, but also whether it is at all sensible to distinguish between burial textiles and the textiles of the living.

**TH1-05 Abstract 07**

**Barbarian chief’s “secret” burials in the forest-steppe zone of Eastern Europe**

Author: - Dr. Stcheglova, Olga, Institute for the History of the Material Culture, St. Petersburg, Russian Federation (Presenting author)

**Co-author(s):** Radush, Oleg, Institute of Archaeology RAS, Moscow, Russian Federation

**Keywords:** burials, prestigious gold objects, Great Migration period, sumptuous complexes, kings and military leaders

Presentation Preference - Oral

By the beginning of the Great Migration period Chernyakhov archaeological culture (its last stage) was spread in the left bank of the Dnieper in forest-steppe zone. At the same time (periods D1 and D2 European chronology - 360 / 370-440 / 450. AD) on the same area occur several extremely rich sumptuous complexes consisting of prestigious gold objects (bracelets, bracelets, neck-rings), the Byzantine silverware production, gold-embroidered garments, ceremonial weapons and horse harness. Findings of individual objects belonging to a prestigious culture of the time are known too. These complexes are not associated with burial grounds of Chernyakhov culture. They were found by chance and were considered hoards. Only one of them (Bol-loyo Kamennyot) was published by L.A. Matsulevich in 1934. The study how complexes have been discovered reveals that they are the burials. In Bol-lroy Kamennyot burial was in a stone crypt, built at the base of a high bank of a creek, which flows into the river Sudzha. Mapping of all finds indicates their exclusive relationship with the sources of large creeks flowing in deep canyons and at the same time associated with the watersheds of river systems. Discussed sumptuous complexes are very different from the burials of the Chernyakhov culture, even at its highest level examples. There are simple common explanations for this difference.

**Commoners and Elites in Southeast Kazakhstan: Kurgans and Settlements of the Iron Age society**

Author: - Dr. Chang, Claudia, Sweet Briar College, Sweet Briar, United States of America (Presenting author)

**Co-author(s):** Tourtellotte, Perry, Sweet Briar College, Sweet Briar, United States of America

**Keywords:** commoner-elite relations

Presentation Preference - Oral

The spatial distribution of Iron Age kurgan and settlement sites from the Talgar alluvial fan (ca. 550 sq km) derived from survey reconnaissance and Soviet period site inventories indicates the presence of both commoner graves and elite kurgans. The GIS database of the Talgar sites also includes valuable information such as the natural hydrological system, dated geological terraces, and other important topographic features. Our goal is to model a socio-natural system that describes the Iron Age socio-economic, agro-pastoral system and its demographic components. In addition to understanding the relationship between the natural-physical landscape and a mortuary and settlement landscape, we also wish to set the foundation for understanding social hierarchy and the nature of commoner-elite relations.

This mortuary landscape, often robbed in antiquity and destroyed by Soviet agriculture, lacks information on individual burial inventories or skeletal material. Therefore our model relies upon kurgan size dimensions, locations, and density counts in order to model the ancient demographic of the Talgar region and its surrounding environs. Future research in Talgar and neighboring alluvial fans will test demographic models for: (1) population pressure on farming and herding resources; (2) territorial boundaries that define socio-political units within nomadic confederacies; and (3) the rise of social hierarchy within circumscribed regions such as the Talgar fan and its surrounding areas.

By focusing upon landscape features, burial mounds and graves as demographic indicators, new approaches can be develop for modeling changing social landscapes across a branch of the Silk route. This circumscribed region can serve as the first step for building a regional settlement system that incorporates demography, social hierarchy, political organization of territories, and landscape and visual landscapes that cross-cut diverse regions through an aesthetic known as ‘animal-style’ art.

**TH1-05 Abstract 09**

**Miniaturization in the Production of Funerary Aesthetics in the Pontic Iron Age, ca. 600 - 300 BC**

Author: - Dr. Johnson, James, University of Chicago, Chicago, United States of America (Presenting author)

**Keywords:** Aesthetics, Burials, Iron Age

Presentation Preference - Oral

Funerary performances, including processions, construction of burial mounds, and the deposition of bodies and grave goods, are the primary means by which Iron Age social structure continues to be investigated and inferred. However, the scholarly focus on single massive burial mounds and the amount of interred grave goods, such as found at Alexandria or Solokha in present-day south-central Ukraine, skewed our sense of the importance of the ‘produced’ nature of funerary performance and aesthetics in favor of static (and more easily quantifiable) monumental and ostentation displays. Few studies of funerary performances critically explore how a different approach utilizing the lens of production (in a performative/theatrical sense) might highlight often hidden political facets of burial in Iron Age contexts, as well as more broadly.

TH1-05 Abstract 10

The Kurgans of Scythian Nobility in the Eurasian Steppes

**Author:** Dr. Habil. Ochir-Goyinmaa, Maria, Institute of archaeology Tsetserogian academy of sciences, Kazan, Russian Federation (Presenting author)

**Keywords:** Eurasia, kurgan, Scythian epoch, mobility

**Presentation Preference - Oral**

Several thousands of burial sites of the Eurasian steppe dating to the Scythian epoch are associated with a number of archeological cultures of the Scythian type. Their funerary rites have been examined in a number of special papers and monographs, which were largely based on a comparative study of kurgans between each other in terms of their particular parameters. The present paper proceeds from a comparative study of all graves and other elements within one and the same mound in terms of their depth and arrangement to each other, as well as in terms of their orientation, according to the cardinal points, on the mound map, i.e. their planigraphy. To my knowledge, this is the first attempt of this kind. The undertaken analysis of the planigraphy of the kurgans is based on the data concerning every component of a mound earthenwork such as walls, tunnels, bridges, stone embankments, etc., as well as every grave of one and the same kurgan, including central and secondary burials, horse interments and those of their servants, servants and human sacrifices. Such complex earthenwork structures, as well as numerous central and secondary burials are to be found only in the case of kurgans of the royal class, hence these are of major importance for planigraphical analysis. The graves located in the mounds have been analysed to produce a number of their arrangement patterns with respect to the spatial representation of kinship and family hierarchy of the Scythian society and to their system of geographical orientation in terms of cardinal points. Importantly, the results obtained are reviewed in the spatial profiles shown on the kurgan planigraphic profiles seem to be associated with the regional differences in the spatial orientation of the entire burial constructions in terms of cardinal points. Moreover, if these are taken into consideration, it is no longer possible to maintain the idea of the Scythian-Siberian unity of the archeological cultures of the region, where in fact one deals with two distinct cultural communities. Also, as the present work has shown, there is a logically association between the spatial arrangement of secondary burials in terms of the cardinal points and the ideas the ancient populations held about the location of the world of the dead, as well as their geographical worldview, which belongs to the basic conceptualizations of every ethnic group and finds reflection in archeological cultures as well.

TH1-05 Abstract 11

On the Edge: The Politics of Death at the Ends of the Silk Road, c. 100 CE

**Author:** Prof. Linduff Kathryn, University of Pittsburgh, Pittsburgh, PA, United States of America (Presenting author)

**Co-author(s):** Rubinson, Karen S., ISAW–New York University, New York, NY, United States of America

**Keywords:** borderslands, Eurasia, Silk Road

**Presentation Preference - Oral**

Much has been made of the social and economic exchanges across the Silk Road, from Afghanistan in the west and China in the East, in the later first and early second millennium CE. Literary sources at both ends of the route document impressions of the ‘other’ as different from themselves – the residents of dominant state level societies. Material remains certify that the exchange was significant economically, but also culturally. Surely the most visible evidence of the value of that interaction was captured in the deposition of exotic artifacts in funerary settings, where material evidence extro to the local region surround and shielded the elite. This paper will consider what message the assorted choice of non-local or non-locally inspired grave deposits, aovred in the first millennium CE by looking closely at two assemblages, one in Afghanistan and the other in China.

Across Eurasia at this time foreign imagery, technologies and mortuary practices and uses of artifacts derived from all sectors of that far-flung exchange network and we shall argue that this denotes and documents a cosmopolitan attitude about displaying one’s identity at death. More no telling of the ecclicic and intercultural character of those expressions were the grave goods deposited in the six excavated tombs at Tiltesy Tepe, Afghanistan, found in a location that could be characterized as bordering on several powerful groups. Materials in those tombs connect imagery from the Near East, Hellenistic Central Asia, southwest Asia, present-day India and China.

Granulation, inlay and lostwax/lost wax techniques were imported into the region from Western Asia and China. At the far eastern edge of this indirect traffic of goods and technologies, in the later Han Dynasty Protectorate of the Western Regions, anoth-er set of burials, known from the excavations of Qurei, and particularly in the tomb of Cheksi, at Baleeq, Xingjiang, display a similar mixture of goods and practices. There artifacts included gold appliques and ornaments with granulation and loops that made clear western Asian connections as well as a preference for more easterly burial practices and items from dynastic China.

The comparison of these two settings will document the preference for exotic typical of borderlands, especially in times of expansion, political ambition and unrest. Bearing in mind that the choice of materials for one’s tomb is deliberate and not incidental, we argue that the individuals buried were probably lesser leaders and their partners with some authority and that their tombs represent the unequal distribution of power. They were members of communities bordered by larger, more stable polities, making the politics of frontiers an important framework within which to understand these assemblages.

TH1-05 Abstract 12

Relative Chronology and Statistics of Bronze Age Cemeteries in the Southern Urals (Ural-Kazak steppe)

**Author:** Dr. Schreiber, Finn, University Berlin, Berlin, Germany (Presenting author)

**Co-author(s):** Usmanova, Emma, Karaganda State University, Kazakhstan

**Keywords:** Bronze Age, Eurasia, Multivariate Statistics

**Presentation Preference - Poster**

During the EAA meeting in Vilnius I would like to present a poster from my PhD thesis, which I am currently working on. My PhD project is on the chronology and dynamics of Bronze Age cemeteries in the Southern Urals (Russia/Kazakhstan). For establishing a relative chronology, mainly based on ceramics, I use statistical tools like seriation and correspondence analysis on a selection of archaeological burial grounds. The sites belong to different cultural complexes, like Alabaevo, Sintashta and Andronovo and are dated to the Middle and Late Bronze Age.

My poster is about the results of multivariate statistical methods used in archaeology to establish a relative chronology for cemeteries. Results are demonstrated on some examples from my current investigations. Information will be provided for scientists without statistical experience. There is also brief information on the geographical and cultural background of these sites.

The poster shows that the multivariate statistics can lead to a more detailed understanding of the development and dynamics in Eurasian Bronze Age funeral archaeology and to a better understanding of cultural and social differences.

---

TH1-05 Abstract 13

Origin of the Polychrome Style Jewellery

**Author:** MA Janik, Paweł, Antiquity of Southeastern Europe Research Centre University of Warsaw, Legionowo, Poland (Presenting author)

**Keywords:** Huns, Migration Period, polychrome

**Presentation Preference - Poster**

One of the most characteristic element of the hunnic culture of the Migration Period is the polychrome style jewellery. In this style the surfaces of gold or gold objects were decorated with precious or semi-precious stones (like almandines, red garnets, carnelians) or pieces of glass, which usually were red. These ornamental elements were set within strips of gold foil, often surrounded with granulation or filigree. There was another version of this style called cloisonné in which the glass or gemstones were set in compartments of soldered strips of metal foil, separated with wire, over a strip of metal foil. The polychrome style is used in ornamenting dress accessories, horse equipment, diadems, weapons, jewellery and other things. Many researchers have divergent opinions about provenance of this jewellery style. According to popular opinion, the polychrome style was not typical only for European Barbirorum like Carpathian Basin, West Europe or Black Sea region, but it existed also in Central Asia, north-west modern China and even Korean Peninsula. Moreover the polychrome style not occurred first time during the Migration Period, but much earlier. There are also some polychrome decorated artefacts from East Europe (Sarmatian culture) and Central Asia (Bala Hssan culture and Kertch culture) dated to period between III century B.C. and II century C.E. These artefacts are very similar to polychrome style ornamented objects from the Migration Period. Some scholars (Arrhenius 1971; 1985) claim that “barbaric” peoples had not such technology and knowledge to shape and stick gemstones and glass pieces to a gold foil. Other scholars (Schmauder 2002: 237-55) affirm that polychrome style evolved from the hellenic jewellery traditions. The problem is that there are some polychrome decorated artefacts from Iran and central Asia dated to Achaemid Period! My poster consist of investigations of the origin and development of the polychrome style jewellery.

---
The many thousands of cremation graves of the urnfield period (Late Bronze Age/Early Iron Age) are perhaps the most prominent funerary legacy of prehistory in Northwest Europe. In the Low Countries alone more than 600 urnfield locations are known to us today. The Hallstatt-C chieftain’s graves, famous for their monumental burial mounds and lavish grave goods, belong to this legacy as well. But these make up even less than 1% of the total of urnfield graves. The other 99% are anything but spectacular: mostly they consist of no more than a handful of cremated bones and occasionally a small vessel or broken metal object. An urn does not even seem to have been a necessity. The funerary ritual of the urnfield period is therefore often regarded as simple and uncomplicated. But are the 99% of urnfield graves really that different from the conspicuous chieftain’s graves? These chieftain’s graves tell us interesting stories about how people thought about their famous dead as ancestors: how these needed to be equipped with objects and which part of their complex social person was represented in the ‘after life’. Can similar stories be found with the inconspicuous 99% of urnfield graves as well?

In this paper I will discuss some preliminary thoughts and present the first results of my research. Making sense of the inconspicuous 99% of urnfield graves

Author - Louwen, Arjan, Leiden University, Leiden, Netherlands (Presenting author)
Keywords: Personhood, Selection and Transformation, Urnfield graves
Presentation Preference - Poster

By looking into the compositions of a large corpus of urnfield graves from the Netherlands, Belgium and Germany this study hopes to unravel the ideas about the dissolution and constitution of personhood at death as reflected in the urnfield graves. It will do so by mapping (a.) the selection of objects and (b.) the treatment of bones and objects prior to burial, (c.) the arrangement of bones and objects within a grave and finally (d.) the positioning of a grave in relation to other graves.

In this paper I will discuss some preliminary thoughts and present the first results of my research.
Interpreting the Archaeological Record

Keywords: Archaeology; History of hygiene; Late medieval period

Presentation Preference - Oral

The complex of Vilnius Castles consists of the Upper Castle on a hill and the Lower Castle located in a valley at the foot of the Castle Hill. The cultural layer of the Lower Castle territory has been accumulating since the 13th century and it is 8 meters thick in deepest places. The late medieval layers at the bottom are saturated with ground water and are rich with preserved organic artifacts and wooden infrastructural objects.

Over 3000 wooden or such composite artifacts were found while investigating the territory of Vilnius Lower Castle. The findings which are conditionally attributed to hygiene segment compose small part of this collection and encompass combs and mirror frames. During the investigation 23 combs and 17 mirror frames were found, as well as 7 findings related with their production: blanks and wastes. These artifacts represent the period of the 14th - 16th centuries. The majority of combs are made of boxwood (Buxus sempervirens L.) but two items made of Rosaceae (subtribe Malinae) wood were also determined by the wood anatomy analysis. The combs are rather uniform, double-sided, rectangular with lenticel profile and quite simply decorated.

The mirror frames are round-shaped with a round socket for a reflecting plate. The majority of 9 frames are turned from softwood planks. One frame is made of pine (Pinus sylvestris L.), two - of spruce (Picea abies (L.) H. Karst) and three – from the wood of fir (Abies alba Mill.), which is not native in Lithuania. One mirror frame had two sockets on opposite surfaces and was made of a cross-section of lime (Tilia sp.) round wood. This frame was decorated with carbon-black triangles. No traces of reflecting plates were found in any case but adhesive paste made of chalk and animal glue was detected in three frames. Fragments of tin used for decoration and also for undefined purpose were found.

The specific production technology and the selection of material indicate that combs and at least a part of mirror frames could be imported.

Both combs and mirror frames are not massive finds in medieval old towns. In the Vilnius Castle the ratio of mirrors to combs is quite high as compared with other European archaeological sites. Mirrors and combs were used for beauty and personal hygiene. Being luxury goods they showed the social status of a person too. Perhaps the proportions of these items were influenced by Christian views of the prevalence of vanity in certain territories or in conformity with the liturgical rules or rules of some monastic orders, the mirrors have been considered the symbol of vanity for a long time.

TH1-06 Abstract 04

Tableware in the Vilnius Lower Castle: function, significance and evolution

Author - PhD student, Archeōcita-Ramanauskienė, Skaistė, Vilnius University, Vilnius, Lithuania (Presenting author)

Keywords: dining, tableware, Vilnius Lower Castle

Presentation Preference - Oral

Recent research has continually been focused on the feasts and dining of the Middle Ages. Significant attention has been given to the types of food that was consumed during medieval times by different social classes of the time as well as the reconstruction of medieval recipes. Although tableware plays an integral part in feasts and dining culture, its exact development, function and importance to the different social classes and cultures has mostly been overlooked in these studies. The territory of Vilnius Lower Castle is chosen for the present study as it played a significant role during the late medieval period of the Lithuanian-Polish Commonwealth. Moreover, the territory distinguishes itself with continuous chronological records, dating back to the first mention of Lithuania as a state. The Palace of the Grand Dukes of Lithuania played a central role in this area as it was the residence of the grand dukes of Lithuania and the kings of Poland. Other buildings in order of importance were the Bishop’s Palace and the Cathedral, as well as the Arsenal and barracks, houses of nobles and ordinary townspeople. Therefore the entire territory of Vilnius Lower Castle reflects the lifestyle of the grand dukes, nobles, nobility, clergy and citizens, as well as their connections with Western cultures.

An analysis of function, significance and evolution of the tableware found in the Vilnius Lower Castle is presented in this paper. The aim is to explain the table culture and dining traditions through the investigation of the available archaeological and historical sources.

TH1-06 Abstract 05

Iron nails of cultural layers from Klaipeda castle: a functional aspect

Author - Master Stankovičūtė, Eglė, Palanga Resort Museum, Palanga, Lithuania (Presenting author)

Keywords: Iron nails, Klaipeda castle, Medieval

Presentation Preference - Oral

This study is dedicated to introduce the auditor with currently in Lithuanian archaeology not widely analysed archaeological findings group – iron nails. In 2014, during archaeological excavations of Klaipėda castle, more than 13 000 units of nails and their fragments were collected, which, according to cultural layers, corresponds with Medieval and Modern ages of Klaipėda castle, and also city historical development.

The paper is based on the written sources, the letters which are published e.g. in Diplomatarium Fennicum and SDHK (even if the building itself gives inspiration). The aim of the paper is to examine in which way the castle and the life in it is mentioned in the correspondence of Ingelbergs Åkesdotter and Åke Jöransson.

TH1-06 Abstract 06

Glimpses into the armed life in the medieval castle of Raseborg

Author - M.A. Taniävä, Elina, University of Helsinki, Helsinki, Finland (Presenting author)

Keywords: Medieval culture, Medieval castle, Weapons and armour

Presentation Preference - Oral

From the end of the 14th century to the middle of the 16th century, the castle of Raseborg was the administrative center of the region of Western Nyland (Fi, Uusimaa) in Finland. The ruins and surroundings of the castle have been under research since 1890. The most recent archaeological investigation has been done 2008-2009 and 2014-2016 especially concentrating on the research of the surroundings of the castle. During the restauration works and archaeological excavations done within these 126 years there has been collected diverse find material containing bunch of objects related to military life. Because the historical sources related to Raseborg are quite fragmentary, are these objects crucial source material when trying to interpret the military aspects of the life in the castle. Raseborg was definitely a stronghold that needed to be equipped in case of attacks or sieges. About this tale especially weapons mentioned in the inventories of the castle.

As well as indicating preparation for conflict, weapons and armour belonged to everyday life at Raseborg. For example, they were a part of military dress, so it is clear that in a place where soldiers lived and military culture was clearly visible, some remains of military culture would be found. About this side of military life tell especially personal weapons and armour, that are not visible in written sources related to Raseborg, but can be reached via archaeological finds. By studying the found objects and historical sources related to the castle and comparing the data collected, it has been possible to consider the military side of the life of the castle more critically. Historical sources have given the archaeological material the context they needed so that the people behind the objects could be reached more closely.

TH1-06 Abstract 07

A Fief Holder’s Castle.

Case study of Häme Castle in Finland in the beginning of the 16th century

Author - Hockman, Tuula, University of Tampere, Finland (Presenting author)

Keywords: Häme castle, Tott family, written sources

Presentation Preference - Oral

This paper is a case study on the significance and value of a castle for a fief holder’s life – using as an example the era of the Tott family in the Finnish castles, especially the fiefs of Lady Ingeborg Åkesdotter Tott (fief holder of Häme Castle 1497/1504–1507) and of Åke Jöransson Tott (fief holder of Häme Castle 1508–1520).

A fief holder’s duties were administrative and military on the level of the realm (as a member of the council of Sweden), as on the level of the län (administrative district) as in the castle. To be able to take care of their duties, the medieval fief holders also lived in their castles.

The paper is based on the written sources, the letters which are published e.g. in Diplomatarium Fennicum and SDHK even if the building itself gives inspiration. The aim of the paper is to examine in which way the castle and the life in it is mentioned in the correspondence of Ingelbergs Åkesdotter and Åke Jöransson.

TH1-06 Abstract 08

The use of space at the castles of Östergötland province, Sweden

Author - Dr. Rundkvist, Martin, Umea University, Sala, Sweden (Presenting author)

Keywords: Castles, Medieval

Presentation Preference - Oral

This study focuses on during archaeological excavations in year 2014 in Klaipėda castle obtained iron nails types function, their adaptability in the old Klaipėda city constructions and the mode of life. Latter research resulted more data about Medieval and Modern ages of Klaipėda castle, and also city historical development.
The selective deposition of metalwork in the Bronze Age: a pan-European phenomenon?

Saturday, 3 September 2016, 09:00-18:30  
Faculty of Philosophy, Room 201  
Author: Fontijn, David, University of Leiden, Leiden, Netherlands (Presenting author)  
Co-author(s): Civilyte, Agne, Lithuanian Institute for History, Vilnius, Lithuania  
Keywords: Bronze Age, metalwork  
Presentation Preference: Regular session

The Bronze Age hallmarks the rise of a globalized metalwork exchange. New technologies involved such as copying, re-cycling even suggest that it was sustained by new, more economization-like attitudes towards material. This seems in marked contrast to the deliberate deposition and giving-up of metalwork across Europe. Understanding the rationale behind these practices remains one of the major challenges of European Archaeology. Research by scholars from different countries has shown that this 'giving up' was not arbitrarily done, but shows particular patterns: specific objects seem to have been placed in specific places only. In this session, we aim to chart the general characteristics of this 'selective deposition' of metalwork during the Bronze Age, by inviting scholars from different ends of Europe to present overviews and interpretations of this remarkable practice. Questions to focus on will include: Are there general, widely-shared aspects to this practice across Europe, or is the 'phenomenon' no more than an array of local practices that differ substantially from region to region? Was it a cultural phenomenon that is 'unique' for Europe, and if so, what exactly is its distribution? Was deposition of metalwork in metalliferous regions essentially different than in non-metalliferous regions? We invite archaeologists to present the patterns of their region, and aim to cover Europe from the far West (Ireland) to the Far East (Ukraine, Russia). The focus will be on different periods of the Bronze Age, starting from the Early Bronze Age until to the Late Bronze Age with the aim, to recognize variable tendencies of metalwork depositions across time and space.

Object deposition in Central Norway c. 2350-500

Author: Phd Henriksen, Merete, Norwegian University of Science and Technology, Trondheim, Norway (Presenting author)  
Keywords: Late Neolithic, Bronze Age, Object deposition, Central Norway  
Presentation Preference: Oral

Object deposition, mainly in wetland environments such as bogs and lakes was practiced in Central Norway throughout the Late Neolithic and the Bronze Age (c. 2350-500 BC). In the Bronze Age, it was one of the northernmost regions in Europe where the deposition of metal work took place. However, although bronzes constitute a significant amount of the total number of objects deposited, the group as a whole is characterized by a variation in objects and materials and includes objects made of bone, amber, flint and wood alongside objects of bronze and gold. Among these finds we find a well-preserved wooden stool with Bronze Age carvings from Hvitstad outside Trondheim, found together with wooden platters and cups probably used in a ritual meal. Although there are differences in how the various objects were treated and deposited, they all seem to follow the same distribution in time, with significant peaks in the late Neolithic/Early Bronze Age (c. 2350-c. 1500 BC) and at the end of the Bronze Age (c. 900-500 BC). Thus, they seem to represent related practices.
This paper will give an overview of the practice of deposition in the area, and consider how variations in the material can be interpreted by applying a biographical approach in order to increase their interpretative value in studies of prehistoric deposition.

**Taming the Might of Bronze – Localisation of Bronze-Related Ritual Practises in Bronze Age Finland**

**Author:** MA Saipio, Jarkko, University of Helsinki, Helsinki, Finland (Presenting author)

**Keywords:** Bronze Age, Fennoscandia, Ritual archaeology; Structured deposition

**Presentation Preference:** Oral

The area of present-day Finland was a crossroads of Scandinavian and Russian bronze networks throughout the local Bronze Age (1900/1800-500 BCE). Even though the archaeological assemblage of Bronze Age bronze artefacts is not abundant in the area (numbering less than 200 specimens), relatively well-established relations to eastern and western bronze centres are indicated by both imported bronze objects (predominantly of Scandinavian origin) and local casting of Russian bronze artefact types. Interestingly, while many of the bronze object types encountered in Finland were obviously connected with long-distance networks, their deposition patterns appear highly localised even within the area of Finland. Cells and daggers seem to have been especially prone to change their roles when travelling between eastern and western or southern and northern Finland. Such regional differences are discernible not only in differential treatment and significance of specific artefact categories but also in general relations between Bronze technology, mortuary rituals and ritualization of landscape. This paper suggests that local ritual practises of Stone Age origin had substantial impact on deposition patterns of bronze artefacts in Bronze Age Finland. Continued influence of Neolithic ritual frameworks may also have contributed to the general scarcity of bronze in the area throughout the Bronze Age.

**TH1-07 Abstract 04**

**Early Bronze Age metalwork deposits in Denmark**

**Author:** viisé, MariAnne, Laerd University, Faculty of Archaeology, Rotterdam, Netherlands (Presenting author)

**Keywords:** Denmark, Early Bronze Age, Metalwork deposits

**Presentation Preference:** Oral

Denmark is known for its rich, well-documented archaeological record dating to the Bronze Age. Metalwork has been found in bogs, on dry land and in burials. However, Denmark is a non-metalliferous region, which means that all metal had to be imported. And yet, valuable metal objects were deposited and never recovered. Some very spectacular and famous finds have been found in Danish bogs, like the Trundholm Sun Chariot and the bronze lures. A strong tradition of interpreting these finds in terms of religion, and divine offerings, exists in the area, going back to early archaeologists from the 19th century and their interpretations. Another research tradition distinguishes different categories of non-religious hoards, for example metalworkers’ hoards and traders’ hoards. However, these rigid classifications fail to fully explain these deposition practices.

More recent research has shown that patterns seem to have existed regarding deposition. Certain objects are found in wet areas, like bogs, and other objects in burials. The emergence of these deposition practices in the Early Bronze Age in Denmark, going back to the Neolithic, is the topic of the present study, with a particular focus on Jutland. Selective metalwork deposition practices in northwest Germany (western Schleswig-Holstein and Niedersachsen) and the north-western part of the Netherlands are part of the present study as well in order to acquire an increased understanding of the Danish patterns and to set these in a wider regional perspective.

**TH1-07 Abstract 05**

**Horse harness in Late Bronze Age hoards in southern Scandinavia and the southern Baltic area**

**Author:** PhD Sarauw, Torben, Museum of Northern Jutland, Aalborg, Denmark (Presenting author)

**Keywords:** hoard, Horse harness, late Bronze Age

**Presentation Preference:** Oral

In the summer of 2014, a late Bronze Age hoard was found and excavated in Northern Jutland, Denmark. The hoard not only contained both male and female items, but also several parts of horse harness and bridles, bearing witness of the use of two-horse teams. Most surprisingly, several meters of leather straps were preserved. Furthermore, cheek pieces and phalerae were in situ on the leather straps allowing a reconstruction of parts of the bridle. Apparently, a similar tradition of deposition took place in a large area corresponding to Southern Scandinavia and the southern Baltic area.

**The metal hoards practice in Central and Western Europe: a statistical and geographical approach**

**Author:** Dr. Bítte, Hélène, PARIS, France (Presenting author)

**Keywords:** Bronze Age, Hoards, social practice

**Presentation Preference:** Oral

During my PhD I was able to study and to characterise the hoard practice of five European regions during the Bronze Age. These areas were chosen according to their high number of hoards and their affiliations to different cultural complex or their strategic position. The study focused on: Western Carpathians, the Mitteleste-Baale-Galetz (central Germany), Denmark, the Burgundy doors (Switzerland, Eastern France, south-eastern Germany) and the Amorcan Massif (Western France). The single finds were included in the study, since they are part of the same practice as the so-called metal hoards. The aim of this PhD was to study the high variability of these hoards and single finds in space and time, in order to better understand this social practice. In this way, different statistics have been used and a GIS has been developed for each region. 1555 hoards and 2776 single finds have been analysed.

The results of these analyses show similarities between the regions as well as regional preferences. In terms of similarities, we can refer to the categories of objects deposited in the hoards or as single finds, which are mostly weapons, adornments and axes. The evolution of the single finds is similar to the evolution of the hoards in most regions, except in Denmark. In all regions, the complexity of the hoards composition (number of categories) increases through time, as well as the number of hoards with fragmented objects. However, this fragmentation is relatively marginal since very few hoards have a high level of fragmented objects (the median of the boxplot is zero). Most hoards and single finds have been buried in low altitude and the spatial analysis reveals high densities of hoards near confluences of rivers.

Regional preferences have been observed in depositional contexts like in Denmark where a lot of hoards have been buried in swamps or in the Burgundy doors which have a lot of immersed single finds. The favourite objects are different from one region to another: axes in the Amorcan Massif and the MESG or weapons in Denmark and the Burgundy doors. In terms of composition, differences appear between the studied areas. Thus, the Amorcan Massif is the only one with a majority of one-type hoards and also with a majority of homogenous hoards (objects from a unique cultural area). Hoards in domestic contexts could have been also a regional preference, as it is well known in Western Carpathians but rare in the Amorcan Massif and totally missing in Denmark.

Regarding to several criteria, some of them appeared earlier in the Western Carpathians and the MESG than in Denmark and the Amorcan Massif. In this way it seems that some modalities of the Bronze Age hoards practice took place first in Central Europe before spreading to Northern and Western Europe. Besides, this hoard and single find practice necessarily reflects individual and collective initiatives.

**Oscillating Metal - comparing selective depositions and graves in the Bronze Age of Central Europe**

**Author:** Dr. Neumann, Daniel, Frankfurt a. M., Germany (Presenting author)

**Keywords:** Bronze Age, Grave, Selective Deposition

**Presentation Preference:** Oral

The Bronze Age is characterized by a large amount of voluntarily deposited objects made from Bronze. This presentation will especially set the focus on similarities and differences between selective depositions and graves by comparing both from different angles and scales.

As both archaeological features indicate social significance the examination of the regionally and chronologically changing patterns reveal different strategies of social expression. Furthermore, the interplay between both which is known from many areas of Europe enables us to contrast areas of diverging ritual practice by addressing the selection of objects as well as the varying quantity. This paper takes the pan-European development into account, but will mainly focus on data from Southern Central Europe which is an area – unlike others – that yielded bronze objects from graves and hoards as well.

**TH1-07 Abstract 08**

**The selective deposition of metalwork: an introduction**

**Author:** Nessel, Bianka, Institut für Geowissenschaften, Ruprecht-Karls-Universität, Heidelberg, Germany (Presenting author)

**Keywords:** Bronze tools, hoards, selective deposition

**Presentation Preference:** Oral

Bronze Tools and other finds associated with metal working processes are part of the inventory of most Bronze Age depositions. The tools in question have mainly been identified as metal workers tools since they appear in hoards. But functional analyses show, that this is only valid for a comparably small amount of the items. Specific patterns of the treatment and relative occurrence of tools can be identified in hoards throughout Europe. Large mixed depositions with a majority of bronzeas with various functions are
TH1-07 Abstract 09
Fragmentation as a common feature in European Bronze Age hoarding

Author - Dr. Maraszek, Regina, Landesamt für Denkmalpflege Sachsen-Anhalt, Halle, Germany (Presenting author)  
Keywords: Bronze Age, Deposition  
Presentation Preference - Oral

Deliberate fragmentation is a well known feature in Bronze Age hoards all over Europe, shifting in space and time. The aim of the paper is to discuss and specify the German term „Bruchertörte“ (scrap hoards) and to discuss these finds. We will consider especially depositions where broken pieces outnumber all other metal pieces. To illustrate this the central German „scrap hoard“ from Eiterwerda was chosen consisting of more than 320 bronzes, most of them broken, bent, damaged or cut into pieces: casting debris, tools, ornaments and weapons. The aim is to identify the variability of fragmentation, the degree of typologically important bronzes and the relation of regional versus imported artifacts. Similar structured scrap hoards from different European regions will be introduced and compared.

Are we dealing with a random choice of fragments collected for re-usage following regional weight systems? Do scrap hoards represent results of single exchange transactions? Following recently discussed theories the scrap hoards will be defined as a special hoard group, separated from so called craftman’s deposits and the hoarding of raw metal (“Susseze”).

TH1-07 Abstract 10
Places of deposition of metalwork assemblages in West Bohemia

Author - Prof. assist. Jirí, Luboš, Institute of Archaeology of CAS, Prague, Czech Republic (Presenting author)  
Co-author(s) - Dr. Šumberová, Radka, Institute of Archaeology of CAS, Prague, Czech Republic  
Keywords: Bronze Age, hoards, Landscape  
Presentation Preference - Oral

One way to answer questions concerning the selective deposition of metalwork in the Bronze Age is the detailed analysis of the place where metalwork assemblages were deposited. A territorially and chronologically defined sample of such assemblages – hoards – was deliberately selected. We assume that if hoards had differing functions in different periods and/or territories in the past, the data obtained through a single analysis of a de facto heterogeneous set of objects would affect the quality of the final interpretation. Our chosen method, the targeted analysis of a closely-defined set of objects, helps eliminate this risk, and allows the subsequent testing of the newly-obtained data on an ever wider set of objects that seem to show identical features, but have different territorial or chronological ambits. We therefore focused on 31 Umfried Period hoards recorded to date in the West Bohemia region. For our questions, it is important that it was possible to determine precisely the original location for 27 of the hoards. The field survey focused mainly on evaluating the subjective reception of the given space in order to assess potential links of the hoards to significant natural features. We therefore focused on 31 Umfried Period hoards recorded to date in the West Bohemia region. The area of middle Danube was a focal point for introducing swords at the end of the Early Bronze Age. It is well known, that since their introduction they occupied a special place in material world, as is the case of Achaian swords. These first swords, as soon as they started to be produced were deposited in rivers. This special type of deposition practice was soon followed by swords of Bosnian type family, when the only place you could find a sword in this area was in grave or river. This practice continuously gained momentum and reached peak at the beginning of the early urnfield period (BD-HA). Notwithstanding, there is almost complete lack of other types of metal deposits in the area of middle Danube during this period. It is most striking when compared to hoard-rich areas in central and north Slovakia, Czech lands as well as western Hungary, where swords were among other types of hoards primary deposited in „dry land“. This paper will be based on my personal long-term, yet unpublished research. Since hallmark studies by W. Torbrügge, R. Bradley and S. Hansen, this area received some research attention. However, I still lacked more robust theoretical models for interpreting this interesting archeological record in contact. I will provide a detailed overview of situation reinforced by basic and multivariate statistics. Hypotheses are postulated and tested through theoretical models and methodology based on hermeneutics, advanced formal logic and some basic game-theory elements.

TH1-07 Abstract 11
The Copper Highway - An Overview of Early Bronze Age Hoards in South Bohemia

Author - Dr. John, Jan, University of South Bohemia, Ceske Budejovice, Czech Republic (Presenting author)  
Co-author(s) - Chvojka, Ondrej, University of South Bohemia, Ceske Budejovice, Czech Republic  
Keywords: copper ingots, Early Bronze Age hoards, South Bohemia  
Presentation Preference - Oral

The territory of South Bohemia provided an important link between Danube valley and Central Bohemia in the Early Bronze Age. There are currently more than 80 hoards known from this area, a large part of them were discovered in the last two decades, thanks to a massive use of metal detectors. Not surprisingly, a number of hoards include cast copper ingots of various shapes, transported from the Alps to the north. Although copper ingots represented undoubtedly valuable items, thousands of them were deposited underground and never picked up again. In this presentation we are going to discuss possible interpretation of these hoards as votive offerings or merchant’s hoards. Attention will be paid also to the chronology and technology of artefacts found in Early Bronze Age hoards.
and Koszider ‘hoard horizons’ have provided ample material for such analyses. The turn towards a ritual interpretation of the deposition of metal in Bronze Age Europe has hardly been felt in local scholarship. The aim of our paper is to change this situation and to analyze Middle Bronze Age metalwork from the Carpathian Basin from the point of view of selective deposition. We will highlight the patterns observable in the composition of these hoards and compare them with other depositional contexts such as graves and settlement finds. Based on these comparative analyses we will attempt to reconstruct various social practices that involve the removal of metal objects from circulation.

TH1-07 Abstract 15
Late Bronze Age metal deposition practices on the southern outskirts of the Carpathian Basin
Author - Hvojke, Kalafati, Institute of Archaeology, Zagreb, Croatia (Presenting author)
Keywords: Carpathian Basin, Late Bronze Age, settlements
Presentation Preference - Oral
When attempting to study the cultural manifestations of the Bronze Age, it is necessary to point out that the development of metalurgy intensified new social practices such as depositing metal objects. The Carpathian Basin is a region with a high density of metalwork hoards present throughout all the phases of the Bronze Age. Its southern edges, the Sava and Drava River Basins, see the peak of bronze object deposition in the Late Bronze Age. The earlier research of Late Bronze Age of the southern part of Carpathian Basin was almost exclusively focused on the phenomena of hoards, mostly observing such hoards as a feature separated from the communities that contemporaneously inhabited the area. This approach was the consequence of the fact that almost all available Late Bronze Age metal artifacts were found as parts of hoards, while at the same time context of such hoards and its relations to contemporaneous settlements and cemeteries is unclear. The main reason for this is the fact that a large number of hoards were found in time when archaeology was still developing discipline, so that context of find was not properly documented or even observed. In these circumstances the Late Bronze Age hoards were never studied as a part of the communities present, separated of its social and archaeological context.

In the Croatian part of the Carpathian Basin the numerous rescue excavations have been done due to intensified development of state infrastructure. In the last 30 years these extensive rescue excavations revealed large number of the Late Bronze Age settlements and cemeteries. These excavations revealed that metalwork deposits in this period are commonly found inside settlements. Fine example of this is the site of Čepinski Martinci-Otvarove where a sword was found in the defense ditch near the settlement gate. This and similar finds open the possibility for the reinterpretation of previously excavated finds and for a more complex contextualization of metal object hoards deposited by Late Bronze Age communities.

TH1-07 Abstract 16
Hoards, burials, ornaments – selective depositions in Middle Bronze Age Hungary
Author - Dr. Kiss, Viktória, Research Centre for the Humanities, Hungarian Academy of Sciences, Budapest, Hungary (Presenting author)
Co-author(s) - Balkiczky, Péter, Miskolc University, Miskolc, Hungary
Co-author(s) - Maji, Dóra, Eötvös Loránd University, Budapest, Hungary
Co-author(s) - Szabó, Gábor, Wosinsky Mór Museum, Szekszárd, Hungary
Keywords: Bronze Age, hoards, selective depositions
Presentation Preference - Oral
The standardised structure of the content of the so called Tolnánémedi type hoards (18 hoards from western Hungary, basically sets of ornaments and a few weapons and tools) is a clear indicator of the practice of selective deposition, and supports the assumption that this group of finds was buried for the same reason in the entire territory connected to Transdanubian Encrusted Pottery style during the Middle Bronze Age (2000-1500 BC). When comparing the numbers of the artefacts from these hoards with the data coming from the graves of the same region during the same period the numbers show the multiple of one person’s attire. This fact was important during interpretation of the Tolnánémedi type hoards. According to former assumptions these hoards were connected to military actions (wars) or to rites of passage. However, recent results of burial practice analysis of the period suggest another model. We would like to present the reinterpretation of the mentioned hoards concerning the results of statistical analysis of the jewellery types from burials and hoards, examinations of the microstructure of metal finds, and the study of a recently found clay human figurine of the same period with the depictions of the ornaments concerned.

TH1-07 Abstract 17
Patterns of metalwork deposition during the LBA in the Lower Danube region
Author - Matea, Florina, Alexandru Ioan Cuza University, Iasi, Romania (Presenting author)
Keywords: deposition patterns, LBA, Lower Danube region
Presentation Preference - Oral
In this paper I address the distinctiveness of the metalwork deposition patterns traced in the Lower Danube region during the Late Bronze Age (LBA). This calls for the analysis of hoards and single finds found in the region in terms of content, treatment, and context of deposition which may later on involve the interpretation of the underlying cycles of activity and the motivation behind deposition. Based on the metal artefacts distribution within the landscape we observe that most of the hoards follow the main river streams, concentrating on the hills area or on the lowland, in the north and south of the Danube. The main artefacts of the study area are the socketed axes and sickles which are widely distributed, especially in hoards. If we analyse the patterns of deposition we can observe a groups of hoards containing only a single type of artefacts. The preferred objects are the socketed axes of the sickles. Not only finished good quality artefacts were chosen for deposition; stone moulds used to obtain the bronze artefacts were also included in hoards. Two of the hoards contains moulds which were used to produce socketed axes widely distributed in the region, while the hoard from Pobit Kamál contains over 30 stone moulds, including some for objects not known to exist in this area in positive.

Through the Lower Danube, the Carpathian-Stara Planina interface was opened to Central Europe and to the north of the Black Sea. In order to trace how the bridging position of the region influenced the cultural landscape, firstly, a spatial and contextual analysis of the single finds and bronze hoards will be performed. The constituent objects of hoards will be investigated and compared in terms of quantity and association, but also in terms of artifacts treatment.

TH1-07 Abstract 18
Bronze Age hoards deposition in the Upper Tisa Basin: time, space and cultural context
Author - Kobal, Josip, Transcarpatian regional museum, Uzgorod, Ukraine (Presenting author)
Keywords: Bronze Age, Metaldeposition, Ukraine
Presentation Preference - Oral
Characteristic feature of the European continent population in Bronze Age is metal works deposition in form of “hoards”. Upper Tisza Region (UTR) is one of the richest in Europe on the finds of “hoards”: nearly 500. From the topographical point of view it’s very varuious, UTR, especially the eastern part, is rich on different mineral resources (such as salt, gold, copper). During Bronze Age at local population, by an insignificant exception, the cremation as a mortuary rite was dominated. The first metal works hoards in UTR appeared at the beginning of Copper Age. At the Late Copper Age (Baden culture, Cotofeni culture) and in the Early Bronze Age (Mako culture, Nirség culture) the tradition of deposition was not continued. The Middle Bronze Age (BAZ) is a new stage of hoarding in UTR. Culturally they belong to Ottoman-Füzesabony culture and early phase of Sucevita culture. Geographically they belong to eastern part of UTR. The earliest hoards consists mainly of prestige objects (ornamented weapons and gold wares).

Author examines two versions of appearance of this phenomenon in UTR: 1) tradition of deposition arose up as a result of internal development of local Bronze Age society; 2) tradition of deposition arose up as a result of external contacts of local tribal elites. Development of this tradition continuing with maximal distribution in periods from BD-HaA1 (Sucevita and Dava cultures) and till the end of Bronze Age.

TH1-07 Abstract 19
Going with the flow? Atlantic Bronze Age metalwork deposition practices
Author - Dr. Gibson, Catriona, University of Wales, Salisbury, United Kingdom (Presenting author)
Keywords: Atlantic Bronze Age, ebbs and flows, metalwork
Presentation Preference - Oral
As the title of this session proposes, the deposition of metalwork is one of the defining characteristics of the European Bronze Age. Superficially, certain types of objects were seemingly deposited in similar ways across supra-regional areas, suggesting widely shared socio-ideological practices. Scratching below the surface, however, reveals a myriad of complex and competing traditions both across space and through time. In particular, regions rich in raw metal resources (e.g. copper, gold and silver) exhibit marked differences in depositional practices to those areas that lacked locally-available ores. This paper will draw upon a large relational database created for a research project on ‘Atlantic Europe in the Metal Ages’ to highlight a few of the key patterns.
in metal depositional practices between 2800 and 800 BC. From Scotland in the north to Spain in the south, there is marked diversity, but also some striking similarities, in the nature and types of deposition. This will be demonstrated through focusing on specific artefact selections and associations, object biographies, contexts of deposition and their wider landscape relationships.

The extent to which transformations in metal deposition reflected the fluctuating and volatile nature of metal demand and supply throughout Atlantic Europe during the Bronze Age will also be considered. The intensification or fragmentation of networks of interaction had ramifications on metal supply and flows, and thus also upon the underlying metalwork depositional traditions and the ways in which metal was thought about, used, recycled and decommissioned. A more integrated approach will be adopted to help fine-tune several of the pertinent questions this session wishes to address.

TH1-07 Abstract 20
Structures and function of Bronze Age deposition in Ireland
Author: Dr. Becker, Katharina, University Colleage Cork, Cork, Ireland (Presenting author)
Keywords: Bronze Age, Deposition, Ireland
Presentation Preference: Oral

The depositional record in Bronze Age Ireland (c. 2500 BC to c. 800 BC) is exceptionally rich, with both gold and bronze artefacts being deposited in hoards or singly in the natural landscape. Deposition as burial goods is rare and restricted to the earlier part of the period. This paper will demonstrate how typological depositional patterns structure the record and reflect deliberate selection processes regarding which materials and object types were suitable for deposition in specific types of context. This paper will outline the main characteristics of this practice, highlighting trends with great longevity throughout the Bronze Age. Based on a selection of case studies an interpretation will be suggested that transgresses conceptual boundaries between ‘ritual’ and ‘functional’ and may open up new avenues of thinking of the at first sight rather disparate parts of the depositional record – single finds, hoards, burials, gold, bronze - as part of one cohesive, but diverse, cultural practice.

TH1-07 Abstract 21
Creative Destruction - Early Bronze Age deposits in the broader Middle Rhine Valley
Author: Autenrieth, Sabrina, Faculty of Archaeology, Leiden, Netherlands (Presenting author)
Keywords: Bronze Age, Deposition, Middle Rhine Valley
Presentation Preference: Oral

The Middle Rhine region is one of the best known examples of the excessive use of depositional practices of valuable objects in rivers. To understand this phenomenon, the focus from the river itself and their back swamps needs to be broadened to the adjacent area in the hinterland of Germany, France, Belgium and Luxembourg. In this region, we have the opportunity to compare a variety of depositional practices in wet and in dry contexts that have so far never been studied together. This will not only readjust the previous one-of-focus on river finds, but also reveal whether objects deposited in and lands represent a practice steered by ideas and motivations contrasting from those of river depostions. The aim of this research is to identify a potential cognoscible correspondence between the rise and fall of watery depositions and dry-land hoards and to reveal it communities in the Middle Rhine Valley shared the same ideology in the practice of depositions.

TH1-07 Abstract 22
Selective deposition of Metalworking Remains in Bronze Age Britain
Author: Dr. Adams, Sophia, University of Bristol, Bristol, United Kingdom (Presenting author)
Co-author(s): Dr. Walesby, Leo, University of Bristol, Bristol, United Kingdom
Keywords: Bronze Age, Deposition, Metalworking
Presentation Preference: Oral

A range of archaeological remains provide evidence for the production of metal objects in Bronze Age Britain, from the extraction ore to the finished objects. This paper focuses on the deposition of the material in between, the copper and bronze artefacts used for and derived from metalworking, casting waste and tools. Just as patterns are visible in the placing of complete and deconstructed objects so too are patterns present in the deposition context and selection of metalworking. By combining the results from a range of collection processes including archaeological excavation and metal detecting survey we can explore the context and content of these differing deposits, and question the social processes and implications behind the choices that led to these variations. This evidence for the deposition of bronze mounds, smithing tools, casting waste and ingots will provide a valuable comparative dataset to the evidence for the deposition of finished, used and deconstructed objects.

TH1-07 Abstract 23
Deposition of Middle Bronze Age Metalwork on the Isle of Wight: GIS Based Approach
Author: Kaleta, Robert, University College London, London, United Kingdom (Presenting author)
Keywords: Bronze Age, Metalwork, spatial analysis
Presentation Preference: Oral

Selective deposition of Bronze Age metalwork in the British Isles is a well documented phenomenon which has been studied intensively by a number of researchers. Initial work focused primarily on establishing and refining typochronological frameworks based on patterns of association within hoards. With the realisation of the selective nature of Bronze Age depositions however, it became clear that the role of bronze extended beyond its value as a commodity buried for safe-keeping and storage, and that deposition was part of a long standing social practice represented in the archaeological record by buried metal objects. The landscape context where the structured depositions took place, must have been viewed as suitable for that purpose by individuals and communities involved in the act. As such we might expect to see an inherent structure in the depositional settings of metalwork, preserved by the topography and the relationship to environmental and cultural landscape features, exhibited by the finds. Recognising these patterns has for the most part been a qualitative process, which relied on a visual assessment of the distributions; a difficult task considering the seemingly random distribution of most metalwork. In this context, identifying and evaluating any depositional patterns is best handled through the use of GIS and spatial analysis, which surprisingly has not been applied to the Bronze Age metalwork data in Britain. This paper explores the long term potential of wide scale application of multivariate logistic regression and Monte Carlo simulations to the distribution of Middle Bronze Age (c. 1500 - 1150 cal BC) metalwork, through a regional case study focused on the Isle of Wight. The aim is to establish whether any significant relationships between the finds and their landscape settings can be identified, and if these varied between hoards and single finds. Focusing on a relatively small, naturally bounded region with a high density of Bronze Age finds, allows us to understand the suitability of spatial analysis to the data and questions at hand, and relate the structure of the data-set to cultural processes leading to deposition with a degree of confidence and subjectivity not afforded by qualitative research.

Attention is paid in particular to exploring the divergence of the depositional characteristics of metalwork from those exhibited by randomly distributed data to establish whether similar patterning could be arrived at purely by chance, and, by contrasting different types of metalwork, whether this had an influence on the location of the depostions. Ultimately, a systematic approach to metalwork depositions is required to verify some of our assumptions on the role of landscapes in the deposition process, and to create a baseline against which further discussion and analysis can take place.

TH1-07 Abstract 24
The selective deposition of Bronze Age metalwork in the River Trent, English East Midlands
Author: Professor Pearce, Mark, University of Nottingham, Nottingham, United Kingdom (Presenting author)
Keywords: Bronze Age, Metalwork, River Trent, River Witham
Presentation Preference: Oral

In this paper we examine a specific example of selective deposition, Bronze Age Gewässerfunde from the River Trent, in the English East Midlands, as compared to the regional assemblage for Central England. The Trent has a major assemblage of more than 170 metal artefacts known from watery contexts. Most of the material dates to the Middle and Late Bronze Age, with fewer Early Bronze Age artefacts; it is weighted to high-status weapons, particularly from the Middle Bronze Age. Distinct clusters of finds can be noted, particularly in the section of the river close to Nottingham, where some 40% of items were found. The river assemblage is dominated by weapons, in contrast to the regional assemblage for Central England as a whole, which has different characteristics and is dominated by tools. The River Trent material also shows marked differences in character to the contemporary assemblage from the nearby River Witham, wellknown in the literature for the deposition of prehistoric metalwork. This is surprising, as the River Witham flows as close as 5 km to the River Trent. It has become a commonplace of the archaeological literature to argue that Gewässerfunde are the result of ritual behaviour. We argue that the special character of the River Trent metalwork, high prestige and male, and its contrasting nature compared to the regional assemblage, marks it out as special and that the most parsimonious explanation for its deposition is that it was indeed ritual in character, perhaps in the context of funerals, and that this behaviour was concentrated at a number of special places along the river.
TH1-07 Abstract 25

Late Bronze Age metal depositions in the West fringe of NW Portugal: contingencies

Author: Sampaio, H., Laboratório de Paisagens, Património e Território (Lab2pt), Guimarães, Portugal (Presenting author)
Co-author(s): Bettencourt, A., Laboratório de Paisagens, Património e Território (Lab2pt), Guimarães, Portugal

Keywords: Metal hoards, Mino

Presentation Preference: Oral

Deposition of metal artifacts during the Bronze Age is a wider phenomenon attested all over the Europe. Occupying a western end position rich in mining minerals, the North-eastern Iberian Peninsula also witnesses these kind of past societies manifestations during the mentioned period. The present work aims to explore the archaeological remains of those practices in a narrowed part of the Iberia, specifically, in the Atlantic fringe of the North-western Portugal (between the basins of Tâmega and Minho) during the Late Bronze Age. For that, it will be taken into account some of the regional available data, including in progress research, in order to verify some contingencies of such a complex past age.

Such a task will not only prioritize the different types of metal objects, their hypothetical biographical character and chronologies, but, specifically, and whenever possible, their micro and medium contexts of deposition, including recent contributions from fieldwork research. In a regional scale it is interesting to attest that some depression preferences prevail.

TH1-07 Abstract 26

Between two worlds – Hording practices in the Caucasus between European and Near Eastern traditions

Author: PD Dr. Reinhold, Sabine, German Archaeological Institute, Berlin, Germany (Presenting author)
Keywords: Caucasus, Hoards, Ritual practice

Presentation Preference: Oral

Hoarding metal objects is an important ritual practice during the Bronze Age, both in Europe and in the ancient Near East. Yet, context and places of depositions are entirely different. While in the European tradition, remote places next water bodies are preferred, metal objects in the Near East were predominantly deposited within ritual spaces, buildings or real sanctuaries. The Caucasus mountain range is the border between both traditions. This presentation will focus on the different ritual environments of hoarding in Caucasian Bronze Age, on the different locations of ritual places – off-site hoards or sanctuaries, and on the different historical trajectories that led Caucasian people to this specific ritual principle.

TH1-07 Abstract 27

Non-burial metalwork depositions in Bronze Age China: a case study of the Shang

Author: Qin, Cao, Oxford, United Kingdom (Presenting author)
Keywords: Bronze Age, China, metalwork

Presentation Preference: Oral

Numerous bronze items, mainly vessels and weapons, have been recovered from Bronze Age (c.1600–500 B.C.) tombs in China, and such mortuary contexts have always been the focus of research. Though not as well attested archaeologically, comparative metalwork was also deposited in non-burial contexts such as sacrificial pits, building foundations, and ‘hoards’. The implications of these depositional phenomena have not been holistically explored. In this paper, I will discuss metalwork depositions during the Shang (c.1600–c.1050 BC, Middle Bronze Age) in the Central Plain. Questions to be investigated include: what are the variety of depositional contexts for ‘giving up’ metalwork? What compositions of objects were deposited? Can any chronological patterns be discerned? What were the intentions of the depositors and the significance of the deposits to the Shang?

TH1-07 Abstract 28

Selective deposition in the Bronze Age. Selective deposition and the visibility of innovations

Author: M.-A. Dietrich, Oliver, Deutsches Archäologisches Institut, Berlin, Germany (Presenting author)
Keywords: Bronze Age, Socketed Axes, Southeastern Europe

Presentation Preference: Poster

Selective deposition due to ritual intentions has in the last years been identified as a key-concept governing the formation of Bronze Age metalwork assemblages. Especially in regions like the Carpathian Basin, where the transmission of metalwork depends heavily on deliberate decisions on the inclusion or exclusion of certain object classes in hoards and the exclusion of others, severe repercussions for the interpretability of the archaeological record can be expected. Although widely accepted on a theoretical level, until now the full consequences of selective deposition have not been explored for the southeastern European Bronze Age archaeological record. The present contribution aims to highlight the far-reaching implications of formation processes for dating the earliest appearance of object groups and technological innovations, using the earliest appearance of socketed axes in southeastern Europe as a case study. Socketed axes seem to appear all at once in a hoarding horizon parallelized with the central European phase Bz D. It is argued that selective non-deposition of socketed axes during their pre-Late Bronze Age History, which however can be reconstructed by taking into account other sources than hoard finds. The transmission of settlement finds is governed by a different set of rules and can serve as a corrective for a more balanced view on the development of Bronze Age metalwork. Isolated instances of early settlement contexts for finished objects, but even more so evidence for casting equipment discarded after use make a much earlier start of production of socketed axes in southeastern Europe probable.

TH1-07 Abstract 29

The middle bronze age necropolis in Gilareave-the Mycenaean influence in Kosovo

Author: Prof. Luq, Kamaj, Museum of Kosovo, Prishtina, Kosovo (Presenting author)
Keywords: Necropolis, The Middle Bronze Age, the Mycenaean influence in Kosovo

Presentation Preference: Poster

Kosovo’s favorable geographic position in the central Balkans has enabled its connection with neighboring and farther territories, thus making the influence of various cultures possible from the earliest periods. The development of early prehistoric cultures in Kosovo has been sufficiently explored through systematic work. Nonetheless, there is insufficient knowledge on the development of the Bronze Age in Kosovo. With the finding and excavation of the necropolis in Gilareave, important new steps have been made to complete this gap. Excavations in Gilareve have provided the most precise data for solving important problems of the Bronze Age in Kosovo, as well as for the development of period as a whole. Two necropoleis have been identified marked as Gilareve I and II. Both can be dated to the XV and XIV centuries BCE. So far, 48 grave constructions have been found, consisting of two types of burial practices: inhumation and cremation. Regarding the analogies and chronological determinations of the bi-rual burial practices it is possible to conclude that inhumation, with or without stone constructions, is the older type of burial. The task of dating the graves with cremation was conducted through reference to urn fragments, specifically their handles, which can be placed in a broader time frame. Dating the graves with inhumation can be done through reference to the other numerous finds, some of which have analogies in the larger geographical region, such as jewelry, weapons, and ceramics. The cultural material also, which is quite exclusive and in particular the weaponry, attests to the high degree of knowledge of metal manufacture, production techniques, as well as decoration. The Gilareve necropolis shows that the Middle Bronze Age in Kosovo had a developed culture with significant influences from, and ties to, Mycenae, as an important social, economic, and political center. Swords, axes, and various types of knives point to the connections with production centers in Epirus and Albania from where the Mycenaean influence expanded through the Drin valley and Vardar depression. Excavations in Gilareve have also given evidence to the beginnings of a stratified society in the area, the formation of a ruling clan, and the formation of the Illyrian Dardan “tribe” in the Central Balkans. Thusly, the Bronze Age in Kosovo becomes and important stage in the formation and development of the Balkan peoples, their culture and ethnogenesis.

Their further development can be observed in the course of the following periods, specifically the Early and Late Iron Age in the first millennium BCE.

TH1-07 Abstract 30

“Multienvironmental” concept in Early Iron Age offering contexts of Central Asia

Author: Prof. Savinov, Dmitri, Saint-Petersburg State University, St.-Petersburg, Russian Federation (Presenting author)
Keywords: Central Asia, Early Iron Age, offerings

Presentation Preference: Poster

“Multienvironmental” concept is a model of ancient population worldview. It was used basing on Iron Age archaeological sources from Central Asia, especially on so-called “offering” contexts.
UNDER THE RAISED ROOF: CREATING THE SPACE FOR FAMILY AND COMMUNITY

Friday, 2 September 2016, 09:00-16:00

Faculty of History, Room 330

Author: M.A. Postma, Daniël, Groningen Institute of Archaeology, University of Groningen, Netherlands (Presenting author)

Keywords: Buildings, archaeology, Methodology, Netherlands

Presentation Preference - Oral

Archaeological settlement research in the Netherlands can traditionally be characterised by its coverage of large excavation areas, often yielding substantial numbers of house-plans. This paper presents a simple strategy to establish a more solid argumentation for interpreting archaeological building remains. It is argued that we should not move away from classic methodological typologies, as some archaeologists suggest, but neither should we lower our expectations when it comes to interpreting these plans in economic, socio-political or ideological terms. Instead, we should elaborate on well-established research strategies in such a way that we can support each other; as Trebsche (2009, 515) puts it: “Contextual analyses should always proceed from better-documented interpretations.” In order to really understand ancient building traditions, information on the use and technicalities of built structures will have to be analysed ‘in a more methodological ‘building blocks’ approach, as a means of closing the gap between methodological analysis and interpretation. It will be demonstrated that the concept of a ‘functional typology’ can provide a framework for systematically building up a well-founded, yet holistic view of excavated ground-plans. The key objective in setting up a functional typology is to analyse and explain how ancient buildings functioned in their various respects. Starting as objectively as possible, the level of interpretation gradually increases to a total of five steps: 1) typological analysis, 2) functional use analysis, 3) technical analysis, 4) reconstruction and 5) contextualisation. The basis for this methodological approach is shown to have been sketched in and tested during the research of early medieval buildings in the north of the Netherlands. Buildings remaining previously unearthed in the (Holocene) clay and peat areas have shown that a lot more information can be gathered from ground-plans than excavations in the sandy soils have so far suggested. Using early medieval turf-built buildings with cruck-like trusses as an example, it is argued that a structural approach (cf. steps 3 and 4) is essential for in-depth research of ancient buildings. Refereed article: Trebsche, P. 2009. “Does form follow function?” Towards a methodological interpretation of archaeological building features.” World Archaeology 41 (3): 505–19. doi:10.1080/0043824090311253.

Interpreting the Archaeological Record

TH1-08 Abstract 04
Creating a home. Ritual practice related to houses in a terp settlement in the northern Netherlands
Author: Dr. Niewenhof, Annat, University of Groningen, De Punt, Netherlands (Presenting author)
Keywords: human remains, Northern Netherlands, Ritual practice
Presentation Preference: Oral
Between 1923 and 1934, excavations were carried out in the terp settlement of Ezinge by one of the founding fathers of Dutch archaeology, A.E. van Giffen. Ezinge is located in the coastal area of the northern Netherlands, a former salt marsh area. It is one of many terras that are found in this region: artificial dwelling mounds, which once protected their residents against floods. A terp started with one or several houses built on separate platforms, which clustered as they were heightened, developing into single larger mounds. The terp of Ezinge ultimately reached a height of 5.5 m and covered 16 ha, about 10% of which was archaeologically excavated in 22 levels.

Ezinge became famous because of the well-preserved remains of 85 longhouses, dating from the 5th century BC until the early middle ages. The lower parts of wooden buildings often were still preserved in situ, revealing the structure of these 3-aisled, two-partite houses with built-in byres. Excellent preservation, also of pottery and bone, enabled not only a thorough investigation of the material culture, but also of ritual practice in this settlement. This investigation was carried out only recently, between 2011 and 2015.

This paper will present some of the results of the study of ritual practice. It will discuss the ways in which rituals were related to various stages of the lifecycle of a house: raising the house platform, building the house, living in it and finally abandoning the house. A conspicuous element of ritual practice was the burial of human remains in and near houses. It will be argued that burying the remains of deceased family members created ancestral grounds and also made people feel at home. Single inhumations and single bones (probably the remainders of the dead which were collected after a process of excarnation) were both used that way.

Ritual practice associated with houses changed over time. It was influenced by internal developments, especially population growth, which caused changes in the layout of the settlement and competition for the available space on the terp.

TH1-08 Abstract 05
Construction, function and interior design of sunken floor huts in Middle Eastern Sweden
Author: Eriksson, Susanna, SAU, Uppsala, Sweden (Presenting author)
Co-authors: - Celin, Ulf, SAU, Uppsala, Sweden
Keywords: Building construction, Sunken floor hut, Viking age
Presentation Preference: Oral
During the last few years some Vendel and Viking age settlements with a large number of pit-houses (sunken floor huts, ground-floor huts etc) have been excavated in Middle Eastern Sweden.

Due to their construction the sunken floor huts are very well preserved and contains a lot of information of construction, building materials and interior details such as, steps, benches, ovens etc. Often the floor layer is intact and finds made from this layer can give useful information about what action actually took place within the walls.

Questions to dwell upon is how the inhabitants found themselves within these rather small damp, constructions, some researchers have argued that these buildings must have been almost unbearable to endure and others think they been inhabited by thralls. The question is, have they been lived in at all or have they been a place for daytime occupations and handicraft mainly? How can these types of buildings be understood? We think that most important it is to find out what actually took place within the four walls.

The paper will present a study upon the placement of entrances, building material and construction details. The houses within the study shows a great variation concerning construction and interior design details such as ovens, benches, loams, etc. Another study deals with what activities that has taken place in the pit-houses. Arceobatonical analysis combined with osteology and tpid analysis have helped us reach further in our interpretations.

Finally we will look further into how architectural reconstructions actually can be useful when interpreting the archeological record.

TH1-08 Abstract 06
The Dark Ages? Light and its absence in medieval domestic spaces
Author: PhD student Qvarnström, Linda, Stockholm University, Stockholm, Sweden (Presenting author)
Keywords: Buildings, Darkness, Light
Presentation Preference: Oral
Windows and light are essential parts of domestic buildings in most places today. The importance of light is often taken for granted, something that is frequently reflected in interpretations and in the questions we ask, or don’t ask. It is not rare to find reconstructions of medieval, and even prehistoric, Scandinavian buildings with windows of a kind that could be highly questioned.

Artificial light in medieval houses is often presented, directly or indirectly, as something insufficient, and the available light sources as dim substitutes for the sort of illumination that we are used to today. Although this accurately reflects our modern perceptions of medieval dwellings, it does not necessarily tell us much about the everyday experience of the people who actually lived in them.

In this paper I apply a ‘dwelling perspective’ to the use of light in domestic buildings. Rather than assuming a ‘lack’ of sufficient light to be the norm, a more fruitful approach might be to consider darkness instead, asking to what degree and in what circumstances it was ever considered a problem. How and to what extent was light used, and expected, in domestic buildings?

This paper presents a range of data and interpretations from my ongoing work, primarily using material from excavated domestic structures, hearths and light sources in Uppland province, Sweden.

TH1-08 Abstract 07
Long-houses in east central Sweden during Late Bronze Age
Author: Magnusson, Reidar, Stiftelsen Kulturmiljövård, Upplands Väsby, Sweden (Presenting author)
Keywords: Interpretation, Late Bronze Age, Long-houses
Presentation Preference: Oral
This paper addresses the issue of interpreting the remains of post built long-houses. During Late Bronze Age there is a diversification of the building styles, partly due to influences from north central Europe but there are also some domestic development. Almost all dwelling houses are three-aisled long-houses, it is easy to determine from the heavy roof-supporting post holes, but other parts of the construction, as remains of the wall structure, are much more scarce. That leaves us with the just the layout of the roof-supporting structure which is often interpreted in infinity. What could we actually say about the layout of the house from that information?

As the size of the long-houses decrease significantly in the shift between the Early and the Late Bronze Age it is often considered that there is a change in the basic family structure, another long debated issue is the one about whether parts of the house where designed for livestock or not.

This is due to a new roof-supporting posts structure that allow the posts to be used as supports for livestock boxes as well. That is introduced at the same time as the size of the long-houses decrease. But is there any evidence for the livestock’s presence in the house?

Even if the subject of this paper covers a relatively small area and a limited material, it is possible to see some patterns. Based on the basic roof-supporting structure it is possible to see local building traditions that do not change during the Late Bronze Age. But as these traditions are not consistent, skipping a generation now and then, could this observation be flawed?

TH1-08 Abstract 08
The use of architecture as cultural and socially discriminators in Iron Age Denmark
Author: PhD Hawe, Niels, Historical Museum of Northern Jutland, Aalborg, Denmark (Presenting author)
Keywords: Buildings, Community organization, Settlement
Presentation Preference: Oral
Most of the Iron Age Houses in Southern Scandinavia shows an irrevocable construction that only allows minor differences in the architecture of the individual house. The houses are three-aisled, east west orientated and divide into a stables in the east and living area in the west. However, in rare occasions the alignment and the interior design of the house is fundamentally different. This paper will address whether these differences should be explained by functionally or economically patterns, or rather as a deliberate discriminator in a social-cultural and ideological context? The paper will present how architecture was used to express and manipulate identity and social groupings in the settlement, and discuss what the consequences of the “distorted” space within the house could have.
Interpreting the Archaeological Record

TH1-08 Abstract 09
At the hearth. Daily life, and domestic architecture in Early Iron Age farmsteads of Western Denmark

Author - Dr. Kyler, Nails Algreen, Museums of South West Jutland, Ribe, Denmark (Presenting author)
Keywords: Domestic activities, Iron Age, Settlement Archaeology
Presentation Preference - Oral

This paper will discuss the evidence of domestic activities in the Early Iron Age (500 BC - 150 AD) farmsteads of Western Denmark. The Danish evidence of daily life and domestic activities can roughly be divided into two: Evidence from well-preserved settlements with preserved cultural layers excavated in the 1920s to 1950s and evidence retrieved from settlements levelled out below modern day plough soil. The former has the advantage of in situ evidence of daily activities on the preserved floors while the later mainly benefits from the large amount of completely excavated farmsteads and macrofossil - as well as geochemical evidence collected on settlement excavations in the last 20 years.

By combining the two types of evidence, it is possible to establish a generalised picture of the development of domestic activities. The longhouse is throughout the Iron Age at the heart of domestic life with evidence of food processing, storage as well as stabling livestock. However, during the Early Iron Age some activities, both specialized crafts and to some extent food preparation are moved into nearby outhouses and the fenced of interior of the farmyard as the farmsteads grow in size.

During the period under consideration the Reaplan of individual houses is prolonged, the number of burials in connection to individual farms increases, as do the number of votive deposits found within the longhouses. Within the farmsteads of the later part of the Early Iron Age we find architectural traits such as stone paved entranceways, decorated hearths and fenced of farmyards. Individual households may through a more elaborate use of these architectural traits and votive deposits have created a sense of homelessness and interconnectedness between the house and the household members. Though these developments at the same time set individual households apart from other households in the growing village communities by stipulating social differences.

Thus the study of daily life in the Danish Iron Age houses and farmsteads is a study of practicalities, ideology and the basic segments of Iron Age society.

TH1-08 Abstract 10
Charting the microstratigraphic life-cycle of an early Roman urban property, Roman Silchester, UK

Author - Dr. Banerjea, Rowena, University of Reading, Reading, United Kingdom (Presenting author)
Co-author(s) - Fulford, M. G., University of Reading, Reading, United Kingdom
Co-author(s) - Clarke, A. S., University of Reading, Reading, United Kingdom
Co-author(s) - Barnett, C., University of Reading, Reading, United Kingdom
Co-author(s) - Parkhurst, N., University of Reading, Reading, United Kingdom
Keywords: Architecture, Soil Micromorphology, Urbanism
Presentation Preference - Oral

In Roman Britain, domestic urban properties are dynamic spaces with constantly evolving architectural forms. The evidence for super-structure components can often be ephemeral as these properties have timber or earthen walls, which are frequently truncated by later building formations or, as observed at Roman Silchester, by the trenches of Antiquarian excavators. Previous research at Silchester has integrated thin-section micromorphology and experimental archaeology to characterise sediments and occupation deposits to identify doorways rolled, semi-rolled, and open spaces within the properties in order to understand their architectural form.

Building on this previous research, this paper will chart, using a micromorphogic approach, the evolution of a dynamic property, early Roman timber building B, which stood from the period immediately after the Roman conquest (A.D. 43) until c. A.D. 125/50. By the end of the life of this property, it had taken on an interesting architectural form comprising a ‘zig-zagged’ formal structure system, a road, and had become poorly maintained with in situ evidence for metalworking activities. Micromorphology has demonstrated that in its earlier phases, the entrance way to the building had moved several times. There is also evidence for earthen floors, and the division of spaces. Earlier uses of this property may include the manufacture of glass, and spaces where animals were stabled.

The application of a spatial and diachronic micromorphogic approach presents the opportunity to examine, at high resolution, the finer details of the daily lives of its inhabitants. In particular, this paper will examine how did the inhabitants structure their space? Were there divisions of craft and domestic activities? Early Roman structures at Silchester and elsewhere in Roman Britain are frequently single-noshed structures with central hearths. This is arguably a continuation of single-noshed Iron Age architecture. How does the architectural form of early Roman timber building B adapt and deviate from this model? Are changes due to a process of accretion?

TH1-08 Abstract 11
Understanding household activities: an examination of two Medieval dwellings in Atlantic Scotland

Author - Prof. Sharples, Niall, Cardiff University, Cardiff, United Kingdom (Presenting author)
Keywords: House, Material culture, Special organisation
Presentation Preference - Oral

In this paper I want to explore the organisation of space in two houses excavated in the Western Isles of Scotland. One dates to the late 11th century the other to the late 13th century AD. They provide the opportunity to explore change across a major political division; the transfer of political power from Norway to Scotland.

An understanding of the use of these houses can be explored by an examination of the architectural changes but more importantly by the substantial assemblage of material present in the house floors. The contrast between the communal organisation and material richness of the Norse house and the poverty and partitioned spaces of the Scottish house are dramatic and may reflect the diminished status of Norse people in the late medieval period.

TH1-08 Abstract 12
‘Private’ spaces???... Reconstructing the ‘living-rooms’ of medieval castles

Author - Dr. Dempsey, Karen, Dublin, Ireland (Presenting author)
Keywords: Medieval Castles, Reconstruction, Social Space
Presentation Preference - Oral

During the thirteenth century, the hall and chamber were typically separate structures within castles complexes in Ireland and Britain. Careful examination of the architecture of medieval chambers - understood as ‘private’ spaces - has revealed that their first-floor spaces appear to have been divided into ‘rooms’ most likely using partitions comprised of timber and/or textiles. Some castles have very tangible indications of divisions such as masonry corbels that once supported wooden partitions. Many other internal divisions, though now lost, have left significant indicators of their former presence, such as the arrangement of windows; groups of three or five spaced apart which indicated a deliberate spatial organisation that allowed for the placement of internal divisions or even furniture. Further clues for partitions are evident in the arrangement of certain internal features, such as the grouping of latrines and fireplaces together at one end of the chamber away from the main entrance. We can also see that the latrine was typically situated in the furthest corner angle from the main entrance (diagonally opposed) or directly opposed suggesting that either the doorway or the latrine (or both) may have been screened from view.

Interestingly, the latrine was always placed on the cold north side whereas main entrance faced south indicating that heat and light (or its absence) played a major role in their choices of interior design.

Does the arrangement of spaces inform us of the social practices of the medieval world? Or are we transposing modern interpretations of ‘public’ and ‘private’ on the past? This paper demonstrates how we can read the ‘space syntax’ of these buildings to inform us of how these ‘rooms’ may have acted in the past and how their inhabitants behaved within these spaces.

Furthermore it raises questions about how the modern concepts of ‘public’ and ‘private’ may obscure our objectivity in understanding these buildings. In reconstructing the interior spaces of these buildings we must be mindful that only certain elements survive, like the tantalising gaps which we must ‘reconstruct’ whilst remaining open to the idea that these spaces were ultimately occupied by people - the households - who made choices about how to use and live in them (within the constraints of their traditions).

TH1-08 Abstract 13
Family space vs. community space from the perspective of settlements from the Lower Danube Region

Author - Dr. Magureanu, Andrei Mircea, Institute of Archaeology Vasile Parvan, Bucharest, Romania (Presenting author)
Co-author(s) - Clupec, Bogdan, History and Archaeology Prahova County Museum, Ploieşti, Romania
Keywords: early middle age, family space, community space, house, settlement
Presentation Preference - Oral

The archaeological discoveries from 5th-10th centuries from the Lower Danube Region are numerous enough to sustain a discussion about what is family space and what can be considered the community space. This discussion is based on two concepts: house and settlement/village.

The problem is what can we interpret as a house and what we can consider a settlement. Generally, the archaeological reports described only similar constructed structure, settlements from this time frame seeming to be monotonous and against a discussion like that we intend to provoke.

But, in fact, discussions like: how can we identify a house? (what are the arguments for); what is the habitation space? (it is only the pit in the cases of sunken building); what are the meanings of the objects discovered into the archaeological structure and...
how those changes can help us to understand the family space? can we definitely separate this space from the community one? where those spaces interact and where those are divergent, if they are? architectural differences between the structures of the same village can suggest us appurtenance to different spaces? are still important and, in our paper, we intend to propose some possible responses.

TH1-08 Abstract 14

Beyond the cone: possibilities for exuberant buildings

Author: McCullogh, Rodolick, Historic Environment Scotland, Edinburgh, United Kingdom (Presenting author)

Keywords: architecture, evidence, reconstruction

Presentation Preference - Oral

Taking inspiration from the recent discovery of “painted” walls on Neolithic buildings at two sites in Orkney, this paper argues that buildings could be “traditional” and functional but on occasion, exuberant. A casual view of the reconstructed architecture of the time would see an almost homogenous dominance of the cone roof. This may represent the best fit of technology to need and circumstance but in many other aspects of life, seen through preserved archaeological fragments, we can see an exuberance of design and masterful display of skill.

From the ornate gilded hair-style of the bog-body from Clonycavan to metalwork masterpieces such as the Monymusk casket, and to ornate sculpture, such as Forteviot arch, we have evidence that in some circumstances, builders, designers and craftspeople stepped far beyond what more practically or practically demanded to create visually stunning artefacts. By presenting examples of buildings that seem to depart from the norm and that express a spirit of experimentalism, such as the early Christian church at Whithorn, this paper will seek to stimulate a discussion on how archaeological practice needs to be more sensitive to the possibility for evidence of fantastic design and colour in the architectures of the past.

TH1-08 Abstract 15

Reconstruction of Neolithic dwellings.

On the materials of North-West Russia (Smolensk region)

Author - Khristaleva, Irina, The State Hermitage museum, Saint-Petersburg, Russian Federation (Presenting author)

Keywords: Dwellings, Graphic reconstruction, Neolithic

Presentation Preference - Poster

Long-term settlements of ancient people are one of the most interesting categories of archaeological sites. The various aspects of the material and spiritual life of the ancient groups are recorded in settlements - their relationship with the environment, productive activities, social status, spiritual culture.

The main function of settlements and dwellings is to create the necessary enclosed space, protecting people from the harmful effects of natural and social environment. This is related to topography of settlements, presence of fortifications, orientation of dwellings, and their connection with the water and the prevailing winds, the presence of drainage ditches, etc. The same aspects dictated appropriate technical solutions in the construction of dwellings. Questions of the protection of people from the cold, damp, heat, and questions of the positions of fire and cooking places were decided taking into account the environmental conditions. Various building materials were used depending on natural conditions and resource availability.

The appearance of settlements and dwellings largely determined by the type of economy. This involves determining number of inhabitants of the settlement and each dwelling, the location of settlements in places that were convenient for fishing, the necessary raw material production (stone, first, clay, etc.), hunting, grazing, etc. This also explains the functional differentiation of settlements into spatial units (settlements of fishermen, hunting camp, etc.) and buildings (household, living and industrial). In addition, domestic production activities (ceramic production, bone and stone processing) proceeded in a living area.

Finally, the nature, the layout, the size of settlements and dwellings, details of interior depended on the social and demographic factors: the level of development, the structure and number of communities.

Identification and justification of the constructions on the archaeological site is a difficult goal to achieve: it’s necessary to define the features that can distinguish the remains of objects. The first feature includes structures which can be defined as area of the cultural layer different from the surrounding space. The differences may be in color of the cultural layer; in the presence of bone, stone, wood remains or decay laying in an order; remains of hearths and fireplaces. Specific set of tools can be an indicator of unpreserved construction in some cases. But it’s necessary to remember that a dark spot of the cultural layer can be explained by natural (chemical) processes.

The complexity of the objects identification of settlement situated in sandey sediments is in the absence of organic materials. The pits are determined because of their darker filling, different from the color of the surrounding cultural layer. Fireplaces and hearth are detected due to their structures (for example, plates of stone), and caltared sand, characterized by reddish or grey ash interlayer.

Multi-layer settlements of the Smolensk region of North-West Russia contain the remains of dwellings revealed due recessed floors (if any) or due the posts and postholes and their strengthening structures (stones), as well as the remains of hearths. These data, when interpreting archaeological and ethnographic analogies, allow reconstructing in general the ancient dwellings and the structure of the settlements themselves.

TH1-09 Abstract 01

Investigation of glass objects from Dodona Sanctuary, Epirus, Greece: an interdisciplinary approach

Author - Dr. Oikonomou, Artemios, University of Nottingham, Nottingham, United Kingdom (Presenting author)

Co-author(s): Henderson, Julian, University of Nottingham, Nottingham, United Kingdom

Keywords: Epirus, Greece, Hellenistic glass, scientific techniques

Presentation Preference - Oral

Dodona Sanctuary was the major religious centre of north-west Greece, in the Epirus region, connected with the cult of Zeus Dendaronos and his wife Dione. According to ancient Greek tradition it is considered to be the oldest oracle in ancient Greek world. Archaeological evidence has confirmed continuous habitation from the Bronze Age (2800-1100 BC) to the end of the 4th c. AD. The Dodona Sanctuary flourished during the Hellenistic period and especially during the reign of King Pyrrhus when major reconstruction works took place. The Dodona Sanctuary played an important role as a political, administrative and religious centre during that period and its relationship with regions outside Greece, i.e. Alexandria in Egypt, is well attested both archaeologically and historically. Our presentation will focus on glass found in the excavations of Prytaneion and Vouleutirion which were the major political buildings at the Dodona Sanctuary.

Our primary research objectives are: (1) to suggest the raw materials used to make the glasses; (2) identify any compositional contrasts between middle and late Hellenistic glass; (3) to suggest a provenance for the glass by comparing our results with other published datasets - especially whether compositions suggest both a Levantine and a non-Levantine provenances.

Here we present results form 40 samples that we have analysed using SEM/EDX and LA-ICPMS analysis. The assemblages from which samples were taken consist of fragments of various vessel types (core formed vessels, ribbed bowls, cast bowls, conical engraved bowls) of a variety of colours (deep blue, green, amber, colours).

According to the chemical analyses, the glasses from Dodona is a typical soda-lime-silica type with added mineral salts (natron) as a flux. Its chemical compositions are homogeneous. Small differences in various major, minor and trace elements between individual samples suggest the use of different types of raw materials and also different production zones. A comparison of these glass chemical compositions with contemporary glass artifactuals thus gives new insights into the production and distribution of glass used in Greek region during the Hellenistic period.
The results of an archaetical investigation of Early Iron Age glass beads from Lika, Croatia are presented. A distinct type of ovoid bead, decorated with yellow concentric circles, or "eyes" was widespread on the territory of the lapodians, an Iron Age group inhabiting the area from Central Croatia to the Una river valley in Bosnia and Herzegovina. So far, lapodian material culture has been studied in the cultural-historian manner, with the focus predominantly on chronology and typology. Production, technological networks and glass use have received little discussion apart from conjectures that these beads must have been of local production due to their perceived basic production requirements, their absence in neighbouring areas, and their analogous productions in the neighbouring regions. This study builds on the typological analysis (and a few AAS measurements by Braun in 1983), tests the hypothesis of local production, and evaluates prior conclusions about the manufacturing conditions of 43 sampled beads by looking into their chemical composition with SEM-EDS and EPMA instruments. The study shows how archaeometry can assist in providing a clearer picture of prehistoric production, use and trade of prestige materials. The prior hypothesis about the vitreous material is largely disproved; rather than being glass paste, the beads are in fact a transitional phase between glass and faience, and the yellow decoration is not painted on top but made of true glass. The two types of glass, and the raw materials used for their production, are very different: the yellow glass is probably imported as ingot, while the cobalt blue possibly indeed locally produced. Furthermore, the archaeological context allows a discussion of the beads’ meaning and use. Their distinct appearance was intentional, possibly in order to reinforce the identities of the lapodian group. Although the lapodians were importing glass from their well-known glass-producing neighbours of the Lower Carniolan group, they still held on to this particular type of bead. Additionally, these beads predominantly appear in female burials, possibly signifying a certain ascended or achieved status of these women within the lapodian society, which sheds light on the existing female social roles in the Iron Age.

Prehistoric Glass from Iron Age Segestica (Present-Day Croatia)

Owing to its prominent position at the crossroads of Pannonia, eastern Adriatic coast, northern Italy, south-eastern Alps and the Danube, the Segestica settlement, located at the mouth of the Kupa and Sava rivers in Central Croatia, became an important trade nexus in the Early Iron Age. This is archaeologically attested by the abundance of imported objects appearing at the site at this time, such as bronze vessels, weapons, horse gear, dress ornaments, and glass items. If compared to chronologically contemporary groups – the lapodians in Lika, Croatia, and the Lower Carniolan group in Slovenia (which is also a possible glass production centre) - whose cemeteries have a high concentration of glass finds, frequency of glass items retrieved from Segestica seems scarce: twenty five beads and four bracelets. This is largely due to the fact that no Iron Age graves in Segestica have yet been found. Most of the glass items were retrieved during the dredging of the river Kupa at the beginning of the twentieth century, leaving them without a clear archaeological context. Only a few cobalt-blue glass beads have been properly documented in their context during the 2015 excavation of the Pogorelic site, situated at the right bank of the river. The glass artefacts will be presented according to their typological and chronological parameters, and manufacturing techniques. In order to gain further insight into the use and trade of prehistoric glass in Slavak and, more generally, into the technological traditions of glass-making in the Iron Age period, the items were also analysed using SEM-EDS. The results of the chemical analysis of various types of beads (strawlight eye beads, globular translucent light green beads, dark opaque beads with linear decoration, barrel-shaped and conical cone-shaped beads with protruding decoration, blue globular beads with wavy linear decoration) and bracelets (all blue in colour, but of various shapes) with smooth D cross-section, with three ribs, with five ribs – the motif being the most prominent – will also be presented and interpreted. The quantitative analysis focused on the possible difference in raw materials, technological recipes, and craft traditions of the chronologically and culturally distinct artefacts, in order to look at the variability in glass production and relationship between the various bead groups dated to Early (Hallstatt as opposed to the Late (La Tène) Iron Age, as well as the differences in the chemical compositions of glass beads and bracelets. Bracelets appear in this area around the third century BCE and are connected with the arrival of Celtic groups, which could potentially signify a different technological knowledge and tradition. The results of the analysis shed light on the processes of the transfer of knowledge and perpetuation of glass making traditions, adding to the more comprehensive knowledge of the prehistoric glass use and trade in continental Europe.

---

The Blue from the Sky: Hellenistic monochrome glass in La Tène Europe

Late Iron Age settlement in Central and Southern Germany represents an important part of the Eastern La Tène Culture Province. With regards to evidence of glass, it is fair to say that the region may be appreciated as one of the major centres for the use of glass bracelets, beads and other forms of glass jewellery during the last centuries BC. Research carried out on the largest assemblage from the oppidum of Manching was very influential on glass studies of the Hellenistic world. If compared to chronologically contemporary groups – the Iapodes in Lika, Croatia, and the Lower Carniola group in Slovenia – adding to the more comprehensive knowledge of the prehistoric glass use and trade in continental Europe. This paper focuses on two important settlement sites with abundant craft activities in two sub regions of the area: Berching-Pollanten (Bavaria), only about 30 km from Manching and best known for its iron working evidence, and Bad Nauheim (Hesse), famous for its salt production and an impressive stratigraphical sequence of settlement and production activity several metres in height. Both sites also produced large amounts of glass artefacts, including some raw material and production waste. With more than 450 fragments of bracelets and about 300 beads the glass collection of Berching-Pollanten is the second largest of the area. The Blue from the Sky: Hellenistic monochrome glass in La Tène Europe is a transitional phase between glass and faience, and the yellow decoration is not painted on top but made of true glass.

Raw glass to La Tène glass productions: news analytical studies of French collections

This paper presents a review of recent research on the technical and chemical analysis of glass artefacts dating to the Iron Age.

---

Oral
I would like to present the results of an analytical program of La Tène Glass characterization conducted on more than seven hundred glass objects from 32 different settlements of France, using Laser Ablation Inductively Coupled Plasma Mass Spectrometry (LA-ICP-MS) with the collaboration of Bernard Gratouze. We had the possibility to study the important collections of Latarra (Hérault), Bobigny (Seine-Saint-Denis), Toulouse (Haute Garonne) and a part of the large glass deposit of Mathay-Mancheau (Dourda). The study has also been conducted on 40 raw glass fragments from 3 shipwrecks: sink between the third century and the end of the second century BC. One of these raw glass fragment was recent on a wood fire oven with through collaboration and the authorization of French ministry of culture and direction of underwater and submarine research, (D.R.A.F.S.M). Glass bracelets was produced. It give an experimental framework to this analytical study to observe the potential changes of glass compositions during its recast. This experimental and analytical work allows us to observe evolutions of glass recipes during the second Iron Age. It’s give new clues on the organization of raw glass productions. The objective of this communication is to share this result in order to suggest it to the European projects on La Tène glass characterization.

TH1-09 Abstract 09
Romano-British glass bracelets: where La Tène Continental technology meets Iron-Age British design
Author - Dr. Béa, Talleda, Newcastle University, Newcastle upon Tyne, United Kingdom (Presenting author)
Keywords: glass bracelets, Iron Age technique, Roman Britain
Presentation Preference - Oral

The aim of this paper is to bring the Romano-British glass bracelets into the discussion of the Iron Age Continental glass bracelets. The paper suggests that the British glass bracelets were Romanperiod British development of an existing Continental La Tène skill. Romano-British glass bracelets have primarily been studied from the regional perspective. Earlier research into the distribution and typology of British glass bracelets suggested that British examples stand out in their difference of production technique compared to bracelets made on the Continent. The start of the production of the seamless glass annulars in Britain corresponds with the decrease in the circulation of these glass adornments on the Continent. In the late first century BC, the Continental glass bracelets gradually stopped being produced, yet the craft reappeared in Britain which had no history of glass bracelets’ production prior to the Roman invasion of Britain in AD 43. The presentation attempts to answer the question as to where the inspiration and skills for the British glass bracelets came from by discussing their production technique. The experiments conducted with the modern glassmakers and the close-inspection of the British glass bracelet fragments reveal that the British annulars were most likely produced in the similar manner as some of the La Tène Continental bracelet types, that is in a technique similar to that suggested by Joelle Roland for some Continental types. However, the design of the British bracelets is rather different from the Continental ones. Most British annulars have either twisted cord decorations or tails with curved terminals. A convincing hypothesis was put forward by the earlier scholars that the design of some British bracelet types is likely to be closely related to, or may well have been developed from, the British insular Iron-Age beads.

The paper presents, therefore, a case-study for the interaction between craftsmen of various communities regarding the production and development of the British glass bracelets. It suggests that La Tène glass bracelet craft and technology continued well into the Roman times, contesting the common opinion that the Iron Age production of the seamless glass bracelets was interrupted at the turn of the first century AD.

TH1-09 Abstract 10
Analyzing a material ‘culture clash’: ‘sealing wax’ red glass in Late Iron Age Britain
Author - Dr. Davis, Mary, National Museum Wales, Cardiff, United Kingdom (Presenting author)
Keywords: Britain, glass, Late Iron Age
Presentation Preference - Oral

This paper will present work carried out on the analysis of Insular Late La Tène and Early Romano-British ‘sealing wax’ red glass. This was used principally as an inlay on high status decorative bronze work, which developed from the earlier La Tène traditions in both Europe and Britain of using opaque red ‘sealing wax’ glass to decorate metal artefacts. In late Iron Age Britain (1st century AD), the use of inlaid red glass flowered on objects exhibiting ‘Celtic’ styles and from regions in Britain resistant to Roman occupation. The quantity of this type of material produced was also significantly greater than in previous periods. During the first century AD, in much of the Romanised world, the composition of red glass changed significantly from that used in the late high lead copper ‘sealing wax’ type used in the Middle Iron Age and Continental La Tène pieces to the low lead, low copper red glass produced for Roman mosaics and probably exported as tessaree or rods. However, within Britain the use of ‘sealing wax’ red glass was retained, but of a slightly altered composition to the majority used within the ‘Celtic’ world; one principle difference was a significant increase in antimony. Although not used for previous La Tène glass, there are a few examples of similar high antimony ‘sealing wax’ red glasses noted within the southern Mediterranean: as re-used glass vessel fragments in early mosaics in ‘nymphae’ in southern Italy, in Hellenistic red glass and in red glass from Jerusalem. Antimony was used in small quantities as a decolourant in clear glass; its addition in larger quantities in ‘sealing wax’ red glass was advantageous in several ways: it replaced iron as an internal reducing agent, produced a brighter red colour, and acted as a fixing agent. However, antimony ores are relatively rare in Britain, and there is no evidence these were used.

Conversely, antimony was available in the form of lead antimonite, for which there were ancient and extensive trade networks. This was used as a yellow pigment and a colourant in glass. Yellow beads from the Middle and Late Iron Age in Britain were usually coloured using lead antimonite, and tessarre continued to be coloured with this red within the Romano-British period.

One hypothesis for the prevalence of this distinctive composition of red glass in Britain is that yellow glass was converted to red by the addition of copper (and lead): metals readily available in Britain. If yellow glass is heated, lead and antimony can combine, the subsequent addition of copper (and lead), plus careful cooling in reducing conditions, could result in the production of red glass. This would account for the levels of antimony in Late Iron Age British red glass, for the change in technology, and for the increase in the use of red inlays. Theoretical amounts of copper and lead could be added to the composition of analysed yellow glass to achieve results similar to those of analysed red sealing wax glass from Britain.

TH1-09 Abstract 08
The Irish Glass Toggle: Exploring the function of an enigmatic Iron Age ornament
Author - Jordan, Alexis, University of Wisconsin-Milwaukee, Milwaukee, United States of America (Presenting author)
Keywords: glass, Ireland, Iron Age
Presentation Preference - Oral

The study of personal ornaments in the European Iron Age has long been a fruitful avenue of research for archaeologists wishing to explore topics such as social status, identity, technology, and trade. As portable pieces that can be reliably sourced and serve as stylistic, temporal, and social markers, beads reflect larger patterns of social interaction and communication especially during periods characterized by significant change and increasing mobility. In the Irish Iron Age, the systematic study of artifact types has raised new questions regarding intercultural and indigenous craft production on the island. This paper will focus on glass toggle ornaments, often described as dumbbells, which have typically been categorized as a glass bead form although they lack the distincting perforation. Few in number and appearing almost exclusively in Ireland, Iron Age glass toggles span mortuary, ceremonial, and settlement sites across the island. The glass toggles vary in shape and color, and bone and amber examples are known. Through an examination of emergent patterns within the site types, associated artifact assemblages, spatial and temporal distribution, and stylistic variability of the toggle, an analysis of the potential functions and archaeological significance of this enigmatic personal ornament will be explored.
Sandwich gold-glass: elitist glass production in Hellenistic Mediterranean

Author: Cesarein, Giulia, Universität zu Köln - Archäologisches Institut, Cologne, Germany, Castoria di Strada, Italy (Presenting author)

Keywords: Hellenistic glass, Mediterranean, Sandwich gold-glass

Presentation Preference: Poster

Sandwich gold-glass is a particular technique, employed between the 3rd and the 2nd century BCE to produce some of the most precious and rare glass bowls ever realized. This production is testified by about 20 specimens, which were found among Southern Italy, Rhodes, Anatolia, Syria-Palestine, Egypt, Mesopotamia, Black Sea, Caucasus...

The technique consists in assembling two colourless glass vessels (obtained by slumping, grinding and polishing), which fit perfectly one into the other. Between them, a gold-leaf decoration is sandwiched.

These artifacts belong to the so called “Canosa Group”, which was attributed to Alexandria of Egypt and includes several glass techniques.

My interest in the Sandwich gold-glass production started with the purpose to define “Alexandrian glass”, strongly celebrated by the written sources. Through a preliminary investigation it was possible to understand that “Alexandrian glass” was an archaeological common place, still in the latest decades. The only group unanimously recognized as Alexandrian, though not basing on solid archaeological evidence, appeared to be the Sandwich gold-glass. This became the topic of my Master thesis in Classical Archaeology at the University of Padua (2012).

The study revealed also a great variety of gold-glass techniques, before and after this particular and limited production, from the second half of the 4th century BCE, and spread around the Mediterranean basin in the following ages.

The main aim of the project was to conduct a comprehensive analysis, combining different approaches, starting from the written sources. They constituted in fact the principal clue for an Alexandrian attribution (in particular Athenaeus of Naoura).

An important step consisted in the creation of a catalogue, obtaining a clear and reliable morphological classification. The comparative analysis on morphology and decoration revealed a correlation among shapes (mostly hemispherical, oval or shallow bowls), technical details and subdivision of the decorated surface.

The decorative motives, mostly geometric and vegetal, were classified. Since they are widespread in the Mediterranean and beyond, they cannot provide significant help in localizing the workshops. Only the two specimens with figurative scene (a sacred landscape and a hunting scene) permit to lean toward Egypt.

The recognition of the workshops location on archaeological basis, also through the comparison with other contemporary productions (such as silverware, faience, pottery), remains difficult. Nevertheless, the presence of few highly specialized workshops in the Eastern Mediterranean basin (Alexandria, Aegean, Syria-Palestine) seems the most reliable hypothesis. The particular lavishness and rarity of these vessels and their meaning as status-symbol allowed also an analysis of the socio-economical dynamics, related to the diffusion and consumption of these luxury items, expression of an extremely restricted elite.

EXPLOITATION STRATEGIES OF THE ANIMAL ENVIRONMENT OF THE LAST HUNTER-GATHERERS AND FIRST FARMERS IN EUROPE

Saturday, 3 September 2016, 09:00-13:00
Faculty of History, Room 218

Author: Margareta, Monica, Babeș-Bolyai University of Targu Mureș, Târgoviște, Romania (Presenting author)

Keywords: environmental change, human impact, animal management, exploitation strategy, Bronze Age, Iron Age

Presentation Preference: Regular session

The profound climatic changes and the need to identify solutions for the survival of humankind represent major topics of debate in contemporary society. Throughout their 200,000-year history modern humans have been faced with climatic changes some of them radical, which had a significant impact on the strategies employed for the exploitation and management of the environment, especially the animal life, and were reflected in the types of economic practices.

Through this session proposal, we will analyze, quantify and compare the effects of this phenomenon and provide an integrated view of the ways in which the animal environment was exploited by prehistoric communities at the transition from hunter-gatherer to farmer-stockbreeder, identifying and comparing different eco-cultural models developed across Europe. The investigations will cover two priority domains: biodiversity evolution (e.g., taxonomic richness; magnitude of faunal turnover) and correlative human societal transformations, especially in animal management and techniques of exploitation (bone manufacturing). Among others, the aim of our session includes the identification of the modifications that intervened in the relation between the exploitation of the animal environment and the way in which it was reflected in palaeo-economy, habitat, social or spiritual organization. We invite speakers to discuss these topics from different perspectives; both theoretical and practical approaches are encouraged.

TH1-10 Abstract 01
Transition to Holocene in the hinterland of eastern Adriatic: Archaeofauna of Zemunica cave, Croatia

Author: Redov, Sinisa, Croatian Academy of Sciences and Arts, Zagreb, Croatia (Presenting author)

Keywords: Pleistocene-Holocene transition, mammal remains, bird remains

Presentation Preference: Oral

The archaeozoology of the eastern Adriatic region is well documented through studies of faunal remains from coastal and island sites. However, hinterland is still ‘shadowed’ due to very little information available, mostly because of lack of explored sites. Zemunica cave is situated in the Middle Dalmatia around 35 km northeast of Split, near the village of Blato. It was excavated in 2005 during rescue archaeological excavations, revealing a stratigraphic sequence from the Late Upper Palaeolithic to the Early Bronze Age. Here we focus on the archaeofaunal material recovered from the deposits dated to the Pleistocene-Holocene transition and the Early Holocene.

The vertebrate faunal assemblage comprising large mammal and bird remains shows interesting temporal trends in its taxonomic composition as well as in surface bone modification, indicating changes in the surrounding environment and corresponding subsistence strategies. The results of this study present interesting new data and contribute to our knowledge of the exploitation strategies practised by people living in the hinterland of the eastern Adriatic as adaptations to the climatic and environmental changes of the Pleistocene-Holocene transition.
Between the forest and the river: hunting and fishing in the Danube Gorges in the Mesolithic

Author: Zlătavcić, Irina, Laboratory for Bioarchaeology, Belgrade, Serbia (Presenting author)
Co-author(s): Dimitrijević, Vesna, Laboratory for Bioarchaeology, Belgrade, Serbia
Co-author(s): Radu, Valentin, National Museum of Romanian History, Bucharest, Romania

Between the forest and the river: hunting and fishing in the Danube Gorges in the Mesolithic. The importance of wild game hunting has also been confirmed by the analyses of animal bones and emphasized ever since the first published archaeozoological reports. The role of the terrestrial vs aquatic resources in the diet has been addressed from the perspective of stable isotope analysis, with somewhat contrasting results. The analyses of stable carbon (δ13C) and nitrogen (δ15N) isotope ratios have suggested that the Mesolithic inhabitants of the Danube Gorges consumed considerable amounts of fish, with gradual broadening of the dietary spectrum to include terrestrial resources at the onset of the Neolithic (Bonsall et al. 1997; 2000; 2004; Gruepe et al. 2003; Borić et al. 2004), whereas the analysis of sulfur (δ34S) has suggested that there were significant inter- and intra-site variations in dietary practices (Nelich et al. 2010). However, this issue had not so far been addressed in greater detail from an archaeozoological perspective, mainly due to great difficulties and biases in cross-referencing quantified mammal and fish remains, but also due to the fragmentary nature of faunal assemblages from some of the sites. Although assessment of the precise proportion of wild game meat vs fish in the diet is elusive, particularly owing to the differences in mammalian and fish skeletons, and biases affecting their survival and recovery, we have attempted to address this issue by estimating their dietary contribution and nutritional potential on the basis of the sum of average weight of the minimum number of individuals for both mammals and fish. In addition, we estimated the proportion (size and number) of the economically most important fish (pinnipeds, Wels catfish and acipenserids) in the assemblages from the sites of Lepenski Vir, Vlasac and Padina. Even with methodological biases concerning recovery techniques employed during the old and new excavations, and different areas of the sites they encompassed, we found that fish species composition on the three sites varied to some extent. Given the site locations, their short distance from one another and similar landscape and environmental conditions (vicinity of cataracts and large whirlpools), this propensity towards fishing particular kinds of fish could suggest that the sites functioned as specialized fishing centres, and held different species of fish in special regard.

Mesolithic boar tusk processing in the Iron Gates: a typological and experimental approach

Author: Mgsri, Monica, Valahia University of Targoviste, Targoviste, Romania (Presenting author)
Co-author(s): Boroneant, Adina, Institute of Archaeology “Vasile Pârvan”, Romanian Academy, Bucharest, Romania
Co-author(s): Bonsall, Clive, University of Edinburgh, School of History, Classics and Archaeology, Edinburgh, United Kingdom

The Mesolithic settlements in the Iron Gates have yielded rich assemblages of modified Sus scrofa canines, exemplified here by the site of Icoana. This raw material seems to represent, for Eastern European, a hallmark of Mesolithic. Indeed, during the Neolithic, the number of pieces made of Sus scrofa canine decreased constantly, becoming sporadic during the Chalcolithic. The typological categories identified are scrapers, bevelled tools, combination tools and adornsments. Debitage remains are also present, indicating on-site task processing. Boar tusk was readily available from the animals that were killed, and analysis of the faunal assemblages identified a large number of boar bones within the mammalian assemblage. This study aims to identify the transformation pattern both of the tooth and the functional marks, which could offer clues to the way in which the pieces were used. An experimental study was conducted, aimed both at the identification of transformational patterns of the tooth, and the presence of wear marks as possible functional indicators. The results of our experimental programme suggest wood processing as the main activity performed with boar tusk tools.

Icoana revisited: an archaeozoological perspective

Author: Prociuc, Mariana, Valahia University of Targoviste, Targoviste, Romania (Presenting author)
Co-author(s): Radu, Valentin, National Museum of Romanian History, Bucharest, Romania

The first study of the archaeozoological remains from Icoana was made 40 years ago by Alexandra Bolomey. The importance of this settlement led us to re-examine all the faunal material using methods such as slaughtering curves, ageing and sexing, biometry, cut marks, butchery patterns and palaeoecogenetics. This has resulted in a new interpretation of the local fauna and of Mesolithic hunting activities. All the remains are interpreted as food refuse, with high fragmentation ratios. The list of taxa identified includes molluscs (11 species), fishes (2), reptiles (1) and mammals (16). The assemblage is dominated (93.5%) by wild mammals, with over 4300 identifiable specimens. Sus scrofa (wild boar) dominates, followed by Cervus elaphus (red deer) and Capreolus capreolus (roe deer). By weight, deer remains are the most important, followed by wild boar. Other taxa represented are Rupicapra rupicapra (chamois), Bos/Bison (aurochs/bison), Ursus arctos (brown bear), Canis lupus (wolf), Vulpes vulpes (red fox), Meles meles (European badger), Lutra lutra (European otter), Martes sp. (marten), Felis silvestris (wildcat), Lynx lynx (lynx), Castor fiber (European beaver), Lepus europaeus (European hare). The dog (Canis familiaris) is the only domestic mammal present in the site. Cut marks identified on the bones shows that dog contributed to the food supply, which was also observed in the Mesolithic levels at Lepenski Vir, Vlasac and Padina.

Use of beavers and bone industry in the Late Mesolithic – Early Neolithic site of Zamostie 2

Author: Lazovskaya, Olga, Institute for the History of Material Culture, Russian Academy of Science, St. Petersburg, Russian Federation (Presenting author)
Keywords: beaver exploitation, bone industry, Mesolithic
Presentation Preference: Oral

This work was supported by a grant of the Romanian National Authority for Scientific Research and Innovation, CNCS – UEFISCDI, project number PN-II-RU-TE-2014-4-0519.

Use of beavers and bone industry in the Late Mesolithic – Early Neolithic site of Zamostie 2

Early Neolithic site of Zamostie 2
Lacustrine settings of hunter-fishers in the Mesolithic–Early Neolithic of the forest zone of European Russia are part of the particular cultural and stable economic world of “the last hunter-gatherers.” The economy was based on hunting elk, beaver, aquatic and wading birds, as well as intensive activity. The site of Zamostje 2 was located in the centre of a wide lake plain in a former glacial basin. Cyclical fluctuations of the palaeolake level and a gradual change of the landscape did not influence subsistence strategies of ancient inhabitants greatly, in spite of the appearance of pottery making techniques. Beating the hunting always occupied an important place in the subsistence activity of the Zamostje 2 inhabitants. The bone industry includes hundreds of implements made from beaver jaws and incisors, used as woodworking tools, as well as ornaments and pendants. In spite of pronounced changes in cultural traditions over more than 2000 years, the main principles of production, shaping and final use of the tools made from beaver jaws remained the same. This, as well as some other specific types of bone tools, typical of the Upper Volga region, raise the question of how an ecological niche influenced some aspects of human activities and the rational use of natural resources.

TH1-10 Abstract 07
Exploitation of animal raw materials in the Early Neolithic in the Balkans
Author - Selena, Vlako, Institute of Archaeology, Belgrade, Serbia (Presenting author)
Co-author(s) - Srdan, Stojanovic, Institute of Archaeology, Belgrade, Serbia
Keywords: bone technology, Early Neolithic, osseous raw materials
Presentation Preference - Oral
Raw material selection of animal hard tissue is directed by technological, but also cultural factors. The availability of specific skeletal elements, their physical and mechanical properties, as well as cultural attitudes toward a certain animal and its body parts are the main factors in the process of selection. In the Early Neolithic of the Balkan region, osseous raw materials had an important role for crafting everyday tools, but also personal ornaments. In this paper are presented some aspects of the exploitation of osseous materials, in particular raw material acquisition and management. Bones from both domestic and wild animals were used, but also antlers, teeth and occasionally, mussel shells. Preferences in the selection of a specific skeletal element of a specific animal for a specific tool type may be observed - for example, the preference for cattle metapodial bones in spoon and projectile point manufacturing, the predominance of skeletal elements from wild species for ornaments, etc. Furthermore, a certain diversity among different Early Neolithic communities may be observed, especially in the ratio of antlers; in some sites antlers are not represented, while in others they are almost completely absent. To some extent, this is related to the immediate environment, but also is connected with differences in economic activities and local cultural preferences.

Co-author(s) - Sfe, Maria, Laboratorio de Arqueozoología, Departamento de Prehistoria, Universitat Autònoma de Barcelona, Bellaterra, Spain
Keywords: animal domestication, early Neolithic, pig management
 Presentation Preference - Oral
The contribution of animal domestication to the socio-economic changes in the Iberian Peninsula during the spread of the Neolithic in the first half of the Holocene is indisputable. Animal domestication was a transcendental turning point in the management of animal resources. Among the domesticated species, pigs were an important food source. However, it is difficult to discriminate between domestic (Sus domesticus) and wild (Sus scrofa) species in the faunal assemblages of this period. Several methodological approaches have been applied to address this issue, the most common being based on morphological and biometric criteria. Stable isotope analysis of bone remains can also provide valuable insights into human–faunal interactions, while offering new perspectives on animal domestication. Here we present the results of an integrated study involving carbon and nitrogen stable isotopes, slaughter pattern, morphometric and biometric analysis of wild and domestic pig assemblages from the northeast Iberian Peninsula, dated between 5700-4600 cal BC. This multidisciplinary approach aims to: (i) evaluate changes in pig management and exploitation strategies; and (ii) assess the broad social and environmental implications during the Early Neolithic in the northeast Iberian Peninsula. Our results indicate that the diet of Sus scrofa was substantially modified by Neolithic societies in the northeast Iberian Peninsula. We interpret this change as a result of the new selective pressures to which the wild species were submitted by humans during their domestication. The impact of this change on management strategies is also assessed, taking into account the different work processes and social relationships involved in the management of this resource.

TH1-10 Abstract 09
Aurochs' distribution and evidence of hunting in the pre-Neolithic and Neolithic Central Balkans
Author - Dimitrijevic, Vlana, University of Belgrade, Belgrade, Serbia (Presenting author)
Co-author(s) - Blagojevic, Tamara, University of Belgrade, Belgrade, Serbia
Co-author(s) - Stefanovic, Sofia, University of Belgrade, Belgrade, Serbia
Keywords: Aurochs, Central Balkans, pre-Neolithic and Neolithic
Presentation Preference - Oral
Cattle played a dominant role from the very beginning of neolithization in the Central Balkans, unlike in southernmost Europe, where sheep and goat, mostly for environmental reasons, preceded and subsequently kept their key position in animal husbandry. As genetic evidence suggests, cattle was introduced to Europe from its initial centres of domestication in the Near East. However, incidences of local domestication cannot be completely ruled out, and, even more so, hybridization of domestic stock with wild progenitors. In order to understand whether these processes ever happened, data on the distribution of the wild ancestor of cattle in the region are important, as well as its features observed from skeletal remains and archaeological contexts of discovery. Although scarce, aurochs were present in the Central Balkans during the Late Pleistocene, as can be judged from the faunal remains from Palaeolithic sites and alluvial deposits. The steppes became another large bovid of comparable size and ethology, which featured a more frequent role in hunting. The preponderance of bone remains from wild animals once again became so important at some locations during the Copper Age.

TH1-10 Abstract 10
The Copper Age fishery at Pietrela, Romania (5th millennium BC) and the return to wild resources
Author - Ritchie, Kenneth, ZBSA, Ikast, Denmark (Presenting author)
Keywords: Copper Age, fishing, Romania
Presentation Preference - Oral
The Chalcolithic period (5th millennium cal BC) in the area of the Lower Danube River is of particular interest for archaeologists because of evidence of very early metallurgy, incipient social stratification, and (at many sites) a renaissance in the exploitation of wild animals in the subsistence economy (although domesticated animals continue to be important). Since 2002, excavations at the site Pietrela, Romania (on the floodplain of the Danube River) have produced abundant evidence of the exploitation of fish and other aquatic animals both in the form of faunal remains and some of the technologies used to procure them. Although examples of very large catfish and cyprinids are common in the assemblage, wet sieving of soil samples has also revealed the presence of numerous bones from very small fishes - indicating a very intensive exploitation of aquatic resources by the site's occupants. Understanding the fishery is essential to understanding how the settlement was provisioned and to questioning why wild resources once again became so important at some locations during the Copper Age.

Workshop

Urban development is one of the most pressing topics within Early Medieval archaeology. Among scholars there is heated debate about how to think about and study these urban places before the emergence of ‘proper’ High Medieval towns. Strategies range from analyses of Latin vocabulary from contemporary historical sources, to the application of Polanyi’s concept of ‘ports of trade’, to the use of neologisms such as ‘early towns’ or ‘proto-towns’ or lately the designation of ‘Viking-age towns’ or ‘towns of the age’. However, apart from a few exceptions (e.g. the works of R. Hodges or J. Callmer), discussions soon turn into debates over terminology rather than on the actual nature of these sites, and most studies have fall in one declarative way: the sites under discussion are treated as monolithic entities instead of dynamic environments with distinct development phases and different characteristics over their often considerable periods of existence.

Archaeologically, this misconception is often predominately based on the mid-phase of an urban development, which has been taken as representative for the site as a whole. Being covered by metres of cultural layers, a search for these settlements’ spatially limited roots can literally turn into a quest for a needle in a haystack. The latest Early Medieval developments on the other hand are often either largely disturbed in the plow layers or strongly affected by the subsequent High Medieval settlement activities, including masonry construction and cellars. This session, therefore, seeks specifically to address the inconspicuous phases of urban development at both their inception phases and up through the latest Early Medieval structures on these sites. Papers in the session will address methodological problems, but more importantly, they will seek to widen our understanding of early urbanism as a complex and utterly dynamic process.

TH1-11 Abstract 03
Bypassing monolithic entities: diachronic and spatially informed approaches to early medieval towns
Author - Wouters, Barbara, Vrije Universiteit Brussel & University of Aberdeen, Brussels, Belgium (Presenting author)
Keywords: early medieval, geoarchaeology, urbanisation

Presentation Preference - Oral

The settlement areas of early medieval towns have in the past been subject to generalising interpretations of their character, layout and function. Changes in the towns’ dynamics over generations of town dwellers have often not been addressed, while these changes are the key to a multi-faceted understanding of the daily lives of the inhabitants, and how these may have changed over time. The complex nature of urban deposits has in some cases prompted excavation using a random division in spits, while an opposite reflex is necessary to produce a clearer phasing of each separate case. Before comparisons are made, the individual life trajectory of each town should be understood to its fullest.

This paper examines how geoarchaeological approaches (micromorphology, microXRF, and other techniques) contribute to a more nuanced understanding of these towns, with a focus on the earliest and latest phases of the towns under study. Illustrating this approach with case studies from the Low Countries, including Tongeren and Antwerp, and Scandinavia, such as Holtey and Kaupang, this paper makes a case for a particularistic examination of early medieval towns before wider comparisons are made.

With current geoarchaeological methods, it is possible to record and interpret separate phases of each town in more detail, to collect finds accordingly and source dating materials more securely. It is also possible to add information about well-dated but unclear phases of the towns, such as in the case of homogeneous deposits, so-called dark earths. The latter often occur precisely at the beginning and perceived end of early medieval towns, making their interpretation a challenging endeavour. Not every single layer or nuance is captured by geoarchaeological means, but more details can be added to the state of art of each individual town, perhaps even narrowing down the scope to particular changes at the scale of generations. Not just a diachronic approach, but one that takes into account diversity on a horizontal level as well, is necessary to further grasp the complexity of these urban entities. A combination of a diachronic approach and spatially informed one on a micro-scale yields archaeological results with the strongest interpretative value, and, if integrated into the research project design from the very beginning, provides a way to contextualise the enormous amounts of material these sites produce.
TH11-11 Abstract 04
Changing Places: a comparative discussion of London and Tours in the Early Medieval Period

Author - Donnelly, Harriet, The University of Sydney, St Leonards, Australia (Presenting author)
Keywords: early medieval, settlement patterns, urbanism
Presentation Preference - Oral

The settlements of Western Europe experienced a period of significant transition following the decline of Roman control in the 5th century AD. The movement of people and ideas resulted in change and reorganisation for many communities living in what had previously been Roman settlements. Such developments occurred both within the boundaries of the old structures, and by expanding or moving beyond those existing limits. Many of these sites which saw significant change developed slowly over a longer period of time, often not taking the recognisable Medieval shape until at least the 12th century. This paper examines by expanding or moving beyond those existing limits. Many of those sites which saw significant change developed slowly over a longer period of time, often not taking the recognisable Medieval shape until at least the 12th century. This paper examines the development stages that occurred at those settlements which saw significant changes from the 5th to 12th centuries AD. London and Tours. Both developed according to a pattern of twin towns with the two halves divided by a small area with limited occupation. London and Tours were both hugely important settlements and a comparative discussion of respective changes at each site during this period highlights the various methods by which such settlements developed as well as providing insight into both a trade driven and monastic model of the twin town phenomenon. Examination of these sites and how they changed during the Early Medieval period, will enable a deeper understanding of the complexity of urban development and transitional processes.

TH11-11 Abstract 05
A Subversive Urbanism: Venice in the 9th century

Author - Calaon, Diego, Stanford University, Stanford, United States of America (Presenting author)
Keywords: Adriatic, Emporia, Venice
Presentation Preference - Oral

How did Venice's urban story look in the 9th century?

Venice suffers from its own legends. The materiality of the rising Venice has been generally perceived as sites without time and space, where a fully established myth describes the origin of the city. The Venetian lagoon, in fact, was the place where the noble Romans sought refuge from the barbarian hordes: they had been forced to move to uninviting islands among the marshes to be free and safe. In the islands the newcomers were able to rebuild a place that - according the historic narratives - was ideologically and materially comparable to the old Roman sites. The uncovered wooden structures of the early medieval houses, for example, have been described as a poor reaction to a supposedly advanced and more important archaeological assessment, on the contrary, has shown how these buildings were comfortable and perfectly designed for the lagoon environment. Clay foundations and wood structures were technically appropriate for a cold and humid setting. The choice of the lagoon itself was not forced. The settlement patterns were not exemplary, but followed precise social and economic designs. The settlement followed the movements of the lagoon and the river mouths: the first Venetians tried to occupy the more distant islets in order to control both the maritime and the riverine sailing routes. Artisanal productions (glass goblets, parchments, metal crafts) were not subsistence economies; the emporia layout of the sites allowed the circulation of raw materials, techniques and skilled people.

Venice was a proto-capitalistic site. A large part of the production (shipyard, timber industry, glass and metal productions, etc.) was made by labour forces with a status very similar to slaves. Probably, also, slaves were one of the most valuable goods, which the Venetians traded with the Islamic world. But slaves, dirty workshops or labour class issues are not good ingredients for the myth of the origins or for the official history of a superpower state. Venice proudly defined itself from the very beginning as a democracy and a free republic: Venetians needed a respectable and glorious past, and they made it up, reshaping also the "idea" of the early city.

The idea of the early Venice, moreover, cannot be separated from the present. Traditional archaeology, instead, has studied it as phase of the previous roman past. The archaeological study of its urbanism should it considered in the counter light of the fluid social negotiations that took place around a very specific environment, creating polyfocal sites, which will be cities in the following centuries.

TH11-11 Abstract 06
How and when Venice became Venice.
Framing the urban development of a trading town in Italy

Author - Dr. Piazzera, Annamaria, Ca' Foscari University, Venice, Italy (Presenting author)
Keywords: Early Medieval Venice, Trading Town, Urban Identity
Presentation Preference - Oral

Venice was one of the most important cities in Europe in the late Middle Ages and the Modern era, when it formed an independent state which controlled trade across the Mediterranean and towards the Levant. A myth of Venetian uniqueness has been cultivated by local historians and international specialists which has always attributed to the town on the lagoon an innate and unique vocation for political autonomy and trade.

This in fact is only partially based on historical facts. Although some exceptional elements are observable – such as the local government of the Venetian public assembly (collegio) and the amphiprion nature of the settlement with its much overestimated at least as far as the Early Middle Ages is concerned. In the 9th and 10th centuries the apparently novel appearance of Venice on the Italian political scene and the associated emergence of the Venetian public assembly presided over by the doge has numerous parallels in other parts of Italy where several urban communities, mostly represented by their fiefs, claimed to act as social and political entities at the same time. In addition, the region around Venice demonstrated its own economic vitality with other towns competing for the control of the Adriatic sea well before the 9th century by engaging in maritime and artisanal activities remaining similar to those of other settlements in Northern Europe, which archaeologists such as Chris Loveluck and Will Bowden usually call emporia.

Moreover, some recent reconstructions suggest that the rapid growth of Venice in the 8th and 9th centuries can be explained by the conjunction of the contemporary expansion of the Carolingian empire which increased demand for luxury goods with Venice's special location on the sea near a great river delta (the Po). Although it is likely that the convergence of both these factors had played a major role in the sudden development of the city, it is often forgotten that Venice shared the same ecological and the same economic system with many other trading towns at least in this earlier period.

These facts pose other challenges to the traditional triumphalist explanations. Why did Venice enjoy a more durable success in a longterm perspective with respect to other towns? What exactly made the difference in the Venetian case? Was it mere coincidence that Venice was the seat of a political authority, the doge, whereas the other emporia were not? Was the fact that this authority was secular (a duke) rather than religious (a bishop) as elsewhere the key point?

The paper will seek to answer these questions by analysing the case of Venice in a comparative context and in the light of both archaeological data and written sources, by suggesting for the city, before 1050, typically rather than exceptionally in terms of population size, accumulation of wealth and socio-economic development.
Large unfounded settlements of Suzuki land have much in common with the sites in different regions of Rus’, which were earlier attributed as proto-urban centers or trading centers on the river reaches. The difference is that the former could hardly be regarded as the sites with the central functions - 10 dwelling sites were concentrated in considerable area, the distance between the neighboring sites varied from 6 to 14 km. Another important point is that large unfounded settlements couldn’t have been used for the control over the water routes. They are located on the small rivers, often – on the waterways.

Far more to the sites of Suzuki Opole lead to re-evaluation of the interpretation of sites, which were formerly regarded as empiria or proto-urban centers in the Upper Volga, like Timevoro and Sarsko near Rostov. Their status in the settlement hierarchy probably was overstated. New investigations reveal, that long-distance trade in the Upper Volga in the Viking age was not monopolized by one single center – it developed through the formation of considerable wide networks of sites.

**TH1-11 Abstract 10**

**Viking winter camps: towns on the move?**

Author - Prof. Hadley, University of Sheffield, Sheffield, United Kingdom (Presenting author)

Co-author(s) - Prof. Richards, Julian, University of York, York, United Kingdom

Keywords: urbanism, Viking winter camp

Presentation Preference - Oral

This paper will contribute to the debate about urban origins through exploration of the new archaeological evidence from the camps at which Viking armies were based during the period of raiding in the ninth century. Since they were evidently occupied for only a number of months, they do not accord with the definitions of urbanism that we have been accustomed to adopting. Yet in most other respects it is now difficult to deny their urban attributes. In particular, discussion will focus on the evidence from Torvast (Unostland), where the Viking ‘Great Army’ is recorded as having spent the winter of 872-3. Recent archaeological investigation has illuminated the nature of this site, which is considerably larger and more complex than hitherto suspected. It has yielded evidence for trade (in the forms of bullion, weights and coinage), manufacturing (including the processing of precious metals, smithying and textile working), minting of coins (in the forms of imitations of local currency), and religious practice and burial. The site has undoubted urban attributes, but can we really conceive of a ‘town’ as a mobile enterprise? And, if so, how do we envisage that the community supported itself? The archaeological evidence from the winter camps at both Torvast and elsewhere, not only challenges definitions, but it also prompts us to look at a new range of sites in our analysis of the development of urban settlements, since the winter camps did not develop in any direct way into the towns of the later Anglo-Saxon and medieval periods. They are physically unrelated, albeit connected in terms of the range of activities undertaken on them. The scale of the winter camps as we now understand them suggests that they housed unusually large concentrations of people, and may have given many of the members of the Viking armies their first experiences of urban living; they may also have provided a similar introduction to urban life for many of the communities in the regions where they were established. The newly emerging archaeology of Viking winter camps makes a novel, and as yet largely untapped, contribution to debates about urban development.

**TH1-11 Abstract 11**

**The emergence of Odense, the third largest city of Denmark. Methods, definitions and dynamics**

Author - Dr. Runge, Mads, Odense By Museum/Odense City Museums, Odense C, Denmark (Presenting author)

Keywords: Ringfort, Urbanism, Viking Age

Presentation Preference - Oral

The Viking Age and Medieval center of Odense were before the introduction of the systematical archeology heavily destroyed by development work without prior archaeological excavation. This means that the earliest history of the town rests on fragmentized ground.

An ongoing research project responds to this and has started the chase on the earliest history of Odense. The project is based on the search for the two different urbanistic combined in new analysis on old material, among others new AMS carbon dating. At the same time new large-scale excavations in the city center brings new possibilities to get the most out of the remaining parts of the city’s past.

Also a new excavation at the ringfort (trelleborg) Nonnebakken is relevant in this aspect. The paper will focus on the following questions: Who is Odense and not one of the other late iron age central places that became the centralcity? What is the significance of Nonnebakken – the only trelleborg near a contemporary city – in relation to the making of Odense? Or is it the ringfort that is placed by the city? May a smaller trade- and crafts area be seen as an urban phenomenon? Or must there be more to it?

These questions are essential in the context of Odense, but will be used also to address central points in a principal discussion on methodologically challenges, definitions and dynamics regarding early urbanism.
TH1-11 Abstract 14
Hot beds? Manure pits in medieval Ackerbürgerstädte

Author - Dr. Van Oosten, Roos, Leiden University, AMERSFOORT, Netherlands (Presenting author)
Co-author(s) - Aerts, Sander, Leiden University, Leiden, Netherlands
Co-author(s) - Habrank, Ruben, Bio Archaeological Research Bureau, Leiden, Netherlands
Co-author(s) - Hees, Erica van, Leiden University, Leiden, Netherlands
Co-author(s) - Hos, Jantine, Municipal archaeological service of Delft, Delft, Netherlands
Co-author(s) - Riddervoorde, Femke, Leiden University, Leiden, Netherlands
Keywords: agrarian towns, hot beds, medieval
Presentation Preference - Oral

Dutch urban archaeology has uncovered hundreds of pits dating from the thirteenth to fifteenth century containing animal manure mixed with bedding straw. On occasion an array of manure of pits has been uncovered. The traditional explanation is that they were used to store manure for agricultural use. This explanation is questionable given that manure requires aerobic conditions and frequent turning for it to be transformed into useful fertilizer. A dung heap rather than a manure pit would be expected. Historical texts dating from the seventeenth and eighteenth centuries describe a method of hot beds that might help explain the manure pits. Horse manure was spread on the bottom, and once fermentation had begun, a layer of soil was spread on the steaming manure, ready to be planted with cucumber, radish and melon. The heat produced by the manure guaranteed that vegetables could be planted months earlier than if a hotbed had not been used, and then also harvested earlier.

The main question in this presentation is whether archaeological manure pits can be designated as hot beds. If so, this would reveal a form of urban market gardens. The preliminary results of the multi-disciplinary manure pits research group will be presented.

The rural component in the early urban development of Brussels, Belgium

Author - Dr. Nicosia, Cristiano, Université Libre de Bruxelles, Bruxelles, Belgium (Presenting author)
Co-author(s) - Devos, Yarrick, Université Libre de Bruxelles, Bruxelles, Belgium
Co-author(s) - Vrydaghs, Luc, Université Libre de Bruxelles, Bruxelles, Belgium
Co-author(s) - Charruadas, Pablo, Université Libre de Bruxelles, Bruxelles, Belgium
Co-author(s) - Degraeve, Ann, Head of the Department of Archaeological Heritage, Brussels, Belgium
Keywords: Brussels, Geoarchaeology, Urban agriculture
Presentation Preference - Oral

The study of the early development of Brussels, Belgium, has shown to be a challenge. Over the last centuries historians have heavily debated on the scarce existing – often very questionable – historical sources, trying to explain the emergence of this city situated along a steep slope bordering the Senne river. In the last decades, a new generation of historians underlined the importance of agricultural development and expansion as an important factor for the early development of Brussels (Charruadas, 2011).

Of course the question should be raised whether there are any archaeological data supporting this hypothesis. Despite the many interventions taking place over the last decades, no remains of farmsteads have been recovered. But archaeologists do almost systematically encounter dark earth dating from the 10th-13th century AD, period where the historians situate the early town development.

An interdisciplinary approach has been developed to study these dark earths, involving not only historical research and archaeology, but also geoarchaeological (including soil micromorphology and physico-chemical analyses) and archaeobotanical studies. These studies highlight that several human activities can be hidden behind complex formation processes, some related to the development of an agric-pastoral system (Devos et al., 2009; 2011, Vrydaghs et al., 2016). The present contribution will discuss the results of the study of these dark earth units, and demonstrate how they contributed to the understanding of the early town development and the importance of agricultural activities, the location of crop and pasture land, and the cultivated crops.

This paper will discuss how to understand the early development of Odense seen through the archaeological record. Is it possible to see, if and how the town transformed from agrarian to urban during the 11th to 16th Century? Until now the evidence in the material culture history of Odense has mainly been based on the sparse remains of a Viking Age ring fortress and written sources testifying to Odense as a place of significance from around 1000 CE. Recent large-scale excavations have offered the opportunity to study this early phase of the town from an archaeological point of view emphasizing the physical remains and change in use of space.

Up to several meters of well-preserved stratigraphy were excavated applying a strictly managed contextual method, reflective interpretation of the formation of the cultural deposits and sampling for macro botanical, zooarchaeological and micromorphological analysis. With an extensive finds assemblage and well-preserved structures such as boths, houses, stables and latrines, paths, roads, fences, manure heaps and much more the site data forms the basis for addressing the question if certain features can be distinguished as agrarian or urban and how these features change over time.

This paper argues that the organization of crafts had an imperative significance for the emergence of urban environments in early medieval emporia in Northern Europe. This is demonstrated in a re-assessment of a non-ferrous metal workshop from the eighth century excavated in Ribe, Denmark. 3D laser scans are used to classify previously unidentified mould fragments, and new identifications are offered as a result. The work shows that the produced a range of items including bits for horse harness and horse contact plates. With each case the finished product demanded a range of specialized materials, and thus presumably the skills and expertise of a group of craftsmen. This need for collaboration between specialized artisans was a vital reason why permanent communities of an urban character emerged in ports with privileged access to imported raw materials. This offers the basis of a revised model for the emergence of urbanism in the North Sea region.

This paper aims to counter these questions using examples from the survey of multimetal sites conducted as part of the thesis project. A comparison between selected sites will be presented. The purpose of this is to evaluate the role of multimetal within the “urban package” and discuss the role of complex metalworking in the establishment of urban areas of interaction in Late Iron Age Scandinavia.

This paper discusses how to understand the early development of Odense seen through the archaeological record. Is it possible to see, if and how the town transformed from agrarian to urban during the 11th to 16th Century? Until now the evidence in the material culture history of Odense has mainly been based on the sparse remains of a Viking Age ring fortress and written sources testifying to Odense as a place of significance from around 1000 CE. Recent large-scale excavations have offered the opportunity to study this early phase of the town from an archaeological point of view emphasizing the physical remains and change in use of space.

Up to several meters of well-preserved stratigraphy were excavated applying a strictly managed contextual method, reflective interpretation of the formation of the cultural deposits and sampling for macro botanical, zooarchaeological and micromorphological analysis. With an extensive finds assemblage and well-preserved structures such as boths, houses, stables and latrines, paths, roads, fences, manure heaps and much more the site data forms the basis for addressing the question if certain features can be distinguished as agrarian or urban and how these features change over time.

This paper argues that the organization of crafts had an imperative significance for the emergence of urban environments in early medieval emporia in Northern Europe. This is demonstrated in a re-assessment of a non-ferrous metal workshop from the eighth century excavated in Ribe, Denmark. 3D laser scans are used to classify previously unidentified mould fragments, and new identifications are offered as a result. The work shows that the produced a range of items including bits for horse harness and horse contact plates. With each case the finished product demanded a range of specialized materials, and thus presumably the skills and expertise of a group of craftsmen. This need for collaboration between specialized artisans was a vital reason why permanent communities of an urban character emerged in ports with privileged access to imported raw materials. This offers the basis of a revised model for the emergence of urbanism in the North Sea region.

This paper aims to counter these questions using examples from the survey of multimetal sites conducted as part of the thesis project. A comparison between selected sites will be presented. The purpose of this is to evaluate the role of multimetal within the “urban package” and discuss the role of complex metalworking in the establishment of urban areas of interaction in Late Iron Age Scandinavia.
production and distribution networks in the diocese of tuam, west of ireland, ad 500-1000

author - tighe, john, trinity college dublin, the university of dublin, castletown co mayo, ireland (presenting author)

text:

the discussion of early medieval urban development in ireland is dominated by the coastal emporia of the vikings at dublin, waterford etc. as vigorous the vikings were in facilitating broad social and economic change, they were still an ethnic minority in ireland, so it is imperative to look at sites with little or no viking connection. there are pre-viking ‘ports of trade’ which while similar to english wics, although seem to develop slightly earlier and not to have an organised plan.

these include sites such as doonoughough, a coastal site where exchange happened in the eighth century. the primary mode of the production of crops is thought to have been by buying in the grain, as there is a lack of evidence for on-site production with the grain samples excavated being entirely free of chaff. the site, and possibility others like it were not permanently used, but seems to have been occupied between late spring and early autumn, the very same as the main sowing season for much of europe.

this form of exchange may have been brought into fruition as increased specialisation of production coupled with increased opportunities to exchange. this may have had a direct impact on the decline of the importance of the cow can be seen as a move away from the type of economy, widespread in pre-roman europe, where an items value was bestowed upon it not because of its intrinsic value, like that of the silver economy which the vikings helped to develop, but in its cultural value. the silver bracelets found at places like cuddalore, co. mayo and portumna. co. galway could indicate a much richer trade network through peripheral ireland, or at least a heavier viking presence in the area than previously thought.

while the terminology of ecclesiastical sites, particularly the use of ‘cities’ to describe sites such as kilkare, has smugled the idea of what constituted urban in this context, it is clear that these establishments acted as centres of production and distribution, in a way that ringsfort could not in the unstable political milieu of the day. this research is focused on the diocese of tuam, centred on tuam, which was a centre of exchange in this period, with a high cross being erected to delineate the boundary of the secular and the ecclesiastical. the role of the church in providing centres of production and manufacture cannot be doubted, especially in the unstable and fragmented political milieu of early medieval ireland.

while market exchange was seen as primarily an urban phenomenon, sites such as doonoughough and tuam have shown that despite the west of ireland being largely ignored when talking about the early medieval irish economy, its peripheral nature than and now, mitigates the problem of modern urban development that is common, particularly among the environments of formerly viking emporia. i hope, through this work, to provide a framework for further investigation of the early medieval economy, not only within ireland, but also for other comparable regions of europe.

early medieval urban life in the low countries before the 10th-11th c.: approaches and problems

author - professor dries, tys, vrije universiteit brussel, brussels, belgium (presenting author)

abstract:

the low countries were together with northern italy the most heavily urbanized regions of the medieval world. the origin and understanding of this phenomenon has been debated in a long and impressive historiographical debate, involving famous scholars like pierre, weilb, verhulst and others.

today we agree that the take-off of the successful towns can be related to the organisation and stimulus of trade in the context of power in the 10th and 11th centuries. the debate remains however on how to understand the evolution and character of the urban phenomenon before the 10th-11th century. this debate will always tend to suffer from both teleological thinking towards the road of success and the stress on the question of continuity between roman centres and later towns. the main problem regarding our archaeological understanding of urban life, fabrics and functions seems to be that they can have totally different material translations that might not always be recognisable from the modern perspective. the question is therefore maybe what different forms urban life and functions could have and which methods we need to identify these.

The Eneolithic adornments as components of the costume.

The case of Sultana-Malu Rosu cemetery

Author - student Sandu, Roxana, National History Museum of Romania, Bucharest, Romania (Presenting author)
Co-author(s) - Margarit, Monica, Valahia University of Targoviste, Targoviste, Romania
Co-author(s) - Lazar, Catalin, National History Museum of Romania, Bucharest, Romania

Keywords: Beads, Cemetery, Eneolithic

Presentation Preference - Oral

The Eneolithic adornments from the Sultana-Malu Rosu cemetery represent a particular case of archaeological artefacts, mainly because of their reduced dimensions, but also from the typological perspective, in this cemetery being present almost all types of beads known for this period in the Balkans. Two communities that were belonging to the Boian and the Gumelnita cultures (ca. 5000-3800 cal BC) used this cemetery. In these circumstances, the beads encountered some changes in form, dimension and raw material preference for their crafting, but other aspects remained the same in their evolution. Furthermore, the anatomical deposition of the beads on the skeletal remains is a significant source of information in the identification process of the beads as components of the costume or if they were only jewellery pieces.

The aim of this paper is to explore the beads discovered in the Sultana-Malu Rosu cemetery, from the contextual, technological, functional, and symbolical point of view, but also to interpret the ways in which they were worn, combined and deposited in the graves. Our approach will cover use-wear analysis to identify the meaning of this beads, and to determine the social, economic, gender, and religious connotations of this kind of artefacts.

This work was performed through the Partnerships in Priority Areas Program - PN II, developed with the support of MEN - UEFISCEDI, project no. PN-II-PT-PCCA-2013-4-2352.
Women's funerary dress in 12th-century North Estonia.

One costume – complex meanings.

Late Iron Age inhumation cemeteries dated to the end of the 12th and the beginning of the 13th century in Estonia reveal traces of richly decorated funeral dresses of mature women. Although textiles have preserved in the graves very rarely, sets of copper alloy jewelry and tiny metal elements used to decorate clothing items give plenty of information about the attire of the dead.

Collected information allows constructing the appearance of the whole costume that seems to be common to the North and North-Eastern Estonia of that time. Various details of the costume can be related with stressing and protecting the fertility of a woman’s body, for example, the colours of textiles or the habit to adorn certain parts of the body with jewellery (breasts, waist and stomach).

On the basis of ethnographic sources describing how clothing expresses the social status of a woman, and the tradition to bury females in their wedding dress, we suggest that the above mentioned archaeological finds could also reveal the main characteristics of female costumes that were used to wear in the weddings or during the fertile age.

Funerary garment of the first woman (coffin No. 9) was the silk, long apron dressed on linen shirt, which cuffs was decorated with ribbons. Apron was made of 26 pieces (simple textile with plain weave 1/1) having different sizes and shapes (rectangles, triangles). At the lower edge of the apron was silk 90 mm wide. Apron was sewn with silk threads.

Repeated use of that garment confirm the tight seams connecting the individual elements. Costume was completed with long, silk, knitted gloves and shoes with textile uppers. Upper shoes were made of patterned fabrics and decorated with ribbons.

Second woman’s garment consisted of a silk dress with a complicated cut and numerous haberdashery. The dress consisted of a bodice with long sleeves and seen into it, heavily a gathered at waist long skirt. The dress was seen a dense, carefully stitch. Bodice consisted of 12 elements, two at the front (front left and right), the two at the arms (constituting mirror images of each) the eight at the left and right rear part (also constituting its mirror image).The skirt consists of 7 elements: two located on the left front, two on the right front, and a single central rear portion considerably elongated. Left side is a mirror image of the right side. Fabric used to sew a dress has an area approximately 5 square meters. The head of the dead woman was laid on a pillow with a soft pillowcase. Pillowcase was made from a single piece of fabric (front and rear part are of the same shape), but in the course of many years, the bottom portion has been destroyed, so archaeologists recorded two separate components. Pillow shape is similar to a quadrilateral with rounded corners. The maximum height is 470 mm, the maximum width is 510 mm. Around the edges either the front or rear part is silk ribbon. The band is now a dark brown color. In addition, between the edges with the ribbons was seen decorative frill.

The aim of the presentation is the identification of similarities and differences in the 19th century funeral textile equipment of two women, forms of clothing, typefaces, type of additives and manufacturing technology used fabrics.

The variety of female textile funerary equipment from nineteenth century (Biala Raw ska - Poland)

Author - MA Majorek, Magdalena, Nicolaus Copernicus University Torun Poland, Torun, Poland (Presenting author)

Keywords: female garments, funerary equipment, textile in 19th century

Presentation Preference - Oral

Female textile funerary equipment can take very different forms and functions. They include both woven and knitted fabrics, dresses with intricate cuts as well as simple shirts, coffins upholstered or clothing accessories (ribbons or shoes).

Two burials of women discovered during archaeological excavations in the crypt of the church in Biala Raw ska were compared and characterized (coffin No. 9 and No. 12). Discussed women were buried in wooden coffins. The state of preservation of textiles led to the analysis functions and technological features.

TH1-12 Abstract 08

Jewelry: decoration or a detail of construction? Theory and practice

Author - PhD Stapanescheni, Daiva, Vilnius University, Lithuania (Presenting author)
Keywords: construction, costume, jewelry

Archaeologists, having found ancient jewelry in the burial monuments, most often regard it as a decoration element, classifying and typologising it according to the shapes and ornamentation. Mostly only the metallic decoration details remain from all the attire set or, generally speaking, costume. It is not an easy task to recreate the costume itself with no preserved organic material – textile and leather, though the task is made easier by knowing the jewelry’s relation to the skeleton. In this way, the position of the brooches makes it possible to guess what kind of clothing was pinned with it – lapses of the blouse, sides of the coat, corners of the cloak; pins with pendants and chains tell us the style of the women dresses; the shape of the bracelets let us understand the cut and the length of the sleeves; some types of neck rings let us assume about their function of fastening the cloaks. Decoration details found in the area of the head give an image of the shaping of a haircut or one or another variant of the headdress; even the rings, their decorations, the contents of the bead necklace may indicate the ownership of a certain person. It is noted that among thousands of archaeological findings, despite their stylistic uniformity, specific to one or another chronological period, there are no identical items; all differ in both size and ornamentation, thus, being a possession of a certain person, they may have been recognized by others and used to prove an absent person’s delivered messages’ validity.

Sometimes the dead are buried wrapped in the sheet, which was also fastened with brooches or pins; also sometimes additional jewelry (several neck rings, headbands, rings) placed was into the grave and not always in the anatomical order, but beside the head, on the legs. This aggravates the research of the costume’s construction. Textile researchers determined that the fabric for the clothes until the Medieval times were woven with plain colors, not striped, not checkered; the patterns were made using the yarns of one color for the warp and another color for the weft, the edges of the clothes were reinforced with woven multicolored bands. In this plain-colored costume the brass and silver jewelry would especially splendidly expose. Themselves being the works of art, they had another, much more important function – the formation of the costume, the connection and fastening of its details.

The report is intended to emphasize the functionality of the jewelry, having practically checked the theoretical assumptions by reconstructing the wear of the different periods and tribes.

TH1-12 Abstract 09

Costume of deads or costume of livings?

Author - Dr. Ciprian, Bogdan Iosif, History and Archaeology Prahova County Museum, Ploiești, Romania
Co-author(s) - Dr. Magureanu, A., Institute of Archaeology Vasile Parvan, Bucharest, Romania (Presenting author)
Keywords: early middle-age, from object to costume, social meanings

There is a long debate of interpreting the archaeological discoveries from cemeteries, especially, as a suggesting (sometime as a certainty) of the costume of certain community/group/ethnic. Discoveries from settlement where never taking into consideration as a relative source for such debate. But there are epoche when we do not have cemeteries, they are epoche when we do not have settlements, archaeologists prefer to excavate the cemeteries. Such a situation is in Lower Danube region in the 6th-10th centuries. So this is a good situation to a wider kind of questions relating the costume. Costume of a person? Of a group? Or of a family? Or of the other, non-elites? Of the dead? Of the living? Of the image of the buried person? Of the image of the costume, the connection and fastening of its details. We intend to provoke some answers and more debates based on the discoveries from the mentioned area and not only, dated in the time frame of second half of the 1st Millennium A.D., a region and epoch of dramatically changes in the hole Europe.

TH1-12 Abstract 10

Jewelry on mosaics from Roman Africa. Functions, aims and reliability of representations

Author - MA Mech, Anna, University of Warsaw, Warszawa, Poland (Presenting author)
Keywords: jewellery, Roman Africa, Roman mosaic

At the beginning of 2nd century AD a special form of art appeared in Roman Africa - figural mosaics. They depicted both mythological scenes and everyday life and were displayed in public places and private estates of influential landords. Among these works of arts, those with representations of landords, their wives and workers draw particular attention. The hierarchy of African provincial population between the end of 2nd and the beginning of 6th century AD is clearly visible on these mosaics. Moreover, they are very important documents of everyday life of different social groups in Roman Africa.

The aim of this paper is to analyse the representation of jewellery on mosaics from third Roman Africa. Through comparing them to artefacts found in the area of Roman Empire, it is possible to observe traditions in Roman jewellery and changes happening over the years, as well as discover local trends and their relation to Empire-wide patterns. The richness of landords and their wives is emphasized by clothes and jewellery which they wear, adapting to Imperial and even divine prototypes, so it is possible to notice a clear relationship between forms of dress and the position within social order. Sometimes those traditions reached way farther back in time than the existence of the Roman Empire, for example the representations of chets for jewellery (pyxides) which are known status symbols already on Classical Greek grave-stakes.

TH1-12 Abstract 11

Transformation of Zupan from military to elite element of the men’s costume among gentry

Author - PhD Barvena, Hanna, National Academy of Sciences of Belarus, Minsk, Belarus (Presenting author)
Keywords: complex, costume, Zupan

Zupan - one of the oldest components of the costume wearing by the elite of the Belarusian society. From the XIX and the beginning of the sixteenth century Zupan was a component of the military costume, was functional, warm, made of woolen fabrics and quilted. Over three hundred years from the end of the XVI and to XVIII century Zupan became an essential element of the Belarusian gentry culture. During the Renaissance Zupan has evolved from military clothing to the main component of ceremonial Belarusian dress. Zupan began to sew from precious silk, velvet tissues, using a trim and gilded buttons. Such a rich clothes acquired status significance. During this period suit with the Zupan has become a unique distinctive artistic phenomenon, the hallmark of noblemen, manifestation of their political life.

This report will propose six major reasons for the emergence elite men’s suit with the Zupan in the sixteenth century. Among them it will be noted that rich, celebratory men’s suit was born with changes in the world of the gentry class in Polish-Lithuanian Commonwealth, the desire to emphasize its own peculiarity among European Community. There will also be observed evolution of the complex costume, which included Zupan. The differences between celebratory and everyday Zupan, changes of details (collar, sleeves, etc.) from the end of XVI and XVII centuries will be presented. It will be noted that the basic principles of cutting and style of wearing Zupan remained almost unchanged for three centuries. Red, white and gray colors of Zupan were most widespread during the lifetime of the gentry’s suit.

Wearing a costume with the Zupan in Belarus during the partitions of Polish-Lithuanian Commonwealth was a symbol of nobility, patriotism, symbol of freedom. Zupan has evolved into a costume component wearable by participants of revolt for independence. After the destruction of the nobility as society class, Zupan has transformed into a retina - Belarusian component of the traditional male costume. Today Zupan becomes a component of the Belarusian intelligentsia costume during family (weddings), and corporate events.

TH1-12 Abstract 12

Small adults – forms of children clothes until 2nd half of 18th c.

Author - Grupa, Dawid, Institute of Archaeology, Nicolaus Copernicus University Torun Poland, Toruń, Poland (Presenting author)
Keywords: child clothes, copy, reconstruction

Presentation Preference - Oral

In the space of the centuries, obligatory trends in fashion influenced greatly the outlook of representatives of different social groups. Changes in adults’ outfit were also reflected in types of clothes worn by children, especially in case of noble families and social elites. Thanks to numerous archaeological material referring to children burials, we are able to trace the changes in children fashion as well. In many instances, special grave robe was replaced by casual clothes.

Detailed analyses of clothes fragments enable to identify various children clothes’ forms by descendants of the elite up to 2nd half of 18th c. Many family portraits present repeatable fashion of depicting fathers and sons dressed in identical man attire or mothers and daughters, which dresses were smaller variations of models worn by mothers. Similar references can be observed in child burials, where the offspring was put to grave in everyday clothes, even in accordance to fashion of their parents’ clothes. Children needs were neglected, their garments had to reflect their parents’ wishes only. That tendency had frequently negative effects on proper development of the youngest members of the society. That trend is observed till the end of 18th c., when changes in pedagogy rules were slowly introduced, thanks to which child clothes were adjusted to proper child age, body building and development, providing free body movement, necessary for proper development of young organisms. First clothes of that type appeared in England and France and the trend spread next to other European countries, putting an end to many centuries tradition of dressing children in copies of their parents’ clothes.
Late Bronze and early Iron Age costumes in the Southern Baltic: unknown and unexplored

Author: Dr. Szuarska, Katarzyna, University of Gdansk, Gdansk, Poland (Presenting author)
Keywords: female/male costume, LBIA, early Iron Age, Southern Baltic zone
Presentation Preference: Oral

Except for some specific times and regions or very specific context of organic material preservation archaeologists do not have much chances to study costumes of past societies. Most of our knowledge come from proxy data like jewellery types and its distribution within inhumation graves, rare representations of human figure or fortunately survived pieces of clothing. But still we can assume that there are dealing with every-day or ceremonial, human or divine being.

However costume is not just a means of protection against environmental conditions. Most of all, it is a powerful tool of communication, regulating or forming social practice. And therefore our limited knowledge about the costumes used in specific times limits also our knowledge about social sphere. Funeral tradition of the late Bronze and early Iron Age Central European groups make the situation even more complicated. Not only cremation left very little evidence for studies on costumes, but barely complete absence of human figure representation in the Bronze Age makes almost impossible to speculate about the clothes that were worn at that times at any occasion. The situation changes a bit during early Iron Age with the emergence of face um tradition and human figure representation when at least in funeral sphere we can observe the emergence of well-defined set for men and women.

The main aim of this paper is to analyse the late Bronze Age and early Iron Age data from nowadays Poland for potential proxy data for identification of the elements of costume and further studies within the scope of male/female suits as well as everyday and ceremonial costumes.

Women’s headwear from the burials of the III-IV centuries in Sudzial Opole

Author: Dr. Zaytseva, Irina, Institute of Archaeology of RAS, Moscow, Russian Federation (Presenting author)
Keywords: burial rites, headwear, Migration period
Presentation Preference: Oral

In 2007-2010 the Institute of archeology of the Russian Academy of Sciences has conducted the archaeological investigation of the Migration period necropolis Bolshoe Davydovskoe 2 in Sudzial Opole. In the small cemetery 18 burial pits with 23 burials were excavated. They performed the role of inhumation. Funeral rites, grave goods and the parts of the clothing allow to attribute the monument to a be a part of Riazan-Oka culture. The burials can be dated to the end of III - IV cc.

According to the anthropological remains and the presence of decorations is determined that 9 adult individuals are women. Remnants of headwear found in 5 of them and in one burial of girl 8-10 years. 2 women were buried wearing head cords of different types: in one burial, it was a ribbon, fastened with an iron buckle. It was decorated with glass beads, small bronze rings and fragments of jungling pendants. In another burial the corolla consisted of a ribbon with attached plates with rings, decorated with pearl ornaments. According to the observations of I.Belotserkovskaya, similar clips with rings appeared at the end of the II-III cc. In IV-V cc. they have proliferated and are becoming an indispensable part of the corollas and occasionally necklaces from the population of Riazan-Oka culture. T. Krachenko believed that the head corollas put on the top of the textile shawls, which were a mandatory part of women’s headdress. 3 persons had the head decoration of a different type: these were clusters of oval bronze clamps that were closely strung on cords with small wire rings and semicircular plaques. Probably cords with clips and small ornaments were sewn onto organic bases (leather, textile?). In all these burials near the skull found a pair of large cylindrical temporal rings with blade. The presence of complicated, often multi-layered women’s headdress is one of the characteristics of funeral rites in cultures of Finno-Ugric type, continuing over a long period of time from the Migration period to the late middle ages. T. Krachenko, N. Trubnikov and I.Belotserkovskaya made a reconstruction of the typical headdress of female burials of the early phase of Riazan-Oka culture. Mostly it’s a cap of leather or textile with a rigid skeleton, represented by the bronze plaque or bat. Caps were decorated with sew-on badges and straps with bronze spirals. Bronze cylindrical temporal rings with blade were attached to hats. At the back they were often fastened with a brooch with jungling pendants. The hats from Bolshoe Davydovskoe 2 are something different in design. The complexes have no fibulae, which could be used for attachment of the temporal rings, no round plates to a rigid foundation. Belotserkovskaya indicates to a rare variety of soft caps without metal plates but with small plaques sewn on. Probably found all the hats belong to this type. We have no evidence of the textile shawls.

Sasanian influence on the Chinese and Central Asian textiles

Author: MA Kossowska, Dominika, University of Warsaw, Otwock, Poland (Presenting author)
Keywords: China, Silk Road, textiles
Presentation Preference: Oral

From 8th to 14th century silk textiles produced in Asian and European workshops were very often decorated with the motive of confronted animals standing on the floral ornament. The scene is usually put into medallion-type decoration. It is believed that this convention had its roots in Sasanian weavering tradition, but the oldest depiction of it is known from “jin” fabrics discovered in Tufan oasis (Krinjai and Dulan (Grihbal). Because of its technical features (wrap-faced compound lobby) is obvious that these were made in Chinese workshops. Some components of the motive depicted on these textiles are pure Sasanian (animals decorated with flying ribbons, pearls medallions), but after analysis of the Chinese weaving, I assume that other aspects had been rooted in Chinese tradition (for example antithetic position). These two schoths of weaving were under influences of each other especially because of Sogdian trade activity on the Silk Road. This Sasanian-Chinese convention was introduced into Central Asia in 7th century (especially to Sogdiana) and then was adopted in Muslim and European art.
The dress has an important place in any research about people from particular time period and location, as it holds a lot of information about its wearer. In historic and ethnographic literature dresses have long been recognized as an indicator of group affinity. The aim of the paper is with the use of available knowledge from burials, literature, and images to draw the possible look of the well-off Grobin woman in the 7th - 8th century. Unfortunately, during this period, mainly cremation burials are used for women, thus adding to the difficulty of reconstructing such dresses. Some later evidences from Sweden and Denmark are used, although with limitations, in the process also local evidence to Scandinavian fashion has been detected and further analysed, thus trying to determine how far one has influenced the other. It must be noted that this is only hypothetical version lacking definitive proof in form of actual archaeological finds, although backed by strong supporting evidence.

**TH1-12 Abstract 18**

**Formation of Jewelry types in Baltio-Slavic border zone in the 12-13 centuries (Based on settlement Maskovichi)**

**Author** - PhD Varatnikova, Aleksa, National Academy of Sciences of Belarus, Minsk, Belarus (Presenting author)
**Keywords**: costume, decorations, medieval
**Presentation Preference** - Oral

Exposure collections of famous archaeologists Ludmila Dutsch and George Shtygrova in the Department of museum ancient Belarusian culture emphasizes the aesthetics of medieval clothing. Group objects (more than 100 units) with mounds of Polotsk land frontier emphasizes ethnic aspects of development early Middle ages (suspensions types, heads). On a material settlement Maskovichi during the XII-XIII centuries is clearly the organization of agricultural and solar symbols in stable circuit (cosmographic images of the horse, crescent). They have evolved and entrenched in artisan products XIII-XIV century. Borderlands allows materials to demonstrate a certain stage of coexistence of eastern European tribes, exposure to stress by means of a multithetic features of the northern land of Polotsk culture. Rings and brooches with Mascavichav, as the embodiment of motion, equally characteristic aesthetics Baltic or Slavic dress. They show a wide existence of Slavic ideas in this habitat. Museums show and attribution complementary archaeological items and actualizing artefactelor Balticans.

**TH1-12 Abstract 19**

**Jewellery workshop in the medieval Smolensk**

**Author** - Muneevava, Tatjana, The Institute of archaeology, Buturlinovka, Russian Federation (Presenting author)
**Keywords**: Archaeological excavations, Jewellery workshop, Medieval city
**Presentation Preference** - Oral

The report focuses on the work of the Smolensk archaeological expedition undertaken in the summer of 2015. The purpose was to determine the time development of the area in ancient period. A pit filled with waste jewelry production middle – 2nd half XI century was found. In the fill of the pit contained many fragments of smelting crucibles, and also some almost entire instances.

In addition, were found metal objects associated with jewellery production. The report provides a description and analysis of objects. All these findings, the mass and concentration in the small hole indicate the presence nearby of areas with ancient jewelry manufacturing. These findings allow us to make important conclusions and to supplement information about the city’s history.

**TH1-12 Abstract 20**

**Andronovo Costume: Headgear and Ritual**

**Author** - Senior Fellow Usanova, Emma, Sayarka Archaeological Institute, Reserve Park “Ulytau”, Karaganda, Kazakhstan (Presenting author)
**Keywords**: Ancestral relic, Andronovo culture, Headress
**Presentation Preference** - Poster

Female’s costume attributes of Andronovo culture consist of jewelry, woven fabrics fragments and leather, mainly belong to the head decorations. Andronovo community is assembling of steppe cultures of Inner Eurasia belonging to the Bronze Age dated to 2500 – 1300 BCE. Thus far, approximately 30 burial sites have been investigated that contained preserved remains of female’s headdress (Ural-Kazakhstan zone). Two types of head adornments are now identified: headgear with and without hanging ornaments. A headress constituted the main part of the costume, which is represented by the marked top of a head as a place for the concentration of a vital force. The headdress usually points toward the age, social status of the deceased. A headgear with the minor elements was assigned to girls under 10 years old, while richly decorated headdress belonged to individuals of the fertility period of over 15 years old. Headdresses have been found in the following positions: detached head, re-deposited backbones, complete backbones. Some of the burial have been penetrated post-burial in order to remove the headdress: backbones have been found without the skull or with a partially destroyed skull. It is possible that the headress was an ancestral relic which passed on from generation to generation; in some cases it was left in the graves, in others removed.

**TH1-12 Abstract 21**

**Peruvian textiles in Warsaw National Museum**

**Author** - MA Kosowska, Dominika, University of Warsaw, Otwock, Poland (Presenting author)
**Keywords**: Paracas, textiles, War
**Presentation Preference** - Poster

Four fragments of pre-columbian textiles are part of Warsaw National Museum’s collection. Two of them are colorful embroideries depicting flying creature characteristic to Paracas culture (late Nazca: 500 B.C. - 200 C.E.) and other two are tapiz fragments woven in Inca state (500 -1000 C.E.). Embroideries (plain stitch looped behind) are similar in shape and it is very probable that they were pieces of the same material. Analogical fragments are part of collections of Metropolitan Museum of Art in New York. These types of embroideries were depicted on the big blankets - mantles, which were part of the fardos – funeral bundles. Two tapiz fragments were originally sewn into the small purses (trapezium in shape), which were also typical burial object. Its ornamentation is very schematic – geometrical, colorful designs. Pre-Columbian textiles fragments from Warsaw National Museum are very well preserved and they are one of the most beautiful Peruvian fabric in polish collections.

**TH1-12 Abstract 22**

**Collar of the 17th century. The find of the settlement of the Novodevichy Convent (Moscow)**

**Author** - Eksina, Irina, Institute of Archeology of RAS, Moscow, Russian Federation (Presenting author)
**Keywords**: 17th century, collar, Novodevichy Convent, Costumes complex (clothes and its attica)
**Presentation Preference** - Poster

During the archaeological work in 2014 under the leadership of L.A. Belyaev in the settlement of Novodevichy Convent (Moscow) necropolis of the 17th – 18th centuries was studied. Among the burials the burial of a man of 55-60 years was of great interest.

In the burial, numerous textile fragments, forming the shape of a trapezoid, were found around the head and shoulders. Metal buttons – dumb-bells and baptismal cross were fixed on the chest. In the area of the belt there was a rectangular metal buckle.

A comprehensive study of textile remnants shows that they are the remnants of collar clothes, made in the technique of golden embroidery on the red velvet. The main patterns of the embroidery ornament are vegetable branches forming sharp oval stamps, as well as elements such as tulip, bugle bract, pomegranate flower, typical for the Turkish fabrics of the 17th century. Phelonion (a sleeveless vestment) had high solid collar of trapezoidal shape. Trapezoidal collar is characteristic for priests’ garments (cloak). Preserved in the burial pieces of gold embroidery and the presence of spherical buttons, buckles, their location in the burial give the possibility to partially reconstruct the shape of a phelonion. The main fabric of phelonion has not been preserved, but the position of the buttons in the burial lets assuming that the cloak was long, and its front edge was fastened with buttons. This is typical of the ancient type of phelonion.

Based on these studies a color graphic reconstruction of ornamental patterns and design of the collar was performed. Phelonion collar was performed by high-end skilled workers, and certainly is a striking example of the Russian decorative art. Ornamental pattern of the collar and the nature of gold embroidery execution relate to the 17th century.

**Jewelry from Germanic graves in Krakovany - Stráže (Slovakia)**

**Author** - Mgr. PhD Danova, Miroslava, University of Trawa, Department of Classical Archaeology, Trawa, Slovakia (Presenting author)
**Co-author(s)** - Krupa, Vladimír, Balská Archaeological Museum Púchov, Púchov, Slovakia
**Keywords**: decorating techniques, golding, Krakovany
**Presentation Preference** - Poster

The Balská Archaeological Museum in Púchov (Slovakia) acquired golding from grave of noble person in Krakovany – Stráže (Slovakia). The ring was found by brickwork employees in 1930s but it have disappeared for almost 80 years. Analysis of decoration techniques confirms that the ring comes from Germanic workshop inspired by Romans. Bali decorations made of silver, golden and silver clasps from the grave II are decorated with identical motifs.
TH1-12 Abstract 24

Burying parishioners at Köyliö, Finland – Aspects on attire and burial habits

Author - Doc. Lipkin, Sanna, University of Oulu, Oulu, Finland (Presenting author)
Co-author(s) - Järveto, I., Satakunta Museum, Kouvola, Finland
Co-author(s) - Untiïa, K., Muuritutkimus ky, Kaarina, Finland

Keywords: Burying, Parishioners, Köyliö, Finland

Presentation Preference - Poster

Burying deceased parishioners beneath the wooden church floor was a common practice for approximately for 50 years at the church of Köyliö, built in 1752. Due to church renovations during the summer of 2015, a number of burials were surveyed and excavated as part of a salvage effort due to the risk posed to the remains, with an unknown number of burials remaining in situ. The dry and well-ventilated microclimate beneath the floor resulted in exceptional preservation levels for both human remains and their accompanying textiles. This is a rare occurrence in Finnish church studies, as textile materials require unique and often extreme environments for preservation.

The funeral attire at Köyliö represents both social and symbolic aspects, contrasting the life and death of these individuals. The sample includes two elderly women, a middle aged man and three children. Based on their attire and various ornaments, we may look into the social ranks of the deceased. Additionally, the selection of cloths and accessories, their manufacture and materials in addition to the plants used to mask the smell of decomposing bodies under the floor, may shed light on and around its lower extremities. The projects on-site conservator was able to identify the leather, and could therefore instantly develop a strategy for the retrieval of the objects. Both conservator and archaeologist worked together to isolate the presence of the leather; that seemed to be primarily concentrated around the upper body. The leather was much degraded and a decision was made to lift the entire upper body in a block and continue the excavation in the conservation studio.

Excavation of the leather and the individual was conducted using water, soft brushes and tools. When the first layers of clay and sand were removed it became apparent that this was in fact an individual buried in a leather jacket. In order to fully understand the jackets construction it was decided to remove it from the individual. Osteological analysis revealed that the jacket belonged to a 20 year old man. Once separated textile conservators continued the excavation and conservation of the jacket by cleaning and flattening the different pieces and fragments. As previously predicted the leather was in a much degraded state. However, some typical features were exposed and a pattern was traced and then constructed. References pertaining to the jacket place it in the fashion of the second half of the 18th century.
TH1-13 Abstract 01

Bronze Age wool economy: production, trade, environment, husbandry and society

Author: Dr. Sabatini, Sara, Gothenburg University, Göteborg, Sweden (Presenting author)
Co-author(s): Bergendt, Sophia, Gothenburg University, Göteborg, Sweden
Keywords: sheep-husbandry, society and economy; wool production
Presentation Preference: Oral

This paper aims at discussing the significance of wool production in the European Bronze Age. The focus is on discussing which archaeological and anthropological material best is used in order to identify, and interpreted the impact wool production had on the society, and the environment. The basis for this paper will be well-documented material from Hungary (Benta Valley) and northern Italy, areas that have clear indications of extensive wool textile production.

The available contemporary written sources from the Mediterranean and Near East bear witness to the fact that sheep husbandry was a vital component in wool based economies. In Europe only archaeological material can guide us to understand the importance of sheep-husbandry and woollen textiles. Strontium isotope analyses that has been conducted on the well-preserved textiles from Scandinavia shows that wool in the same textile came from various geological areas, both probable local and none local. This shows that a complex system of production and trade must have existed in Europe during the Bronze Age. This paper aim discussing the cultural, economic and social role of wool production in the above named regions.

TH1-13 Abstract 02

Manufacturing Traditions in Textile Archaeology

Author: Dr. Band-Buygues, Johanna, Landesamt für Denkmalpflege, Esslingen, Germany (Presenting author)
Keywords: Manufacturing Traditions, pile-dwellings, Textile Archaeology
Presentation Preference: Oral

Research results of the past 20 years have made it possible to recognise traditional manufacturing techniques of textile production from the Neolithic to the Iron Age, representative of the significance of textile products in prehistoric Central Europe. This significance displays a degree of appreciation which goes beyond the ideas we would associate with textiles from a modern standpoint. Within the scope of a large exhibition of 4000 years of pile-dwellings, on display in Baden-Württemberg from 16.04 to 9.10.2018 (www.plattbauten2018.de), a key textile find from Pfalten-Irgenhausen (CH) has been analysed and reconstructed anew. The patterned textile fragment has been radiocarbon-dated to the Early Bronze Age. It occupies a key position in the textile production between the Neolithic and the Early Iron Age. While correctly identified as brocade in research of the 1930s, more recent publications arrived at erroneous identifications of the technique employed in the manufacture of this piece of fabric. New analyses and a reconstruction of the piece of fabric attest to a combination of weaving techniques which demonstrate the immense significance of textile manufacturing traditions in prehistoric textiles; manufacturing traditions, which did not reduce the textile to a mere carrier of decoration, but which instead recognised appearance and manufacturing technique as a unity.

TH1-13 Abstract 03

Textile impressions on ceramics from the late Neolithic to the early Iron Age in Central Europe

Author: Dr. Ulanowska, Agata, Centre for Research on Ancient Technologies, IAiE PAN, Łódź, Poland (Presenting author)
Keywords: Bronze Age, Central Europe, Textile ceramic
Presentation Preference: Oral

Due to their bad preservation conditions, textiles represent an unusual find in archaeological find contexts. Impressions of textiles on ceramic appear, however, more often and provide information about textile technology and raw materials. The so-called textile impressions occur worldwide in all time steps. The objective of this paper is to analyse this phenomenon from the late Neolithic to the early Iron Age in Central Europe. The function (functionality versus ornamental art) as well as the analysis of used raw materials and techniques are up for debate. Silicone impressions, experimental archeology and grouping procedure serve the investigation. In a case study the production technology, the materials and the usage will be analyses in the social context of the Bronze Age settlement Bruszczewo in Poland. This central settlement was integrated into a commercial network and had many different raw materials. The socio-cultural meaning of textiles was probably far more important than we can imagine today, living in a world of textiles mass consumption. Grave findings of web weights illustrate this. This contribution’s intention is also to examine the value of textiles in general.

TH1-13 Abstract 04

Innovative or traditional?
Diacronic approach to weaving technology in Bronze Age Greece

Author: Dr. Ulanowska, Agata, Centre for Research on Ancient Technologies, IAiE PAN, Łódź, Poland (Presenting author)
Keywords: Bronze Age, Greece, textile production, weaving technology
Presentation Preference: Oral

Weaving in Bronze Age Greece has been acknowledged as highly advanced technology resulting in greatly valued products of supreme quality and high importance to local economies and external trade. Because of the notable time-consuming character of the textile craft and its overall complexity, it is assumed that even slight changes in textile technology (including weaving) must have had a direct impact not only on the properties and presumably the aesthetic qualities of textiles, but also by effecting the amount of the necessary workload) on economics and social life of past societies. Traditional and innovative factors in the weaving craft throughout the Bronze Age are not easy to understand based on the archaeological evidence. They may be grasped in presumably progressive changes in the forms of textile tools (yarn weights) and their distribution which may have reflected the transfer of technical novelties, skills and techniques, and they can be observed in the iconography of fabrics and clothes.

In this paper diachronic changes and the long-lasting traditionalism of certain types of loom weights are considered and analysed in context of gradual development and ground-breaking novelties of the Aegean Bronze Age weaving technology.
that spinning with spindle whorls and weaving on the warp-weighted loom were commonly practiced. Plant fibres, particularly linen, seem to have been the main material for the production of cloth and textiles during this period. At some point, most probably during the Early Bronze Age, animal fibres (sheep wool) began to be used in the Aegean on a wider scale. Since hardly any Neolithic and Early Bronze textiles are preserved from the Aegean, we can study textile tools made of stone, bone and clay in order to comprehend technological traditions and innovations in textile production.

One can observe changes in the use of spindle whorls and loom weights over time. They are particularly light on alternations in not only fibre use, but also in various spinning and weaving techniques. In this paper I would like to focus on chosen aspects of textile implements from Early Bronze Age Peleponnes.

Investigating textile technologies in the Middle Bronze Age (MBA) Aegean has often focussed more on the impact of Minoan-type implements and techniques than on local craft traditions. Especially discoid, Minoan-type loom weights attesting to the presence of Minoan-type textile traditions exist on both islands of Crete and on the Greek mainland. However, not all areas of Minoanisation were equally affected. The eastern part of Crete appears to have been strongly affected by Minoanisation, whereas the western part of Crete and the Greek mainland were to a lesser extent. This paper compares Middle Bronze Age textile tools from two settlement sites located on opposite coasts of the Aegean Sea: Aegina-Aegina and Kyme/Bağhis. The fortified settlement of Aegina-Kolonna in the Argo-Saronic Gulf is known as a major hub of commerce and pottery production in the first half of the second millennium BCE (Gaus and Kleebinder-Gaus 2015). Late Middle Bronze Age occupation layers in Çemy Bağhis in the western part of Cappadocia feature an affluent harbour town with very early evidence for wine production (Şahvol 2015). Evidence of textile tools and production from both sites comprises mainly terracotta spindle whorls, numerous centrally pierced discoid, Minoan-type loom weights as well as horizontally pierced spools and several bone artefacts. The paper discusses what types of tools were involved in textile production at both sites during the Middle Bronze Age, what kind of textiles could be produced with the available tools and if specific chaînes opératoires of textile production can be reconstructed. We will consider the use for a variety of purposes. Our observations compare to another set of data, namely the actual strings and ropes that have been exceptionally preserved and published from the same site.

Beyond textiles: alternative uses of twisted fibers.

Evidence from Akrotiri, Thera

Author - Dr. Vaskirtzis, Sophia, University Of Crete, Athens, Greece (Presenting author)

Co-author(s) - Dr. Gaoma, Fragoula, Hellenic Ministry of Culture and Sports, Ephorate of Antiquities of Corfu, Corfu, Greece

Keywords: Aegean, Bronze Age, Fiber crafts

Presentation Preference - Oral

Fiber crafts are among the oldest technological practices of mankind. Although commonly associated with textile manufacture, twisted fibers in the form of threads have always had a wide range of use in everyday life. Strings and ropes constitute a humble but essential category of fiber products deriving from the same technology and organic matter as threads. Due to their organic nature, however, they rarely survive in the archaeological record, unless special environmental conditions occur. This paper discusses the alternative uses of twisted fibers in the Bronze Age Aegean, with particular reference to the settlement of Akrotiri in Thera. The primary focus of the paper lies on impressions of threads, strings and ropes preserved on objects made of clay and on wall paintings. We will attempt an examination of the technical properties of these products on the basis of their impressions and we will consider their use for a variety of purposes. Our observations compare to another set of data, namely the actual strings and ropes that have been exceptionally preserved and published from the same site.
Interpreting the Archaeological Record

TH1-13 Abstract 10
Technical Innovation in Flax Yarn in the Northwest of the Iberian Peninsula. The Spinning Bowl

Author: Doctoranda Ruiz de Haro, Maria Irene, Escuela Internacional de Posgrado-Universidad de Granada, Almuñécar, Spain (Presenting author)
Keywords: innovation, Linum usitatissimum, spinning bowl
Presentation Preference - Oral

This paper will discuss two basic concepts in addressing the archaeological documentation of a new technological element, in this case the spinning bowl documented in the Castellana culture located in the northwest of the Iberian Peninsula from the Late Bronze Age to the entrance of the Romanization. These two basic concepts are innovation and technological loan. Through these conceptual tools that enable us to face a research methodology on spinning bowls, which help us answer arises why this innovation and its spread to other areas, although this study will focus on documenting spinning bowl in Castellana culture. To explain his presence in this geography and chronology, we will investigate on issues related to the use of Linum usitatissimum, textile raw materials relates to this innovation and secondly to open the investigation to their role within the technical chain embodiment of linen thread in the phase of the splicing techniques.

TH1-13 Abstract 11
Woolen textiles from the times of Roman influences, the site in Grudna, Poland

Author - PhD Grupa, Malgorzata, Nicolaus Copernicus University in Torun (NCU), Torun, Poland (Presenting author)
Keywords: import, textile, wool
Presentation Preference - Oral

Textile samples (with sizes not exceeding 2 x 3 cm), sent to The Laboratory of Archaeological Monuments Conservation of the Institute of Archaeology of NCU in Torun were exceptionally interesting when it turned out that they were made of woolen fibres in spinning bowels technique, while the other part imitated, known in later ages, so called gauze, made in weave 1/1. Technological analyses of the fibres proved their high quality. However, having very few examples of this type of textiles in Poland, we are not able to answer the basic question: is it an import or local production? Information collected from Europe suggest the imported material, but here another question arises – from which direction?

TH1-13 Abstract 12
Biconical ceramic spindle whorls from Maleva mogila near Veselinovo Village, Bulgaria

Author - Vatchev, Todor, Regional historical museum - Yambol, Yambol, Bulgaria (Presenting author)
Keywords: ceramic spindle whorls, Early Bronze Age
Presentation Preference - Poster

The prehistoric Maleva mogila is situated on the left bank of the Tundzha River. It is situated approximately 2 km south-east from the village of Veselinovo in the Yambol district, Bulgaria. The site was inhabited during the Late Neolithic, Early Bronze Age and Medieval periods. During the archaeological excavations and field surveys, 9 whole biconical ceramic spindle whorls were found. Most of them showed similar size and measuring. All of them belong to the third phase of the Early Bronze Age according to Bulgarian chronology (2800 – 2000 BC).

The presented ceramic spindle whorls are connected with the processing of wool. They are heavier than flat spindle whorls which are used for the processing of hemp. The appearance of biconical spindle whorls depict a change in the prehistoric economy during the Early Bronze Age, through a larger breeding of sheep and goats, showing developments in human society during this period.

TH1-13 Abstract 13
The fabric of Bronze Age society: a pilot study on Bronze Age textile production in Hungary

Author - Dr. Kiss, Viktória, Research Centre for the Humanities, Hungarian Academy of Sciences, Budapest, Hungary (Presenting author)

Keywords: Bronze Age, Central Europe, textile imprints
Presentation Preference - Poster

Despite the vast number of textile imprints on ceramics as well as of textile tools (e.g. spindle whorls, weights, spools and needles) from the Bronze Age, textile production – although a key social and technological element of society in this period – has been a profoundly neglected topic in Hungary.

As part of a recent multidisciplinary research project (“From bones, bronzes and sites to society. Multidisciplinary analysis of human mobility and social changes in Bronze Age Hungary (2500–1500 BC)”, http://i.kft.mta.hu/en/eng/automenu-08) launched this year by the Hungarian Academy of Sciences Momentum research programme, our study focuses on local textile production and consumption during the Early and Middle Bronze Age in the Carpathian Basin. The primary goal of our poster is to present the pilot study of this research concerning the technologies used for producing woven and non-woven textiles imprinted on the surface of ceramic storage vessels.

Furthermore, based on the above evidence, the duality of tradition and innovation in textile technology, the organization of production, apprenticeship and the possible emergence of specialisation in the Bronze Age would be examined, as well as how they shaped the socioeconomic role of Bronze Age communities in Hungary.

TH1-13 Abstract 14
Bronze Age (1800–500 BC) textile craft in Estonia on the basis of archaeological sources

Author - PhD Rammo, Riina, University of Tartu, Tartu, Estonia (Presenting author)
Presentation Preference - Poster

Although textile craft is complex, and socially and economically significant, there is little known about textile techniques during the Bronze Age on the eastern shore of the Baltic Sea. In Estonia no textile or cloth remains dated to this period have been found so far. As a result, only indirect evidence such as probable tools (e.g. spindle whorls, bone needles) and textile impressions on pottery can be used to study how the cloth was made. This is also the reason why this topic has deserved only little attention by the researchers.

Textile impressions on ceramic demonstrate techniques of making cloth already in the Neolithic. The tradition to finish the surface of clay vessels with this method prevailed in south-eastern Estonia until the Migration Period. The aim of this study is to gather and systemise all pieces of information concerning Bronze Age pottery with textile impressions, with the focus on differentiating technological variability and pointing out traditional and innovative elements.

TH1-13 Abstract 15
Hallstatt textiles in Poland. Analysis of textile finds from the bi-ritual cemetery in Świbie

Author - MSc Slomska, Joanna, Polish Academy of Sciences, Łódź, Poland (Presenting author)
Co-author(s) - Antonius, Lukasz, IAE PAN, Łódź, Poland
Keywords: bi-ritual cemetery, Hallstatt Period, Textiles
Presentation Preference - Poster

Textile production during the Hallstatt period was an integral part of everyday life of societies living on Polish territory. However, discoveries of fabrics are very rare. Textile remnants from this period, survived primarily in the skeletal bi-ritual graves in Silezia voivodeship. Among preserved fragments of organic finds we were able to distinguish the clothes remains and the elements of accessories. The best preserved and well studied textile remains come from the cemetery in Świbie, Gliwice district.

The locality was accidentally discovered in 1930s, but regular excavations started 30 years later. As a result of the archaeological work, 576 crematory urns and skeletal graves were explored, which provided a rich set of materials. Grave goods are local products, as well as imports from the regions of the South and West Europe. 63 graves contained remains of textiles. Most survived fabrics adhere to metal outfits. In addition, research encountered woven waxes remains, braided ribbons, threads and strings.

Material acquired from the cemetery in Świbie is the largest textile collection from Hallstatt period, discovered in Poland. It waited at museum warehouse for years and only in 2015 at Institute of Archaeology and Ethnology Polish Academy of Sciences in Łódź we could proceed with further studies. Despite the fact that most of fragments were small and mineralized, all undertaken analyses lead to better understanding of textile production in Hallstatt period in Poland, with its innovative and traditional elements.
One of the most characteristic decorative motifs, appearing at the facial urn from Pomeranian culture, are combs. Those most schematically shown in its simplest form, a few vertical lines engraved from the horizontal line. A more realistic had singled handle, circle suspension and sometimes also the details of ornamentation. Combs images were placed on the central parts of urn, on its upper or lower part. Among the researchers any ideas of several vertical lines are interpreted as combs. In this poster I want to draw attention to another possible interpretation of ornamentations on urn of Pomeranian culture from Szemud, Poland. In literature, this image is described as “alleged” comb. It was noted that both the same image, as well as the location of the engraving is unusual for typical combs motifs. If not a comb, then what? According to the author it is a representation of the vertical loom. This interpretation is supported by exceptionally long and densely arranged engraved lines, but most important are located halfway up the three horizontal lines that bring to mind three heddle bars. These elements of the vertical loom for making more complex patterns.
Infant burials on Colonia Iulia Emona's northern cemetery

Childhood interrupted:

It is commonly estimated that in Roman era around 50% of individuals born were unlikely to reach maturity. From the sources we had been bestowed important status within their families, and their enculturation was already in process prior to their death.

Socialization through gender roles is also visible through examination of funerary attire. That even small children learned manufacturing technologies, perhaps through play. Funerary data proves that even small infants were very possibly (also) conducted by children. Further case study material is presented from other temporal and geographical contexts, including the Eastern Mediterranean and the Near East.

In the protohistoric European communities, due to the scarcity of evidence in archaeological record, the role of infants and children is difficult to grasp; indeed, in the largest European cemeteries, children burials are severely lacking, limiting interpretations about the social identities. Contrary to what is usually attested in Central and Southern Europe, in Baltic funerary contexts, social patterns appear more complete, including all age groups; particularly, in Estonia the youngest society members were highly integrated in mortuary spaces since Bronze Age. By analyzing some Estonian case studies (e.g. Kasela, Jõelähtme and comparing the findings with other researches conducted in the largest European cemeteries (e.g. Otro di Nogara, Italy), we can improve our knowledge about the role of children in past societies. This project aims to set this youngest part of the protohistoric communities on the social and cultural background: through spatial analysis and the study of grave goods associated with children/infants burials, we can suggest that children have not played only a marginal role but rather the youngest members have represented a significant component within hereditary social structures in Estonia during the Protohistory.

Weapony in child burials: work, play or a symbol.

Study cases from Latvia’s Iron Age cemeteries

Between 1124 and 1128, Western Pomerania was visited by the missionary bishop Otto from Bamberg who Christianised the region. He founded several churches and taught people how to practise the true Christian life. One part of this community that was involved in this big historical event were children. The aim of this paper is to present the differences between the children burial from Western Pomerania from the pre-Christian medieval period and the period right after the Christianisation. This will be done to examine essential elements of changed religious practices in treating children’s dead bodies.

Christianisation of children’s death in Western Pomerania

During the Protohistory, the role of infants and children is difficult to grasp due to the scarcity of evidence in archaeological record. In the largest European cemeteries, children burials are severely lacking, limiting interpretations about the social identities. Contrary to what is usually attested in Central and Southern Europe, in Baltic funerary contexts social patterns appear more complete, including all age groups; particularly, in Estonia the youngest society members were highly integrated in mortuary spaces since Bronze Age. By analyzing some Estonian case studies (e.g. Kasela, Jõelähtme and comparing the findings with other researches conducted in the largest European cemeteries (e.g. Otro di Nogara, Italy), we can improve our knowledge about the role of children in past societies. This project aims to set this youngest part of the protohistoric communities on the social and cultural background: through spatial analysis and the study of grave goods associated with children/infants burials, we can suggest that children have not played only a marginal role but rather the youngest members have represented a significant component within hereditary social structures in Estonia during the Protohistory.

Interpreting the Archaeological Record

Infant burials on Colonia Iulia Emona’s northern cemetery

Childhood interrupted:

It is commonly estimated that in Roman era around 50% of individuals born were unlikely to reach maturity. From the sources we can conclude that high infant mortality was connected with lack of attachment, lesser pollution resulting from child death and, possibly, marginal position of children in community. Here, I wish to reconsider these assumptions using a group of Late Roman infant inhumations from Colonia Iulia Emona (Ljubljana, Slovenia) as a case study. Those infant inhumations represent around 20% of all inhumations in the colony’s largest cemetery in Late Roman period. They are a consistent group exhibiting similar characteristics in terms of burial rituals and grave construction. Grave goods, when present, often include apotropaic objects, such as phallic amulets, cruciﬁa and nails, connected with mors immutae.
TH1-14 Abstract 09

Getting better. Learning how to know
at the Early Neolithic Flint mine of Casa Montero (Spain)

Author - Dr. Castañeda, Nuria, Université Paris 1-Panthéon Sorbonne, Nanterre, France (Presenting author)
Co-author(s) - Casa Montero, Pedro, Institute of History-CSIC, Madrid, Spain
Keywords - Casa Montero, learning, Neolithic mining
Presentation Preference - Oral

In Prehistoric times, the opportunity to take part in first procurement at a mine was part of the initiation process for infants that would grow up to become the active members of the group. The analysis of lithics remains from the Early Neolithic Flint mine of Casa Montero (Madrid, Spain c. 5300-5200 cal BC), where three different skill levels have been recognized, supports the presence of first knapping apprentices. In order to become part of the community, apprentices had to start working in peripheral tasks before being trained in first knapping techniques. Therefore, management of waste, selection of raw material, extraction and recycling were probably the first stages of learning while helping. Identifying the waste produced by unskilled knappers in the lithic record is critical in order to discriminate them from the general assemblage. Lithic leftovers are expectedly composed by skilled reduction by products and processes generated in the learning process. The latter not only reproduced the normalized reduction schemes, but also could eventually contribute to the final production of blades. This paper will focus in the technical criteria used to recognize the remains of unskilled knappers and which kind of previous knowledge must acquire the novice knappers by helping in secondary tasks at the mine. At Casa Montero, limited access to most quality raw material is one of the main features to determine novice knapping lithic remains.

TH1-14 Abstract 10

Children and animals in ancient Greece; animals as children’s pets, toys or gifts

Author - Dr. Dipalo, Anthi, Hellenic Open University, Athens, Greece (Presenting author)
Keywords - animals, pets, toys, gifts
Presentation Preference - Oral

This presentation aims to examine the relation of children and animals, as illustrated by animal-shaped objects used as toys or grave gifts, as well as animals used as pets by children from infancy onwards, or being presented as gifts to boys in adolescence (the fourth and final stage of childhood) by prospective lovers. Its ultimate goal is to explore the varying or changing attitudes towards animals, as set in particular social and chronological terms, and as based on one of the fundamental dualities permeating Greek thought (humans vs animals, Greeks vs barbarians et.). These attitudes are beweaved to the "unmarked" members of society, children, as part of their upbringing and their training into their future social and gender roles. The main sources of evidence are depictions on Greek vases, mainly Athenian of the Classical period, in which daily scenes become very popular, supplemented by figurines of animals used as toys, as well as works of sculpture, such as funerary reliefs, showing children playing or fighting with animals. Animal-shaped toys, such as rattles, held by either toddlers or their nurses to tull them to sleep, include pig- or wolf teeth, possibly meant to ward off evil. We hear of rocking horses in literature, or come across wheeled animals, mainly horses, for babies to push or pull; once they could walk or crawl. These are either depicted on vases or form figurines found in children's graves. Birds, such as geese, ducks, swans, doves, were the favourite pet of both boys and girls, sometimes buried with them, if they died. Only rarely do we find caged singing birds. Youngsters were associated mainly with dogs and only occasionally with cats, of the Abyssinian breed that was imported to Athens, as well as exotic felines, such as cheetahs. These exotic cats, or occasionally also monkeys, were reserved for the rich youth of fifth c. Athens. Children also appear to play with goats or deer on vases, while we know that older boys could keep racehorses or hunting hounds, as part of their hunting or athletic activities. Pets are not only shown at play, but also being petted, walked, trained, or even mistreated. A special category of pets are the cockerels, often in fight, since they were used to evoke a pugnacious spirit in young boys. Moreover, cocks, as well as hares, tend to copulate a lot, so they are often suitably depicted as erotic gifts in the context of pedastry (boys’ love), along with other animals associated with hunting, such as deer, or pet birds, such as doves.

TH1-14 Abstract 11

The social construction of childhood through Roman artefacts: finger-rings and their motifs

Author - Dr. Swift, Ellen, University of Kent, Canterbury, United Kingdom (Presenting author)
Keywords - artefacts, Roman, social identity
Presentation Preference - Oral

The Roman life course is a well-studied topic, but there have been few considerations of how artefact evidence can contribute to our understanding of childhood in the Roman period. Yet objects made specifically for children both define and conceptualize childhood as a separate category to adulthood, and embody this through social practices involving material culture. This paper takes one object category, finger-rings, and investigates the evidence that relates to the use of rings by children. By examining grave contexts containing finger-rings, we can establish the normal size ranges that existed for rings worn by children and adults. A much larger sample of rings can then be examined, identifying rings in sizes that are likely to have been worn by children, and documenting any decorative motifs on the bezel of the ring that were particularly associated with them. We can show that decorative motifs that were much used for children in the Roman period include the phallicus symbol, palm branch, depictions of the Egyptian god Serapis, and other motifs such as theatre masks. Many of these themes chosen for children’s rings reflect ideas of benevolence and protection appropriate to the perceived vulnerability of children in antiquity, while others relate to childhood activities and conceptualise childhood as a time of leisure. A difference can even be identified between motifs felt suitable only for babies, and those given to older children. We can also investigate the likely age at which children may have been given seal rings, and so document the life course stage at which they began to articulate their identity as a literate person. The paper suggests a methodology that could be fruitfully applied in many periods to reveal more about how childhood was conceptualised in the past.

TH1-14 Abstract 12

The children of medieval and post medieval Copenhagen

Author - Jark Jensen, Jane, Museum of Copenhagen, Kopenhagen V, Denmark (Presenting author)
Keywords - burials, child labour, children
Presentation Preference - Oral

Children are often quite invisible in the archaeological material for many reasons - the (few) toys have disappeared or can no longer be identified; children’s bones are more fragile and perish faster than those from adults from burial sites. With the aim to give nuance to the lives of children in past society, this paper will present the evidence of children living in historical Copenhagen through different unique findings of artefacts, a cemetery and an example of child labour. The Metro excavations in the city centre have given a lot of new evidence of the presence of children in Copenhagen. Well preserved finds of toys made of organic materials were excavated from the moats of the fortification surrounding the city. These unique toys reflect play and fun, but also some of them must have been a means of preparing the children for adult lives. Along with the manufactured toys the evidence of children’s daily life and their curiosity in the things around them are shown. The manufacture-like work at fixed times of the day the children had to help out with the household chores. The girls assisted the orphan Mother in the kitchen and other housework, like cleaning and fixing the clothes and the boys would help the Orphan Father with gardening, knife grinding and repairs. When they were around fourteen years old the orphans were forced out of the institution and had to make a life on their own; most of the boys as apprentice of a craftsmen and the girls as maids. Nevertheless the everyday life of an orphan not only consisted of work. In the mornings the children attended school and they also found some time for leisure and play: the finds of some toys from the orphanage can prove this.

TH1-14 Abstract 13

Work and play at the early modern orphanage in Altenburg

Author - Schäfer, Kathrin, University of Bamberg, Bamberg, Germany (Presenting author)
Keywords - History of Childhood, Orphanage, Post-Medieval Archaeology
Presentation Preference - Oral

In context with my dissertation project at the University of Bamberg I am editing findings from an early modern orphanage. The institution in Altenburg in Thuringia was founded after the 30 Years’ War like many other houses for this purpose in Germany. The walls of the former church of a monastery were used to establish the orphanage. It was financed by donations of the citizenry of Altenburg. Slave and servant children in Archaic and Classical Athenian art

**Author:** Dr. Dipi, Anthi, Hellenic Open University, Athens, Greece (Presenting author)
**Keywords:** servants, slave

In the course of archaeological explorations in former Evangelical church in Bytom Odrzański, a crypt with relics of children belonging to the church founders’ family was excavated. One of the coffins contained the body of a girl dressed in clothes imitating the splendor and social position of the dead girl, but also to show the living that their beloved daughter was to be in future a real lady, but death put an end to her life. Careful manufacturing of the head decorations and sophisticated dress design must have been very expensive, which rarely appears in graves.

TH1-14 Abstract 15

Children and environmental stress in Wielbarkian societies

**Author:** Dr. Chmiel-Chrzanowska, Marta, University of Szczecin, Szczecin, Poland (Presenting author)
**Co-author:** Fatmer, Rafal, University of Warsaw, Warsaw, Poland
**Keywords:** children, environmental stress, Roman period

In the following poster we would like to consider the impact of environmental stress on children in the Wielbark Culture and research possibilities related to this phenomenon. An interdisciplinary research on this type of data allows obtaining the data about landscape use, use of natural resources and economy, as well as information about biological condition of the buried people, paleopathology connected to work, etc. We still lack information about children and their place in the Wielbarkian society based on archaeological finds. The fusion of archaeological and biological points of view will allow describing children and childhood in Wielbark Culture from a different perspective.

TH1-14 Abstract 17

Children in Vilnius potteries

**Author:** Dr. Blazevicius, Povilas, National Museum – Palace of the Grand Dukes of Lithuania, Vilnius, Lithuania (Presenting author)
**Keywords:** Child labor, Fingerprints, Medieval archaeology

In medieval times, careless childhood was but a short period of one’s life. Children started helping adults out at the tender age of 5-7, often doing hard physical work. Written sources depict children as auxiliary workers and apprentices in various workshops and manufacturing sites. What about archaeological sources? The aim of this presentation is to analyse what tasks children could have performed in ceramic workshops manufacturing bricks, roof tiles, glazed tiles and other household ceramics. The data base of the analysis consists of ceramic artefacts discovered during archaeological research in Vilnius, Lithuania. Artefacts with fingerprints found in production sites and residential urban environment are analysed with the help of dactiloscopic methods to establish whether these were children’s fingerprints. The interpretation of background information helps identify the nature and scope of children’s work, as well as changes possibly dependant on the child’s age.

TH1-14 Abstract 18

Work & Play; an archaeology of childhood in Early Modern Scotland

**Author:** Campbell, Stuart, National Museums Scotland, Edinburgh, United Kingdom (Presenting author)
**Keywords:** Archaeology of Childhood

The role of childhood in early modern Scotland can be studied through both documentary sources and visual art, yet recent archaeological discoveries have provided a more immediate form of analysis in the form of toys and the traces of the industry which produced them. Most importantly, these objects allow an analysis of childhood in ‘everyday life’ rather than the images and ideals depicted in the portraits and writings of the social elites. These surviving objects point to an industry geared to producing large numbers of affordable toys and trinkets. The majority of these are miniatures of real world objects, clear indicators of the roles which children were expected to play, not least with the intent of preparing them for adulthood. The study of these objects can elucidate notions of gender and social behaviours as well of those of aspiration; in brief, how adults perceived their offspring and wished them to behave and develop. Not least, the existence of these toys raises questions of the emergence of consumer behaviour, both in their production and in the types produced. There are clear indicators that some of these objects were imported from London or the Low Countries, while others are clearly made in Scotland. These demonstrably not the objects produced for the offspring of the wealthy, and many are home made. This paper will examine these objects in detail and will pose questions about the purpose and nature of these toys and the manner in which they can be interpreted both within the wider themes of European influence and social class.
CHARTING OTHERWORLDS: CEMETERIES AS CULT SITES

Thursday, 1 September 2016, 09:00-18:30
Faculty of Philology, Room 118

Author: - Banerjea, Rowena, Reading, United Kingdom
Co-author(s): - Karczewski, Maciej, University of Białystok, Białystok, Poland (Presenting author)
Keywords: Cemeteries, Cult, Religion
Presentation Preference - Oral

This paper will discuss the definition of cult sites in Vendel and Viking-age Scandinavia. In recent years a number of cult sites with place-names indicating the element of cult (such as theophoric names and place-names containing the element of ‘sacred’), however, suggests that burials were present in these locations. This paper, a selection of these cult sites will be examined through detailed study of archaeological features, topographic features, as well as some written sources, above all liturgical poetry. The overall aim is to investigate how these sites facilitated rituals and ceremonies in terms of movement, acoustics and location of audience and ‘performers’.

Necromancy in grave reopening practices in late Iron Age Scandinavia

Author: - Dr. Klevnäs, Alison, Stockholm University, Stockholm, Sweden (Presenting author)
Keywords: Burials, Excavation, Magic
Presentation Preference - Oral

Vendel and Viking Period burial places in Scandinavia have long been seen as likely sites for cultic activity, indicated archaeologically both through their widespread conversion to Christian places of worship and by sporadic but persistent finds of evidence for offerings at graves. Burials of this period were often also re-entered and disturbed: high profile reopenings like that of the Oseberg grave, rituals, Viking Age

TH1-15 Abstract 03
The Langelid cemetery - landscape, life and afterlife

Author: - Wrenn, Camilla Cecile, Museum of Cultural History, University of Oslo, Oslo, Norway (Presenting author)
Keywords: grave ritual, Viking Age
Presentation Preference - Oral

A Late Viking Age cemetery with 21 graves in Langelid, Aust-Agder County, Norway, will be used as a starting point to discuss cult practices relating to burials in the this period. Ideas that will be explored are how new graves relate to older grave monuments and to the landscape and settlement patterns, how and where the treatment of the corpse (both inhumation and cremation) may have been performed, and to which degree external and internal features of the graves may indicate how they have been perceived and how people have related to them on a physical level. Further, the choices of grave goods will be used to discuss the kind of afterlife that the living helped prepare the dead for. Secondary burials in four graves may give insights into the importance of burial rituals in a late phase.

The cemetery is highly interesting in two particular aspects, which will be contextualised with similar and contrasting examples. Firstly, it covers the very last part of pagan burial custom, at a time when surrounding regions had converted, and shows mostly Christian burials. The religious shift in society seems to some extent to be reflected in acoustically patterned pagan customs in remote areas. Secondly, there is evidence of fairly systematic reopening and manipulation of the graves not very long after the initial burials, which attest to not only activities relating to the actual burials, but also to a later consciousness of the cemetery and its contents, which can be argued to be ritual in nature, and could be interpreted as continued cultic activity on the site.

TH1-15 Abstract 04
Positioning ritual: Interpreting corpse postures in early medieval England

Author: - Mui, Sian, Durham University, Durham, United Kingdom (Presenting author)
Keywords: Anglo-Saxon, body, funerary archaeology
Presentation Preference - Oral

The notion of mortuary theatre encapsulates the drama and performative nature of mortuary (early medieval) Europe. While evidence for mortuary performance is more easily identified in exceptionally sumptuous burials, the narratives of the non-elite may be considerably more challenging to interpret, as a result of smaller-scale funerals and less material evidence. However, even in the absence of ostentatious display of wealth, the corpse in the grave was heavily implicated in the early medieval mortuary theatre. The funerary body was progressively constructed and articulated through its positional arrangement, clothing, and other accompanying features. This paper discusses the ritual significance of corpse positioning in early Anglo-Saxon inhumations, bringing together corpse-positional data from over 2000 graves from 33 cemeteries across England. Patterns of recurring corpse postures demonstrate that positioning ritual was consciously and meaningfully practised in the early Anglo-Saxon period. Nuanced variations in positional preferences within and between cemeteries suggest that body representation was closely linked with the conception and expression of individual and group identities, locally as well as regionally. Addressing the role of the body in early Anglo-Saxon death rituals, this paper explores the belief and practice underlying the organisation of bodies in graves and attempts to unfold the hidden narratives behind the early medieval corpse.

TH1-15 Abstract 05
Christian and pagan: Eggs as grave goods in the Late Iron Age cemetery at Kukruse, NE Estonia

Author: - Dr. Oraa, Ester, University of Tartu, Tartu, Estonia (Presenting author)
Co-author(s): - Jomuk, Tõnno, Estonian Literary Museum, Tartu, Estonia
Keywords: Christian, pagan, grave goods
Presentation Preference - Oral

Vendel and Viking Period burial places in Scandinavia have long been seen as likely sites for cultic activity, indicated archaeologically both through their widespread conversion to Christian places of worship and by sporadic but persistent finds of evidence for offerings at graves. Burials of this period were often also re-entered and disturbed: high profile reopenings like that of the Oseberg mound in Norway are part of a much wider pattern of revisiting and reworking burials. Such reopening practices have frequently been linked to supernatural beliefs, usually on the basis of written sources, and in particular involving communication with the dead. This paper reviews the evidence for disturbance of later pre-Christian burials in Scandinavia, arguing that reopening here cannot be seen as a single phenomenon: it was carried out on a variety of timescales and in different ways. However, a consistent theme throughout the archaeological evidence is the focus of reopening activities on the body of the dead and the artefacts immediately associated with it. The treatment of human remains and their immediate attributes varied - they could be removed and taken away, damaged or destroyed in situ, or removed and left close to the grave. But the focus on these material remains is a key recurring element in Scandinavian reopening practices from the later Iron Age into the medieval period. The evidence from burial disturbance is thus that if cemeteries retain power as cult places, where other worlds are reachable, this power is based on the presence of bodies in graves – it is centred on the physical remains of the dead.
Interpreting the Archaeological Record

Were cenotaphs built at Milai kapis? Analysis of barrows discovered in Wysokie site in Lithuania

Author - Mgr Rosowska, Justyna, Wilczyce, Poland (Presenting author)
Keywords: barrow, cenotaph, Vilkaudnis
Presentation Preference - Oral

In 1913 Stefan Krukowski excavated 22 barrows at Wysokie site (Vikaudnis, dir. Vainoe) in Lithuania. According to the findings, discovered cemetery belonged to the East Lithuanian Barrow Culture and it was used during the Migration Period and the Early Middle Ages. The term Milai kapis means in Lithuanian “the graveyard of giants” and it relates to the part of the site excavated in 1913. During the exploration mentioned researcher found inter alia six barrows without any burial or artifacts inside them. Despite this, these structures revealed certain traces of funeral rites, for example layers of carbon and ash. The same layers were also discovered in the other barrow mounds excavated at Wysokie site. The purpose of my paper is analysis of these six barrows in the context of the funeral rites. Also I will try to answer the question whether they were symbolic barrows.

Cenotaphs in the East Lithuania were built throughout the whole existence of the East Lithuanian Barrow Culture, but it should be noted that their number increased, especially since the half of the 1st millennium. Among them they were often the barrows containing burial inventory without burned human remains. There have also been other variants, while in the barrow there was no evidence of both the burial and the remains of equipment. This case was noted e.g. in the cemetery near the town Alinka (Alinkos, dir. Trakai). The barrows with numbers 9, 10, 11 and 15 did not contain any traces of graves and burial equipment.

The lack of human remains in a grave shows us the new stage in the development of the funeral ritual, which in this case evolved into a symbolic burial. It is believed that this was a result of the new social and political reality, which followed in the Eastern Lithuania at the end of the 1st and the beginning of the 2nd millennium. In this time the increasing number of people could not be buried in their indigenous places. It has happened so probably because of the disappearance of the body. Its absence caused by its death in the distant lands. This was connected with the increasing threat in these times which forced the Lithuanian warriors to heading out to war and also was one of the reasons of the fall of the Roman Empire.

Change of the Lithuanian burial rite in the 14th – 16th century: Archaeological and Written data

Author - Vitkins, Manydus, General Jonas Žemaitis Military Academy of Lithuania, Vilnius, Lithuania (Presenting author)
Keywords: burial, cemeteries, medieval archeology
Presentation Preference - Oral

Lithuania was the last European country converted to Christianity. In its ethnic lands the old heathen faith thrived till the end of the 14th century (and in Samogitia till the early 15th century). Though Christianity featured some signs of spreading to Lithuania since the occurrence of the Lithuanian state (the 1st half of the 13th century), conversions were far from massive. Christian communities (both Eastern Orthodox and Catholic) and their churches and cemeteries existed in Vilnius during the heathen times.

After Lithuania was baptised in 1387 and Samogitia – in 1413, Christianity began to spread causing changes in different spheres of life including burial rites. In the late 14th – early 15th century inhabitants of the present territory of Lithuania practiced inhumation but cremation continued till the 2nd quarter of the 15th century alongside with that. In case of inhumation, the dead were buried both in coffins and without them. Their orientation varied but the tradition of orientating heads westwards started to prevail. This is especially obvious in the burial sites located in the areas where the process of Christianisation was more advanced; burial goods in such graves also tend to be fewer.

Nevertheless, most of the barrows dating to the late 14th – early 16th century still contain burial goods. In most of the cemeteries surveyed burial goods were present in more than a half of the graves; their numbers varied from one to several dozen of items. Knives were the most popular; they were found in the burials of males, females, and children. Female burials distinguished with the numbers of jewellery items, whereas in the male burials only rings were a common jewellery piece. Besides that, female burials often contained spindles and awls, whereas male burials included weapons (and sometimes also spurs and stirrups), first strikers, razors, and belt buckles. Other burial items, such as pouches, purses, coins, chain links, pots, poultry bones, and amulets (laws of wild beasts in metal sockets), were found in burials of both genders.
Though, after Lithuania had been baptised, Christianity began to spread and change burial rites, its influence varied in different ethnic regions of Lithuania. It had a greater effect in the political centres of the state, in the cities, and in the vicinities of castles and churches. Meanwhile, in the periphery old burial customs which were hardly in line with Christianity thrived during the entire period discussed. The faith featured syncretism and entanglement of Christian and ancient heathen traditions which was reflected by the burial rites, as well.

The written sources of the period discussed also present some information on the old burial customs still being practiced in the region revealing how complicated was the way of Christianity into the heathen country.
TH1-15 Abstract 15
What can the cemeteries from 8th – 10th centuries from Lower Danube region tell us?

Author - Dr. Ciperzec, Bogdan Iosif, History and Archaeology Prahova County Museum, Ploiești, Romania

Keywords: cemeteries as social understanding, early middle age, faith in funerary context

Presentation Preference - Oral

In the region of Lower Danube, in the last centuries of the 1st Millennium, a great number of cemeteries were discovered. This is an epoch when Christianity and paganism among barbarians are still fighting for supremacy, generally speaking; in particular a discussion of fighting of different kinds of Christianity with different kinds of paganism, if not even a christian vs. christian. We have a lot of information of this kind of social manifestation of groups, about the cemeteries. Did those information helps us to understand those fighting? To understand the religion of the different groups the lived on the Lower Danube? Did the differences between the way a grave was construct with all its architecture and goods can be viewed as arguments for seeing religious differences between groups or persons? Did the cremation and inhumation are antagonist or not? Overall, we think we have arguments for a discussion not only about what is christian or what is pagan, but for a dipper one, concerning the mainly the person and not the group, taking into consideration small, but we think important, differences in the funerary expression of faith of each grave/person.

TH1-15 Abstract 16
In this World and the Next: Deviant Burial Rites from Medieval Cemeteries in Bulgaria

Author - Parvanov, Petar, Central European University, Sofia, Bulgaria (Presenting author)

Keywords: Bulgaria, deviant burials, medieval period

Presentation Preference - Oral

What is deviant burial and why it occurs are questions that have been part of archaeological thinking longer than we may assume. New perspectives on the interest of such special cases where the deceased received noticeable differentiable treatment is just now forming systematic approach towards them. Recently the theme of deviant burials was reappraised in European archaeology, sometimes creating very heated debate over it. Simultaneously, the increasing finds number of such untypical and strange character attracted significant interest from the media and the wider public on the matter, often turning the topic into academic grey area. This paper will present the general conclusions at the current stage of the research and will illustrate the applied methodology and interpretations with certain case studies. The function of deviant burials in the increasingly complex legal culture of the medieval Bulgarian states and the impact of Christianity and the Church over it will be discussed. Close entanglement between sacred meaning and social evaluation of certain individuals can also be seen as a strategy to create and recreate social identities and memory within cemeteries and landscapes.

TH1-15 Abstract 17
Aegean burials as liminal performances

Author - Dr. Schallin, Ann-Louise, Swedish Institute at Athens, Göteborg, Sweden (Presenting author)

Keywords: Aegean, burial, Performance

Presentation Preference - Oral

Death is one of the moments of transition in life. For the living it is important to affect this event through ritual activities and both pre-liminal rites concerned with the separation from the existing world and post-liminal rites – the incorporation into the new world - are performed. When the Late Bronze Age Aegeans experienced death, they performed specific and appropriate rites and ceremonies in order to connect with the transcendental world and bridge the gulf between this world and the other beyond. This world and the other world were separated by a liminal zone, which partake of the qualities of both and this is where the focus of ritual activity takes place. Special requirements of purity may exist here and a heightened awareness is appropriate, since there is risk of pollution where transition between life and death takes place. The liminal zone is a special and mysterious region, which carries the risks of hidden dangers. The ritual actions of propitiation directed towards the supernatural powers consists of food and blood sacrifice, libations, gifts of non-consumable material objects, prayer and the payment of respect. The present paper brings forward the ritual activities performed at selected Aegean Late Bronze Age cemeteries through the reflection of the material remains and the analysis of the structural components of the tombs.

TH1-15 Abstract 18
Phenomenon of multiple burials and its significance in the studies of Early Mycenaean elites

Author - PhD candidate Dzidzik, Katarzyna, Institute of Prehistory, Zalaszewo, Poland (Presenting author)

Keywords: identity, Mycenaean elites, multiple burials

Presentation Preference - Oral

The presentation will provide a summary of the mortuary customs studies for MH I – LH II Argolis. Multiple graves were only 14% of total excavated number from the sites of Asine, Argos, Dendra, Lerna, Mycena, Tyrins and Prosymna. The analysis focused on the formal nature of specified graves. Following preferences were provided with the MH III period (beginning of Mycenaean culture). The high growth of multiple burials was visible, the traditional burial areas were used and there were no special cemeteries for the elites of society. Some of the objects were highlighted within the cemeteries (perimeter walls, stone steles and tumuli). Using of tumuli (Argos) and perimeter walls (Grave Circles at Mycenae) distinguished them also in the local landscapes. Using of the elaborated tomb structures (cist and shaft graves) and deposition of more sophisticated grave offerings was noticeable. It is also clear that for some multiple burials bigger graves were used, specifically created for this practice. What is deviant burial and why it occurs are questions that have been part of archaeological thinking longer than we may assume. New perspectives on the interest of such special cases where the deceased received noticeable differentiable treatment is just now forming systematic approach towards them. Recently the theme of deviant burials was reappraised in European archaeology, sometimes creating very heated debate over it. Simultaneously, the increasing finds number of such untypical and strange character attracted significant interest from the media and the wider public on the matter, often turning the topic into academic grey area. This paper will present the general conclusions at the current stage of the research and will illustrate the applied methodology and interpretations with certain case studies. The function of deviant burials in the increasingly complex legal culture of the medieval Bulgarian states and the impact of Christianity and the Church over it will be discussed. Close entanglement between sacred meaning and social evaluation of certain individuals can also be seen as a strategy to create and recreate social identities and memory within cemeteries and landscapes.

TH1-15 Abstract 19
The Symbolic Meaning of Grave Goods

Author - PhD candidate Valkotianou, Sarani, Lietuviu literatūros ir tautosakos institutas, Vilnius, Lithuania (Presenting author)

Keywords: Grave goods, Interdisciplinary method, Symbolic meaning

Presentation Preference - Oral

Generally, grave goods are defined as artifacts buried with a deceased that are or will be required in the afterlife. Archaeologists collect the following information about grave goods: the material from which they are made, their measurements and typology, and often detailed descriptions of the decoration of ornaments. Usually the functions and purposes of these artifacts are described in terms of their practical meanings, rather than their symbolic meaning. For example, needles in the grave are approached like sewing tools, that will be used for the same purpose in the afterlife. Grave goods are valuable to determine and identify important data: dates and/or periods of graves and cemeteries, cultural migrations within a certain geographical area, the culture itself or even relevant changes of technologies. Often grave goods are broken down into different groups: by purpose e.g., as tools or ornaments, by whether they were belongings of the deceased or grave gifts, or by location of production i.e., whether they were locally produced or imported.In all these calculations and analyses, grave goods are treated like objects without particularly deep meanings. Also it seems to have been forgotten that funerals are a complex of symbolic actions, which archaeologists can perceive through material remains. To understand symbolic meaning of grave goods we can use interdisciplinary method. This gives a chance to see diverse view of artifacts. The main aim of this paper is to reveal the symbolic meaning of grave goods, using archaeology, ethnology, history and Lithuanian linguistics. To illustrate, five different artifacts have been chosen: needles, rings, stitch belts, axes and swords.
LITHIC RAW MATERIALS IN PREHISTORY: SOURCING, NETWORK DISTRIBUTION AND USE

TH1-16 Abstract 01

Obsidian Use on Islands Big and Small: Sicily and others in the Central Mediterranean

Author - Tykot, Robert, University of South Florida Florida, Odessa, United States of America (Presenting author)

Keywords: exchange, obsidian, sourcing

Presentation Preference - Oral

Starting in the Early Neolithic (ca. 6000 BC) obsidian from four island sources was acquired and distributed over great distances in the Central Mediterranean. In recent years, non-destructive analytical instruments, including portable X-ray fluorescence spectrometers (pXRF), have been used to determine the specific geological sources of thousands of obsidian artefacts from many sites throughout this region. Obsidian from the Aeolian island of Lipari was widely used in Sicily, Malta, peninsular Italy, and as far north as France and across the Adriatic Sea in Croatia. Obsidian from Pantelleria was regularly used on Malta and other islands south of Sicily, and to some extent in Tunisia, Sicily, and the island of Utica to the north. Small amounts of obsidian from sources on Sardinia and Palmaireta made their way to southern Italy. Prior studies of the obsidian sources show multiple outliers for each, with differences in visual and physical features (e.g. colour, phenocrysts, translucency, brittleness) as well as in quantity, size, and accessibility. Importantly, pXRF analysis can distinguish between these subsources, including Gabbialotto and Cannei (both in Lipari) and Baia della Turchi and Lago di Venere on Pantelleria. Consideration of these variables is critical in the understanding of obsidian access and selection, distribution, and use, and may be integrated with our knowledge of the availability and transportation of other material culture items (e.g. flint, greenstone, ceramics, animals, secondary products). The large number of artefacts from many Neolithic and Bronze Age archaeological sites has now provided the opportunity to assess socio-economic changes over time, and variation based on location and lithic production methods, typology, and usage. Obsidian distribution patterns also provide better understanding of open water transport capabilities and directions, with Pantelleria 100 km from southeast Sicily, Lipari 30 km from the northeast coast of Sicily, and many obsidian artefacts transported several hundred km further along the coasts of the Tyrrhenian, Ionian, and Adriatic Seas.

TH1-16 Abstract 02

Provenancing Archaeological Obsidian from Bulgaria

Author - Bonsail, Clive, Edinburgh University, Edinburgh, United Kingdom (Presenting author)

Co-author - Gurova, Maria, National Archaeological Institute with Museum - BAS, Sofia, Bulgaria

Co-author - Ivanov, Georgi, National Archaeological Institute with Museum - BAS, Sofia, Bulgaria

Co-author - Ensenki, Nedko, Archaeological Museum, Veliko Tarnovo, Bulgaria

Keywords: Bulgaria, obsidian, provenancing

Presentation Preference - Oral

Use of obsidian is documented in a small number of Neolithic and Chalcolithic sites in Bulgaria. With no known geological sources in the eastern Balkans, the obsidian must have been obtained from areas further afield. Establishing the provenance of archaeological obsidian can provide insights into social and economic contacts among regions and to the nature of those contacts. We report the first results of non-destructive XRF analyses of obsidian artefacts from Bulgarian prehistoric sites and comparisons with geological sources in Anatolia, the Aegean, the central Mediterranean and Carpathians. Our findings have an important bearing on lithic raw material exchange systems in the Balkans from the Early Neolithic onwards.

TH1-16 Abstract 03

Sites, Sources and Flint Routes

Author - Manolakakis, Laurence, CNRS-Lab. Trajectoires, Nanterre cedex, France (Presenting author)

Co-author - Aubry, Laurent, CNRS-Lab. Trajectoires, Nanterre cedex, France

Co-author - Robert, Bruno, CNRS-Lab. Trajectoires, Soissons, France

Keywords: Bartonian flint, sources, procurement, control, Neolithic, Michelsberg, routes, access

Presentation Preference - Oral

During the Middle Neolithic in the Alpine and Velese valleys, the numerous sites dating to the Michelsberg Culture mostly exploit Upper Bartonian Tertiary flint (e7b). This was used predominantly for producing flakes, although long blades and polished axes were also made. Other Tertiary silicifications are used, as well as varying amounts of Secondary flint. Survey was recently undertaken to record all Upper Bartonian outcrops located between the Velese valley and the well-known source at Romigny/Lhery. The aim here was to address a number of issues. Is there a source of Bartonian flint closer than Romigny/Lhery with sufficiently large and good quality nodules for production of long blades? Are there any short shafts of the kind known in other Michelsberg areas? Are ditched enclosures involved here in controlling access to the resource? Is the area elsewhere in Michelsberg contexts, for example at Jablines, in the central Paris Basin, or in the Pays de Gex in Switzerland? Using the results obtained, we tested various models of routes between sites and sources, based on least cost analysis algorithms for travel times. This enabled us not only to identify the possible routes used, but also to calculate more accurate distances involved. Different hypotheses were tested, including direct or indirect access, with or without an enclosure controlling either access or distribution. To conclude, the preliminary results are compared with evidence elsewhere of Michelsberg lithic procurement territories.

TH1-16 Abstract 04

Lithic raw material and flint mining sites in Lithuania in the Final Paleolithic-Early Neolithic

Author - Šatavičius, Egidijus, Vilnius University, Vilnius, Lithuania

Keywords: Final Paleolithic, Neolithic, lithic raw material, flint, mining sites, workshops

Presentation Preference - Oral

High quality flint nodules (Baltic erratic flint), which are found in abundance on the ground surface and in the larger river and lake valleys in nowadays southern Lithuania were usually used for knapping by the Stone Age people. Furthermore, flint concretions in Lithuania are associated with Upper Cretaceous chalk / chalk marl beds transported by glaciers and their outwash streams. The blocks of Pre-Quaternary rocks occur quite frequently in the southern and southeastern parts of Lithuania. Till now, the Final Paleolithic flint mining sites and workshops had been discovered at 4 places in south Lithuania: Elyenyas, Margykos, Tiltas and Būdės. Several others have been only preliminarily identified. However, the small hunters’ communities in northern Lithuania, which territories lack high-quality flint raw material, were forced to import a high-quality raw material from southern regions of the country. Such cooperation between the southern and northern local communities continued until the end of the tanged point manufacturing tradition (Middle Mesolithic). Later exchange contacts are interrupted and the northern part of the country’s population was forced to settle for poorer local flint raw material, or even choose a different raw material for their tool production.
Dysna river corridor was widely re-used at the turn of the Neolithic-Bronze Age, when the yellow flint was imported from the Valdai usual. Other kinds of rocks used widely for the production of special tools (axes, chisels, grinding stones, etc.). Daugava-assemblages from north-east and north Lithuanian, due of sizes of cores, tools and debris which are 3-10 times smaller than usual. Other kinds of rocks used widely for the production of special tools (axes, chisels, grinding stones, etc.). Daugava-Dy尼亚 river corridor was widely re-used at the turn of the Neolithic-Bronge Age, when the yellow flint was imported from the Valdai / Upper Volga region.

It is a known fact that the available lithic resources in Ireland and Portugal are quite distinct from the ones in coastal Mesolithic sedimentary basins. This is reflected in lithic assemblages where quartz is clearly dominant while exogenous rocks such as flints and cherts are residual and have specific roles in the raw material economy. Work undertaken recently in the Sabor valley, northeast Portugal, brought to light several prehistoric assemblages (from Palaolithic to Bronze Age) where a huge range of local and regional rocks were used. Dozens of different raw materials were identified and such diversity led to the creation of a regional raw materials reference collection, now in the Natural History and Science Museum of the University of Porto. Although several varieties of quartz dominate the assemblages, other local high silica content rocks were selected by prehistoric communities such as hydrothermal silicifications, opal, jaspers, lydite, mafic granulite, and greywacke among others. These had a crucial role in the economy of those human groups. Among all lithotypes greywacke represents an important part since it was applied in several uses throughout times. It presents not only decent knapping aptitude but also a good thermal conductivity. With easy access it was used in various further uses: for structural purposes (hearth, post holes, floors), portable art (engraved slabs), anvils, but also on knapped stone assemblages as blanks or tools. It was also applied in daily tasks. In this paper will be presented the multiple uses of greywacke from Palaolithic to Bronze Age, in a specific region and its significance for each human group.

Lithic procurement as a social phenomenon

TH1-16 Abstract 06

Differences in the raw material preferences in Polgárd-Czechohalm, northeast Hungary

Author - Faragó, Norbert, Eötvös Loránd University, Budapest, Hungary (Presenting author)
Keywords - chipped stones, Late Neolithic, raw material

Chipped stones played an important role in the sustenance of human life not just in the Palaolithic, but in the Neolithic period also. The raw material preferences and choices became more indicative as more complex settlements and societies emerged. Chipped stones in different contexts teach us to take into consideration the many aspects of the prehistoric world. The case of the Late Neolithic site Pomp-Czechohalm reflects well these combined phenomena, where two different habitation units (bell and horizontal settlement), two different geographical regions (Central Europe and the Balkans), two different scenes of life (fugal and proto-literate) met and mixed with each other. Although these categories were more plastic and permeable for the prehistoric people, it is worth trying to investigate separately the various situations, where chipped stones played their role. Through these analyses it became clear that, generally, the local raw material is more related to the part of the settlement presumed to be related to daily, while the tell is more oriented toward to distant sources. In other situations the stone itself became a medium and bears a significant meaning in a different way. No matter which is the case, the raw material choice and the technology used may have been forced by practical reasons, without any other motives behind it.

TH1-16 Abstract 08

Double cache – single core: a case of long distance (85 km) stone tool refits from southern Norway

Author - Nielsen, Svein, Museum of Cultural History, University of Oslo, Oslo, Norway (Presenting author)
Keywords: Long-blades, Middle Neolithic, Norway

The paper presents selected issues related to the manufacture, distribution and function of the Final Neolithic flint axes in western Poland. The main subject of our study is flint axes associated with the Funeral Bower Culture, Ostdroher Amphirole Culture, and Corded Ware Culture. For the research presented in this paper, we combined raw material analysis with morphomeric, morphologic, microwear and experimental methods. We carried out studies on the types of raw materials from which the flint axes were made. The data obtained were compared to the sources from local outcrops, and two important centres of axe production associated with the Lithics from southeast Poland and “Scandinavian flint”. Based on these results, we created models of chaine opératoire relating to the production and use of the flint axes made from different types of raw material. Additionally, we investigated the character of the distribution route – whether craftsmen manufactured the lithics axes only near to the prehistoric flint mines and their goods were imported to the other territories, or they journeyed as specialists who distributed and repaired the flint axes.
TH1-16 Abstract 10
Banded flint from Central Poland – new discoveries, new questions
Author - Sałdzi, Michał, University of Cardinal Stefan Wyszynski in Warsaw, Warsaw, Poland (Presenting author); Co-author - Budziszewski, Janusz, University of Cardinal Stefan Wyszynski in Warsaw, Warsaw, Poland; Co-author - Grudzi, Włodzisław, University of Cardinal Stefan Wyszynski in Warsaw, Warsaw, Poland; Co-author - Jakubczyk, Michał, Institute of Archaeology and Ethnology Polish Academy of Sciences, Warsaw, Poland; Co-author - Radzińska, Katarzyna, University of Cardinal Stefan Wyszynski in Warsaw, Warsaw, Poland
Keywords: banded flint, flint mining, remote sensing
Presentation Preference - Oral
Prehistoric banded flint mines were discovered on the northeast margin of the Świętokrzyskie Mountains nearly a hundred years ago. Since then, they have been attracting the attention of several generations of Polish archaeologists. A special place in these studies was taken by a large and well-preserved mining field “Krzeszowice”. Intensive research on prehistoric banded flint exploitation conducted in the last quarter of the twentieth century was summarized during the VIIth International Flint Symposium. In recent years, one has returned to the research of flint mining using new technical possibilities. Geological survey showed the location of many kilometres of outcrops of banded flint in the southeast margin of the Świętokrzyskie Mountains. However, there is no evidence of its use in prehistoric times. Survey also located sporadic occurrences of secondary accumulations of banded flint in glacial deposits in southern Poland (near Cracow). Airborne Laser Scanning (ALS) make it possible to analyze in detail the entire course of banded flint outcrops from the NE margin of the Świętokrzyskie Mountains. This resulted in the discovery of yet another prehistoric point of exploitation. Also allowed to create detailed maps of all known prehistoric mining sites. These plans revealed a previously unknown method of exploitation and also changed our ideas and state of preservation of most sites. Verification surface survey of prehistoric banded flint mines resulted in the discovery of materials that show in new light the problem to access of resources and how they used in the final Neolithic and Bronze Age.

TH1-16 Abstract 11
Still in Prehistoric Times? The mined flint for production of high quality tools in Dynastic Egypt
Author - Butalwa, Sylwia, Institute of Archaeology and Ethnology of Polish Academy of Sciences, Warsaw, Poland (Presenting author)
Keywords: Dynastic Period, Egypt, flint, mining, exploitation
Presentation Preference - Oral
Flint as a material for the production of implements in Egypt was still common during the Bronze Age. It was caused mostly by the difficult access to copper and tin deposits and especially the costs of the production of metal tools. In contrast, sources of flint were easily accessible for everybody. Additionally, products of this raw material had a long durability and a low cost. Flint appeared almost throughout Egypt, but mined flint of better quality, was placed mostly in wadis, such as in Wadi el-Sahhak, Wadi Sojoor, Wadi Umm Nhayabar and in Western Theba. These places attracted the attention of researchers since the end of the 19th century. However, none of them has been comprehensively examined. Only recently research has been resumed. In the area of the wadis there are still place of extraction of raw material, lasting its quality, knapping workshops and some temporary workers’ shelters visible at the surface. On the other hand, there are not many traces of knapping workshops on the settlement area in the Dynastic Period. However, a wide spectrum of everyday objects made of flint is known from the territory of Egypt. This paper is concerned with the study of flint assemblages from a number of Egyptian archaeological sites of the Dynastic Period. The observations are based on published material from mines and settlements, on museum collections and excavations. The attempt to compare the mined flint and flint from secondary placer deposits products will be carried out. The results of the analysis will provide an introduction to the topic of flint knapping specialization and indicate the importance of this raw material in Dynastic Egypt.

TH1-16 Abstract 12
Obsidian blades débitage at Kašov-Čepegov I (Břeclav Culture), Slovakia
Author - Aliard, Pierre, CNRS, Nantes Céder, France (Presenting author)
Co-author - Klaric, Laurent, CNRS, Nantes Céder, France
Co-author - Homodrou, Bibiana, Institute of Archaeology, Slovak Academy of Sciences, Nitra, Slovakia
Keywords: Early Neolithic, lithic technology, obsidian
Presentation Preference - Poster
This paper will present the result of a new study of the site of Kašov-Čepegov I in eastern Slovakia. Excavations at Kašov were led by Ladislav Banesz during the mid-1980s. Excavations revealed one pit with hundreds of obsidian waste concentrations and associated decorated pottery sherds belonging to the Břeclav Culture (Bnepz 1991). The exploitation and trade of obsidian is usually linked to the Břeclav Culture. Previous analyses of chipped stone industries from various sites have shown that obsidian played a major role especially with the existence of so-called specialized on-site workshops where blocks were preliminarily worked and partially exploited to produce blades. The detailed technological study of the concentrations shows that the raw material exploitation of obsidian knapping at Kašov is quite an original Neolithic obsidian débitage. The production is not very regular and shows « macro blade debitage » as well as smaller blades. Evidence of flint-knapping apprenticeship has also been detected. Finally, we demonstrate that Kašov can rather be interpreted as a domestic assemblage. The obsidian production does not suffer much from other blade productions made in lemovian or radiolarite described on other Bněka sites. We believe that the blade débitage of the pit at Kašov belongs to a laminar tradition that appeared in the Early Phase of the ELC in eastern Slovakia.

TH1-16 Abstract 13
In search of a non-destructive way of identifying lidite in archaeological lithic assemblages
Author - Manninen, Mikael A., University of Oulu, Museum of Cultural History, Helsinki, Finland (Presenting author); Co-author - Anttiroiko, Niko, Archæological Field Services, National Board of Antiquities, Helsinki, Finland; Co-author - Heikkilä, Pasi, University of Helsinki, Department of Geosciences and Geography, Helsinki, Finland; Co-author - Pesonen, Petri, Archæological Field Services, National Board of Antiquities, Helsinki, Finland; Co-author - Tarasov, Aleksey, Karelian Research Centre, Russian Academy of Sciences, Petrozavodsk, Russian Federation
Keywords: Lake Onega, Mesolithic, Fennoscandia, Russia, lidite, shungite, lithic provenance analysis
Presentation Preference - Poster
Lidite is a low grade metamorphosed siliceous sedimentary rock consisting of quartz and approximately 5% noncrystalline shungite carbon. The rock has a coarsish fracture but often contains internal flakes while the noncrystalline carbon gives it a pitch black colour. In Northeastern Europe deposits of this rare rock type can be found only on the north-western shores of Lake Onega in Russia among other shungite-bearing rocks. The Onega beds from bedrock and glacial-drift derived pebbles, were used for stone tool raw material since the initial postglacial habitation of southern Karelia in the Mesolithic. Outside present-day Russian Karelia artefacts made of lidite are rare but no systematic study of their distribution outside the core area has been conducted so far. However, several artefacts made of a raw material that we suggest to be lidite were recently detected among the finds from Jokivarsi 1, the earliest Mesolithic site in Finland and some 250 kilometres from the western shore of Lake Onega. In support of our working hypothesis of the source of the Jokivarsi 1 artefact a radio carbon date indicates a contemporaneous Late Preboreal human presence on the northern shores of the Onega Lake. In order to identify the raw material of the Jokivarsi 1 artefacts, a multidisciplinary research project was designed with two aims: 1) to identify the raw material of the Jokivarsi 1 artefacts using a variety of petrological and archaeological methods, and 2) to develop a non-destructive method for identifying lidite in archaeological assemblages. The study was conducted and the paper prepared with support from the North Karelia Fund of the Finnish Cultural Foundation and the Russian Scientific Fund (grant 14-17-00766).

TH1-16 Abstract 14
A Danubian raw material exchange network: a case study from Chelmo Land (Poland)
Author - Wiara, Dagmara H., Institute of Archaeology and Ethnology Polish Academy of Science, Warsaw, Poland (Presenting author)
Keywords: Danubian communities, distribution of siliceous rock, East-Central Europe
Presentation Preference - Poster
The Polish Lowland is poor in deposits of good quality raw materials for the manufacture of chipped stone artefacts. Linanbandkeramik communities, in Chelmo Land, distributed good quality siliceous rock. Some of them were distributed over dozens of kilometres. On the sites “imported” flints were predominant. Among the most important are the “chocolate” flint from the northeast margin of the Świętokrzyskie (Holy Cross) Mountains, and Jurassic-Cracow flint from the Polish Jura, near Krakow. From 14 inventories from Chelmo Land were analysed more than 1400 flint artefacts. The presence of distributed materials is from 3.3% to 85%. In the oldest phase Jurassic-Cracow flint predominates, whereas in the younger stages “chocolate” flint is dominant. The latter is present in several varieties, which indicates that it may have been imported from different outcrops. This suggests that the links with the south were not limited to one area. The presence or absence of these two types of flint has an influence on our knowledge about the meaning of the sources, the use and existence of flint mining and the reconstruction of exchange routes. Unfortunately, mistakes are sometimes made when distinguishing the various flints. In particular “chocolate” flint is mistaken for Jurassic-Cracow flint. To better distinguish these two types of flint we made several analyses. One method we used was Electronic Probe Micro Analysis (EPMA). We analyzed several geological samples as well as artefacts from four prehistoric sites from Chelmo Land. In this paper we present the results of the analyses and their potential implications for our knowledge of Linanbandkeramik communities’ exchange and distribution of siliceous rock. Acknowledgements: The investigations were funded by the National Science Centre in Poland (PRELUDIUM 2; UMO-2011/03/N/HS3/03973).
TH1-Abstract 15
Local flint pebbles reduction strategies in the settlement of Sārnate

Author - Kalnins, Marcis, University of Latvia, Riga, Latvia (Presenting author)
Keywords - Neolithic, pebble reduction strategies
Presentation Preference - Poster

This study is an analysis of local flint pebbles reduction strategies in the settlement of Sārnate. The site is located approximately 2.5 km from the present Baltic Sea shore on a former lakeshore on the Kurzeme Peninsula (western Latvia) and is dated to the Neolithic of the East Baltic. It was excavated between 1938 and 1959 by Eduards Šturms and Lūcija Vankina. During excavations in the site several levels were discovered many separate dwellings. Therefore, in this site it is possible to analyse knapping strategies and techniques that were used in each dwelling and determine similarities and differences between them. According to the data from proximal debitage analysis it is possible to divide dwellings into two major groups on the basis of the way flakes were produced from local flint pebbles. The first group consists of dwellings where for flake removal from a pebble the cortical surface of the pebble was used as a striking platform. In this group flakes are produced from impact along the cortical edge of the pebble. Using this strategy the dwelling inhabitants made quite thick and massive monopolar flakes that mostly belong to the secondary flake group (grouped by the Triple Cortex Typology). The same pebble reduction strategy was used for poorest quality imported flint as well. While good and excellent quality imported flint pebbles and nodules were transformed into platform cores or used as irregular multidirectional cores. In some cases, in this dwelling group local flint pebbles have been divided into massive debitage using bipolar technology as well. The secondary dwelling group consists of dwellings where the quality of a flint pebble did not affect the reduction strategy. In these dwellings both poor quality local flint pebbles and all kind of imported flint pebbles were transformed and used as platform cores and irregular multidirectional cores. In these dwellings flakes from local flint are more like flakes from imported flint - thinner and mostly with a flat striking platform. If the results of this study are compared with the study of pottery in the Sārnate settlement by Valdis Bērziņš, then the first group dwellings where raw material quality affected the pebble reduction strategy are mostly those where were used local pottery tradition: dwellings with Early Sārnate Ware and dwellings with Late Sārnate Ware; while in dwellings where raw material quality did not affect pebble reduction strategy Typical Comb Ware pottery was mostly used.

TH1-Abstract 16
Localisation of Sources of Obsidian Registered in Bohemian Prehistory (Czech Republic)

Author - Burgert, Pavel, Institute of Archaeology of the CAS, Prague, Czech Republic (Presenting author)
Co-author - Prichystal, Antonín, Department of Geological Sciences, Masaryk University, Faculty of Science, Brno, Czech Republic
Co-author - Prokeš, Lubomír, Department of Chemistry, Masaryk University, Faculty of Science, Brno, Czech Republic
Co-author - Pavlík, Jan, Department of Geocological Sciences, Masaryk University, Faculty of Science, Brno, Czech Republic
Keywords: Czech Republic, Neolithic, obsidian
Presentation Preference - Poster

The poster summarises the results of the first geochemical analyses of prehistoric obsidian artefacts from Bohemia (Czech Republic, Central Europe). The analyses focused on eleven samples with reliable find contexts. The majority of the samples come from the Neolithic period (Linear Pottery Culture: LBC; 5500–5000 cal. BC; Brk). The other samples are all from the data obtained, it is possible to locate the raw material of nine samples to the Slovakian source called Carpathian 1t (Brno – Čajkov). However, the raw material of the two remaining samples dated to the same period comes from Hungarian sources, Carpathian 2b (Erdeiö); Olsztyn 04. It is therefore evident that in the Neolithic period, obsidian from the Olsztyn region was also used in Bohemia. Both sources are more than 500 km away from the site studied, which suggests that direct access to the sources is highly unlikely. There are two possible explanations. Either, the obsidian raw material was transported to the Bohemian territory with the primary aim of gaining the raw material as such (good quality, black colour), disregarding its source. Thus, the final evidence of the two sources in the site is the result of a pure coincidence. The other explanation is based on the possibility that different societies (settlements) had different demands or exchange strategies.

TH1-Abstract 17
Chocolate flint extraction points and workshops in Oronoso, Poland. Spatial and functional analysis

Author - Knechtel-Gubala, Katarzyna, Institute of Archaeology and Ethnology Polish Academy of Science, Warsaw, Poland (Presenting author)
Keywords: chocolate flint, Oronoso, Palaeolithic
Presentation Preference - Poster

Oronoso village and region is located in the northwest part of the chocolate flint deposits (one of the most valuable raw materials of Poland), on the northeast Masovian margin of the Holy Cross Mountains and Radom Plain, in the district of Mława, Masovian voivodship. The history of researches in this area began in the early XX century, when S. Kruszkowski discovered numerous sites connected with the exploitation of local raw materials that are dated from Late Palaeolithic to Early Bronze Age. Judging by the research, the use of underground, mining methods there was also confirmed, and dated as early as the Late Palaeolithic and probably Early Bronze Age. All of the sites known from archival research (conducted also by other researchers until recently) have been collected in one database. This contains several hundred sites concentrated in the northwest part of the chocolate flint outcrops (about 60 km2), connected with the Stone Age settlement. The problem was that the density of their data results (besides potential prehistoric settlement factors) from the accessibility for research of the area, connected with the hydrology of the region, with many marshy areas that were inaccessible for surface observations, as well as the accuracy of research in particular areas. In part of this area, few investigations such as road building have been undertaken, which would have led to detailed surveys and excavations. Regardless, the database highlights the intensity of the sites and their broad chronological range. This database is consequently increased. Recently, after new surface field works that has to verify known mining sites (mining fields, workshops), new data were collected. This paper presents the information from the sites already known from earlier researches in light of new data obtained during the field works as well as remote sensing, aerial and satellite imagery analysis. Generally, it raises the problem of the Stone Age (mainly Palaeolithic and Mesolithic) settlement organisation system in the vicinity of the chocolate flint outcrops, its preferences and dependence on natural conditions, as well as the question of chocolate flint outcrops vicinity and mining in different periods of the Stone Age. * the project ‘Exploitation and processing of chocolate flint during the Palaeolithic and Mesolithic in the northwestern part of its deposits based on non-invasive archaeological and geophysical research and test trenches’ financed by the National Science Centre, Poland (2015/17/N/ HS3/0179).

TH1-Abstract 18
Analysis of household units from chipped stone tools at Alsónyék–Bátszék (Hungary)

Author - Szabó, Kati, Eötvös Loránd University, Budapest, Hungary (Presenting author)
Keywords: chipped stone tools, Late Neolithic, Lengyel culture
Presentation Preference - Poster

Alsónyék–Karasz-dűlő site belongs to the Southeast-Transdanubian group of the Late Neolithic Lengyel culture. The chipped stone tools stem exclusively from the settlement at Alsónyék. The research focuses on the raw material definition, thus, the centre of the discussion is the typological and technological analysis and the aspect of household archaeology. The settlement’s collection is processed in the aspect of household archaeology, which research method has gained ground in the last few years. This is backed by favourable conditions, such as the large-scale excavations joined by large-scale construction projects, and the archaeologist’s more frequently used “toolbox”, including new types of analyses in natural sciences. The technical analysis of the chipped stone tools provides an opportunity to reconstruct the tool making procedure, which may result in the tool production system of a cultural unit. The operation of the creating procedure, the phases of the sequence show the tool making place and aspect / character in the site on a rudimentary level. This method enables the localisation of the activity zones within the settlement. The activity zones, defined from the results of the technological analyses on all kind of artefacts, determine the final household units. The settlement structure at Alsónyék comprises large pits, which contain the great majority of the chipped stone tools. The postfamed houses and the large pits determine four, significant comparable household units, which allowed of a hypothetical assumption. The raw material distribution of the household units reaches near equivalent ratio, and, additionally, every category / type of tools occurs in the site, which consequently leads to a presumption that there was a complete tool making activity in the settlement. However, on the score of differences between typological categories of the household units, the procedures of tool making are located partly within the site.

TH1-Abstract 19
The Flint Inventory of the Neolithic and Bronze Age from the sites at Żylicy (western Belarus)

Author - Valent-Scherbach, Svjatiana, Institute of History NAS of Belarus, Minsk, Republic of Belarus (Presenting author)
Keywords: flint industry, Neolithic, Prehistoric-Age culture
Presentation Preference - Poster

The results of the project “Exploitation and Processing of flint during the Palaeolithic and Mesolithic in the northwestern part of its deposits based on non-invasive archaeological and geophysical research and test trench” financed by the National Science Centre, Poland (2015/17/N/HS3/0179).
Interpreting the Archaeological Record

for further detailed research that would be useful to conduct using 3D visualisations. Considered as sufficient and should be chosen as minimal requirement for artefact documentation. It allows also choosing items used for interpretation. Therefore, still the high-quality 2D documentation in representative projections of artefacts can be obtained data are more complete comparing with 2D documentation, however, dominant part of information cannot be directly options of various detalization morphometric methods were evaluated using 2D images and 3D models of the studied objects. Photogrammetric methods using images obtained with a Canon EOS 700D SLR camera, which were processed using software visualization. Accordingly, in the study were conducted experiments in which the 3D models of pebbles and lithic artefacts were and determination of standard characteristics of artefact shapes. The mentioned indicates that it is necessary to develop a regional context often applied in case studies, but would be also used as a method for obtaining data for wider comparisons studies conducted do not allow to evaluate the suitability of applied methods and point to fact that still there has not been developed an approach that would enable to characterize distinguished tools or tool types, mostly in narrow regional context often applied in case studies, but would be also used as a method for obtaining data for wider comparisons and determination of standard characteristics of artefact shapes. The mentioned indicates that it is necessary to develop a context. Morphology analysis is based on precise and uniform documentation of artefacts and one of topical approaches is 3D visualization. Accordingly, in the study were conducted experiments in which the 3D models of pebbles and lithic artefacts were created using Acon Breuckmann smartSCAN 3D scanner and software OPTOGAT. As well the objects were visualised in 3D by photogrammetric methods using images obtained with a Canon EOS 700D SLR camera, which were processed using software Agisoft PhotoScan Professional and MeshLab. The studied objects had dimensions from 0.5-2.0 cm. Subsequently, application options of various detalization morphometric methods were evaluated using 2D images and 3D models of the studied objects. In order to conduct comprehensive morphology analysis of lithics, documentation and appropriate methodology are important. The study conducted reflects possibilities of accurate documentation in 3D, however, the solutions are resource intensive. The obtained data are more complete comparing with 2D documentation, however, dominant part of information cannot be directly used for interpretation. Therefore, still the high-quality 2D documentation in representative projections of artefacts can be considered as sufficient and should be chosen as minimal requirement for artefact documentation. It allows also choosing items for further detailed research that would be useful to conduct using 3D visualisations.
Anglo-Welsh social and political relations is therefore an original dimension of this paper to both castle studies and to the study of the medieval March of Wales.

TH1-17 Abstract 03

The medieval roof trusses in the Swedish landscape of Västergötland

Author: M-A. Vinnjö, Jesop, Croatian Conservation Institute, Svetvinčenat, Croatia (Presenting author)

Keywords: development, medieval fort, preliminary reconstructions

Presentation Preference: Oral

The Medieval fort Petrapilosa is situated in the northeast of the Istrian peninsula in the Republic of Croatia. It is one of the largest, and as historical sources indicates, one of the most significant feudal forts in Istria. Systematic archaeological researches of the fort area have been conducted in the last six years that confirmed the lengthy and very dynamic development of this fort. The results of the archaeological researches in combination with the detailed analysis of the preserved wall structure allowed us to distinguish different phases of development that cover period from the 11th to the 17th century - a process that synthesizes both the stages of development and episodes of destruction or degradation. These analyses allowed us a reconstruction of the appearance of the fort in its various developmental phases. Development of building structures was closely connected with different production of the army and military that more or less influenced the character of buildings and activities that have been happening in and around it. In a way, preserved structures of Petrapilosa are reflection of historical processes that have been changing Istrian peninsula through long period of Middle Ages.

TH1-17 Abstract 05

Medieval Roof Trusses in the Swedish landscape of Västergötland

Author: Master Gullbrandson, Robin, Västergötlands Museum, Skara, Sweden (Presenting author)

Keywords: Medieval churches, Medieval roof structures

Presentation Preference: Oral

This paper deals with the methods and results of an inventory made 2014-2015 with the aim to survey what is preserved of medieval roof constructions in church attics in the Diocese of Skara in the landscape of Västergötland of western Sweden. More or less intact roof truss-es from the 12th century up until the first half of the 13th century are scarcely preserved outside Scandinavia, which add up to the importance of mapping this unique unknown heritage in Sweden. Similar surveys have been made in the diocese of Lund, Skara, Stockholm, Strängnäs and Västerås during 2013-2015 and are about to be made in Linköping, thus giving us a more complete view of the grade of preservation.

It has been as-sumed that the Swedish material may consist of some hundred Romanesque roof structures and probably almost a hundred Gothic structures. Until the conduct of above mentioned surveys our knowledge of the number of preserved-wed objects was scarce and more or less random. In the present study it seems that the early-medieval roof structures of churches in the landscapes of Götaland may comprise the largest preserved corpus of this kind in Northern Europe. This heritage is at the disposal to be studied and discovered in the future for understanding the processes behind their erection.

164 churches in the Diocese of Skara have medieval origins. They are all situated in the old landscape of Västergotland. The survey has identified whole or partly preserved medieval roof constructions or traces of such in the attics of almost 70 of these churches. 28 roofs can be regarded as well preserved roof trusses with tie beam, dating from the 12th century and the first half of the 13th century. Ten are only partly preserved and 18 remains as reused parts in later constructions.

Some of the early medieval churches have been dated with dendrochronology and span from the 11th to the 13th century. A group of roof trusses with two carried struts (often meeting the rafters and tie beam) was in use for about a hundred years, until it was in turn pulled down during the second half of the 11th century, when the first Romanesque Cathedral was being built. Subsequently, the ruins were disturbed and partly destroyed by the 11th-12th centuries' medieval grave yard and later still by numerous medieval and modern intrusions. The analysis of this discovery (archaeological context, architectural features, building materials) offers a unique opportunity to explore the history of the Carpathian Basin around the year 1000.
Recent excavations in Oslo's medieval town revealed two masonry cellars close to the episcopal complex. Both cellars date to the late 13th or early 14th century, i.e. the high-medieval period in Norway. Most excavated masonry cellars in Oslo are interpreted as late- or post-medieval.

However, this paper problematizes the basis for the dating of some of these structures. The recent finds accentuate the need to revisit Oslo's masonry buildings and discuss the impression of the medieval town as an almost exclusively timber-constructed town, built around the high-status masonry complexes belonging to the bishop, the king, and the monastic orders. This paper will utilise both archaeological and written sources and address Oslo's known secular masonry buildings, their chronology, context, use, and owners. A central question is how the masonry buildings functioned as social markers in a town where the secular architecture mainly consisted of timber constructions. Oslo might have a greater number of medieval masonry buildings than hitherto believed. This possibly impacts earlier interpretations of the town's social topography. A central aspect considered in this paper is how the secular masonry architecture reflects the builders' status, motives, and activities.

The metalworker’s farm. A study of a medieval “bygård” in Oslo

Author: Edman, Therese Marie, Norwegian Institute for Cultural Heritage Research, Oslo, Norway (Presenting author)

Keywords: building and property, medieval town, Norway

Presentation Preference: Oral

Since 2013 the Norwegian Institute for Cultural Heritage Research has been excavating several sites in the medieval town in Oslo, in connection with a major railway project. One of the sites contained remains from several phases of medieval buildings with domestic and industrial activity from the late 11th to the early 14th century.

The paper aims to present one of the buildings in a Norwegian medieval town property, a “bygård”, literally a “farm in the town”. The building itself has at least two building phases, and possibly several phases of occupation and use. There are several ovens used for metallworking on the property, as well as evidence of domestic activities like a latrine and keeping animals. I will show how the use of the building and the surrounding property changes over time and how they fit into the context of the town.

The excavations have shown that several of the neighboring properties may also have been used for metallworking. This could mean that the buildings and other features in the excavated area formed part of a metallworking district in the heart of the town of Oslo until a new law, Magnus the Law-mender’s law for the towns, was introduced around 1276. This law regulated metallurgical activities to the fringes of the town because of the risk of fire. The excavated building was destroyed in a fire, demonstrating the need for such regulations.

Finnish medieval brickmakers’ marks as markers of identity

Author: BA Aalto, Ilari, University of Turku, Turku, Finland (Presenting author)

Keywords: Buildings, Identity, Symbols

Presentation Preference: Oral

Late medieval ‘brickmakers’ marks used in the Nordic countries are a poorly studied set of symbols used by master brickmakers to sign their production. The signs consist mostly of symbols that derive from the common medieval imagery – attributes of saints, apotropaic symbols and letters. In Finland the brickmakers’ marks can be mostly found in still standing masonry buildings like castles and particularly churches. Laterly they have also been found in excavations of urban sites. As the marks seem to have been personal, they offer also a mean of relative dating of masonry buildings.

It’s suggested here that these marks could be used to study both the medieval brickmaking industry and the visual and mental culture behind the marks. Furthermore the comparison of marks in different buildings makes it possible to study the geographic areas where the brickmakers worked. In this way the marks could reveal data about the craftsmen that has not been preserved in written sources. I will also bring up the question of the ethnicity of the medieval brickmakers who worked in the area of modern Finland. Were they Swedish-Finnish or German?

To build the Medieval harbourside of Gammel Strand, Copenhagen, Denmark

Author: Whitelaw, Stuart, Museum of Copenhagen, Copenhagen, Denmark (Presenting author)

Keywords: Buildings, Landscape, Medieval

Presentation Preference: Oral

From the Early Medieval period onwards, the harbourside of Copenhagen was constantly developed to provide a safe and profitable harbour for shipping and trade. By the 1400s, the harbourside had expanded southwards to Gammel Strand, and this area became...
the central area of the harbour in Copenhagen. At this location a new set of administrative public buildings focussed on trade were constructed, with the newly created land to the north, east and west developed into private housing for the elites. A curious mix of marine industry, administration, elite private housing and the fishing industry existed side by side in a way that would not occur in modern times. The buildings were located on the southern border of Copenhagen, and maritime border to the Baltic Sea.

The aim of this talk is to discuss the Late Medieval and Early Renaissance buildings uncovered in the Metro City excavations in relation to the development and later use of the area. From a combination of structural evidence, artefact remains and natural science evidence a picture emerges of how the structures were built, where the building materials were transported from, who would live there and how the buildings were used.

**Urban life in an early byzantine small scale house**

**Author:** M.-A. Steinborn, Miriam, Römisch Germanisches Zentralmuseum Mainz, Mainz, Germany (Presenting author)

**Keywords:** Byzantium, Excavation, Household

**Presentation Preference - Oral**

The early byzantine settlement of Carinčin Grad in southern Serbia, which is supposed to be the imperial city Latinovica Prima, existed for merely 90 years. Without any marks of earlier or later occupation, the excavations provide undisturbed insight into everyday life in an early medieval settlement of the 6th century. Excavations in Carinčin Grad take place since 100 years. The early campaigns concentrated on representative buildings like churches, while the emphasis nowadays is on the living quarters. Considering the concept and methodology of Household Archaeology, one single room house was excavated in 2014 and 2015 in high resolution with integration of archaeozoology and soil science. The finds indicate a habitual function.

The interpretation of the building bases on the results of the interdisciplinary research. The simple configuration of the house and the multiplicity of potential types of use in a single room structure challenge the examination. This is the crucial point where field work and the theories of Household Archaeology come together. Working with an elementary constructed house and a few objects connected with specific activities restrict the possibilities which houses with many rooms and outdoor-areas may provide. It is necessary to examine the activities in- and outside the building to understand the function the household fulfils in the settlement system regarding social, religious and economic aspects. The building accommodated one or more persons who belonged to the so-called

**The Formation of the three-compartment rural house in medieval Central Europe**

**Author:** Assoc Prof. Věra, Pavel, University of West Bohemia, Plzen, Czech Republic (Presenting author)

**Keywords:** cultural synthesis, medieval archaeology, rural housing

**Presentation Preference - Oral**

A new house form represented by a three-compartment rural dwelling was formed in Central Europe during the 12th – 14th century. Consisting of a central entrance room, a living room and a storage room/granary (mostly in Eastern Central Europe) or a byre (in Western Central Europe) it has remained the most common type of traditional village house until the 20th century. Identical house forms appeared in areas of fundamentally different early medieval building traditions of “Germanic” and “Slavic” culture spheres. A comparison of the formal attributes of this new house form with earlier house types provides evidence of a formation process which can be characterized as a synthesis or type of cultural hybridity based on the mutual influences.

**TH1-17  Abstract 15**

**Special building materials? The architectural importance of placed deposits in early medieval Europe**

**Author:** Dr. Sofialid, Clifford, University of Oxford, Oxford, United Kingdom (Presenting author)

Deliberate burials of animals, vessels, and other artefacts are persistent if rare discoveries in and around buildings throughout early medieval Europe. Sometimes called ‘foundation deposits’, such discoveries have traditionally been interpreted as offerings (e.g. as blessings upon a new house, charms to ward off evil, or offerings to a supernatural power). Recent research has preferred to view these deliberately ‘placed deposits’ as traces of household practices, intended to achieve practical domestic results. This paper proposes that placed deposits can be partly understood as a kind of building material widely used throughout early medieval Europe, with specific examples drawn from southern Scandinavia, Germany, the Netherlands, England, Ireland, and Iceland.

The main focus will be on two widespread patterns: the placement of objects under hearths or floors, and the burial of material (especially animal remains) in doorways. The paper will argue that such deposits should be viewed not as accessories to a self-sufficient, completed structure, but as integral components of the building’s architecture, without which its ability to function as a building would be seriously, even fatally, compromised. The paper will close with a brief consideration of how objects deposited in buildings at their demolition may have been cornerstones of an ‘architecture’ of destruction.
The rise and development of brick production in Vilnius, the capital of the former Grand Duchy of Lithuania, was inspired as strategically important craft. The production of bricks has been changing and improving during more than seven centuries. The rise and development of brick production in Vilnius, the capital of the former Grand Duchy of Lithuania, was inspired as strategically important craft. The production of bricks has been changing and improving during more than seven centuries.

During the excavations at the Follo line project a small plot outside the main excavation area was explored in the medieval town. In one spot horn debris together with a horn comb were found, in another spot a whetstone together with whetstone fragments samples, b) multi-elemental method of determination of real total contents of elements, c) multivariate statistical analysis (cluster, factor analysis), d) analysis of the ratios of geochemical indices, e) graphical representation of data. Energy-dispersive X-ray fluorescence is usually used for investigation of chemical composition. Its advantage is that great number of elements for multivariate analysis basing on various geochemical features (not only variability of composition); f) to verify and supplement the results of cluster analysis with the help of other multivariate statistical methods; g) to accumulate geochemical data on potential raw material (clay) deposits.

Geochemical investigations are understood as a complex of methods which includes: a) purposeful selection of brick fragment samples, b) multi-elemental method of determination of real total contents of elements, c) multivariate statistical analysis (cluster, factor analysis), d) analysis of the ratios of geochemical indices, e) graphical representation of data. Energy-dispersive X-ray fluorescence is usually used for investigation of chemical composition. Its advantage is that great number of elements which can be determined including those related to clay minerals and their additives (Al, Ca, Fe, Mg, Na, K, Si, Ti) accompanied by specific trace elements (Ga, Co, Cr, Cu, Mn, Nb, Ni, Rb, Sr, Si, P, Br, Cr, Zn, Pb, etc.).

Aiming to obtain more precise interpretation of brick origin and technological processes using geochemical methods it would be useful: a) to take more (10) sub-samples from the same brick (avoiding the effect of random sample selection), b) to take samples from the inner part of the brick (reducing anthropogenic geochemical component), c) to use multivariate analysis method with obligatory determination of total content of main major chemical elements and their specific satellites, d) to compile geochemical database of as many as possible exactly dated bricks (when a, b and c requirements are met), e) to select the set of chemical elements for multivariate analysis basing on various geochemical features (not only variability of composition), f) to verify and supplement the results of cluster analysis with the help of other multivariate statistical methods; g) to accumulate geochemical data on potential raw material (clay) deposits.

Aiming to obtain more precise interpretation of brick origin and technological processes using geochemical methods it would be useful: a) to take more (10) sub-samples from the same brick (avoiding the effect of random sample selection), b) to take samples from the inner part of the brick (reducing anthropogenic geochemical component), c) to use multivariate analysis method with obligatory determination of total content of main major chemical elements and their specific satellites, d) to compile geochemical database of as many as possible exactly dated bricks (when a, b and c requirements are met), e) to select the set of chemical elements for multivariate analysis basing on various geochemical features (not only variability of composition), f) to verify and supplement the results of cluster analysis with the help of other multivariate statistical methods; g) to accumulate geochemical data on potential raw material (clay) deposits.

The Neolithic societies of southern Scandinavia were clearly demarcated from those of the Mesolithic by labour-intensive, large-scale construction works such as monumental tombs and enclosures. However, we do not yet see the long-distance, monopolized exchange of metal and prestige items that characterises Bronze Age societies from period II onwards, and which bear witness to a chiefdom organisation.
Interpreting the Archaeological Record

How then should we perceive the Late Neolithic and Earliest Bronze Age societies of southern Scandinavia?

One of the most significant features of the Late Neolithic was the 'reintroduction' of metal. Even though limited in number, the presence of metal objects bears witness to the establishment of far-reaching contact and exchange networks, which then developed further from around 2000 BC, as a result of increased links with the Jutlandic culture. The amount of imported metal had, however, not yet reached a level, which allowed the creation of formal hierarchies.

Hoardings and depositions show the display of wealth and surplus, probably deposited as the culmination of large gatherings and feasts, which included the distribution of food and drink. The variation in length evident in contemporaneous dagger types indicates furthermore that supreme examples functioned as elite items that were used as status symbols, bride price etc. What we see is probably the appearance of some kind of big-man competition for power and recognition through feasts and potlatch-like give-aways. However, this status was not yet formalised into fixed hierarchies. One of the reasons for this lack of formalised hierarchisation was probably that it was difficult to monopolise the necessary raw materials (for example flint for the production of flint daggers).

Copper and gold, on the other hand, held opportunities for control by powerful and influential lineages or individuals, as these metals could only be obtained through exchange. Consequently, if upcoming chiefs were able to monopolise external exchange, increased visibility could be facilitated and might have led to the formation of self-perpetuating elites. The occurrence of large 'chiefdom' houses and the increasing number of metal objects evident from 2000 BC onwards shows that certain individuals and/or lineages were successful in creating a production surplus to be exchanged for metal objects and that these lineages were able to obtain influential positions in the exchange networks over time. The creation of chiefdom structures was, of course, a long and complicated social process with no single explanatory factor, as clearly illustrated by copper imports in the Early Neolithic, which did not lead to the formation of formal hierarchies.

However, in contrast to the Early Neolithic, metal was, from around 2000 BC, an inevitable precondition for the production of 'international' status symbols and up-to-date weaponry such as daggers, halberds and spearheads, as well as gold and bronze rings etc. The necessity of obtaining bronze and gold meant that it became more difficult to manifest oneself as an influential individual or 'big-man' without access to these prestige goods. As a consequence, formal hierarchies and centralisation of wealth developed further and the classic Nordic Bronze Age became a reality.

New types of longhouses as a result of an increasing need for storage in Late Neolithic?

At the location dibbtik, Eastern Jutland, large quantities of charred grain reflect the extended agriculture in the Late Neolithic. Different crops were cultivated separately, presumably in a system of crop rotation. At the same time new types of 'outhouses' emerge at the settlement, apparently linked to a function of economy building or barns. Was it an increasing demand for storage that also soon affected the construction of the longhouses ending up with a three-aisled construction at the beginning of the Bronze Age? A moderate size indicates that the appearance of the three-aisle building here initially had a functional purpose related to the interior of the house.

Notion of the individual in archaeological interpretation of Neolithic – EBA transition processes

In the UK, the period of Late Neolithic - Early Bronze Age is the time of changes in potteries types, wider range of artefacts, use of metal, the end of the building of major communal monuments and an increased emphasis on the individual in burials. However, the exact boundary between the two periods is difficult to recognize.

The most common prehistoric monuments of the period in the UK are round barrows. They differ from the Neolithic practice in that they are not constructed of earth but consist of a 'maximum' diameter and a 'maximum' height. Long barrows usually enclose disarticulated remains of several individuals in a single deposit, whereas round barrows carry primary graves, sometimes with grave goods and secondary burials of individuals added later.

I adhere to the premise that material culture provides a means to develop an understanding of social dynamics. If so, how individuals are buried reflects the behaviour of social groups which in turn arises from the interactions between individual group members. The changing relationship between the living and the dead, reflected in the changes to funerary practices, thus allows us to study the relationship between individual interactions and group level behaviour.

TH1-18 Abstract 07
Renfrew reloaded: the social organisation of monument construction in Neolithic Wessex
Author - Harris, Barnabas, UCL, Institute of Archaeology, London, United Kingdom (Presenting author)
Keywords: Monumentality, Social organisation, Wessex
Presentation Preference - Oral

In 1973, Colin Renfrew published Monuments, mobilisation and social organisation in Neolithic Wessex. This seminal study examined how the amount of time invested in monument building changed throughout the Neolithic period in south central England. Renfrew's (1973) calculations appeared to demonstrate that the number of 'man-hours' invested in building monuments increased as the absolute numbers of individual monuments fell. On the basis of these findings, Renfrew (1973) argued that a number of hierarchical, centrally controlled chiefdoms had emerged in Wessex by the late Neolithic / EBA period. He surmised that whilst the smaller, tribal societies of the earlier Neolithic had built many, small monuments, the later and more populous polities of the Late Neolithic harnessed labour from vast geographical territories in order to build the few great henge enclosures of Stonehenge, Avebury, Durrington Walls etc.

The implications of Renfrew's (1973) study were far reaching: the great monuments of Wessex were, in effect, presented as the earliest evidence of hierarchical institutions exercising power and control in Britain. Moreover, in contrast to earlier, culture-historical models of the past, Renfrew's (1973) explanatory framework succinctly demonstrated how internal processes, not external invasion, could drive large-scale social change. Throughout the 1980s and 90s, however, a number of researchers began to question Renfrew's (1973) claims and the anthropological theory that underpinned them (e.g. Hodder, 1985; Barnett, 1994). They argued that functionalist, social-evolutionary models like Renfrew's (1973) were simply a means of making the historically specific and unfamiliar comprehensible (Barnett 1994: 161). In fact, the actions and experiences of individuals – the very things that actually constitute human history – were erroneously being written out of these overly generalised accounts of the past.

This postprocessualist view garnered particular popularity within the field of British prehistoric monumentality and, from the mid-1980s onwards, there was a rapid move away from quantifying the intrinsic properties of Neolithic monuments towards a structuralist consideration of the kind of social orders their form, material, or position in the landscape could have embodied (e.g. Parker Pearson and Richards 1994). This theoretical shift allowed archaeologists to successfully refame narratives of monumentality around the individual but it also had two other consequences. Firstly, the empirical basis of Renfrew's (1973) thesis was never thoroughly interrogated (though see Starlin and Bradley, 1981) and, secondly, alternative narratives of how changing monumentality fitted into large-scale upheavals within social organisation were eschewed.

This paper aims to redress this imbalance by critically examining Renfrew's (1973) claim that the labour expended on constructing prehistoric monuments steadily increased over time. Renfrew's (1973) methods are reviewed, replicated and his sample expanded so that a more comprehensive but comparable set of data are generated. These data are subjected to statistical and a variety of spatial analyses within a GIS package. The results are considered in terms of how and when they may be used to construct an alternative narrative of large-scale social change in Wessex from c. 4000 BC – 2000 BC.

TH1-18 Abstract 08
Making silent stones speak. A diachronic view on flint craftsmanship in Bronze Age Denmark
Author - Prof. Dr. Eriksen, Berit Valentin, Centre for Baltic and Scandinavian Archaeology, Schleswig, Denmark (Presenting author)
Keywords: Bronze Age Denmark, craft specialization, lithic technology
Presentation Preference - Oral

An archaeological examination of lithic inventories from a number of Danish Bronze Age settlement sites will provide the basis for a discussion of the role of skilled mass production of lithic artefacts in past metal using societies. Based on a contextual chaine opératoire analysis the paper will focus on the technological and socio-economic processes pertaining to raw material exploitation patterns and procurement strategies through time and it will examine the question of control over and access to resources. The concluding discussion will proceed to address the degree of craft specialization and the role of flint craftsmanship on a diachronic scale in relation to contemporary socio-economic structures.

TH1-18 Abstract 09
Contact Networks in Metalcraft: the Nordic Bronze Age between 1500-1100 BC
Author - Dr. Nygaard, Heide, Moesgaard Museum, Ebeltoft, Denmark (Presenting author)
Keywords: Itinerant craftsmen, Metalcraft, workshop organisation
Presentation Preference - Oral

Different craftsmen and their area of influence could be identified, from a craftsperson's point of view, and as such also workshops and contact networks. With the knowledge of distinct techniques, the different skill levels of craftsmen and their affiliation to each other the organisation of metal craft and specific workshops were defined within the Nordic Bronze Age.

The intensive exchange of technical knowledge between workshops around the North Sea formed contact networks that are clearly visible in the material of the Nordic Bronze Age. This presentation will focus on distinct traces on bronze ornaments that show the development of specific technologies or techniques especially at the beginning of the middle Bronze Age and its end. The analysis of said technological peculiarities resulted in differently structured workshops, like kinship based workshops (spread over the entire area and probably related to villages), communities of practice (with an extended market and possibly some kind of relationship to the local elites) and occasionally also attached craft, in the sense that the craftsmen fully or partly a governing institution (raw-material supply, workshops and far reaching knowledge exchange), which will be shortly introduced.

Moreover, the focus should lie on the influence of the surrounding regions on specific technological developments. As technological innovation and the specific use of stylistic elements clearly separates single workshops from each other, and support the idea of regional groups within the social unit Nordic Bronze Age, this analysis tries to show the contact networks in between and explains how and why we can talk about one social unit during the Bronze Age.

TH1-18 Abstract 10
Dynamics and transformation during the Late Bronze Age of western Norway
Author - Ass. Prof. Ainslie, Nils, University of Bergen, Bergen, Norway (Presenting author)
Keywords: EBA-LBA, Materiality, Transformation
Presentation Preference - Oral

This paper aims to take an in-depth look at the changes that take place during the transition from the Early Bronze Age (EBA) to the Late Bronze Age (LBA) in western Norway. Traditionally western Norway had a central position during the Late Neolithic and EBA, but during the the transformation of the Bronze Age, there is an apparent change in relations and material culture in the LBA. It has been argued that the region loses much of its significance to the cost of eastern Norway. Therefore, this paper will look at the materiality including changes in burial patterns and the use of various raw materials of the LBA in western Norway and correlate this with possible changes in economic structures and agricultural practice. This will be combined with the broader north European pattern of changes in order to understand the social dynamics involved in these processes.

TH1-18 Abstract 11
Social dynamics in Bronze Age Scania
Author - Dr. Skoglund, Peter, University of Gothenburg, Göteborg, Sweden (Presenting author)
Keywords: Bronze Age, Cultural landscape, Social dynamics
Presentation Preference - Oral

In south Scandinavia an interesting turning point appeared around 1200 BC when the tradition of building mounds came to an end and was replaced by um-burials. New excavations in south Sweden (Scania) demonstrate the um burials to be organised as grave fields possibly related to individual farms. In parallel to these changes the number of different grown crops expanded and the tradition of building very large longhouses came to an end. These changes demonstrate a rather complex re-organisation of the cultural landscape. In this paper I will discuss whether changes in burial traditions and resource exploitation also involved a new social organisation focusing on the individual household. Does the re-organisation of the cultural landscape reflect a social dynamic through time?
The settlement is located in the north-western part of Orenburg region. About 800 square meters of the settlement area were investigated (1982, 2014-2015). The stratigraphy on the all excavation trench is the same. The lower cultural layer of the Eneolithic is approximated by 4250-3950 BC (cal). The BA-complex (Early Bronze Age) was well-represented findings as ceramics (about 2000 fragments of more than 50 vessels), animal bones, wrechages of construction stones, macro products made of sandstone, and big pebbles, tools made of bones are numerous. Possibly, the findings of fragments of copper ore and slags, as well as stone casting moulds, are also related to this complex. The found pendant with through hole and small horns made of plain bone blade is similar to the materials of the early Yamnay culture.

Archaeological materials: the E-layer contains mainly the bones of domestic species: cattle and small cattle, dog, horse, and also of elk and beaver; the BA-layer contains predominantly the bones of domestic species and horse; the remains of welding, including elk, aurochs, bear, beaver, and fox, are live in number.

The series of 15 radiocarbon data based on animal bones from the all sections of the settlement area, and from different depths was undertaken. The materials of E-complex have been dated approximately by 4900-4400 BC (cal). Above that, some materials have been dated approximately by 4250-3950 BC (cal).

The series of radiocarbon dates based on animal bones from the upper cultural layer confirmed previously established data based on the shadings from Turganic settlement. KI-15997-4710±80 BP. In total, the BA-layer could be dated by 3900 - 3400 BC (cal).

This dating corresponds with the well-known dates of the ceramics from Repin Hutor and Kyzyl-Hak I and II settlements, and from some other sites of Repin horizon of Early Yamnay culture. The ceramics from the BA-layer of Turganic settlement is similar to the ceramics from these sites.

The author thanks NEH for support with grant No. 14-01-00127 and Ministry of Education Russian Federation for help with the State Assignment No. 33.147.2014K.

THI-19 Abstract 01

The Chenopodium album presence in Romania Prehistory.

Sign of consumption?

Author - Golse, Mihaela, National Institute for Research and Development in Environmental Protection, Bucharest, Romania (Presenting author)

Keywords: archaeology, Chenopodium album, seeds

Presentation Preference - Oral

From the oldest times, humans have been intentionally and selectively collecting the herbaceous plants. Often, such species were recognized for their contribution to vitamins and caloric enrichment in human's diet and also, of their medicinal properties. The evolution of human's culinary preferences was based, initially, on the natural products of their immediate environment. Alongside such plants (Polygonum lapathifolium L, Fallopia convolvulus L) Chenopodium album L. which has medicinal properties and nutritious values (such as laxative, blood purifier, vitamin A, and so on) is this species' plant remains have been discovered in some Eneolithic and Bronze Age archaeological sites in Romania. Although different discovery contexts imply different actions in using this plant, these discoveries can suggest the usage of this species, most probably as a supplement for human consumption. However, only through discovery of a large quantity of seeds of Chenopodium album L. and knowing the contexts of discoveries, one can be sure of its usage and can suggest the awareness of this plant’s properties and benefits for consumption. Plus, the cultural heritage of different countries such as old recipes of Chenopodium album L., has a substantial impact in the reconsideration of its use in prehistoric times. One can think that these dishes have an older origin, which can be used in explaining empirically usage of this plants. Therefore, the findings of plant remains of Chenopodium album L. will be presented in a matter that it will put into light the intentions of gathering of this species in the prehistoric times. Also, based on the experimental studies we will try to show the cooking process of these plants and their mode of consumption.

This work was performed through the Partnerships in Priority Areas Program - PN II, developed with the support of MEN - UEFISCEDI, project no. PN-II-PT-PCCA-2013-4-2832.
TH1-19 Abstract 02
Bronze Age foodways in the Carpathian Basin: similarities and differences, continuities and changes

Author: Priznak, AnnaMaria, University of Pécs, Pécs, Hungary (Presenting author)
Co-author(s): - Steiner, Vajk, Hungarian Academy of Sciences, Budapest, Hungary

Keywords: Bronze Age, Carpathian Basin, Subsistence economy

Presentation Preference - Oral

The Bronze Age of the Carpathian Basin is characterized by a series of communities with stylistically rather diverse material culture. This has traditionally led scholars to believe that the area is divided between culturally rather different groups. While in some respects this may be true, there is a considerable number of cultural traits that cross-cut such boundaries through both space and time. The aim of our paper is to examine if this is also true for Bronze Age foodways. ‘Subsistence economy’ is generally a rather neglected field of Bronze Age research in the region, and its wide-ranging cultural implications are rarely considered. In our paper we will examine the subsistence economy and foodways of the study area through the review of the available paleoethnobotanical and archaeozoological data, the study of macrocultural implementations used in food production and of the ceramic repertoire used to prepare and serve meals. Our aim is to reveal if the reconstructed foodways of the Bronze Age Carpathian Basin show similar cultural boundaries as some aspects of material culture or cross-cut them instead.

TH1-19 Abstract 03
Evidence from experimental & organic residue analysis of beeswax and honey uses (Argaric Bronze Age)

Author: - Dr. Molina Muñoz, Elena, Autonomous University of Barcelona, Bellaterra, Spain (Presenting author)
Co-author(s): - Rosell-Mellet, Anton, Institut de Ciència Tecnologia Ambientals, Autonomous University of Barcelona, Barcelona, Spain
Co-author(s): - Micol, Rafael, Autonomous University of Barcelona, Bellaterra, Spain

Keywords: Beeswax, human feeding, organic residues

Presentation Preference - Oral

The Argaric society was developed during the Early Bronze Age (c.2200-1550 BC) in the South east of the Iberian Peninsula, and became one of the first State societies in continental Europe. This society had a very characteristic pottery repertory, with a high degree of standardisation distributed in 8 ceramic forms. Nevertheless, the Argaric ceramics have generally been studied from a morphometric point of view, rather than their functional aspect. In this context, the organic residue analysis has been applied on just two occasions and over a small set of ceramics. For the first time in an Argaric context, we have investigated the molecular and isotopic composition of organic residues (by gas chromatography and mass spectrometry) over a wide suite of ceramics (43 pottery sherds) from two of the main Argaric sites: La Bastida (Totana, Spain) and La Almoloya (Piego, Spain). One of the key results is the detection of invisible substances in just two occasions and over a small set of ceramics. The experimental research consisted in the dehusking of several cereal species using different techniques and different pre-treatments in order to observe the degree and type of breakage that was produced on the grains. Finally, a systematic analysis of these fragments produced prior to charring in Neolithic sites of the NE of the Iberian Peninsula was conducted. They were not only quantified but also the type of fragment and the size were recorded, as potential relevant variables to understand the process that generated these fragments. The combined sum of experiences will be used to make some recommendations for future research on this issue, both in terms of necessary experimental work and the archaeobotanical analysis of these remains.

TH1-19 Abstract 04
Finding broken grain in the archaeobotanical record: ethnoarchaeological and experimental approaches

Author: - Dr. Antoni Ferran, Integrative Prehistory and Archaeological Science, Basel, Switzerland (Presenting author)
Co-author(s): - Alonso, Natalia, University of Liébana Lieza, Spain

Keywords: Cereal milling, cereal products, dehusking

Presentation Preference - Oral

Cereals have been a major contributor to human diet in many parts of the planet during the past 10,000 years. They can be consumed in a large variety of ways (grouts, bulgur, flour, bread, etc.), which makes the archaeological recognition of cereal food remains extremely difficult. In the last decade, a larger number of archaeobotanists have shown their concern for the identification of archaeological fragments of cereal grain produced prior to charring. Their identification seems to remain somewhat problematic, and their interpretation is open to discussion. They are often seen as evidence of bulgur production, but how can we exclude that they were not produced during cereal dehusking or threshing, or during flour production? During the last years we developed three independent lines of research that we would like to combine in this presentation. These are of different nature: ethnoarchaeobotanical, experimental and archaeobotanical. The ethnoarchaeobotanical research aimed to record the steps involved in grinding and the many by-products obtained from this process. These change according to species and the desired product. The work was conducted in the villages of the Querej Berber tribe (Mor, western Tunisia), where women still prepare many of the domestic tasks related to the preparation of cereals for consumption, and they still often mill with rotary querns. This involved the manual cleaning and grinding of bread wheat and durum wheat, and the cleaning, roasting and milling of hulled barley. We detail the different steps of each process, as well as the different by-products, products, byproducts and residues resulting from each stage of the operation. The experimental research consisted in the dehusking of several cereal species using different techniques and different pre-treatments in order to observe the degree and type of breakage that was produced on the grains. Finally, a systematic analysis of these fragments produced prior to charring in Neolithic sites of the NE of the Iberian Peninsula was conducted. They were not only quantified but also the type of fragment and the size were recorded, as potential relevant variables to understand the process that generated these fragments.

This combined sum of experiences will be used to make some recommendations for future research on this issue, both in terms of necessary experimental work and the archaeobotanical analysis of these remains.

TH1-19 Abstract 05
The diet of non-Romans living in the border area of the Netherlands

Author: - Drs. Hondslik, Merit, Archeodienst Noord bv, Groningen, Netherlands (Presenting author)
Co-author(s): - Dr. Molina, Elena, Autonomous University of Barcelona, Bellaterra, Spain (Presenting author)

Keywords: Bio-archaeology, Food and alimentary practices, Roman Limes

Presentation Preference - Oral

The diet of non-Romans living in the border area of the Netherlands, as reconstructed by bioarchaeological research. The Roman empire has been the subject of numerous archaeological and historical studies over the past decades. In the Netherlands, Roman occupation of the southern provinces has been studied intensively via archaeological research. Forts, villas and vii have been excavated and some have been reconstructed. These layouts speak to the imagination, as well as the ships used for transport. Recently, the Limes has been reconstructed to visualize the Roman border and demarcate the Roman province of Germany Inferior and the lands inhabited by the indigenous tribes. It used to be thought that the arrival of the Romans brought on a culture shock in the area south of the Limes, imposing another way of life on the tribes living under Roman rule. However, archaeological and historical research has shown that this was not the case. The indigenous people assimilated and took over some aspects of Roman life whilst at the same time continuing with some of their own traditions. Roman culture mixed with the traditional lifestyle of the peoples of Germany. An important part of culture are food and alimentary practices. It is what you do and do not eat, how we eat, how we prepare food, and how we think about food that is culture bound. It is assumed that in some way, the Roman food culture is not where necessary. This has been proven for some sites in the occupied area of Germany Inferior. However, little is known about the food and alimentary practices of the non-Romans living north of the border. We know that both sides of the border traded with each other supplying the other party with men, materials and perhaps produce. But to what extent was the diet of non-Romans living above the Limes border influenced by the neighbouring Romans? This paper tries to answer this question using archaeological, bioarchaeological and archaeological data retrieved from archaeological excavations in the area north of the former Limes.

TH1-19 Abstract 06
Islamic diet and agricultural practices in rural al-Andalus: new archaeobotanical evidences

Author: - Dr. Ros, Jerome, UMR7209, CNRS/MNHN, Paris, France (Presenting author)
Co-author(s): - Dr. Gilotte, Sophie, UMR9168, Cihm, CNRS, Lyon, France

Keywords: Al-Andalus, archaeobotany, Islamic diet

Presentation Preference - Oral

In the literature (i.e. Watson, Aubâie-Sallanae, Decker), it is stated that the beginning of the Islamic period (7th c. A.D.) led to the development and spread of new type of agriculture, event often characterized as “the Islamic agricultural revolution”. This “new” agriculture would have been based on several criteria: spread of new irrigation methods, use of intensive fertilizers, spread and improvement of several agricultural practices (i.e. grafting), development of spring crops, broadening of the diversity of plants exploited and spread of new species, development of new varieties, etc. A recent synthesis led agriculture in al-Andalus dates 47 species, introduced or spread by arab-barber populations. Nonetheless, the knowledge we have of Islamic diet and agriculture in al-Andalus is mostly based on three types of sources: written sources (i.e. agronomic, medical, food treatises, tax sources, etc.), iconographic sources (illustration of said treatises) and archaeological sources (i.e. excavation of irrigation structures). Data documenting directly these questions remain scarce, especially for rural areas.
Since 2013, archaeobotanical studies are led on the Islamic rural settlements of Albalat (Extremadura, Spain) and Las Sillas (Aragon, Spain). These studies, based on about 150 samples extracted from various types of domestic (kitchens, ovens, storage and patios) and craft (forge) contexts, allow us to propose a first review on past agricultural biodiversity and practices in rural al-Andalus, based on direct material evidences. From the analysis of the carpological samples, 19 cultivated/gathered taxa were found: 7 cereals, 1 pulse, 1 technical/oil plants and 10 fruits, and additionally an approximate 20 weeds/wild plants. This communication will characterise Islamic diet and agricultural practices in rural al-Andalus, compare the spectra obtained with those existing during previous periods and enlighten the possible introduction and role of “new” or “exotic” plants in rural contexts.

PLANTCULT: An investigation of plant foods among prehistoric cuisines of Europe

**Author** - Prof. Valeroti, Soutain Maria, Aristotle University of Thessaloniki, Thessaloniki, Greece (Presenting author)

**Keywords**: ancient plant foods, prehistoric Europe

**Presentation Preference**: Oral

The plant component of cuisines of Europe's prehistoric farmers, together with the associated transformation equipment such as grinding equipment, cooking vessels and cooking installations will be explored within a five year research project titled PLANTCULT, recently funded by the European Research Council (ERC). The project will investigate culinary practice among early European farming communities, from the Aegean to Central Europe, spanning the Neolithic through to the Iron Age (7th-1st millennia BC).

A collaboration between the Aristotle University of Thessaloniki in Greece (author), IPNA-Basel University in Switzerland (Prof. Stefanias Jacomet), University of Hohenheim in Germany (Dr. Hans Peter Sikka) and University of Vienna (Dr. Andreas Heiss) this newly launched project seeks to identify the ‘food cultures’ of prehistoric Europe, and to reconstruct how cultivated and wild plant foods were transformed into dishes, exploring their underlying cultural and environmental contexts and their evolution through time. The project will explore how culinary identities were shaped through the selection of plant foods, both in terms of ingredients as well as processing and cooking practices. Through the examination of macroscopic and microscopic remains of plant foods, combined with experimental replication of various aspects of food preparation techniques, original gastronomic investigations and insights of ancient texts, the project aims to provide a multifaceted and integrated approach of Europe's cuisine during late prehistory.

In presentation we focus on the data and methods that will form the basis of the project and present an overview of the available data, research questions and lines of investigation that will be followed to address them.

Medieval alimentation habits deduced from archaeobotanical studies of cesspits

**Author** - Dr. Wettholm, Julian, Inrap, Metz, France (Presenting author)

**Keywords**: Archaeobotany. Early modern times, middle Ages

**Presentation Preference**: Oral

Medieval alimentation habits deduced from cesspits: a comparison of archaeobotanical results from cesspits of towns in eastern France and from the Baltic harbor towns of Stralsund and Greifswald in northeastern Germany

Cesspits fillings are the most commonly studied contexts in late medieval and early modern archaeobotany. In most cases, especially when waterlogged plant remains were retrieved, abundant plant remains were recorded, but the archaeobotanical data sets from cesspits are hampered by taphonomic problems. Oil plants, spices, collected and wild fruits are in most cases much better preserved than cereals and pulses. Nevertheless, despite quite different preservation conditions for different types of plant food these emblematic deposits of faecal remains and kitchen waste are most suitable for comparisons due to a high number of recorded taxa of cultivated and wild edible plants used. Rescue excavations conducted by the Institute national de recherches archéologiques preventives (Inrap) in the medieval towns of Sambourg and Toul in eastern France revealed waterlogged and mineralized plant remains in huge quantities. These towns have developed since Roman times and some of the recorded spices and other cultivated plants are at least introduced since Roman times. These data of recent conditions in Medieval Visby.

Aspects of the Diet of the Medieval Population (10th – 12th Century AD) in Northern France: the archaeobotanical study from the castle of Boves and surroundings sites

**Author** - Dr. Preiss, Sidonie, Royal Belgian Institute of Natural Sciences, Brussels, Belgium (Presenting author)

**Keywords**: diet, medieval period, social status

**Presentation Preference**: Oral

Archaeobotanical investigations from medieval sites in Northern France have provided charred and mineralised plant remains (seeds and fruits). Despite some taphonomical constraints of the different preservation of these plant assemblages, archaeobotanical analysis revealed valuable information on the diet, food choice and alimentary practices of the medieval population in Northern France between 10th and 12th Century AD. The archaeobotanical results were influenced by the different types of features from which macro-remains were retrieved and by the reliability of the studied samples. Many seeds and fruits remains, especially found in latrines and/our dump pits, were used to understand the alimentary practices of the populations studied.

The social context of the archaeological sites is heterogeneous. Therefore, it’s possible to compare and to discuss the potential of archaeobotanical data helping to identify social differences by defining archaeobotanical indicators of social level from the food practices and the diet. Indeed, we can define and approach some direct (presence of certain species, taxonomic size spectrum...) and indirect indicators (method of administration, food preparation, food quality, such associations ...) of the social status.

The contribution of pollen analysis to the archaeobotany of cesspits

**Author** - Dr. Deforce, Koen, Royal Belgian Institute of Natural Sciences, Brussels, Belgium (Presenting author)

**Co-authors** - Brinkkemper, Otto Dr., Cultural Heritage Agency, P.O. Box 1600, NL-3800 BP Amersfoort, Netherlands

**Keywords**: cesspits, diet, pollen

**Presentation Preference**: Oral

Archaeobotanical analysis of cesspits is an important source of information on former diet, medical practices and other types of plant use. A large range of food plants such as leafy vegetables, herbs and spices of which only the leaves or flowers are used, generally remain invisible or occur only very sporadic in the macrofossil records. This is because these plants are harvested and used as food before they produce seeds. As a result, little is known about the import, local production and consumption of many of these plants in the past.

The former use of some of these plants, such as garden chervil (Anthriscus cerefolium), beetroots (Beta vulgaris), borage (Borago officinalis), capers (Capparis spinosa), spinach (Spinacea oleracea) and many other plants can be demonstrated by pollen analyses of archaeological remains of cesspits however. This paper now presents a first overview of a large set of pollen data from Roman, medieval and post medieval cesspits from Belgium and the Netherlands for several of these plants and discusses their use during the respective periods.
Interpreting the Archaeological Record

TH19 Abstract 12
Problems and progress in the study of postmedieval archaeobotany in London

Author - Stewart, Karen, Museum of London Archaeology, London, United Kingdom (Presenting author)

Co-author(s) - Dr. Best, Julia, Bournemouth University, Poole, United Kingdom

Keywords: Archaeobotany, Postmedieval, Food choice and alimentary practices, Urban

Presentation Preference - Oral

In the 18th and 19th centuries, London was at the heart of the British trading empire. The collection, propagation and cultivation of new plant species from its colonies was a focus of the British Empire and its naturalists, and this had a huge impact on foodways in Britain.

Archaeobotanical evidence from this period has tended to be underevaluated in the past, with funding often biased towards earlier periods. This paper will demonstrate the results that can be gained when environmental research aims are fully incorporated into the project design from the outset, presenting some lessons learned and data produced from a commercially excavated site in the centre of London. Well preserved archaeobotanical remains from this site help to build a picture of London society in the 18th and 19th centuries. Results show that the occupants of the site had access to plants from the Americas and Asia, as well as those grown more locally, though the continued absence of certain plants in the archaeological record was also noted. The use of imported plants for the production of alcohol was also found at the site, presenting evidence of the ‘Gin Craze’ which swept London in the 18th century.

TH19 Abstract 13
Unmasking milklet from a multi-proxy approach

Author - Vigil-Escalera Guiadó, Alfonso, University of Salamanca, Madrid, Spain (Presenting author)

Co-author(s) - Accetela Bocanegra, Francisco J., Universidad de Antioquia, Medellín, Colombia

Keywords: Milklet, autochthonous, cross-validation, Bayesian, information theory

Presentation Preference - Oral

An extensive palaeobotanical sampling program was carried out at the Early Medieval village of Gózquez (central Spain, AD 525-750). It is one of the most comprehensive collections of botanical remains so far analysed for this kind of geographic and chronologic context. A total of 8800 items from 34 positive samples were retrieved. Hulled barley and free-threshing wheats were the dominant species. Hulled wheats and rye were present in minor proportion, and Avena only appeared sporadically. In this setting, any trace of millet production and consumption seemed to be completely absent.

Other carbon and nitrogen isotopic analyses performed on bone collagen of 40 individuals buried in the cemetery and some sites of the same village revealed a first surprising result: villagers widely consumed C4 plants. Since no such crop was identified in the carpological record, starch analysis of the grinding surfaces of some rotary milling stones were performed as an alternative proxy. These revealed abundant starch grains of Panicum or Setaria in all the four items analysed in the first round, in addition to wheat, barley and oats.

At this point, we realised of several possible explanations for the invisibility of the production and consumption of millet at Gózquez. Insufficient sampling, unbalanced preservation of carbonized plant remains, or complete distinct routines in the processing of different cereal types may be possibly argued. Whatever the right explanation, this case study suggests that we should be extremely cautious when drawing conclusions if there is no way to consider unexpected biases on archaeological and palaeobotanical records.

TH19 Abstract 14
Meals on Wings: Multi-strand investigation of avian contributions to diet and nutrition

Author - Dr. Best, Julia, Bournemouth University, Poole, United Kingdom (Presenting author)

Co-author(s) - Dr. Mattoy, Mark, Bournemouth University, Poole, United Kingdom

Keywords: Avian Archaeology, Eggs, SEM

Presentation Preference - Oral

Today, birds, and especially the chicken, provide huge quantities of food products – both as meat and eggs. However the archaeological investigations of avian contributions to diet have often been limited in extent and application. Eggs form an important part of avian-human interactions both today and in the past. However, eggs are one of the more challenging avian dietary areas to address due to the fragility of eggshell in acidic soil conditions, the need for rigorous retrieval processes, and the resources needed to identify archaeological eggshell to species. Eggs can be sourced from wild and domestic birds, but due to the creation of extended laying times in several domesticates, egg acquisition is frequently weighted towards poultry. Ducks, geese and other birds can all be kept for their eggs, but the chicken plays perhaps the most important role. As such, this work focuses on chickens but is contextualised within the wider body of archaeological evidence. Such examination allows fuller understanding of past human-avian relationships in the context of diet, economy, society, and (particularly for wild birds) the environmental and seasonal aspects of their relationship. This paper investigates egg use in the past by combining zooarchaeological and scientific analysis of physical eggshell remains from archaeological sites with evidence from documentary sources and material culture. Determining the hatching profile of archaeological eggs can indicate whether these were being utilised to produce live animals or as a direct egg food source. As such new methods of analysing eggshell material are allowing unprecedented insights into these areas of food choice and nutrition. Documentary sources, where available, are valuable for aiding these studies and include letters and orders (e.g. the Vindolanda tablet), and agricultural guides detailing husbandry and usage (such as Columela’s Res rustica). Using case studies from Roman and Medieval Britain this paper demonstrates how multidisciplinary integration of eggshell analysis with other lines of evidence can offer new insights into avian contributions to diet and food selection. These case studies are then situated within the extended application of this methodology to a wider European dataset (including material from France, Portugal, Turkey, Romania and Estonia) to explore the challenges and benefits of applying these approaches across a wide geographic and temporal area, and on material from a diverse body of archaeological sites which range from Neolithic tells to Post-Medieval monasteries.

TH19 Abstract 15
Diagenesis, biostratinomy and taphonomy: Seeking out the pathways to destruction or preservation

Author - O’Meara, Don, Newcastle, United Kingdom (Presenting author)

Keywords: Archaeobotany, Taphonomy

Presentation Preference - Oral

This presentation will argue that the catch-all term ‘taphonomy’, when used to describe a seamless or continuous process, distracts from the differing cultural and natural formation processes which act together to preserve or destroy the archaeological record. Through the influence of zooarchaeological taphonomic experiments and observations (which have reached an increasingly advanced level) archaeobotanists often have recourse to ‘taphonomy’ as an explanation for how assemblages may present a biased record of the past. However, with few actualistic experiments to determine what the primary taphonomic processes might be within a burial system and the understanding of preservation within archaeobotany is largely based on inference rather than experiment. This presentation discusses the case of the products of digestion and highlights the difficulties for the archaeobotanist in interpreting the recovered assemblage. Understanding the effects of multiple taphonomic agents, often acting independent of each other but combining to alter the environmental record is a key to understanding the nature of the recovered assemblage. Using evidence from medieval historical sources, experimental taphonomy work, and an archaeobotanical study of urban cesspit remains from England this presentation will highlight the gaps in our knowledge and argue that we need to develop new methodologies for approaching urban remains, or begin the treat the record as the preservation of multiple separate assemblages with shared taphonomic routes into the archaeological record, but not shared taphonomic routes in the post-burial environment. It is hoped that in the course of discussion researchers from across Europe will be able to present their own observations to stimulate debate on how we approach these problems.

TH19 Abstract 16
Reconstructing the Greek Byzantine Diet using a comparative analysis of archaeozoology, isotope studies and literature

Author - Janine, van Noorden, Leiden University, Leiden, The Netherlands (Presenting author)

Keywords: Late Byzantine period, archaeozoology, faunal remains, Euboea, Chalcis, Venetians, dietary variation, animal exploitation

Presentation Preference - Oral

Until now, not much archaeological research has been conducted on faunal diet in Late Byzantine Greece. Most of the knowledge on the diet in Greece from this period is based on literature studies. Recently, isotope studies have also contributed to wider knowledge. However, so far no archaeozoological analysis has been conducted, focusing in this topic. The main goal of this research is to contribute to filling the lacuna of knowledge of the food supply in the Late Byzantine period in Greece and comparing the results to the existing data from isotope and literary studies.

As a case study for this research, faunal material from Chalcis will be studied. In Byzantine times, between the 10th and 12th centuries, Chalcis was the harbour for Thrive in Boeotia, one of the most important centres in this region. Later, from the 13th century, the city become a trading colony and transit port for the Venetians. The excavated material from a rescue excavation in...
Interpreting the Archaeological Record

The current city centre is extremely diverse (including glazed and unglazed earthenware, metal, glass, coins) especially within the material culture (i.e. wooden remains, burial relics, amphora for transport). This indicates that Chalcis was an important distribution centre with contacts in Venice and Constantinople. This makes the research interesting not only by creating a dietary image of Byzantine Greece, but also to see whether intercultural changes in diet have taken place between the Late Byzantines and the Venetians. From its prominent geographical location, Chalcis, with its well analysed stratigraphy and vast quantity and quality of faunal material, it offers the unique possibility to fill the absence of knowledge surrounding the food supply of the Byzantine period in Greece.

This paper is in progress and I will present my first results and problems during this conference.

TH1-19 Abstract 17

Analysis of a latrine from 17th century Copenhagen, Denmark

Author - Dr. Hald, Mette Marie, National Museum of Denmark, Copenhagen K, Denmark (Presenting author)
Co-author(s) - Mosekilde, Jacob, Museum of Copenhagen, Copenhagen, Denmark
Presenting Preference - Poster

During archaeological excavations in central Copenhagen a latrine dated to the 1680s was uncovered. The poster presents results from the combined analyses of animal bones, waterlogged plant remains, pollen, and eggs from intestinal parasites found in the latrine. The results show how the diet of the local users of the latrine was varied, including several types of fish, pork, a range of cereals, herbs and fruits, some of which were exotic. The number of intestinal parasites also shows that hygiene was rather low. DNA analysis of the parasite eggs is carried out in order to get a species determination as well as investigating the zoontic potential. The archaeological material from the vicinity suggests that the local inhabitants would have been in contact with traders from the Netherlands, based on the architectural, numismatic and ceramic finds. This is corroborated from the find of buckwheat chaff in the latrine, which is known to have been used as a packaging material for goods exported from the Netherlands, while being only a very minor crop in Denmark.

TH1-19 Abstract 18

Middle Bronze Age spread of broomcorn millet in N-Italy: cultural choice or environmental change?

Author - Dr. Perigo, Renata, Integrative Prehistory and Archaeological Science IPNA/IPAS, Basel, Switzerland (Presenting author)
Keywords: archaeobotany, Middle Bronze Age, Panicum miliacum
Presenting Preference - Poster

In the Neolithic Northern Italy, broomcorn millet (Panicum miliacum) remains are sporadic and doubtful. Certain identifications originate from two Chalcolithic sites: Monte Covoio and Velatum-Tanzgasse. Nevertheless, these finds are represented by single grains. Panicum is still sporadic in Early Bronze Age (EBA), while it expands from the Middle Bronze Age onwards and reaches its maximal diffusion in the Iron Age and in medieval times.

The huge amount of broomcorn millet remains in the Middle Bronze Age (MBA) layers of the Lagagnone site (Garda region), are of importance as they are found in stratigraphic continuity with underlying EBA layers. This allows analysing quantitative changes in plant macroremain spectra, shedding light on the acquisition of new crops at the Early to Middle BA boundary. After this transition, we observed a higher biodiversity in the plant fossil assemblage, marked by increase and diversification of the terrestrial herbs. The occurrence of many new taxa accounts for a diversified and wider open land. Most of these newly introduced taxa (i.e. Agropyron repens, Medicago minima, Cichorium intybus, Onopordum acanthum, Pastinaca sativa, Silene stelis, Herbaconum sp.) favour dry and warm habitats. It is in this scenario that broomcorn millet started to be widely cultivated. The ecological tolerances of broomcorn millet should also be considered in order to explain its adoption in a multiple cropping system. It is a summer crop, so very late in spring, as it does not withstand frost during germination. It grows well in regions characterized by warm and Mediterranean-type climate with a short rainy season, on poor soils and under severe droughts. The MBA Garda region held very well all these environmental features.

All in all, ecological drivers seem to have played a significant role in spreading the cultivation of broomcorn millet in the Garda region. Furthermore, social processes and economic relations are not to be excluded in the perspective of an overall process of improvement of crop husbandry practices.

We can conclude that the plant economy of Middle Bronze Age in Northern Italy is well characterized by introduction of new cultivars (broomcorn millet), together with an intensification of pulse cultivation (horsebeans), and a diffusion of rotation systems.

TH1-19 Abstract 19

Unravel the Medieval Islamic diet: preliminary data from the malacofauna of Tejo do Praio (Portugal)

Author - Branco, Rute, Universidade do Algarve - FCHS / NAP, Faro, Portugal (Presenting author)
Co-author(s) - Arruda, Ana Margarida, Faculdade de Letras de Lisboa - UNIRAP, Lisboa, Portugal
Keywords: Diet, Islamic, Zoarchaeology
Presenting Preference - Poster

The Tejo do Praio site is a Medieval Islamic settlement dating from the 10–12th century, located in Quinta do Lago in Loulé, Algarve, Portugal. Nowadays, the site is approximately 1.8 km from the coastline, within the Ria Formosa Natural Park. The unique nature of the site - due to its rural nature, residential areas, types of structures and proximity to the coastline - raises several questions, such as the importance and characterization of the exploitation of aquacultural resources for this Islamic community.

The main objectives of this study are to understand the local diet, to characterise the exploitation strategies of wild life and marine resources and to do an environmental characterization of the area during the occupation period. The results will then be integrated in what is already known for other Medieval Islamic contexts in Algarve. For this we will do the zooarchaeological analyses (classification of remains, abundances, anthropic and other modifications, biometry) of the aquatic invertebrates remains. Ultimately, zoarchaeology informs us on our diet behaviour by studying the mechanisms used in the exploitation of natural resources by past societies, the processing techniques developed for animal resources and the possible trade of resources and commercial routes.

So far data show a greater abundance of Cerastoderma edule (common cockle), followed by Ruditapes decussatus (clams), species that presently are quite common in region, well known as the highest mollusk production area of Portugal. Among other identified species are Ostra edulis (oyster), Mytilus cf. galloprovincialis (musselet), Solen marginatus (razor clam), Venus verrucosa (venus) and remains of Pectinidae family (scallop). The level of fragmentation is very heterogeneous across the contexts, from a mix of pre- and post-depositional agents.

TH1-19 Abstract 20

Parasites in archaeological deposits. How to interpret their presence and how to recognize them

Author - Dasendi, Anna Maria, INRAP, Paris, France (Presenting author)
Presenting Preference - Poster

The study of archaeological deposits reveals a lot of information about the ways of life and the food economy of the ancient communities. Diet food, farming methods and the surrounding environment are not the only information that we find during the study of the finds. Often, pests and insects are part of the organic assemblages. Recognize and interpret these remains is not always easy. The following posters will analyze a study of a subsiding area of the fourteenth and fifteenth century in the northeast of France.

**Keywords:** zooarchaeology, medieval, diet, parasites, anthropic modifications, biometry, faunal material, environmental characterization, medieval Islamic context, Algarve, Portugal, Tejo do Praio.
TH1-20 Abstract 02

Discontinuities in fishing practices at the onset of Neolithic: a case study from Starčevo

Author - PhD candidate Živković, Ivana, Laboratory for Bioarchaeology, Belgrade, Serbia (Presenting author)
Co-author(s) - Stefanović, Sofija, Laboratory for Bioarchaeology, Belgrade, Serbia
Keywords: Early Neolithic, Fishing, Starcevo
Presentation Preference: Oral

Whereas the significance of fishing is well documented at a number of Mesolithic and Early Neolithic (c. 9500 - 5500 cal BC) sites in the Danube Gorges (the Danube stretch between present-day Serbia and Romania) and is corroborated by archaeozoological, isotopic and archaeological evidence, the importance and active participation of fishing has received less attention in the study of surrounding areas. The issue of determining the role of fishing is particularly relevant for the understanding of transitions from foraging to farming. This paper aims to explore the patterns of fish exploitation in the Northern-Balkan area and the role that the Starčevo-Körös-Criş culture played in the transition to sedentary living. The presentation will focus on the Starčevo-Criş sites from the Hungarian part of the Starčevo-Criş-Criş cultural complex (e.g., 8000 - 5500 cal BC). Existing data on isotopic dietary signatures of human remains from Early Neolithic Starčevo-Körös-Criş sites signal a more terrestrial diet (Whittle et al. 2002; 2005), however archaeological data from several Körös sites in Hungary (Barossiewicz 2012) suggest that the role of fishing, in addition to being obscured by inadequate recovery techniques, would have varied greatly depending on site location and other socioeconomic factors. In this paper, we present the results of the analysis of fish remains from the early Neolithic. The Early Neolithic site of Starčevo-Grad in Serbia. The site is located on the former bank of the Danube at the edge of its floodplain, little over a 100 km upstream from the Danube Gorges as the crow flies. The faunal remains collected over the course of 1992 and 1998-1970 excavation campaigns (originating from both domestic and wild animals, waterfowl and fishes) were previously published by Clason (1980), and are indicative of a both stock-breeding and hunting/fishing economy. The fish remains, albeit few, were collected mostly by hand, and the role of fishing was probably more substantial. The occurrence of large fish hooks and fishing net weights speak in favour of such hypothesis, as well as the environment of the site, which was located in the very proximity of the river. In addition to the re-analysis of the remains from older excavations of Starčevo-Grad, our study also included the analysis of fish remains collected during 2003-2008 excavation campaigns. The aim of this paper, as well as future analyses of Early Neolithic faunal assemblages is to problematize the presumed dichotomy between Mesolithic and Early Neolithic subsistence strategies and to assess the role of fishing at the advent of food producing economies in the Central Balkans.

TH1-20 Abstract 03

Comfortable fishers in Mesolithic western Norway

Author - Prof. Bergsvik, Knut Andreas, University of Bergen, Bergen, Norway (Presenting author)
Co-author(s) - Richeth, Kenneth, Zentrum für Baltische und Skandinavische Archäologie, Schleswig, Germany
Keywords: Fisheries, Fishing gear, Settlement patterns
Presentation Preference: Oral

In late Mesolithic western Norwegian fishing stood for a major factor in the subsistence. The large majority of the residential sites are situated close to the shoreline, near good fishing grounds. Line-sinkers of soapstone occur frequently at these sites, and at some of them - where conditions for preservation for faunal materials are favourable - fishhooks of bone are found, and also...
Fish constitute a significant source of essential nutrients in the human diet. Over time, people around the world have developed numerous different methods of obtaining vital nutritional elements from aquatic environments. Early fishers, with their substantial content of fatty acids, vitamins, and, not least, fat, are an example of a nutrient-rich food source that has been prized in many parts of the world for millennia. Numerous different fishing methods have been employed, founded on observations of the mystical behaviour of the fish. Its remarkable biology did not begin to be understood until the 20th century and there are still some unanswered questions. The fishing methods and equipment required to catch eels, both on a daily basis and in large quantities as stored provisions, were developed on the basis of experience and oral traditions, handed down from generation to generation. In a Danish context, written sources such as law texts and ethno-historical evidence can provide information that is useful in interpreting prehistoric fishing strategies. Ethno-historical sources support evidence from studies of prehistoric woodland suggesting that Stone Age people systematically managed the surrounding forest to obtain building materials of an appropriate quality and in the required quantities for their fishing structures in the sea.

Archaeological and ethno-historical data show that eels have been part of Danish food culture for the past 8000 years. In 1988 and 1990, remains of fishing structures dating back between 4500 and 7000 years were investigated. These archaeological structures were interpreted as so-called ålegårde – eel weirs, which the fishers of historical times built on the coast and out into the sea. They were used to catch the schools of silver eels which, then as now, migrated from Baltic and Danish waters to the Sargasso Sea to mate and reproduce. This interpretation provided grounds for examining a number of different ethno-historical source categories from Danish museums and archives in order to assess information on construction methods, choice of materials and landscape use in relation to the corresponding prehistoric structures. According to a Danish adage, it’s hard to catch an eel by its tail. This paper presents diachronous Danish examples showing how the skill, craftsmanship and know-how of the Stone Age fishers, in relation to the manipulation of both marine and terrestrial resources, was passed down from generation to generation until the demise of this activity in the mid-20th century. But everything has its price! Some Danish sources reveal how people risked both life and limb when fishing from stationary structures during autumn and winter storms. Still eels are a much sought-after and highly prestigious food source in many parts of the world. Danish eel stories, from museums and archives, reveal how the people of Denmark have, since the Stone Age, employed special methods, ranging from almost childishly simple tools to complicated wooden structures stretching out into the sea, to ensure that the strong eel ended up making a valuable contribution to human nutrition.

Keywords: diachronous studies, eel fishing, human diet, regional and chronological development of fishing
Our knowledge of Roman fishing is based on a wide range of written and pictorial as well as archaeological sources. The study of the latter came into academic focus in the past few years (cf. International Workshop “NETS AND FISHING GEAR IN CLASSICAL ANTIQUITY: A FIRST APPROACH”, University of Cadiz 2007). All sources teach us about techniques and fish consumption as well as fish processing to manufacture the famous garum. Ancient authors (cf. Oppian’s Halesic) and some rare inscriptions give us insights in the organisation and socioeconmic structures behind the Roman fishing industries. Most of these sources originate from the Mediterranean.

In contrast, almost nothing is known about freshwater fishing in the north-western provinces. Even though fishing tools as hooks and net needles were regularly found at Roman sites (cf. Windisch- Vuolle 2002; Biberoth-Ch, Nethenricht-Ch, Kempraten(Ch) etc.). The Roman poet Ausonius also reported that Romans fished with fishing rods and nets in the Moselle. Thus it must be assumed that fresh water fishing was more common than it seems.

Following this assumption, the paper provides a first comprehensive and interdisciplinary presentation of freshwater fishing during Roman times on the Swiss Plateau. This study area is chosen because of its diversified landscape with lakes, rivers and streams and its good state of research; find assemblages of several ancient cities, vic, villa rusticae and rural settlements have been widely published and discussed.

This paper focuses on the investigation of fishing equipment and fish remains. Data will be compiled from the secondary literature. This quantitative approach will also consider their archaeological context to gain knowledge about the spatial and chronological distribution of the objects. This allows me to draw conclusions in terms of the organisation, nature, dynamic and range of fishing and fish consumption in the north-western provinces.

**Presentation Preference:** Oral

The Steinhuder Meer is a lake of 30 sq. km, northeast of Hannover in Northern Germany. Mesolithic artifacts indicate that people made use of the resources of the lake since that time. As it was an economically underdeveloped area in the past, the two bordering states were a matter of constant quarrels in the Middle Ages and Early Modern Times. In the end the inhabitants of the village of Steinhude won the conflict. Most of the fish was caught with the help of fish traps, a method which together with the traditional boats, known as Torfkähne, is still used today. To gain the necessary raw material for the nets fish was grown by the fishermen who were farmers as well, because they could not make their living from fishing alone. The surplus of flax was used for cloth making which was the start of a linen industry lasting to this very day. In addition the boats were used for transporting past across the lake and for cutting young reed as forage or grass from floating meadows. Traditionally the fishing rights were leased to individual fishermen. This changed around 1900 when the whole lake was leased to a single person. He introduced a type of vessel (Angelkahn) which derived from Havel region and new methods like line fishing and the use of a large seine net. At the same time the railway reached the lake and tourists came in. In the beginning, before special boats for visitors were constructed, Torfkähne were also used for carrying day-trippers. They were fond of smoked eel which was not only sold in the village of Steinhude, but later also at the market in Hannover. In fact the consumption of eel was for many people a reason to visit the lake. Because of this economic success only eels were caught and the rest of the catch was dumped back into the lake. This process lasts until today though most of the eels are now imported from other regions. Perhaps this development can to develop patterns for the economic impact of large settlements like the so-called Fürstensitze of the Hallstatt Period, the Oppida of the Latène Period or the Roman military forts. In those places there were not only many people who had to be fed, but there lived also a group of wealthier persons who were able to afford special food, like eels or other delicacies. On the other hand the Steinhuder Meer shows that the introduction of new means of production can sometimes be linked to a single event. Apart from these questions the paper will deal with the various methods how the fish was caught.
What is the role of cultural heritage for poverty alleviation in coastal areas of Latin America? Along the coastline of Brazil, small-scale fisheries are a traditional and crucial source of food and livelihood for thousands of people. Brazilian coastal communities efficiently integrate modern small-scale fishing techniques with pre-colonial indigenous knowledge, as a "neotraditional" mix. In the coastal areas of Maranhão (northern Brazil), this culminates in the use of historic fish traps (locally known as camboas), built by indigenous populations likely before the European Encounter. We will present the results of a multidisciplinary research effort aimed at exploring and documenting the contribution of this coastal cultural heritage to food security and community livelihood in one of the poorest areas of Latin America. The results offer some insights into the role of archaeology and historical ecology for mitigating poverty in coastal areas of Latin America.
Interpreting the Archaeological Record

Cremations and remains of mortuary sites at the Merovingian cemetery of Broechem, Antwerp (Belgium)

Author - Annaert, Rica, Flemish Heritage Agency, Brussels, Belgium (Presenting author)
Co-author(s) - Lentacker, An, Flemish Heritage Agency, Brussels, Belgium
Co-author(s) - Quintelier, Kim, Flemish Heritage Agency, Brussels, Belgium
Co-author(s) - Deforce, Koen, Flemish Heritage Agency, Brussels, Belgium
Keywords: cremation, inter-disciplinary research, Merovingian cemetery
Presentation Preference - Oral

This paper discusses the preliminary results of the anthropological analysis of the human cremated bone excavated at the Broechem cemetery and sheds light on early medieval funerary practices in the Schelde valley in Belgium. The cemetery was excavated in 2001-2003 and 2007-2010 by the predecessors of the Flemish Heritage Agency. The funerary ensemble includes 442 inhumation graves and 71 cremation graves. Two groups of cremation graves are present. One group is situated in the northern part of the cemetery, which is the oldest section of the cemetery with deposits dating from the second half of the 5th to the first half of the 6th century. This cluster of cremation graves is characterised by big pits with a lot of charcoal and early finds from the 5th century, some with Germanic influences. One urn deposition and one 4-post grave house are to be mentioned. The second group is scattered all over the cemetery and is to be dated in the same period as the inhumation graves in these sections (second half of the 6th till the second half of the 7th century). The funerary structures consist mostly of so-called Brandgrabengräber or Knochenlager. The osteological analysis aims to provide a detailed description of the nature of the deposits, to identify and quantify the human and animal cremated bone, to assess taphonomic effects of thermal alteration and fragmentation, to estimate the minimum number of buried individuals, to assess demographic data (age, sex) and presence of pathological changes, to identify any evidence of pyre technology (used during the cremation process) and presence and type of grave goods. The analyses of anatomical and other dendrochronological characteristics observed in the charred fragments is expected to provide additional information on former wood use for fuel. Additionally for the study of the charcoals from Broechem, attention will be paid to possible differences in fuel selection between the different types of cremation graves.

Funeral cremation of the Middle Oka region from the Great Migration Period to the Viking Age

Author - Dr. Syryavko, Alexander, Municipal budget organization “Kolomna archaeological center”, Kolomna, Russia (Presenting author)
Keywords: cremation, The Great Migration period, Viking Age
Presentation Preference - Oral

Many variants of the funeral rites were distributed rite in Eastern Europe during the second half of the 1st millennium AD. These centuries' burial sites of the Moscow region were unknown until the last years. Systematic studies of these cemeteries have been done over the past 15 years. All known burials are opened in the Middle and Upper Oka river, from Kolomna to Borovskovo, (Moscow region). Rite feature is that burned bone fragments placed on the ground surface. Urns were used rarely. The compact deposition of cremated bones suggests that they were put in any organic (leather? textile? wooden?) boxes. There are no pits in these ground cemeteries. That is why these sites were not detected for a long time. Now for seven cemeteries of different ages are known. The earliest one goes from V c. and the most late has been dated to the XII c. These dating based on the grave goods characteristics. Some burials have no any grave goods. The age of these burials have been dated by 14C (charcoal samples). All findings are presented with imported products, which complicate the cultural attribution of those people, for example, Slavic and Finish jewelry and buckles can be present in the burials together. Melted beads, melted objects from the bronze and silver chain mail parts, sylgams and buckles go from different European, Byzantine, Syrian and other centers. Glass beads and silver ornaments as well as jewelry from the different parts of Khamar Daban characterise Viking Age burials. The latest burials contain grave goods that are typical for the period of Old Russian state. Most things badly damaged pyre, melted, and cannot be
recognised. The human bones and animal bones are present together constantly. In some burials, animal bones predominate. During studies it was determined the sex, the age of the buried, the temperature of burning. In some cases, it was possible to determine some traumas.

Strontium isotope analysis taken as well. According to the results of our research, we can discuss two hypotheses. The first one is that the population of Moscow region was unchangeable from the early Iron Age until the end of the first millennium AD. According to another hypothesis, the population could change several times during the second half of the first millennium AD. We discuss pro and contra.

THI-21 Abstract 06

Folk from “Lodges of the dead” (on the burial sites of the Russian North in the first millennium AD)

Author - Kleshchenko, Ekaterina, Institute of Archaeology of Russian Sciences, Moscow, Russian Federation (Presenting author)

Keywords: ‘Lodges of dead’ approaches, cremations

Presentation Preference - Oral

“Lodges of the dead” – is the special type of burial sites which was typical for the Mologa-Sheksina interface and other parts of the Russian North and central region of the European Russia. This name comes from the special wooden structures (small houses - lodges) with materials of the funeral cremations as well as ash, pieces of carbon, fragments of bronze, iron, glass, bone grave goods. The tradition of these sites stretches for many centuries, from the first cc. BC to the end of the first millennium AD.

These archaeological sites of the Mologa-Sheksina interfluve (western part of the Vogûtga district) were excavated by A.N. Bashenkin [1] during 80-90 years of XX c. The author did not formulate the clear opinion about the ethnocultural background of these sites (2). Skeletal materials from “lodges of dead” of this region were not studied till nowadays.

The report is the first summary of the characteristics of the cremated remains from these burial structures. Burned bones from burial sites Chagoda 1, Pugino, Kurenevichi XII, Kurenevichi XVI were used in this research. Materials were examined with the help of color, weight, number, high temperature cracks and deformations. Clear anatomically fragmented were used to determine the sex and age of the individuals, and to detect the presence of animals. All clear anatomical fragments were recorded in archaeological plans.

All cremated fragments were verified by color, weight, number, high temperature cracks and deformations. Clear anatomically fragmented were used to determine the sex and age of the individuals, and to detect the presence of animals. All clear anatomical fragments were recorded in archaeological plans.

Comparative analysis of the regional sites highlighted the main features of a funeral ceremony: the burning of dead bodies on the funeral pyre outside the cemetery; partial deposition of burned bones together with charcoals, ash, melted grave goods. There is no individual burial space inside the “lodge of dead”. This structure includes all the individuals who were buried at different times together.

THI-21 Abstract 07

Medieval cremations of Novgorod Land: Christians or Pagans?

Author - Sobolev, Vladislav, St-Petersburg State University, St-Petersburg, Russian Federation (Presenting author)

Keywords: Christian burial canons, cremation and inhumation graves, Novgorod Land, Old Russia

Presentation Preference - Oral

The study of funerary monuments of the Novgorod land was started in the middle of the XIX century and continues to this day. In total, about 10,000 different types of burial constructions were excavated. The investigations demonstrated that in the XIX century throughout the Novgorod land cremation prevailed. The adoption of Christianity at the end of the XIX century has become the most important factor in changing the burial rites of medieval population. The first burials according to the new Christian rites (inhumations beneath barrows) have been dated by the middle of the XIX century. Since that time the Christian funerary rites certainly begin to dominate in the Novgorod land. Details of burials and structures could be different, but the transition from cremation to inhumation spread everywhere.

However, a small number of cremated burials in the Old Russian barrows of the XII century were excavated in the west part of Novgorod land. This group of burials has never been the subject of a special study for archaeologists. In the field reports and publications they have been interpreted as “a relic of paganism” without any arguments.

Micro-topography analysis of the cemeteries shows that many such burials with the cremated remains were not separated from the other tombs and located in the early part of the burial groups. The mounds with cremations and the mounds with inhumations of the same period are identical externally and internally. Simultaneously the cremated remains are quite different from the cremations of earlier times (for example, the Culture of Long mounds, Šopka culture, etc.) in size and in the degree of burning. The remains were scattered on the bottom of the burial pits, their size and shape are very similar to the inhumation graves. Finds (tines, iron weapon’s heads, coins) are rare in the analysed group and located like in inhumation graves. The subjects typical for female costume have not been found yet. It is important to emphasize that the found things have no trace of a fire.

Mentioned peculiarities give us an opportunity to clarify why Christian burial rite could be disrupted. Probably the cremation was the only possible way to deliver the body to the family cemetery, where the deceased could belong if according to relative’s opinion. Perhaps the death came far away from home in a military campaign, hunting expedition or commercial travels. In this case other participants of expedition (relatives and/or neighbors, people who knew the deceased victim well) felt obliged to bring the body to his relatives for burial at home.

THI-21 Abstract 08

Underwater burial sites of the 14th century: Kernave case

Author - Dr. Velius, Gintautas, Vilnius University, Vilnius, Lithuania (Presenting author)

Keywords: burial tradition, cremation, underwater graves

Presentation Preference - Oral

At least three underwater burial sites with cremated graves from to the 14th century have been investigated in Eastern Lithuania. In recent years, the cremation graves were discovered close to Kernavė town of the 13-14th centuries. In the dried stream watercourse about 13 kg of cremated human and animal bones, pottery and metal artefacts from the 14th century were discovered.

Burns in the water have received various scientific interpretations. The report provides the archaeological research data analysis of Kernave burial site and reveals the relation of this object to contemporaneous town. The essential question – whether the burial in water was a long - time tradition or was it only the consequence of important historical events? Burial rituals in water are not mentioned in the historical, mythological or folkloric sources. Cremation graves in water are also unknown in broader chronological and geographical contexts. So, bearing in mind the longevity characteristic to funeral traditions, the water burial rituals (which were practiced comparably briefly) forces us to look for unconventional causes of this phenomenon. Together with the current research methodologies do not allow us to state any clear opinion.

Based on artifacts typology Kernave burial site can be dated rather broadly (the 14th century). However cremated underwater graves are essentially treated as a mass burial site, where there are no boundaries among individuals. Mass graves, whether in water or on land are usually interpreted as a simultaneous consequence of deaths of several persons. So, the possibility remains that all the dead were buried there because of the certain circumstances, which occurred for the short period of time. Thus not only burial site was massive, but also the cremation process itself. It also should be noticed that when the deceased is buried in this way, any grave personalisation opportunity disappears. East Lithuanian region is noted for barrow burials tradition with very conservative funeral customs which existed 1000 years until the 13th century. Barrow was installed and used for a long time as a posthumous dwelling for a certain family. The specific individual burial place had to be important and at least several family generations were familiar with it. Therefore, the cardinal change of these traditions had to be the consequence of sudden and unavoidable events. Perhaps these events were the cause of death of significant group of persons. In this context, the attention should be drawn to the fact that precisely in the second half of 14th century the eastern Lithuania was reached by the largest forces of German Order and during the attacks of 1386 and 1390 Kernavė town was left in ruins. Furthermore, precisely at that time the “black death” spread throughout Europe and perhaps plague could reach Kernavė too.

THI-21 Abstract 09

Urn Cremation in the Southeast Baltics in the late Roman period.

Field record sand laboratory study

Author - Dr. hab. Mastykova, Anna, Institute of Archaeology, Russian Academy of Sciences, Moscow, Russian Federation (Presenting author)

Keywords: late Roman period, Southeast Baltics, urn cremation

Presentation Preference - Poster

The cremation was the prevalent burial rite since Roman times and early Middle Ages in Western Baltics. In this regard it should be noted that the development of new approaches to the study of cremation urn particularly relevant. A lot of new burial sites opened in the second half of the last century, but they have not been studied with the biorearchaeological approaches.

New cemeteries with inhumations and cremations of the Roman period (Sambian-Natongan archaeological culture) discovered by Sambian expedition Institute of Archaeology in recent years. Most of the vessels were disturbed, so we cannot...
reconstruct the sequence of packing urns by bones and a grave goods. Often fragments of cremated bones are located out of vessels (above, from the side, spread over the site). Bioarchaeological approaches contribute to understand the causes of these locations (site, taphonomic changes and so forth.)

Romanova-Pugachev pond - one of the monuments, which was opened recently in the Zelenograd district of Kalingrad region (East Prussia). Some graves disturbed by robbers, but one urn burial with cremation has been intact. The vessel was filled with heavy clay soil. Recording and sorting out the urn contents took place in the laboratory. Contents urn studied in layers, taking into account the depth of the layer. As a result, it was revealed that the burned bone fragments were placed in an urn without anatomical order. Weight cremated bones indicates that the cremated fragments of the funeral pyre was collected selectively, but not completely. The most parts of cremation are located in two layers of the urn: at the bottom and in the middle. Objects of iron and iron weapon (ax, spear, umbo and other fragments) tightly pushed above of each of these two clusters of the cremated bones.

This methodical approach of the study of the contents of urn in the laboratory enables to reconstruct the complex and multi-stage procedure for the funeral rites. Als, thanks to this method, we can discuss some of the important characteristics as:

- The temperature and time of pyre burning;
- The presence/absence of single and double (collective) burials; The age and sex of the individuals from the burials with weapons;
- Grave goods burned on a pyre and those that have been put into the urn without burning. Further rise of data will contribute to estimate the interaction of local and outside cultural influences and migrations on the funerary traditions of the inhabitants of the region of Sambian peninsula.

1 The study was supported by the RFBR, № 16-06-00058.

**TH1-21 Abstract 11**

*Thermal or non thermal alterations on the human bones: the case study from the Gnezdovo (9-11 AD)*

**Author:** Dr. Tatyana, Shvedtikhova, Institute of Archaeology Russian Academy of Sciences, Moscow, Russian Federation (Presenting author)

**Co-author(s):** Novikov, Vasily, ANO Historical-archaeological center Gardarika, Moscow, Russian Federation

**Keywords:** Gnezdovo settlement, cremation, human remains, taphonomy

**Presentation Preference:** Poster

Numerous post-depositional and post-burial agents affect and potentially alter skeletal material. Biochemical changes in soil surroundings in some cases has the same manifestations on the bones as fire influence. The difficulty to interpret and distinguish such agents also could be due to the unclear taphonomical situation. The case study from Gnezdovo settlement (9-11th cent. AD, Smolensk region, Russia) shows us the good example of application the different approaches to solve the hazard of black stains appearance on the woman's skull found in the redeposited burial in the trench 2 (excavations of 2012 season). Archaeological center Gnezdovo is the biggest complex of settlements and cemeteries of Viking age period in Europe. Classical description, microscopic investigation, X-ray fluorescence analysis of the bone material, soil analysis in the context of stratigraphy situation are applied. The complex approach led us to the question of elaborating the objective criteria in the similar cases. Also the C14 dating got from the named bone material helps us to indicate the cultural layers of the second half of 10th century and get a new information about the early period of the Gnezdovo settlement in 9th century.
THI-23

Mesoritics Dwelling Structures: From Methodological Approaches to Archaeological Interpretation

Thursday, 1 September 2016, 09:00-13:00
Faculty of History, Room 331
Author: Cuenca-Solana, David, University of Rennes 1, Rennes, France (Presenting author)
Co-author(s): Marchand, Élior, CNRS/University of Rennes 1, Rennes, France
Keywords: Mesolithic, Settlements, Spatial analysis
Presentation Preference - Regular session

The study of Mesolithic settlements is a key issue to understand the articulation of a social and economical system that lasted for several millennia and its collapse. Analyzing the spatial organization of settlements increases our knowledge on activity areas, subsistence strategies, seasonality of occupations and social organization. One of the most informative aspects is the interpretation of dwelling structures identified in the archaeological record as post holes, stakes, pits, walls, floors, hearths, etc. The interpretation of their functions often leads to heavy assumptions (mobility system, storage, social hierarchy). The passage of these archaeo-logical facts to their interpretations is obviously a crucial phase of our works, we need closer monitoring.

Research on dwelling structures can be approached from a wide range of theoretical and methodological points of view, which in turn can provide heterogeneous perspectives of archaeological interpretation that lead to the enrichment of discussion and debate. The session aims to gather together presentations on dwelling structures from archaeological sites but also multidisciplinary research on the structures from multiple methodological perspectives (e.g. spatial analysis by GIS, lithic refitting, geoarchaeology, micromorphometry, geochimistry).

In this session we intend to discuss this crucial topic for the European Mesolithic, considering all geographical locations (coastal settlements located as well as inland sites) and all Mesolithic chronologies, to offer a very wide panel of the concepts, methods and technical means at the disposal of the archaeologists.
Keywords: Mesolithic, refitting, Star Carr

During excavations at the early Mesolithic site of Star Carr, UK, between 2007 and 2015, three features were encountered. One of these was an unambiguously pit and post structure with the pit filled with large quantities of lithics and organic material. In 2014 what appears to have been a similar feature was discovered, though this had been partially truncated by previous excavations. Finally in 2014/2015, a series of post-holes were encountered, though many of these were ambiguous in an area that had been heavily affected by root action. In this paper we present results of post-excavation analysis of these features. Using refitting, use-wear and micromorphology, we investigate the nature of these structures, and their differing history of use and abandonment. Beyond this what do these structures and their relationship to adjacent debris tell us about the nature of dryland activities that complement the well-known wetland archaeology of the site.

TH1-23 Abstract 07
Mesolithic shell midden sites from northern Iberia: habitation sites or waste disposal mounds?
Author - Dr. Guzmán-Zugasti, Igor, Instituto Internacional de Investigaciones Prehistóricas de Cantabria, Santander, Spain (Presenting author)
Co-author(s) - Cuenca-Solana, David, Instituto Internacional de Investigaciones Prehistóricas de Cantabria, Santander, Spain
Co-author(s) - González-Moreno, Manuel, Instituto Internacional de Investigaciones Prehistóricas de Cantabria, Santander, Spain
Keywords: Dwelling structures, Settlement, Shell midden
Presentation Preference: Oral

Research on Mesolithic coastal settlements in northern Iberia has been focused in the so-called Asturian area (northern Iberia). Settlement patterns in the area have been defined by the formation of numerous shell middens. The huge amount of shells discarded at the sites, together with the limited presence of other materials, firstly led to consider these deposits as mere waste disposal mounds, whilst habitation areas were thought to be elsewhere. However, after a century of research in the area no Mesolithic habitation sites related to the shell middens have been found.

Extensive excavations in shell middens were limited to the site of Mazacillos II in the late 70’s and early 80’s, where some living floors were recorded. From 2009 extensive excavations at the shell midden sites of El Toral III and El Mazo have brought to light different dwelling structures, such as post holes and hearths. In addition to these features, the excavation of discrete shell midden units produced a variety of materials including molluscs, mammal, fish & bird bones, lithics, charcoal, seeds and human remains, confirming that shell middens in northern Iberia were not only places where the shells were processed and discarded, but habitation sites where a wide range of activities took place.

TH1-23 Abstract 08
Microstratigraphic investigations at the Mesolithic shell midden of El Mazo, Asturias, Spain
Author - Duarte, Carlos, University of Cantabria, Santander, Spain (Presenting author)
Co-author(s) - Irarbi, Eneko, University of Burgos, Burgos, Spain
Co-author(s) - de la Mata, Virginia, University of Cantabria, Santander, Spain
Co-author(s) - Irarbi, Eneko, University of Burgos, Burgos, Spain
Co-author(s) - Irarbi, Eneko, University of Cantabria, Santander, Spain
Co-author(s) - Arbis, Pablo, University of Cantabria, Santander, Spain
Keywords: El Mazo, Microstratigraphy, Shell midden
Presentation Preference: Oral

The Mesolithic of the coastal karstic platform of eastern Asturias is characterized by more than one hundred deposits of marine shells and other archaeological material cemented by carbonate in the walls and ceilings of karstic cavities. There are only a handful of shell middens that allowed archaeological excavation. The knowledge about the Asturian shell middens still lacks information about the formation and post-depositional processes that are clearly affecting them and complicating archaeological interpretations on its functionality and accumulation. This is also partially due to the scarcity of geoarchaeological approaches to these deposits.

At El Mazo limestone shelter the discovery of a widely stratified shell midden constitutes a rare chance to answering these questions. From a geoarchaeological point of view, El Mazo is particularly relevant for the existence of several layers rich in marine molluscs embedded in matrices with different sedimentary compositions, some of them only a few centimetre thick.

Structures apparently well preserved were also identified, such as combustion features, also with homogeneous configurations (e.g. presence/absence of stone structuration), which might be indicating different behaviours and types of occupations through time.

Undisturbed sedimentary block samples were collected to investigate into the microstratigraphy of this shell midden and the structures within the shell layers. The study under the microscope of the thin sections obtained allows to systematically identify sedimentary microfacies and ascribe them to possible in-situ and reworked contexts, including those of fire combustion features. Ultimately, the identification of sedimentary structures resulting from human activities, that many times leave imprints visible only microscopically, might lead to the reconstruction of the behaviours behind the accumulation of the shell middens.
TH1-23 Abstract 09
Can pits define a settlement?
One example from inland Iberia Mesolithic
Author - Gaspar, Rita, Porto, Portugal (Presenting author)
Co-author(s) - Carrondo, Joana, Porto, Portugal
Co-author(s) - Detry, Cleia, UNIARQ, Lisboa, Portugal
Co-author(s) - Martin Seijo, Maria, CIBIO-InBío, Porto, Portugal
Co-author(s) - Tereso, Joao, CIBIO-InBío, Porto, Portugal
Presentation Preference - Oral

In the last years new discoveries regarding Early Holocene human occupations have been made in inland Iberia, namely in northeast Portugal. One particular site, Foz do Medal, will bring important contributions to the study of Mesolithic communities due to well preserved records as well as to its location in the border of Spanish Meseta.

Foz do Medal has more than 60 pits within three Mesolithic phases, from the 8th to the 6th millennia cal BC. In some Mesolithic phases pits appear associated to other types of structures, such as post holes, hearths and hut floors. Nevertheless pits dominate the settlement area. Its contents were analysed by a multidisciplinary team, revealing lithic industry, faunal and archaeobotanic remains. One pit presented a human burial. Throughout Europe pits have been found in several Mesolithic sites and their interpretation has been a matter of debate. Interpretations range from storage structures to hunting traps.

Considering the amount of pits that were found and the interdisciplinary approach carried out in their investigation, Foz do Medal can be a very important site in such debate. Furthermore the excavation provided relevant data regarding subsistence strategies and the use of botanic and abiotic resources.

TH1-23 Abstract 10
Clues to recognize spatial organization and function of the Mesolithic camps from Polish Lowland
Author - Dr. Olselowicz, Grazgorz, Nicolaus Copernicus University/ Institute of Archaeology, Torun, Poland (Presenting author)
Keywords: Mesolithic, Poland, Spatial analysis
Presentation Preference - Oral

The presentation will discuss the results of the interdisciplinary and multifaceted studies, which were subjected to three Late Mesolithic camps from the area of central Poland: Sasinowko 4 and Ludwicze 6 (eastern and western habitations). The studies included soil, geomorphological and hydrological analysis of the sites area, archaeozoological and palynological analysis of the bones, palynology, AMS dating and multithreaded analysis of stone artifacts, including: petrography, technology, refitting and use-wear study of all artefacts. Spatial analysis were carried out using primarily Kernel density and “Ring and Sector” methods, bones, palynology, AMS dating and multithreaded analysis of stone artifacts, including: petrography, technology, refitting and use-wear study of all artefacts. Spatial analysis were carried out using primarily Kernel density and “Ring and Sector” methods.

TH1-24
WEIGHTS AND WEIGHING FROM THE BRONZE AGE TO THE MIDDLE AGES: PERCEPTION, CONTEXT, USE
Thursday, 1 September 2016, 09:00-13:00
Faculty of Philosophy, Room 201
Author - Rahmstroft, Lorenz, University of Copenhagen, Copenhagen, Denmark (Presenting author)
Co-author(s) - Ditsynski, Aleksander, University of Zurich, Zurich, Switzerland
Co-author(s) - Gralak, Tomasz, University of Wroclaw, Wroclaw, Poland
Keywords: metrology, trade, weights
Presentation Preference - Workshop

The material remains of past cultures are conceptualizations of their creators. Artefacts associated with the application of weight standards from prehistory to the Middle Ages may be analysed in this way. Certainly, weights and scales facilitated trade and exchange, integrated different geographical spheres and cultures in economic terms and became in this way a medium in defining interpersonal and intergroup communication. Weighing is also closely connected the other kinds of measurements of concrete things as well as the conceptualization of numbers.

During this session we would like to raise the following topics:
- When emerged the concept of weighing and under which circumstances? How closely was it related to the increasing importance of metallurgy?
- Whether and to what extent weighing units were abstract concepts?
- Why were certain shapes of weights chosen and preferred in certain regions and periods?
- How were various weighing systems constructed and how were they transformed through time? Can we really define the origin and end of the use of specific weighing systems and units?
- What are the contextual associations of weighing equipment (scales and weights)? What does this tell us about the use of these tools and the social status of the users?
- Influenced weighing systems the perception and description of the world?

We would like to invite all scholars to this workshop who analyse such issues by the study of archaeological remains.

TH1-24 Abstract 01
Introduction: studying evidence for weighing through the ages - problems and challenges
Author - Associate Prof. Rahmstroft, Lorenz, University of Copenhagen, Copenhagen B, Denmark (Presenting author)
Co-author(s) - Gralak, Tomasz, University of Wroclaw, Wroclaw, Poland
Co-author(s) - Ditsynski, Aleksander, University of Zurich, Zurich, Switzerland
Keywords: cognition, metrology, trade
Presentation Preference - Oral

The discipline of ancient metrology is generally considered to be a difficult subject and weighing equipment is often not sufficiently discussed in publications - if the evidence has indeed been recognised at all. One of the aims of this session is to promote such studies and to demonstrate its relevance for many key issues of the human past, among them cognition, trade and economic integration, mathematical conception and socio-economic organisation. The time is past due to disseminate the relevance of weights and measures, especially because the identification of such tools often allows for a considerable reinterpretation of the cultural context in which they appear.

We will highlight some of the problems and challenges we have to face when studying (potential) weights, scales or weight-regulated artefacts. Issues we will touch upon comprise the relation of weighing to metallurgy, abstraction, standardisation, metrology, trade and traders and even to the ancient perception and description of the world.

TH1-24 Abstract 02
Normative and behavioural aspects in Near Eastern weight systems: a Case study from Ebla (Syria)
Author - Dr. Ialongo, Nicola, Sapienza University of Rome, Roma, Italy (Presenting author)
Co-author(s) - Dr. Vacca, Agnese, Sapienza University of Rome, Roma, Italy
Co-author(s) - Prof. Peysner, Luca, University IULM of Milan, Milan, Italy
Keywords: balance weights, Ebla, hoards
Presentation Preference - Oral

We would like to invite all scholars to this workshop who analyse such issues by the study of archaeological remains.
Interpreting the Archaeological Record

TH1-24 Abstract 03
Weight - highly abstract measure
Author: Dr. Siuńska, Katarzyna, University of Gdańsk, Gdańsk, Poland (Presenting author)
Keywords: Central Europe, metal production, weight
Presentation Preference: Oral

Nowadays in most countries of the world we have one coherent metric system in which every phenomenon can be described using 7 base units. But even in not very remote past every unthink its own scope of references and one quantity could be measured using different units depending on physical state, purpose and other properties. Among other measures invented or negotiated the weight is the most abstract one. It is hard to point any natural equivalent that can be used as a comparative amount as e.g. feet, elbow length or the number of eyes, heads of fingers. Even if these units/numbers differs between people there is something like "the ideal model" - every man has 2 eyes, 1 head and 5 fingers in each extremity - except for some rare exceptions. In interpreting our results, we acknowledge that norm and practice are the two sides of a same coin, in that they stand as complementary aspects of real-world economies; therefore, understanding the interplay requires first to tackle each aspect through the appropriate methodology.

TH1-24 Abstract 04
Identifying weights in later Bronze Age Western Europe
Author: Associate Prof. Rahmstorf, Lorenz, University of Copenhagen, Copenhagen S, Denmark (Presenting author)
Keywords: Bronze Age, trade, weights
Presentation Preference: Oral

In Europe, outside the Aegean, secure evidence for the use of weights is known from the second half of the second millennium. The increasing attestation of weights in Europe has been noted in recent decades by archaeologists, particularly by Christopher F. E. P. Par for Central Europe, by Andrea Cardarelli and others for Italy, and Paqueta Vigas for Portugal. These individual authors have contributed immensely to the identification and publication of weights in various regions of Europe, but large blank spots in between these specific research areas still prevail. In some regions we know of balances but no weights have so far been reported – a situation which cannot reflect any ancient reality. In this presentation I will discuss some new finds of weighing equipment in Western Europe from the late second and early first millennium BCE that have been established through systematic research. The identification of weights or scales allows for radical new interpretations for specific sites, the intensity of exchange – i.e. trade – and cultural developments in these regions.

TH1-24 Abstract 05
The social use of metrology in the western Mediterranean Iron Age
Author: Dr. Gorgues, Alexis, University of Bordeaux Montaigne, Pessac Cedex, France
Co-author(s): Poigt, Thibaud, UMR 5608 TRACES, Université Toulouse Jean-Jaurès/Université Bordeaux Montaigne, Toulouse-Bordeaux, France (Presenting author)
Co-author(s): Comte, Florent, Free Lance Archeologist, Bordeaux, France
Keywords: Iberian Peninsula, Institutions, Weighing
Presentation Preference: Oral

In this paper, we will like to present the first steps of an investigation aimed at discussing the nature of metrology in a specific context of the Mediterranean Iron Age. The Iberian one. Metrology is basically an institution, whose materiality in the Iron Age is mainly linked with weighing. It can take different aspects. When based on experience, on practice and on spontaneous and mutual agreement, we can speak of a practical institution. When enforced by law, and guaranteed through the activity of magistrates, it is a formal institution that may have, much more than the first one, a secondary impact on the material record: its existence will promote norms and behaviours, as the fabrication of standardized pottery vessels.

The use of weights and scales during the Iberian Iron Age is well known and has generated an extensive bibliography. These works rely mostly in two assumptions. The first one is that weighing has to be understood on the widest frame of the trading practices connecting at this time the Iberians with others peoples of the Mediterranean area, namely the Greeks and the Punics. The second one is that the weights themselves are characteristics of a metrology having a wide range of application, including – and often predominantly - the proto-monetary sphere. In other word, the adoption of such technology would have meant the deliberate development of an exotic, formal institution, whose imitation aimed at inserting the native networks in the wider Mediterranean ones. This convergence of the Iberian institutions of trade with those of the "Classical" Mediterranean is considered as part of a widest evolutionary process, which conclusion would be the constitution of Iberian "Early States".

We will first look for the evidence linked to weighing. Such evidence is overwhelmingly concentrated in the Valencian Country. We will show that here, from the end of the 9th century onward, metrology is quite coherent from one place to another. However, through the contextual analysis of the weighing instruments, we will argue that weighing is not prominently linked with long distance trade, but rather with one’s patrimony management, and was a highly performative activity.

In a second time, we will examine the evidence for normative behaviours, much sketcher. We will introduce a new analytic method allowing the direct comparison of vessel production standardization in different contexts of the Ancient Mediterranean, in order to show that Iberian practices in this regard didn’t show much preoccupation for the adequacy to any norm. The only tendency for a homogenization of the capacities seem indeed to result from the productive routines. On this ground, we will conclude, that in the Iberian context, metrology is not a formal institution enforced through legal control and public coercion, but a practical one, aimed not at diminishing the transaction costs in a trade context, but at creating interpersonal trust between partners whose association went far beyond the strick economic sphere.
Metal ingots as a medium of exchange in the Bronze Age and the Iron Age

Metal ingots constituted a long-lasting phenomenon that occurred from the beginning of the Bronze Age to the late Middle Ages. They appeared at the earliest in the Elective culture in Central Europe. Specimens made of bronze are rib-shaped, while gold ones were made of spiral wire of wire. In the era of the Urnfield complex, longitudinal ingots of bronze and tin appeared. Sometimes they were also used as currency systems. In the Hallstatt period, objects of this type made from iron appeared. In the La Tène period, ingots of gold, silver or bronze, often broken, have been found together with chopped coins. Analogous finds date from the Roman period, the Migration period and the Middle Ages. From that time onwards, ingots and coins of pure silver are also known. Silver ingots were used as a medium of exchange in medieval Lithuania. It seems the reason for such a long use of ingots is their unique usability. They served as a source of raw material, yet remained bullion money. Their form facilitated their breaking up in smaller pieces in order to achieve the proper weight. This method of their use facilitated relationships with communities using different weight measurement systems. They were also necessary, even if coins were available, in areas where political power was not able to guarantee and enforce their value.

Late Antique and Byzantine weights in the Mediterranean Area. The Glass weights

Byzantine glass weights are essential tools of a regulated and controlled coin circulation. To understand the financial management and ultimately the Byzantine tax system of the 6th and 7th century AD they are of great use. They are made of translucent glass of different colour. Some are pale yellow or green colours, but even pieces made of dark blue and red or opaque brown glass occur. On the front side they are stamped sometimes with a bust of a dignitary surrounded by a legend including his title and name. The majority of the weights are stamped with the names of dignitaries in the form of monograms.

For the first time 1300 Byzantine glass weights were systematically collected from various public and private collections in a database. About half of these weights were studied and measured by the author himself to achieve reliable data. The typology of the glass weights is based on the inscriptions, various monograms and figural elements. The aim of the project is to establish a typological and chronological framework of glass weights from the period of the 6th and 7th century AD.

The main problems in the research of the glass weights occur in the understanding of the whole system and the chronology of the different weight types, which is based on their prosopographic identification.

Multifaceted Head of Neck Ornaments “Perm Type”

The neck silver jewelry of the Viking Age in a large number found in hoards in the Kama River basin, had multifaceted clasp, which was a truncated pyramid. The usual method of archaeological search for analogies, is comparative benchmarking, let still detect only similar things. In fact, many-sided fastener rings “Permian” type is half the geometric figures tetrahedron with truncated corners, which found in Hungarian antiquities originating in the territory of Bulgaria by Alexander Spilman. It is an object against a fastener ring and a size two times greater than it.

Alone or in combination. Neck ring hoards of dark blue and red or opaque brown glass occur. On the front side they are stamped sometimes with the bust of a dignitary surrounded by a legend including his title and name. The majority of the weights are stamped with the names of dignitaries in the form of monograms.

Neck decoration Scandinavians were of iron, they were not used and the Slavs. Slavs used as an expensive silver jewelry and fashion item or as a store of value. But in Sweden rings Permian type were made to get rid of the excess of silver in the form of coins, which were worn as bracelets. Neck rings were brought to the Baltic States through the Arab coin, which is before the first silver crisis of 60-90 years of the 9th century rushed from Arabia to Sweden. Therefore the treasures with the Arab coins could fall in the period of excess revenues coins from the east, and rings with silver heads multi-faceted neck rings head marked by 2 things: bracelets on hands, clasps-fibulae. Mass discoveries brooches, buckles during archaeological excavations in the Baltic States are talking about ethnic identification of this type of things, but in the entire Baltic region is alien neck rings and bracelets. Some of the findings of these items without heads arrived in the Eastern Baltic from different ethnic backgrounds, because they are known only in hoards. All three subjects constitute complex served as money, and the neck ring served as ring money By Br. Hard. Cash and weight standards allow a very high degree of accuracy to determine specific ethnic identity even hoards. If weight hoards standards correspond to the different ethnic groups, and it indicates the direction of trade relations or to cultural and consumer preferences cash holders. Treasures, consisting of the neck rings is preferable to studying in weight than coin treasures, as things that are hidden in them larger and the measurement error is small. Weight measurements artifacts nesassary. They may correspond to the Nordic, Byzantine, Iranian, Prussian, Danish weight standards: 360, 327, 404, 190, 200 grams, Alone or in combination. Neck ring in hoards have tangible evidence of large wholesale trading or tax collection.
TH1-24 Abstract 11
Analysis of weights and measures from the flat axes mould discovered in Pendia’s Hillfort (Spain)

Author: Dr. Rodriguez del Cueto, Fernando, Universitat de Oviedo, Oviedo, Spain (Presenting author)

Keywords: Bronze Age, Hillforts, Weights and measures

Presentation Preference - Poster

In 2008 a flat axes mould was discovered in one of the streets of Pendia’s Hillfort, a fortified enclosure in NW of Iberia (IV BC-II AD). Despite its location, in secondary position after using for casting, this find shows a long term survival. Moreover, this mould is related with the first metallurgical activities in our region. Finally, this piece allow a first approach to check if there is some patterns in weights and measures issue during the production of several prehistoric tools.

TH1-24 Abstract 12
Scales and Weights in Roman Trade: The Case of the Wreck Found in Valle Pega (Comacchio, Italy)

Author: Dr. Corti, Carla, University of Verona, Campogalliano, Italy (Presenting author)

Keywords: Roman trade, scales and weights, weighing procedures

Presentation Preference - Poster

In 1981 in the delta of the Po river, in Valle Ponti near Comacchio, was found one the wreck of a Roman ship with its cargo. The boat was engaged in small scale coastal shipping, but it was able also to transport by river. The shipwreck occurred around 12 BC along the north-western Adriatic coast, between two branches of the ancient Po. The ship’s cargo excavated by archaeologists includes a big variety of merchandise: lead ingots, some with the stamp of Agripa, amphorae and ceramics of various type and provenience, lamps, wooden beams, fourths of meat and various small objects, including several little lead temples. A turn-over steelyard for retail trade and a big stone weight were also found in the cargo. They were part of the ship’s equipment. The turn-over steelyard has two capacities and a stamp with the mention of one personage, probably the mensor who built the instrument in according to similar finds. The stone weight, a centussis (100 librae), was used instead for wholesale trade. This weight has an inscription too, which mentions in this case the magister navis, the shipmaster, as recently proposed. The finding of these measuring instruments on the Valle Ponti’s wreck provides an opportunity for some remarks about weighing procedure on Roman maritime and fluvial trade and about official control of scales and weights.

TH1-25 Abstract 01
How do we understand animal deposits from the Roman Iron Age in the wetlands in Denmark?

Author: PhD student Pantmann, Pernille, Museum of Northern Zealand, Hilleroed, Denmark (Presenting author)

Keywords: Animal deposits, sacred versus profane, Wetlands

Presentation Preference - Oral

Animal deposits are perhaps the most frequent type of sacrifice in Danish wetlands, and they appear in most of the prehistory. However, in Danish animal deposits tend to be overlooked compared to other finds from the wetlands, which includes precious metal objects, bog bodies and weapons etc. In contrast, our neighboring countries traditionally prioritize animal deposits a little higher. However, there is still a tendency to look upon animal deposits from a zoological point of view. In order fully to understand all aspects of the Iron Age utility of the wetlands, we have to reexamine the animal deposits and discuss their part in sacred and profane lifestyle of the Iron Age. Most importantly, we must focus on the deposits and their context, not just consider them as zoological objects but also acknowledge the animal deposits as archaeological objects with substantial information about society, people and beliefs.

During the last eight years, a large number of animal finds, both sacred and profane, have been excavated from wetlands in northern Zealand. Especially the ongoing excavations at the site called Sapetermossem have revealed a small bog with numerous sacred animal deposits. Though still preliminary, a vast amount of results seem to be the outcome, which will enable us to interpret both the new finds as well as reinterpret some of the old finds from northern Zealand. So far, the new discoveries can contribute with information about the variation of sacrificed animals, which parts that were sacrificed, the combination with other items, the context in which they were sacrificed and the differences compared to the profane animal deposits etc.

Finally yet importantly, animal deposits contribute to the discussion about the utility of wetlands. Were their sole purpose to be marginal, mystical and sacred places or were they all that and part of the daily profane life? In other words, based on animal deposits, we should take a holistic point of view when it comes to wetlands.

TH1-25 Abstract 02
Boeren- a bog revisited

Author: Ekund, Susanna, Uppsala, Sweden (Presenting author)

Keywords: Bog body, Ritual practices

Presentation Preference - Oral

Bog bodies have a special attraction and some of these, such as the Tollund man has reached iconic status. However, not all bodies from bogs are preserved similarly and not all remains from bogs are from humans, there are also bones from animal. This session welcome papers that focus on the practices around deposition, retrieval and curating of these remains. The session would address issues about bog bodies in human/animal relations, necropolitics and self-sacrifice, links between archaeology and written sources/folklore as well as ethics of display and present day religion. To what extent would the bog body debate be stimulated by a gender, multispecies and environmental humanities perspective that explores human, non-human relations with watery environments? Can we move on in the discussion on depositional in wetlands being garbage or the holiest of holy? The session would like to invite researcher that address the theories or lack (?) of theory in bog body studies. The session would also like to address the geographical bias in bog body studies and broaden up, particularly with studies from Eastern Europe and if possible with studies of depositions of bodies in wet context from central europe and the alpine region.
Archaeological finds of human and animal remains in bogs and wetlands are random and unpredictable causing trouble for both anthropologist and antiquarian authorities. In Sweden new finds are scarce but searching museums and archives you can find numerous notes of earlier discoveries. This paper asks the question what is the potential in these old notations by presenting recently conducted work on one such a site – Lake Bokaren in central eastern Sweden just some 20 kilometers east of Uppsala. The place was first found when farmers were trying to ditch out the bog/lake to retrieve new farmland in 1939 and found to two human skulls and a couple of horse skulls. The finding was followed by a small excavation in 1941 where more animal bones (primarily horse skulls) were retrieved alongside with a wooden platform covered with flux. Unfortunately this quite spectacular find were forgotten about and the report never written up. It’s only been referred to in some texts. We have now been able to collect most of the material from the excavation that was spread out at different museum storages and we have studied the documentation. We have also dated some the human skulls and some of the animal’s bones and performed osteological analysis of the human remains. Last year we got the chance to return to the place for a small scale research excavation to see how the finds had been preserved and trying to find out how big the actual site was. We found another human being and two horse skulls together with worked wood. The site appears to be quite big, and there is more the 35 meters between the findings of horse skull and human bones and we were not able to find the boundaries of the site. The ritual practices spreads out for about 1000 years from 300 AD until 1300 AD, which is quite remarkable since it means well into the Swedish middle ages and Christian period … It’s interesting that both the humans and the animals have been exposed to similar types of violence on this site, and this might be one of the clues in how to interpret the mysterious bog bodies. Lake Bokaren is placed near double parish boundaries, between Rasbo and Stavby parishes. This can be interpreted as if this was a place where various localities got together around sacrifice. It’s also challenging to try and put the place in perspective in connection to folklore and oral traditions in the neighborhood. For instance many holy springs are known in the area.

TH1-25 Abstract 03
Place-lore concerning bog bodies and a bog body concerning place-lore

Author - Kama, Pille, University of Tartu, Tartu, Estonia (Presenting author)

Presentation Preference - Oral

...Under the swamp sods and when chopping down shrubs, many human bones came out from Lawonio ‘encampment swamp’. Also pigs dug out human bones with rusted pieces of iron. It seems that fighting had been so fierce that there was not enough time to bury the dead, so they were trampled into the swamp [...] (E 63001/2)

The aim of this paper is to introduce Estonian place-lore concerning bog bodies. This oral history is collected and written down mostly in the past, but some narratives are vital among locals also nowadays. There are different stories that describe burials, drowning, suicides and executions in wetlands: actions that may result in bog bodies. In oral tradition, there is also place-lore describing finds of human remains from peat. This refers to incidents where bog bodies were found in the past of which we do not have any knowledge based on archaeological records. In more details I show how a real archaeological find, a Rabiire bog body is reflected in place-lore. How information in place-lore is comparable with archaeological data and how this folklore should be received by archaeologists, will be discussed.

---

TH1-25 Abstract 04
Sacrifice and necropolitics

Author - Associate Prof. Christina, Fredengren, Stockholm, Sweden (Presenting author)

Keywords: Bog bodies, Necropolitics, Sacrifice

Presentation Preference - Oral

This paper will analyse mechanisms of inclusion and exclusion in Late Bronze Age and Iron Age Scandinavia (with case studies mainly from Sweden) manifested in the deposition of human and non-human remains in places outside burial grounds such as in wells, rivers, wetlands and bogs, traditionally seen as sacrifices. Problematising the concept of sacrifice, this paper will deal with the question of bio-politics insofar that it will look at what lives these individuals led as reflected in the skeletal remains. It also particularly deals with questions about Necropolitics and the control of the boundary between life and death and the effects of such control on societies, but also reflect on Zoe-politics as a historical phenomena (cf. Agamben 1998, Mbembe 2003, Braudel 2013).
THE LIFE BIOGRAPHY OF ARTEFACTS AND RITUAL PRACTICE

TH1-26

Thursday, 1 September 2016, 14:00-18:30
Faculty of Philosophy, Room 107

Author - Jensen, Mathias, Aarhus University, Højbjerg, Denmark (Presenting author)
Co-author(s) - Bye-Jansen, Peter, University of Southampton, Southampton, United Kingdom

Keywords: Neolithic Britain, life biographies, depositions, use-wear, Neolithic, causedew enclosures

Presentation Preference - Oral

This paper presents a closer look at the phenomenon of monumentality in the early Neolithic, at a micro scale. The methodological approach is use-wear analysis of flint assemblages from selected contexts of a number of well excavated early Neolithic causedew enclosures in southern Britain and southern Scandinavia. The UK sites include: Elton (Cambridgeshire) and Staines (Surrey), with reference also being made to preliminary analyses of assemblages from Hambledon Hill (Dorset) and Windmill Hill (Wiltshire); for southern Scandinavia, Sarup (Denmark). Results from the use-wear analysis offer a way of characterizing activities at these sites that has not been attempted before. In particular, use-wear analysis has been able to reveal some of the encased life biographies that the flint artefacts hold, and in this way contributes to understanding the temporality in depositional practices at causedew enclosures. The project has also sought to develop method in use-wear analysis, notably through the use of high-end digital microscope technology in combination with a conventional microscope.

TH1-26 Abstract 01

Taking a closer look – causedew enclosures through the lens of a large scale use-wear analysis

Author - Bye-Jansen, Peter, University of Southampton, Hayling Island, United Kingdom (Presenting author)
Keywords: Neolithic Britain, life biographies, depositions, use-wear, Neolithic, causedew enclosures

Presentation Preference - Oral

The ambition is to create a synthesis about life biographies of artefacts from the Stone Age via practises and activities that the material culture reflects.

TH1-26 Abstract 02

Grinding Tools and Circular Enclosures - Ceremonial Behaviour or Common Refuse Management?

Author - Řídký, Jaroslav, Prague, Czech Republic (Presenting author)
Co-author(s) - Burgert, Pavel, Prague, Czech Republic
Co-author(s) - Končelová, Marketa, Prague, Czech Republic
Co-author(s) - Sumáková, Radka, Prague, Czech Republic

Keywords: Circular enclosures, Grinding tools, Neolithic

Presentation Preference - Oral

The presentation will introduce assemblages of stone grinding tools from the late Neolithic sites (4900 – 4500 cal. BC) in the Czech Republic that were collected in the vicinity of circular enclosures (rondels) the function of which is assumed to be socio-r ritual. The assemblages consist mostly of fragments of tools from ditch fillings of the rondels, or from other pits in their vicinity. We would like to present assemblages from several long-term excavations where the origin of raw source, the manufacturing process, the stage of preservation, and the location of the artefacts in relation to the rondel or other features are known. The following issues related to the socio-r ritual features and other surrounding artefacts will be discussed: Is there any evidence that there is a direct relation between the grinding tools and the socio-r ritual structure, such as ritual grinding activities during various ceremonies, or do they represent just a common refuse management in the settlement? Why were some of the grinding tools intentionally destroyed and others not?

TH1-26 Abstract 03

The ritual use of flint

Author - Prof. Larsson, Lars, Department of Archaeology and Ancient History, Skivarpsbro, Sweden (Presenting author)
Keywords: fire, flint axes, Southern Scandinavia

Presentation Preference - Oral

In Southern Scandinavia, as in other areas, flint had a special position as a raw material for making a variety of tools. Flint was not only an important element of daily activities, however; it also became a catalyst of ritual. Flint became a very important element in marking the relationship between people and their conceptions of a different world populated by deities and dead ancestors. In this relationship flint axes played a very special role. The final stage of axes was mainly determined by shape and cultural connections. Deliberate deposition of axes in Southern Scandinavia chiefly occurs in a large number in wetland and also at and in megalithic graves. The transformation of flint tools could also involve changing the material through heating. The use of heat differs depending on tool types. A small number of sites have a large amount of material from deliberate heating, while the majority of other sites, such as megalithic graves, causedew enclosures and pit-houses have a smaller number of objects partly altered by fire, primarily axes. These deposits are also combined with waste from the manufacturing of axes, combining "birth" and "death".

TH1-26 Abstract 04

From the living to the dead.

Lithic artefact deposits in TRB burials in Jutland

Author - Czestowska, Marzena, Aarhus University, Wroclaw, Poland (Presenting author)
Keywords: burial, lithics, TRB

Presentation Preference - Oral

From the Megalithic period onward, sometimes even up to the Iron Age, lithics are frequently found in funerary context. Evidence of ritual use of flint is known from Neolithic settlements, enclosures, ritual houses and graves. Several traditions of treatment and handling of flint such as ritual destruction, burning or scratching the surface of the artefacts were recognized. In this paper, special emphasis is placed on possible role and meaning of lithics in TRB burial ceremonial rituals. Artefact analyses were divided in two major parts. First, the technology of production and the possible traces of use found on flakes, blades and tools were discussed. The second part consisted of statistical analysis of lithic artefact type variation and their possible relation to other grave goods. The results were then compared to the ones obtained from material from TRB settlements. This leads to the general discussion about the interpretation of role and meaning of flint in the burial context. By using such combination of methods, it is possible to discuss different reasons for placement of lithics in the burial context. Various artefacts could be interpreted either as a part of the grave goods set (accessories for further life in afterworld), the belongings of the deceased (which could signify his status or occupation during life) or traces of ritual knapping or other activities during the burial ceremony.

TH1-26 Abstract 05

The biography of megalithic art at Millin Bay, Northern Ireland

Author - Dr. Robin, Guillaume, University of Edinburgh, Edinburgh, United Kingdom (Presenting author)
Co-author(s) - Dr. Hensey, Robert, National University of Ireland, Galway, Galway, Ireland

Keywords: Digital methods, Meaglithic art, Neolithic Ireland

Presentation Preference - Oral

The megalithic monuments of Western Europe are famous for their engraved and painted decoration which adorns the walls of their chambers, passages and sometimes their external features. While most of that art was primarily created to be seen within the fixed setting of the monuments, excavations and studies in Iberia, France and Ireland have shown that a surprising percentage of this art was hidden in inaccessible parts of the architecture, or was erased from the walls, and that many decorated stones were broken and reworked before being re-employed as the structural components of new monuments. This raises at least two important questions: what was the earliest history of the decorated stones before they were placed inside the monuments? And, what was the role, if any, of such ‘un-displayed art’ in their final monumental contexts?
Despite the descending importance of lithic industry at the end of Eneolithic, highly attractive morphotypes – lithic arrowheads – from the Eneolithic graves and settlement pits. The act of placing them into the graves reflects symbolic character but is highly placed there, such as antler or stone tools, are often found in settlement structures as well. In respect to the position of the individual artefacts that were moved, transformed, decorated, reworked, sometimes broken, and eventually brought together and reused as structural elements become the architectural setting of the grave.

This paper will consider Milin Bay in its broader context, with reference to wider evidence of reworked and displaced megalithic art in Ireland and Europe, and will discuss the reuse of megalithic art as representing a specialised form of prehistoric monumental construction.

**TH1-26 Abstract 08**

**Useful, beautiful or ritual?**

The life biography of grave goods from prehistoric burial sites

**Author:** Kogalincean, Radu, Institute of Archaeology, Bucharest, Bucharest, Romania (Presenting author)

**Keywords:**
- grave goods
- Prehistory
- South-East Europe

**Presentation Preference:** Oral

**Neolithic communities used to send their members, on their last road, accompanied by various things, from pottery and animal bones to personal adornments, and other objects such as flint blades, axes, clay figurines, etc. The grave is supposed to be the final resting place for the human individual, but also the end-place of the objects accompanying the deceased. The analysis of grave goods usually focuses on typologies, quantities, whether they are gendred grave goods or not, and how they help create the identity of the deceased. More rarely, they focus on whether they were especially created for the particular event of somebody's burial or they had been previously used. The work done on the Neolithic and Copper Age funerary contexts from Romania showed me that, in spite of the traditional view that most objects were especially created for the burial, the reality is, in fact, had a life of their own before that. The longest chain of events in an object's life identified so far belongs to the adornments made of Spondylus shell that underwent long-distance trade, manufacture, short-distance trade, wear, repair or transformation (or both), wear, and deposition. Another object with a medium life biography is the stone axe/acidochisel, which could include medium-distance trade, manufacture, use, repair, use and final deposition. On the other hand, there certainly seem to be objects with a very short biography, namely those fabricated especially for the event of the burial. One example of this type seems to be illustrated by clay vessels or figurines that are poorly manufactured, indicating that their use might have been deemed from the start to be very short-term. The presentation will review the data, with particular examples, mostly from the Lower Danube area but not exclusively, across a span of time covering the Neolithic and the Copper Age periods. I will also try to discuss the possible underlying reasons behind particular choices made by the prehistoric communities regarding the grave goods deposited with the deceased.**

**TH1-26 Abstract 07**

**Practical and symbolic aspects of arrowheads life cycle in Central Europe (2,500 - 1,800 BC)**

**Author:** Ph Kanakova, Brno University of Technology, Brno, Czech Republic (Presenting author)

**Keywords:**
- Arrowheads life cycle
- Ethnology
- Symbolic

**Presentation Preference:** Oral

Despite the descending importance of lithic industry at the end of Eneolithic, highly attractive morphotypes – lithic arrowheads – play an important role as symbolic communication in Central European societies, although they concern also traces of megalithic occupation, connected with Globular Amphora Culture and Corded Ware Culture. There were few graves of this culture, where especially one is unique. It contained three human skulls probably originally situated on the stone or/and soil platform on the perimeter of grave pit. In the vicinity there were also rare proofs of shooting injuries on skeletons, questionable functionality of wrist guards, low percentage of diagnostic impact fracture of arrowhead tip – it makes us to interpret arrowheads as only a symbolic attribute of male warrior troops crystallizing in that turbulent times. Nevertheless, their presence in burial grounds and settlements is low. Only a small part of male graves include arrowheads. And only a small part of them include more than a single specimen. Archery sets are not frequent. Together with other indicators – rare goods of shooting injuries on skeleton, questionable functionality of wrist guards, low percentage of diagnostic impact fracture of arrowhead tip – it makes us to interpret arrowheads as only a symbolic attribute of male warrior troops crystallizing in that turbulent times. Nevertheless, our results testify to a long practical life of the majority of analysed arrowheads from different contemporary cultures; despite the fact that the deposition of arrowheads in graves is undoubtedly symbolic. We see a cyclic operational sequence with several replications of tip fracture, practical ergonomic-ballistic features, hafting and use, wear and systematic care for functional condition of projectiles. This kind of manipulation is not only practical or useful. Weapons preparation, sharpening, inspecting etc. plays an important role in warriors’ ritualised inter-community behaviour. Warrior grave goods are accompanied by trophy artefacts in graves of some cultures; and we can suppose that the deep symbolism of trophy game hunting was closely tied with ritualised fraternisation of members in male warrior brotherhoods.

**TH1-26 Abstract 09**

**Function and meaning of stones from the grave of the Globular Amphora Culture in Wilczyce (Poland)**

**Author:** MA (Mgr) Kierner-Gubala, Katarzyna, Institute of Archaeology and Ethnology Polish Academy of Science, Warsaw, Poland (Presenting author)

**Keywords:**
- grave
- Neolithic
- stones

**Presentation Preference:** Oral

Stones were used by prehistoric societies in everyday activities, such as preparing of food, production of other tools made of stones, flints or manufacturing of paints. They also served as a weapon, symbol of prestige and were an important material for dwellings, graves and other constructions of ritual meaning.

During the neolithic Globular Amphora Culture in Poland, the role of stone as a building material for grave construction was significant. In this time numerous objects covered with the stones or/and soil platform on the perimeter of grave pit. The site is well known from earlier palaeoethnobotanical (prehistoric) investigations, but it concerned also traces of megalithic occupation, connected with Globular Amphora Culture and Corded Ware Culture. There were few graves of this culture, where especially one is unique. It contained three human skulls probably originally situated on the stone or/and soil platform on the perimeter of grave pit. In the vicinity there were also
other fragments of stones, probably primary being the part of these platforms or some kind of coffers (?) and grave goods in form of tools, personal ornaments, as well as animal bones and pottery. In the upper layer there was the skeleton of aurochs. Some of the stones have traces of primary use as grinding, polishing or hammer stones, but there are also stones without any traces of use.

This paper concerns on stone artefacts from the Globular Amphora Culture grave from Wilczycy and the possibilities of interpretation of their primary function as well as traces of its intentional 'ritual use' and/or 'use in rituals', on the base of the analysis of their spread in the grave, as well as macro- and microscopic features.

TH1-26 Abstract 10
The role of chipped stone artefacts in the Late Neolithic burial practice at Alsónyék (Hungary)

Author - Saliagyi, Kata, Eötvös Loránd University, Budapest, Hungary (Presenting author)

Keywords: Chipped stone tools, Late Neolithic, Lengyel culture

Presentation Preference - Oral

The Late Neolithic Alsónyék- Bgázask site has enormous extension, which reflects in large amount of stone tools (nearly 8000 place stone tools). This site's chipped stone assemblage contains many long-distance import stone tools (e.g.: large-size volhynian flint blades which were removed by indirect percussion). The enormous extension of this site and structured construction of the settlement and a lot of burials; these factors which can reaxon the intensive intercultural connections of the Southeast-Transdanubian group of the Late Neolithic Lengyel culture. This hypothesis is not reflected from the settlement’s chipped stone tools, in contrast to the stone tools from burials. These shows the raw material manipulation's role inside the site. Based on these, we find the everyday’s ingredient tools (e.g.: blade, end-scrapor on blade and end-scrapor on flake) form local and regional raw materials. The long-distance raw materials made import tools from burials means the ritual sphere’s artefacts.

TH1-26 Abstract 11
Ornament biographies in amber and antler from the late Neolithic in north-western Norway

Author - PhD Henriksen, Merete, Norwegian University of Science and Technology, Trondheim, Norway (Presenting author)

Keywords: depostions, biographies, amber, antler, Norway, ornaments, late Neolithic

Presentation Preference - Oral

In the coastal region of north-western Norway, pendants of amber constitute a characteristic element amongst the many objects deposited mainly in bogs in the late Neolithic (c. 2350-1700 BC). The pendants are of different shapes and sizes. Of particular interest are the crescent-shaped pendants that originally formed part of larger composite ornaments. These ornaments are also found in antler in the same area. This group of ornaments stand out from the other pendants of amber in terms of shape, but also by having been created and used as composite ornaments from the outset. Whether manufactured locally or imported as finished products, the amber itself had to be imported, suggesting these ornaments were highly valued items, used for expressing both social status and identity.

Belonging to a rich and varied group of depositions from the late Neolithic and early Bronze Age in Norway, the crescent-shaped ornaments have been interpreted as votive offerings. However, this hypothesis does not necessarily provide the best tool for understanding the ornaments and their deposition. In the present study of the ornaments in both amber and antler, a biographical approach is applied, focusing on the relations tied to the objects during their life-course. Against this backdrop, an alternative view of the ornaments, their role in society and the final deposition is presented.

TH1-26 Abstract 12
A biographical analysis of Mesolithic hoarding in South Scandinavia

Author - PhD student Jensen, Mathias P.B., Aarhus University, Højbjerg, Denmark (Presenting author)

Keywords: hoarding, Mesolithic, ritual

Presentation Preference - Oral

Hoarding has often been characterised as a ritualised post-Mesolithic phenomenon, but when similar Mesolithic deposits are identified they are often considered ‘unique events’ and as profane caches of raw materials. These Mesolithic hoards, which are often carefully arranged or bundled, contain a wide range of objects, from blades, cores and debitage, to axes, beads and unusually large or unique objects. Preliminary results from this study indicate that some of the objects appear to have been produced immediately prior to deposition, whilst others appear to be well-used and even burnt or broken. All too often hoards are just considered as an isolated event of deposition, instead of reaching the final stage in a chain of practices that led to the act of deposition of particular objects. Without understanding the pre-depositional life history of the objects in these deposits we severely limit our interpretation of the deposits themselves, the possible pre-depositional ritualised practices that culminated in these hoards and why specific objects were deposited in this manner.

This paper seeks to address the following questions: Are there any large-scale patterns or are they all idiosyncratic and isolated events? Do these deposits represent profane caches, ritualised hoards, neither or a mix? What, if any, relationship is there between the pre-depositional life history of the objects and the mode of deposition? By understanding the biography of these objects and practices we may further our understanding of both Mesolithic ritualised practices as well as the longue durée of hoarding practices in Southern Scandinavia.

TH1-26 Abstract 13
Ritual Objects asOffering at the Eneolithic Shrine

Author - Kolišťinskiho Nastava, Irena, Archaeological Museum of Macedonia, Skopje, Macedonia (Presenting author)

Keywords: ritual objects, shrines, traces

Presentation Preference - Poster

At Eastern part of Macedonia, near Kozani few years ago the archaeologists discovered an Eneolithic shrine St. Atanas) which is nearby the Eneolithic site-village. Both are of the same period, 4th millennia B.C.

The shrine is positioned on a small hill and it communicates visually with the settlement. It was used by the inhabitants from this settlement and probably from another nearby. Throughout the excavations there where found various ceramic dishes, zoomorphic and anthropomorphic figurines, alters (sacificial items), tools made of stones and bones, as well as many animal bones. Most of them were gifts probably donated by the inhabitants Honouring their festivities and beliefs trough various rituals.

Majority of the material was discovered in fragments, which leads to the conclusion that the items were being crushed in ritual ceremonies.

It is interesting that around these spaces, no remains of wattle-and-daub were found or traces of supporting poles from the buildings construction. The evidence that there aren't any mud walls confirms that the site is a shrine, not a village.

Co-author(s) - Matulioniene, Ieva, Center for Physical Sciences and Technology of State science institute, Vilnius, Lithuania

Keywords: Amber, Daktariškė 5, Late Neolithic

Presentation Preference - Poster

Traditions of amber collecting, production and distribution in the Eastern Baltic – at least in Lithuania, Latvia and territories later inhabited also by Baltic tribes – mainly, Prussians, reach back as far as the very beginnings of Early Neolithic and has an uninterrupted history of 6400 years.

The large Stone Age amber collection are known from Baltic Sea coast settlement complex’ in Šventoji and Curonian peninsula (Juodkrantė, Nida). From the area of big lakes, mainly Būtžės Basin the largest collection of amber artefacts are collected in Daktariškės 5 Neolithic settlement located in the wetland area.

The Daktariškė disc is 3.6 cm in diameter and has a line-shaped cross-section with a small hole in the centre; it has a fine polished surface and is made from good-quality yellowish amber. One side of artefact is divided in four unequal parts by a triple cross made of slight indentations. Along the edges one, two and four small triangles are formed in single and double broken lines of indentations. The other side of this disc is also ornamented: along its edges eight differently sized single and double broken lines of indentations. On the other side of this disc is also ornamented: along its edges eight differently sized small triangles are formed by slight thin lines rather than indentations. This disc, due to the very good preservation to bear special coded information unlike any other artefact found in Lithuania or the rest Eastern Europe. It appears that the remains of dark resin can still be seen in the some of these indentations.

By this reason special traseological, infrared and Raman spectroscopy investigation were carried out by the scientists of Vilnius Academy of Arts, Klaipėda University, Lithuanian National Museum and Center for Physical Sciences and Technology of State science institute.

Traseological analysis was conducted on amber disc from the Daktariškė 5 Neolithic site. During investigations, use-wear and manufacturing traces were detected on the artefact. Analysis showed that during production of the amber disc two different kind
Interpreting the Archaeological Record

Color Symbolism and its Reflection in Prehistory of Latvia

Author: PhD candidate Kokains, Algara, University of Latvia,
Faculty of Geography and Earth Sciences, Riga, Latvia (Presenting author)

Keywords: color red, ochre, symbolism

Presentation Preference - Poster

There are many ways how to approach the study of history – archaeological evidences in excavation sites, dating methods, pollen analysis as well as stratigraphy of geological layers, DNA sequencing techniques for tracing migration routes, admixture analysis etc., to capture in a frame of reference physical evidences of early humans and their past. By studying physical evidence, we see close links to psychological, social and behavioral traits, as well as development of societies, evolutionary perspectives of human mind and material culture. Harder to approach are the development of linguistic capacities, cultural activities as dance and religious beliefs – cosmology and symbolism, primarily color symbolism through prehistory. Stone Age cemetery Zvejnieki (8–5 BCE) is closely associated with the usage of ochre and processed minerals – like red ochre in burial grounds. As well as evidence for white circle structures, that point to ritualistic symbolism. Thus, the physical evidence here reflects on mental phenomena linked to early materialistic and non-ritualistic tribes.

The archaeological site Zvejnieki was excavated in 1960, and physical evidence of the colors that were used is no longer available. However, it is still possible to study indirectly the question about the mental and physical capacities involved, in order to recreate a span in time, where such activities as coloring a deceased family member was a valuable task to do.

In the study, the first questions to answer were whether there are naturally occurring ochre sites in near proximity from burial grounds and in such case what are the material properties of ochre color and purity of the tone. Further research was directed to find out if modification of natural ochre could take place and what could be the range of colors possible to obtain from local material. At the same time information about similar symbolic behavior in other archaeological sites was studied.

During the research the ochre source minerals were found near Stone Age cemetery Zvejnieki. The laboratory analysis for characterization of the material included granulometry evaluation, color spectrum, mineral treatment in various temperatures to alter the color and different natural binders were tested. In order to compare the color variation defined by impurities in the material, iron rich minerals were collected from different parts of Latvia.

It should be noted that considerable amount of ochre color source material can be found in less than a 500 m distance near Zvejnieki archaeological site, but the colors are yellowish or brown (gothite). Thus, the material was not directly suitable for the purpose of red burial. However, the experiments conducted confirm that it was relatively easy to alter color, if necessary, by treating material in temperature not exceeding heat of ordinary campfire to gain a consistent red color (hematite).

The purpose of red burial. However, the experiments conducted confirm that it was relatively easy to alter color, if necessary, by treating material in temperature not exceeding heat of ordinary campfire to gain a consistent red color (hematite). The presence of coniferous resin and wax was identified. This investigation has proved FTIR and micro FT-Raman spectroscopy could be particularly suitable technique for non-damaging analysis of such significant archaeological objects.

TH1-27 Abstract 01

The Personal Value of Correspondence: Letters as material culture in Late Antiquity

Author - Dr. Stoner, Jo, University of Kent, Eastbourne, United Kingdom (Presenting author)

Keywords: Letters as material culture in Late Antiquity, Letters, Sentimental value

Presentation Preference - Oral

The period of Late Antiquity (approximately fourth to seventh centuries AD) has left us with a huge number of documentary texts, handwritten on papyrus and ostraca, and preserved by the arid conditions of Egypt and the Naer East. These documents provide a rare glimpse into late antique society, and as such modern scholarship has tended to focus on the textual contents and its value as evidence of everyday life. Consequently, documentary texts are usually considered as utilitarian and ephemeral objects, whose primary function was to communicate information, after which they were likely discarded.

However, these rare survivals in the archaeological record suggest that informal texts were extensively used and thus had a significant presence within the material culture of Late Antiquity. Therefore it is important to consider these texts as complete objects and possessions that, like other artefacts, had biographies that created meaning and subsequent value. In this paper, texts – specifically private letters written between individuals - are considered in terms of their materiality and reframed as personal artefacts with the potential for significant value beyond utility.

By focusing upon private letters, it is clear that such texts can be deeply valued personal objects. Not only do letters physically trace connections between disparate individuals, but their lifespans also have the potential to expand significantly beyond the anticipated movement from writer to recipient. As such, they can function in ways that are separate from the communication of information. Furthermore, this paper reconceives letters specifically as material gifts and, through reference to the theories of Mauss, Bell, Rochebou-Netlon and Csikszentmihalyi, explores how their essentially handmade nature affected the creation of personal meaning and sentimental value.

The approaches taken to private letters in this paper allow these documents to be viewed once again as whole objects, reuniting texts with material form to provide a more rounded view of such sources. It allows focus to shift from elite and prestigious possessions that usually are at the centre of discussions of value within scholarship on this period. By assessing and evaluating the ways in which we can look at documentary texts, we can better understand the different and often simultaneously held values present within individual objects, both from Late Antiquity and modernity.
THI-27 Abstract 02
Are Merovingian brooches inalienable personal possessions?
Author - M. A. Sorg, Marion, Albert-Ludwigs-Universität Freiburg / Institut für Archäologische Wissenschaften, Freiburg im Breisgau, Germany (Presenting author)
Keywords: Inalienable personal possessions, Merovingian brooches, Wear marks
Presentation Preference - Oral

There is a long tradition among Central European archaeologists dealing with the Early Medieval period to see especially Merovingian bow brooches as inalienable personal possessions of the women buried with them. Although critique on this concept increased over the last decades and alternative models for interpretation have been put forward – like brooches being symbols of an age-related role as some scholars suggested as an alternative explanation. My conclusions rather suggest that they were personal possessions which the women privileged to wear them were able to replace if they wanted, in compliance with certain rules.

The results indicate that Merovingian brooches were neither inalienable personal possessions, as traditional research saw them, nor symbols of an age-related role as some scholars suggested as an alternative explanation. My conclusions rather suggest that they were personal possessions which the women privileged to wear them were able to replace if they wanted, in compliance with certain rules.

THI-27 Abstract 03
Jewels between genders: the shifting values of bodily adornment in England AD 350-700
Author - Dr. Martin, Toby, University of Oxford, Oxford, United Kingdom (Presenting author)
Keywords: Dress and identity, Early Medieval, Gender
Presentation Preference - Oral

Skillfully crafted dress accessories such as brooches and buckles were highly valued between the fourth and seventh centuries AD in Europe, and it is this value that to some extent explains frequent discoveries of grave marks. While their value has traditionally been considered in terms of ‘wealth’, this term has proven to carry with it connotations that are incongruous when applied to economies based more upon gifts than markets. In fact, our understanding of why these objects were valued is relatively under-developed. We might imagine that decorative and substantial personal ornaments were highly valued for a number of interrelated reasons including the materials from which they were made, the skills invested in them, the known individuals through whom the items had been exchanged, and the repeated use of these objects on a daily basis in close association with their wearers’ bodies. This paper concentrates on that final category and contends that a large part of the value of these items came from their implementation in the construction of elite and gendered identities. This usage and these values, however, were highly dynamic. In late Roman Britain exceptionally large and decorative brooches were closely associated with high status men, but by the later fifth century this had become an exclusively feminine practice. Thereafter, highly ostentatious feminine jewellery declined in the later sixth century, when a new type of gold and gemset jewellery predominantly associated with men replaced it. Thanks to recent advances in chronological research, an horizon of particularly rich ornamented female burials has emerged dating the latter part of the seventh century, which may well represent a final swing of the pendulum before furnished burial ceased entirely. This rip-tide of emphasis between the bodily adornment of men and women in graves through these centuries can tell us much not only about how these objects were valued, but also about the dynamic meanings and values of the bodies of men and women through late Roman Britain to early Anglo-Saxon England. This paper explores these relationships in comparison with other regions in Europe including Western Franks, southern Scandinavia and the Eastern Baltic.

THI-27 Abstract 04
How much is that necklace in the coffin?
Grave wealth and grave robbery in early medieval Europe
Author - Dr. Klevnäs, Alison, Stockholm University, Stockholm, Sweden (Presenting author)
Keywords: Artifacts, Burial, Early medieval

Presentation Preference - Oral

Grave robbery – a practice of reopening recent burials and taking objects from them – was widespread across early medieval Europe, peaking in the seventh century. Affected graves have been recorded in hundreds of cemeteries from eastern Austria to southern England. Their disorder and depletion contrast markedly with the carefully laid out and often lavishly furnished burial displays of the period. Many explanations have been put forward for the reopening practice, but common interpretations are that high-value artifacts or high-value reusable materials were being recovered from graves. This paper looks in detail at how objects in particular were taken from graves, using results from recent research (Klevnäs 2014e, a) it shows that only a limited range of artefact types were taken, but that the selection was not based on raw materials or use value.

Many apparently highly valuable objects were deliberately left behind. What lies behind the selection? It will be suggested that the life trajectories which could end in graves differed significantly between artefact types, especially in the degree and nature of objects’ connection with their owners, leading to different capacities for separation of the bodies with which they were eventually buried. An argument will therefore be made for low fungibility between many fifth- to seventh-century grave-good types: different forms of possession did not necessarily bear equivalent or interchangeable forms of value. Considerable fungibility needs adding to our understanding of artefact worth in this period – in particular its emergence from interactions of human and object life courses.

THI-27 Abstract 05
‘Cheap’ bone things, games and travel – on the value of gaming-pieces in an early medieval grave
Author - Zilll, Stephanie, Bayerisches Landesamt für Denkmalpflege, Thierhaupten, Germany (Presenting author)
Presentation Preference - Oral

A grave from Merovingian times, recently found by chance in Leipheim (southern Germany), revealed some small finds that give us a glimpse on the possible dichotomy between the material value of a thing and the ‘real’ value perceived by onlookers at that time. It is a single grave of a man dating roughly to the late 6th or early 7th centuries AD. Buried with weapons, a silver buckle, a glass beaker, a bridle and most prominently a horse, the man’s grave furnishings range well above average for that time and region; yet, the only outstanding finds are fourteen gaming-pieces and a die. Accessories for board games are extremely rare in the - otherwise often so richly furnished - graves of the 6th and 7th centuries in continental Europe. Also, the gaming-pieces in Leipheim belong to a type not known in southern Germany so far, with the closest parallel ones found in the exceptionally richly furnished burial mound in Taplow, Buckinghamshire, England. While the grave’s furnishings in Leipheim are poor in comparison to Taplow, they still allude to the same lifestyle – which is, in short and clichéd: horse-riding warriors drinking and playing board games (or maybe rather: high-ranking men entertaining guests with drinks and games). Both the context gaming-pieces are usually found in, i.e. very richly furnished graves of men, and their general rarity seem to indicate board games were restricted to a rather exclusive echelon of society. At the same time, their material value can be estimated as quite low, as both the raw materials and the skills to produce gaming-pieces – even the nicely turned Leipheim and Taplow ones - were easily available. Thus, gaming-pieces highlight how value might often not so much in the things themselves but rather in how and by whom they were used. They raise questions of where, how and from whom both the gaming accessories and, more importantly, familiarity with the concept of board games were acquired, and also whether their rarity in graves mirrors their restricted use in the living society, or only representational needs that only were relevant for some funerals. The presentation aims to explore these and also some more thoughts on where the idea of board games might have come from, and why gaming-pieces were so rarely put into graves.

THI-27 Abstract 06
“Amulets” in Anglo-Saxon graves
Author - Dr. Hills, Catherine, University of Cambridge, Cambridge, United Kingdom (Presenting author)
Keywords: Amulets, Anglo-Saxon, Burial
Presentation Preference - Oral

Anglo-Saxon women’s graves of 5th-7th century sometimes include items which have been described and discussed as “amulets”, by Audrey Meaney (1981) and others. These are not functional dress fasteners or ornaments, although they may include broken brooches, belt fittings or horse harnesses. There are also fragments of glass, pieces of Roman glass such as crystal, chalk or animal teeth. Some elements of necklaces such as pierced Roman or Iron Age coins can also be seen in this context. Bags containing one or more of these items have been shown by Felde (2014) to be associated with girdle-hangers, and interpreted as indications of the special status of the women who wore them: not straightforwardly social or wealth status, but relating to the role these women played possibly in connection with birth and death. This paper will look at some of these items to...
see how their significance and use changes over time in different contexts, for example from a functional glass vessel to a worn broken fragment carefully kept and deposited in a grave. Questions to be asked include: what kind of ‘value’ did these things have for the woman who were buried with them? Is the name ‘amulet’ appropriate? Do these objects provide a link between pre-Christian and Christian burial practice in Anglo-Saxon England?

Meany, A. 1981 Anglo-Saxon amulets and curving stones British Archaeological Reports 98

*Value-added gold: The physical, social, and cultural re-purposing of Scandinavian bracteates*

**Author:** Prof. Wicker, Nancy, University of Mississippi, Oxford, MS, United States of America (Presenting author)

**Presentation Preference:** Oral

Gold held high status during the Migration Period of the fifth and sixth centuries in northern Europe, as we learn from contemporary and later written sources such as Beowulf. Among the elite articles of personal adornment during this period were the widely distributed Scandinavian-type bracteates, which are one-sided, stamped objects that were provided with suspension loops and worn as pendants. These bracteates may have been markers of prestige to indicate gender, marital status, age, and lineage. The biography of bracteates can be traced from the mining of gold as a raw material, to Late Roman coins and medallions given as military rewards, and then to northern goldsmiths’ workshops where the coinage was melted down and made into bracteates. Thus the gold was transformed from material with economic value in one form (coins) into value in another form as personal ornaments that were distributed by gift exchange and worn by women. The significance and worth of these possessions continued to change as they were 1) given to others (perhaps bequeathed to descendants), 2) purposefully deposited into the ground in burials or hoards (curated and taken out of circulation), 3) melted down and re-purposed into other jewelry (permanently taken out of circulation), or 4) lost — perhaps to be rediscovered later. Subsequently, gold bracteates have been discovered by archaeologists, looters, metal-detectors, farmers, and hikers, and their value is still recognized as we see documented in sales catalogues and in the records of the Portable Antiquities Scheme.

**TH1-27 Abstract 08**

*The things with value. An ontological investigation*

**Author:** Van Vilet, Krista, Stockholms Universitet, Värmdö, Sweden (Presenting author)

**Keywords:** ontology, value

**Presentation Preference:** Oral

While ideas about the various and unstable meanings of value and possession as well as their situatedness have gained considerable interest within archaeology, the ontological statues of these notions remain largely unexplored. This is problematic, for the reason that it leaves us in the dark about what we are actually talking about and, even more important, it keeps presumptions and beliefs about the nature of the world equivalent. Inspired by Deleuze, Guattari, and DeLanda, but also by Lucas, Fowler and Norman, I propose to investigate ‘value’ and ‘possession’ not as references to other abstractions, but as concepts and as such define and redefine ‘value’ and ‘possession’. As such objects are no passive receivers or holders of worth either, nor are they indifferently imbued with ideals of value or meaning, but are (re)defined by the interactions they establish with other entities that may or may not include notions of value or possession.

**TH1-27 Abstract 09**

*Unraveling Value: Cultural Transmission Value-based Constraints among Blackfoot Ceremonial Bundles*

**Author:** Walsh, Matthew, Aarhus University, Aarhus, Denmark (Presenting author)

**Keywords:** Blackfoot, Ceremonial Bundles, Cultural Transmission

**Presentation Preference:** Oral

Archaeologists are increasingly focused on understanding the implications of social learning on the development of material culture. Such studies look to establish the roles of social learning, individual choices, and information transmission within cultural contexts. This study examines the contents of Blackfoot ceremonial bundles to investigate whether heritable continuity is evident in their assembly, allowing for inferences regarding social learning, cultural transmission, and transmission bias among proto-contact Blackfoot bundle-holders. Among the context-era Blackfoot, flexible concepts of the value of different material objects enabled individual bundle-holders to respond creatively when presented with historical, environmental, and social contingencies — and this fluidity is mirrored in ceremonial bundle materials. This study seeks to illuminate the relationships between bundle contents and their distribution in various bundle types as indicators of socially-prescribed and maintained traditions. As such, we hypothesize that rules prescribing a communal value to specific bundle contents were more or less flexible depending on the level of social significance attributed to the ceremonies connected to each bundle under the assumption that the greater the overall social significance of a bundle’s associated ceremonial practice, the more constrained bundle-holders were in the development or maintenance of particular contents. In contrast, bundle-holders in possession of bundles associated more closely with personal practice were able to embellish the contents of those bundles under less-prescribed social constraints.

*My worthless precious. Troubles with fluctuating value of Ancient Greek vases*

**Author:** MA Mileısıç, Wawrzyniec, Jagiellonian University in Kraków, Kraków, Poland (Presenting author)

**Keywords:** Ancient Greece, Greek painted pottery

**Presentation Preference:** Oral

Estimating value of the artifact could prove to be a difficult endeavor even if items come from societies with abundance of coinage systems like ancient Greece. This is true specially for manufactured goods, and specially for Greek painted pottery. The peculiar combination of different stages of consumption of the object, added trade value, and the low cost of raw materials, all this factors are adding up to constantly reflux scholarly debate which now runs for over thirty years. Depending on their calculation researchers estimate value of a standard piece of Greek painted ware from being almost completely worthless, made out of metal vessels to being a prestigious item and luxurious commodity, to present views of just two extreme ends of the discourse. Furthermore, the value of Greek vases could be found all over Mediterranean their value would change accordingly. Indeed, their trade value is also being assessed with conclusions varying from one which sees vessels as being used by the upper classes, deemed as ship’s ballast, a package for other goods, to the one which make pottery production a serious contributor to Greek trade. In my paper I will present theories and estimations of value of the Greek vases for all the stages of consumption, straight from the kiln up to the present day, where they rest in museums exhibitions. Give details on how these theories were created, as they often reflect different worldviews and are stretched over four centuries, as well as explain how they reflect on the studies of Ancient Greek culture. The fluctuating value of the vase not only obfuscates proper understanding and placing of object within Greek culture, but it also changes the grounds for interpreting the iconographical message conveyed in the pot. Greek painted pottery consists of enormous cluster of scenes, ranging in hundreds of thousands which are used for studies of the ancient society. The value of the item is often pivotal as it represents the social class for which these objects were made and by which they were consumed and it allows to connect certain ideology with particular set of scenes.

**TH1-27 Abstract 11**

*Materializing worth and value in archaeological beads*

**Author:** Dr. Miller, Holly, University of Nottingham, Nottingham, United Kingdom (Presenting author)

**Co-author(s):** Dr. Baysal, Emine, Trakya University, Edirne, Turkey

**Keywords:** Beads, Interpretation, Neolithic Anatolia

**Presentation Preference:** Oral

Despite moves in recent decades for archaeology to look beyond “form” and “function” for more esoteric meaning in material culture, there are categories of artifacts that are still under-studied and under-theorized in this way, such as beads. Understanding the sociocultural-economic significance of beads is obscured by their general classification, through typological assessments, as ‘ornamentation’. This implies outward-looking, visually driven social practice with decorative purpose, limiting interpretation of value and worth to societies and individuals. Beads, like any aspect of material culture, do not passively impart their meaning, yet through recognizing only the visual impact of these items in archaeological interpretation, this is what we seemingly expect. Given the potential for beads to have circulated through society in various ways, as shown through ethnographic examples, it is important that we look beyond this for interpretation of value and worth.

In this paper we will address a number of examples from the Neolithic of Anatolia that indicate the drive behind manufacture and use of beads was often not based on aesthetic consideration. The artifacts highlighted are thought to have been relatively mundane objects, manufactured on readily available materials and were not particularly visually arresting, yet their value and
TH1-27 Abstract 12
More luxury for common people than we thought before: Asian items in medieval and later Europe

Author - Dr. Peter, Bray, University of Oxford, Ruislip, United Kingdom (Presenting author)

Keywords: Chemical analysis, Roman Coins, Value

Presentation Preference - Oral

Roman coinage sits at the intersection of a remarkable number of research projects. The art history and iconography of the images stamped on the coins, and the detailed chronology they can create are both full-time specialisms. Coins are used in detailed models of economy, trade, and exchange far beyond the geographical limits of the Empire. As a researcher who spends much of his time studying Bronze Age metallurgy, Roman coins are an astonishing opportunity for examining pellets of copper-alloy coinage and domestic artefacts.

For a long time the historical and archaeological research accepted the conception that items from Asia which reached the medieval Europe were solely assigned to lordly circles. The reason for this assumption was the focus of outstanding and curious collector’s items in the lordly treasuries and cabinets of wonder. However the archaeological research of the last decades in the whole of Europe adduced numerous of finds in different social environments. My contribution to the congress introduces these items and categories of objects inside their social contexts. With the increase of archaeological excavations the rate of finds continues to rise. That’s why our conception from a perception of the eastern continent in the west changes.

Medieval users of suchlike items possessed a potential knowledge, in that case about a distant continent. Therefore it makes no difference if this knowledge was reality or wishful thinking. Often this knowledge concentrated in lordly circles. Nevertheless many of these objects connected with a daily nutrition. The propert and frequently use of respective objects in the medieval and later civil society was able to break through the controlling of the knowledge.

Another question weighs the aspects of a globalisation. The existing contacts of the Trans-Eurasian exchanges until the discovery of the maritime route from Europe to India often were selective. Just a few of contacts stretched steadily over the time. Most of them were unilateral, rarely bilateral. One has to question how comprehensive been these contacts inside the Trans-Eurasian exchanges. Which regions had an amount? How tall was a mutual influencing? A higher measure of a mutual interacting is certifiable. However the notion of a globalisation seems not quite appropriate for this period of history.

TH1-27 Abstract 13
Striking Objects: Comparing the metal used for Roman copper-alloy coinage and domestic artefacts

Author - Dr. Petar, Bray, University of Oxford, Ruislip, United Kingdom (Presenting author)

Keywords: Chemical analysis, Roman Coins, Value

Presentation Preference - Oral

Roman coinage sits at the intersection of a remarkable number of research projects. The art history and iconography of the images stamped on the coins, and the detailed chronology they can create are both full-time specialisms. Coins are used in detailed models of economy, trade, and exchange far beyond the geographical limits of the Empire. As a researcher who spends much of his time studying Bronze Age metallurgy, Roman coins are an astonishing opportunity for examining pellets of copper-alloy coinage and domestic artefacts.

Due to the richness of the data immediately associated with the coins, it is sometimes hard to consider them within the broader context of Roman metal use. This paper highlights new approaches to synthesising and characterising the large corpus of chemical data taken from Roman coins over the last two thousand years. These approaches emphasise the flow of metal and ideas, and the negotiated creation of value and identity. The contemporary domestic metal assemblage has been interpreted using the same methods, which reveals close links between the Imperial control of mints and the wider availability of metal. This work aims to contribute to the broader debate on the creation of economic and social value, as well as discuss the changing prevalence of recycling and debasement.
Interpreting Clay Objects in Neolithic West Asia: Reconsidering "tokens" as early accounting tools

Author - Dr. Barrençon-Chapman, Lucy, Bülent Ecevit University, Zonguldak, Turkey (Presenting author)
Keywords: Neolithic, Token/object, West Asia

The Neolithic period in West Asia (c. 10,500-6,000 cal. BC) saw the appearance of the world's first permanent, farming villages. With this development came significant changes in social structure, subsistence activities and artistic expression as villagers experimented with, and adapted to this new way of life. An enigmatic feature of Neolithic settlements is the appearance of small, geometric-shaped clay objects, or "tokens" as they are more commonly known. Clay objects occur in various shapes including spheres, discs and cones, measuring c.150-3.50cm. Initially appearing at a small number of sites in Anatolia, Upper Mesopotamia, the Zagros and the Levant from the start of the Neolithic period, by the Late Neolithic, clay objects are evident across the region, often found in their hundreds when present at a site. Until recently, clay objects have been overlooked upon excavation, frequently ignored, or dismissed as children's toys, naturally occurring lumps of clay or mere doodles. More recently Schmandt-Besserat (1992, 1996) has interpreted clay objects as mnemonic "tokens", the precursors of cuneiform writing yet their importance in the 18th century contexts at the churches of Haukipudas and Hailuoto as well as the cemetery at Oulu Cathedral. The unique preservation context offers the opportunity to explore less durable items including clothing, textiles, and other decorative elements. This includes specially constructed "false" robes, socks, gloves, caps. Children's and some women's burials also include specially-crafted flower wreathes and crowns.

This paper examines the lifecycle of these textiles, including their material and cultural value, use, reuse, intermittent and eventual burial. This sample includes materials crafted from silk, wool, and bast fibers. While some items indicate local craftsmanship, others are obvious imports to the region. Additionally, some pieces suggest professional craft specialization through the presence of luxurious lace and gold thread decorations. Each of these aspects of construction, material use and craft specialization impact the items' cultural and material values. The items included within these burials are further classified into two categories: (1) items intentionally crafted for inclusion in the burial, often recycled from larger textiles and (2) items worn and used by the individual during their lifetime before interment with the deceased. This paper explores not only the initial value of textiles, but also ways that their use and re-use alters their cultural significance and value within society.

Interpreting the Archaeological Record

TH1-27 Abstract 17

A biographical approach of the pottery from Sultana-Malu Rosu

Author - Opris, Vasile, Bucharest Municipality Museum, Bucharest, Romania (Presenting author)
Co-author(s) - Ignat, Theodore, Bucharest Municipality Museum, Bucharest, Romania
Keywords: biographical, pottery

The Eneolithic site of Sultana-Malu Rosu (Romania) is well known in the overall framework of the Gumelnia-Kodjadermen-Karanovo VI cultural complex (ca. 4500-3800 BC) due to the large amount of good quality pottery, among which some of the vessels are unique in terms of shape and decoration. These characteristics are the ones that assign value and special meaning for vessels according to both old and new interpretations. However, most of the pottery from this site is represented by common vessels and other thousands of shards. Also, the site formation has its own identity with the final contexts of the pottery varying from crushed shards used as temper (grog) to whole vessels assembled in burnt houses or used in mortuary practices.

The aim of this paper is to examine certain stages of the biography of various types of pottery concerning their value both for individuals and the community. Our inferences will be mainly based on the analysis of pottery related to the archaeological record. The close inspection of pottery will include provenance studies based on archaeometric analyzes, identifying manufacture technologies, morphological and typological classification, wear-use analysis, and fragmentation patterns. This approach can establish certain pathways and changes in the vessels' life, addressing various interpretations of the value and meaning of the objects at every stage of their existence.

This work was performed through the Partnerships in Priority Areas Program - PN II, developed with the support of MEN - UEFISCUI (Grant LC-2013-4-2392).

TH1-27 Abstract 18

Valuable pots made with cheap clay.

A biographical approach of the pottery from Sultana-Malu Rosu

TH1-27 Abstract 19

The transvaluation of pottery manufactures in the Basque Country along the Middle Ages

Author - Dr. Escrivano-Ruiz, Bergitz, University of the Basque Country (UPV/EHU), Vitoria-Gasteiz, Spain (Presenting author)
Co-author(s) - Azkarate, Agustin, University of the Basque Country (UPV/EHU), Vitoria-Gasteiz, Spain
Co-author(s) - Biscain, Jose Luis, University of the Basque Country (UPV/EHU), Vitoria-Gasteiz, Spain
Keywords: Secondary use, Textiles, Value

The transvaluation of pottery manufactures in the Basque Country along the Middle Ages

Between the 13th and 19th centuries in northern Finland a number of individuals were buried beneath church floors. As a result of the unique microclimate of these church floors, many of these burials have naturally mummified. This paper addresses the study of the contexts at the churches of Haukipudas and Hailuoto as well as the cemetery at Oulu Cathedral. The unique preservation context offers the opportunity to explore less durable items including clothing, textiles, and other decorative elements. This includes specially constructed "false" robes, socks, gloves, caps. Children's and some women's burials also include specially-crafted flower wreathes and crowns.

This paper examines the lifecycle of these textiles, including their material and cultural value, use, reuse, intermittent and eventual burial. This sample includes materials crafted from silk, wool, and bast fibers. While some items indicate local craftsmanship, others are obvious imports to the region. Additionally, some pieces suggest professional craft specialization through the presence of luxurious lace and gold thread decorations. Each of these aspects of construction, material use and craft specialization impact the items' cultural and material values. The items included within these burials are further classified into two categories: (1) items intentionally crafted for inclusion in the burial, often recycled from larger textiles and (2) items worn and used by the individual during their lifetime before interment with the deceased. This paper explores not only the initial value of textiles, but also ways that their use and re-use alters their cultural significance and value within society.

The patterns of domestic pottery consumption progressively changed over the Middle Ages in the Basque Country. Although some productions present since the 7th Century remained beyond the 15th Century, the ceramic record was completely transformed both quantitatively and qualitatively up to the 15th century that is the ceramic record of the Middle Ages. These changes have been interpreted as an increase in the middle classes due to the Middle Ages. These changes have been interpreted as an increase in the quality and quantity of the pottery production. However, the interpretation of this increase has been limited to the quantitative and qualitative changes in the pottery production. This paper aims to interpret these changes as a result of the social and economic changes that occurred during the Middle Ages. The study of the pottery production in the Basque Country during the Middle Ages will be used to interpret these changes. The study of the pottery production in the Basque Country during the Middle Ages will be used to interpret these changes.

The lack of clay object assemblage homogeneity within and across sites where they occur, along with the lack of a certain, singular and consistent function for these artefacts within the wide context of Neolithic West Asia, adds to the difficulty of artefact classification. Functional uncertainty leads to problems differentiating clay objects from other small artefacts made from clay, yet of a more certain categorisation (schematic figurines and tablets for example). Perceived value of archaeological finds is ineffectively tied to their function, yet when a function, and even the classification of an artefact type is debated, our interpretation of an artefact type’s value within a past community is easily lost. Their large numbers when present, simple shape, crude appearance and lack of a certain, easily assignable function has contributed to the continued neglect of this artefact type within Neolithic archaeology.

This paper stems from recently completed PhD research. An investigation of the nature, role and function of geometric clay objects within Neolithic West Asia, it demonstrates the difficulty in identifying, categorising and interpreting artefacts in pre-literate societies. Evidence comes from morphometric typological analysis, relational database investigation, and chase operatore of manufacture study, comprising almost 3,000 objects from 79 sites. Analysis suggests that in contradiction to the predominant interpretation of these objects as symbolic accounting "tokens", part of a formal, enduring, region-wide system (Bentham-Besserat 1992, 1996), clay objects were multi-functional tools, fulfilling a variety of uses within and across Neolithic settlements. The lack of clay object assemble homogeneity within and across sites where they occur, along with the lack of a certain, singular and consistent function for these artefacts within the wide context of Neolithic West Asia, adds to the difficulty of artefact classification. Functional uncertainty leads to problems differentiating clay objects from other small artefacts made from clay, yet of a more certain categorisation (schematic figurines and tablets for example). Perceived value of archaeological finds is ineffectively tied to their function, yet when a function, and even the classification of an artefact type is debated, our interpretation of an artefact type’s value within a past community is easily lost. Their large numbers when present, simple shape, crude appearance and depositional patterning proves "tokens" were quickly and easily made, and disposed of as readily. Yet, Neolithic clay objects were valued, multi-functional artefacts. Even within a single site, comparable objects likely performed multiple roles (e.g. counting tools, information storage mechanisms, gaming pieces, apotropaic devices). As tools, clay objects operated with fluidity of function, with imbued value and meaning; a quality which was appreciated and valued.
Interpreting the Archaeological Record

TH1-27 Abstract 21
Fluid Fungibles: The Politics of Value in Archaeology of the Early Medieval Volga Trade

Author: Dr. Bringley I, University of Oxford, Oxford, United Kingdom (Presenting author)
Keywords: Middle Ages, Trade, Value in Archaeology
Presentation Preference: Oral

This paper will address diverse “regimes of value” which were brought together by the booming medieval trade along the Volga River during the 9th-10th centuries CE. The paper will focus on how value was attributed to different goods and objects in various cultural contexts, and how fungibility of goods was fluid among different trading communities. The latter included the nomads of the Khazar Empire, the Viking Rus, and a variety of local sedentary communities, who lived along the Volga River. While we possess some textual narratives about the Volga trade, its participants, their rituals, goods, and fungibilities, archaeology speaks louder than words in terms of the meaning of value in this trade. By looking primarily at the archaeological context of medieval burial practices, it is possible to see how new means (objects and goods) were put to old ends in the process of social exchange. Namely, how items such as coins, belt sets, and beads, were circulated among the specific communities, and then taken out of circulation in the process of ritual (burial) action—and in some instances, extracted again. The aim is to show how the politics of value developed during this period of trade and affected the participating communities. The problems connected with archaeological interpretation of these processes will also be addressed.

TH1-27 Abstract 22
Beads, Bells & Baubles: The indigenous Caribbean revaluation of Spanish trade goods (c. 1492-1550)

Author: Kenfneo, Floris, Leiden University, Leiden, Netherlands (Presenting author)
Keywords: Caribbean, early colonial encounters, value systems
Presentation Preference: Oral

This paper juxtaposes archaeological and ethnohistorical sources to explore the early colonial indigenous Caribbean use and valuation of European-introduced goods acquired through systems of barter and gift-giving. Historical accounts written by European chroniclers describe the indigenous eagerness to obtain novel Spanish goods as well as the pace at which such articles were absorbed into indigenous networks. The cross-cultural exchange of exotic objects factuated the convergence, transformation, and recreation of indigenous and European material culture repertoires and value systems. In contrast to the historical accounts, which have always been an invaluable resource for studying the material dynamics of this encounter, archaeological evidence of the aforementioned processes has often been understudied. In this paper, I will discuss early European-introduced materials which have been archaeologically recovered from indigenous contexts in the Greater Antilles, in particular on the island of Hispaniola. With archaeological data it can be revealed how objects of exotic origin were integrated into existing material culture practices, providing clues about their past use and value. Aiming to advance our understanding of the materiality of things in this encounter, I demonstrate how the Americaniserestandardization and reinterpretation of European trade goods drastically changed the way such objects were valued, and continued to do so once adopted by indigenous communities.

TH1-28 Abstract 01
The bishop’s grave in St. Alban Church in Odense, Denmark

Author: PhD Hansen, Jesper, Odense City Museums, Odense C, Denmark (Presenting author)
Keywords: 11th century bishop, Odense, Old bishop - new church
Presentation Preference: Oral

When King Canute was killed in 1086 in the church of St Alban’s in Odense it “…was at that time the bishop’s church…” (“…tunc tenebrosa sedes est apostolica…”). This reference by an unknown author in a commemorative text of King Canute the Holy indicates that St Albans’ church functioned as a bishop’s cathedral until 1095, when the king’s body and St Alban’s relics were transferred 75 metres to the newly built St Canute’s church. In the fall of 2015 Odense City Museums excavated a hrserto unknown bishop’s grave in St Albans, supporting the designation of St. Alba’s as a cathedral in 11th century. During the period of the foundation of the Danish Church, and a number of questions emerge when analyzing the bishop as well as the grave and its context. The paper will primarily address two questions: What are the origins of the bishop in the grave and with which archbishopic and/or kingdom is he most likely associated? In the beginning of the 11th century, the Danish Church had close relations to Canterbury and thus to the Anglo-Saxon Church. In the middle of the 11th century, ties were close to the German Church, and Danish bishops were appointed by the archdiocese of Hamburg-Bremen. Attempts to answer these questions are based on traditional archaeological methods as well as DNA and strontium analyses. Additionally an attempt will be made to explain why the bishop was not moved into the new cathedral together with St Albain’s relics and Canute the Holy in 1095, or in connection with, for example, Canute’s canonization and translation only five years later in the year 1100.

TH1-28 Abstract 02
An abundance of chapels: the pre-parochial religious landscape of the Isle of Man

Author: Johnson, Andrew, Manx National Heritage, Douglas, Isle of Man (Presenting author)
Keywords: early chapels, Isle of Man, landscape
Presentation Preference: Oral

TH1-28 RELIGIOUS LANDSCAPES IN THE NORTH ATLANTIC
Saturday, 3 September 2016, 14:00-18:30
Faculty of Philology, Room 114
Author: Arneborg, Jette, National Museum of Denmark, Copenhagen, Denmark (Presenting author)
Co-author(s): Arge, Sinum, Froyar Formminnissavn, Tórshavn, Faroe Islands
Co-author(s): Vesteinsson, Orri, University of Iceland, Reykjavik, Iceland
Keywords: Early churches, Ecclesiastical landscape, North Atlantic
Presentation Preference: Regular session

At the same time as the pariah system was taking shape in Christian Europe – in the 10th and 11th centuries AD – Christianity was spreading among the colonists of newly settled lands in the North Atlantic. A well known characteristic of the ecclesiastical landscape of the North Atlantic islands is the high number of small churches associated with individual farms. The majority of these did not acquire parochial functions and most were closed down in the course of the Middle Ages. In their heyday, in the 11th and 12th centuries, they were however a very conspicuous aspect of the religious landscape of the North Atlantic. The study of these small churches has progressed in recent years – with comprehensive mapping and identification of such sites and several excavations – but many questions remain. A major issue is how different this pattern was from the Scandinavian and British homelands – or if it was different at all. Other questions relate to architectural influences, the use of space, location and settlement context, but also broader patterns and themes, like continuity from pre-Christian practices, medieval community organisation and ecclesiastical hierarchies, pastoral care in regions of dispersed settlements, medieval religiosity and its long-term development. Taking its cue from the relatively well documented small-church landscapes of the North Atlantic Islands – Greenland, Iceland and the Faroes as well as the Western and Northern Isles of Scotland – this session also aims to discuss also the religious landscapes of Scandinavia, Britain and Ireland and welcomes papers addressing comparable cases and questions in other parts of medieval Christendom.
The Isle of Man is a small island of just 580 square kilometres, yet it boasts the remains of about 200 medieval chapels (in Manx Gaelic, ‘keelis’). In the 1930s Carl Marstrander, the leading Celtic scholar of his day, visited the island to study its many Celtic cultural and linguistic facets. Marstrander was intrigued by the widespread distribution of early medieval burial grounds and chapels, which predate the establishment of a parish system on the island during the 12th century. He proposed and published a highly-influential thesis that the distribution of these chapels was associated with a pre-existing land division system which functioned throughout the island. Several theories have since been advanced which have suggested alternative explanations for the distribution of these chapels, and have been based, for instance, on concepts of peripheral or central location. It is worth taking stock of these, and of Marstrander’s work, in the light of recent discoveries and new dating evidence for some chapel sites, all of which were known at the time of earlier surveys.

Together, the development of GIS and the resulting ability to investigate and characterise historic landscapes, offers an excellent opportunity to study the location and distribution of these chapels, particularly in relation to routes through the landscape. As a result, it is becoming possible to propose some new ideas about their location and about the nature of the medieval religious landscape of the Isle of Man.

TH1-28 Abstract 03
A landscape of belief: Orkney’s medieval churches

Author - Dr. Gibbon, Sarah Jane, University of the Highlands and Islands, Kirkwall, Unied Kingdom (Presenting author)
Keywords: church, landscape, Orkney
Presentation Preference – Oral

Over two hundred churches were founded in Orkney in the eleventh and twelfth centuries. This paper will explore the various functions of these churches by considering them in their landscape contexts as a means of overcoming the lack of contemporary written sources relating to them.

The churches can be grouped according to three different landscape settings: proprietary churches located in close proximity to central places within settlement units (townships); isolated churches located some distance from known settlements; and churches which were isolated from settlement but not isolated. In addition to identifying different types of churches, some sense of chronology and religious development within the Orkney Earldom will be presented, mapping the transition from the forced conversion of the islands by Olaf Tryggvasson in 995 to the creation of an urban diocesan centre, part of the newly created archdiocese of Nidaros, in 1152/3.

TH1-28 Abstract 04
Chapels, Church sites and Settlement in Medieval Faroe Islands

Author - Arge, Simun Vilhelm, Faroese National Heritage, Tórshavn, Faroe Islands (Presenting author)
Keywords: chapels, church sites, settlement
Presentation Preference - Oral

In the Faroe a group of sites has, because of their characteristics and associated placenames, been interpreted as medieval chapels - maybe even remains representing the early Christianisation process. But because of the lack of church archaeological investigations our knowledge of the Faroese Medieval church is quite limited. The paper will discuss the characterisation of the archaeological material at hand based on an ongoing project involving surveys and investigations of possible church ruins. In an attempt to understand these relics - their relation and function within the Medieval church in the Faroes - they will be placed in a settlement-historical as well as in a North Atlantic context.

TH1-28 Abstract 05
Novel topographical surveys and analysis of ecclesiastical sites in the Faroe Islands

Author - Michelsen, Helgi Dal, Faroese National Museum, Høvik, Faroe Islands (Presenting author)
Keywords: early churches, ecclesiastical landscape, North Atlantic
Presentation Preference - Oral

In the Faroe Islands there are ecclesiastical sites that by tradition or place name are associated with bæningar (Faroese for chapel). The lack of historical and archaeological data has made questions regarding the date and function of these sites difficult to answer. Nevertheless they have been used e.g. in explaining when and by whom the Christianisation was introduced. One of the sites has partly been excavated in the 1960s, and only two other sites had been archaeologically surveyed before 2013. To get a better understanding of the variety of ecclesiastical sites the Faroese National Museum started a surveying project in 2013. The aim is to create a platform for future archaeological work and to create a basis of comparable archaeological data to use locally and across the North Atlantic region.

The methods used in the project are a combination of topographical surveying, Georadar survey and archaeological test excavations. The topographic mapping is made by a combination of Structure from Motion (SFM) and vectoring. The collected data are analysed, visualised and compared in an ArcGIS environment. This paper will present the preliminary results of the project.

TH1-28 Abstract 06
The geography of a cemetery – the early Christian cemeteries of Skagafjarðar, North Iceland

Author - Zoega, Gudny, Skagafjardur Heritage Museum, Saudarkrokur, Iceland (Presenting author)
Keywords: burial customs, cemeteries, churches
Presentation Preference – Oral

In the last decade early Christian churches and cemeteries in the region of Skagafjörður, North Iceland, have been the object of extensive archaeological research. A thorough regional survey has suggested the possibility of at least 120 farms with early churches/cemeteries. Of those, 15 have been further examined and four have been extensively excavated. The research indicates that these cemeteries come into being around the date of the official conversion to Christianity in AD999/1000 and that their majority was discontinued just before or after AD1104. A small number ultimately evolved into parish or communal cemeteries and in some instances churches retained their function and boundary walls were rebuilt after the cemeteries were no longer being used for burial. In their outward appearance these cemeteries seem to have been remarkably similar in size and form suggesting that from the outset, they were being managed and structured according to a particular set of laws or customs. Burial customs that have been considered an 11th-12th century development, for instance sex segregation, also seem to have been in place right from the beginning of the 11th century. These cemeteries are adding a new dimension to our understanding of the early ecclesiastical landscape in Iceland and how and when important changes may have occurred. In this paper I will explore the differences and similarities that can be found in the layout and organisation of these cemeteries and how they compare with contemporary funerary data from outside Iceland.

TH1-28 Abstract 07
Hofstaðir in Mývatnssveit. An early Icelandic religious landscape

Author - Dr. Gestsdóttir, Hildur, Institute of Archaeology, Reykjavik, Iceland (Presenting author)
Keywords: church, Iceland, religion
Presentation Preference – Oral

In 2015 the excavation of the early Christian church and cemetery at Hofstaðir in Mývatnssveit, northern Iceland, was completed. The site which dates from the mid 10th to the early 12th century was typical for the early Christian cemeteries of the period in Iceland, several phases of a central church surrounded by typically Christian graves, inhumations oriented west-east, all without gravegoods.

What is noteworthy however is that only 100m away from the church and cemetery are the remains of a substantial Viking age feasting hall (excavated between 1995-2002). The hall, which has clear pagan symbols, not in the least that its exterior was decorated with at least 23 cattle skulls, was in use for a relatively short period, constructed in the late 10th century, and abandoned by the mid 11th century.

The Christian church and the pagan feasting hall at Hofstaðir were therefore contemporary for a while. This brings a new perspective to the discussion of early religion in Iceland, where much of the focus has been on attempting to identify a conversion process thorough the archaeology, in particular burial archaeology. The story suggested by Hofstaðir is quite different, where there seems to be a period of coexistence of these contrasting religions.

In this presentation the results of the two excavations at Hofstaðir will be discussed, and placed within the context of the archaeology of early religion in Iceland in particular, and the North Atlantic in general.
Communities of death in medieval Iceland

Author: Prof. Viktinsins, Orn, University of Iceland, Reykjavik, Iceland (Presenting author)
Keywords: church, Iceland, Medieval
Presentation Preference: Oral

In Iceland, the introduction of Christianity around 1000 AD was associated with fundamental changes in burial customs. In pre-Christian times each farm had had its own cemetery but under the new custom only about a half of the farms had churches with cemeteries. Farms without a church and cemetery are as a rule those of lower status and their occupants presumably buried their dead either in their neighbours’ cemeteries or (if different) in the cemetery of their patron or landlord. Already within the first century of Christian practice the small farm-based churches began to lose their number and the 12th and 13th centuries are characterized by their continued decline and by increasing centralisation of functions in churches which would eventually become parish centres. The paper will explore how this development, from private to communal cemeteries, reflects fundamental changes in community organisation and social structure.

"Small churches" in Norse Greenland – what became of them?

Author: Dr. Arneborg, Jette, Danish National Museum, Copenhagen, Denmark (Presenting author)
Keywords: Churches and church-farms, Norse Greenland, reorganisation of ecclesiastical landscape
Presentation Preference: Oral

Greenland was settled in the latter part of the 10th century when Christianity had been introduced in northern Europe. Christianity was a part of the settlers’ kit, and churches and churchyards were built on the farms from the very beginning of settlement. The churches were built close to the farmhouses, and they were characterised by their "secular" architecture, small size, and a surrounding circular, or sub-circular, enclosure. During the 13th century the early churchyards were taken out of use, as were apparently the church buildings, and a number of farms lost their status as church farms. In the same period new and larger churches were built either on earlier church farms or on newly established ones, now adapting "traditional" church building architecture known in Scandinavia. Based on archaeological excavations of "small churches" 2001 - 2010 I will explore the changes in Norse Greenlandic church building in the context of ecclesiastical and community organisation.

A World apart? Burial rites in a Scottish Carmelite Friary

Author: Hall, Derek, Stirling University, Perth, United Kingdom (Presenting author)
Keywords: Carmelite, leather shoes, wooden staff
Presentation Preference: Poster

Ongoing excavations of the site of the medieval Carmelite Friary of Tullilum in Perth, Scotland in advance of its redevelopment have located at least 300 human burials in the friary church. The earliest group of these burials are consistently buried with wooden shoes, wooden staffs which are apparently not functional objects but symbolic and two of the other burials were found to be wearing leather footwear. This paper will consider the meaning and significance of these and other unusual burial rites from the site in comparison with other similar examples from England and Scandinavia.

Visualizing the Past, Exploring Meaningful Approaches in Interpreting the Archaeological Record through Illustrations and Reconstructions

Saturday, 3 September 2016, 09:00-13:00
Faculty of History, Room 332

Author: Kocken, Marc, MARC heritage consultants, Bemmel, Netherlands
Co-author(s): Thomas, Ben, Archaeological Institute of America, Boston, United States of America (Presenting author)
Co-author(s): Hodges, Sue, SHP, Port Melbourne, Australia
Keywords: public perception, reconstruction, visualization, interpretation
Presentation Preference: Regular session

The initial results of the ICOMOS Survey on Professional Attitudes toward Physical and Virtual Reconstructions of Monuments and Sites, facilitated by the ICOMOS ISC on Interpretation and Presentation (ICIP), were presented at the 2014 ICOMOS General Assembly in Florence. From the results it became clear that the majority of respondents believed that physical reconstructions at archaeological sites were becoming more common (71%) but that the principles of the Venice Charter on this subject were increasingly disregarded (68%). Respondents also highlighted the interpretive and educational functions of physical reconstructions in addition to the goal of increasing tourism. They further noted that digital reconstructions were becoming more common and widely accessible online, in museums, for research, and at heritage sites.

This session proposes to discuss the issue of illustration, visualization, and physical and digital reconstruction of archaeological heritage. Some of the questions that we wish to address are:

• What is the significance and value of physical and reconstructions of archaeological heritage?
• How do we define interpretation in this situation?
• How does visualization impact interpretation?
• What are the ethics of architectural reconstruction?
• Are there generally accepted guidelines and a common visual vocabulary that are shared by archaeologists around the world?
• What are the techniques and applications that inform and guide archaeological reconstruction?
• What are effective ways of presenting reconstructions?
• How does the public perceive reconstructions? What does and does not work?

To assist with the discussion on the evolving roles of reconstructions, we would like to hear from archaeologists, heritage interpreters, conservators, illustrators, artists, and others involved with the creation and presentation of archaeological reconstructions. Through this session and the presentations we would like to identify best practices and compile a set of guidelines that would assist archaeologists in visually representing the past in effective and meaningful ways.
Th1-29 Abstract 02
Reconstructing the Past
Author - BA Gerrit Jacob, Schilp, Reinwardt Academy, Utrecht, Netherlands (Presenting author)
Keywords: Archaeological reconstructions, Museological theory, Open air museum
Presentation Preference - Oral

One way in which archaeology can reach back and experience some parts of ancient life is through attempts to reproduce former conditions and circumstances. By using reconstructions, visitors of archaeological open-air museum can experience what the meaning and importance of these objects was for their original creators and owners. Spread throughout Europe, there are about 300 archaeological open-air museums that have these kind of reconstructions forming their main collection.

This research will give an insight into the different types of archaeological reconstructions. This can occur both in physical and in intangible form. Each different form has its own character and method for transferring the knowledge of the past to the public. Every form has its own function or significance, and some forms are more complete than others.

Often these reconstructions are necessary to make the information of the original such as drawings and plans are understandable for visitors. This is due to the visitors often not being able to interpret the information themselves. The presentation form of reconstruction can, moreover, convey a sense of realism, since not only sight but also other senses are triggered during a visit to a reconstruction.

An archaeological open-air museum is a permanent non-profit institution. This is characterized by outdoor true to scale architectural reconstructions and representations of how people lived and acted in the past. It holds collections of intangible heritage resources and provides an interpretation of how people lived and acted in the past. This is accomplished according to sound scientific methods for the purposes of education, study and enjoyment of its visitors. Visitors of the archaeological open-air museum get, because of that a specific view on the past, a very specific story told about the daily life of everyday people.

In this research creates a basic foundation for developing a new museological theory of archaeological reconstructions. The ultimate goal of this new theory is to improve the quality of the presentations of reconstructions in archaeological open-air museums, by creating a link between general museological theory and archaeological open-air museums.

Th1-29 Abstract 03
Turves and trusses: reconstructing an early medieval building tradition in the northern Netherlands
Author - M.A. Postma, Dathe, Groningen Institute of Archaeology, Lelystad, Netherlands (Presenting author)
Keywords: Methodology, Netherlands, Reconstructions
Presentation Preference - Oral

Archaeological reconstructions of excavated buildings are becoming a common feature in many countries throughout Europe and beyond. The value of such structures for communicating ideas about past life or even a more sustainable modern lifestyle is borne out by the fact that many have been built in open air museums or open (freely accessible) landscape settings. In professional archaeologi- cal reports too, reconstructions or reconstruction drawings to be precise, help to convey the archaeological message to a larger audience. But what does this actually mean? And how do we ascertain its academic quality?

This paper is not intended to simply repeat best practices in making reconstructions based on archaeologically excavated building remains; these points have been outlined and discussed on numerous occasions before. Instead, the question is raised why these practices seem so hard to be adhered to in practice. Perhaps museums prioritise differently than academic building researchers? Perhaps academic researchers lack sufficient knowledge and experience regarding ancient building techniques? And from this: should we not distinguish more clearly between different kinds of reconstructions, each aimed at different kinds of public? These are and may remain rhetorical questions; the concern of this paper is with demonstrating that ‘playing by the rules’ will indeed increase our understanding of past architecture.

Recent settlement research in the northern Netherlands has given a central role to a structural approach in studying previously excavated house-plans. The primary aim of the project was to establish how the region’s early medieval turf-walled buildings were constructed and how their architectural development can inform us about greater societal changes. However, generally accepted ideas on the limitations of turf construction and quality requirements for structural timbers were at first found not to tally with the details of the often well-preserved turf house fragments. A more systematic approach of the data was deemed necessary for outlining and explaining the typology, use, technique, design and context of these buildings.

It will be demonstrated that early medieval turf and timber buildings in the north of the Netherlands were both of a fundamentally different design than previous, less encompassing investigations have suggested. A new series of reconstruction models was developed on the basis of in-depth preparatory research, different assumptions (e.g. on stability requirements), new ethnographic analogies, reasonable chronological depth and a greater geographical range. The resultant model for an ‘average’ early medieval farm building is more characterised, in short, by fully stable arch-shaped trusses rather than the well-known but instable (non-braced) rectangular trusses. In the treeless salt-marsh area along the coast, thick clay turf walls served as load-bearing elements, whereas common belief would generally not allow for such a structurally demanding use of turf blocks. It is hoped that this case study will help raise awareness of the possibility that our views on past architecture may be subject to radical new interpretations, which is something to bear in mind for future visualisations and reconstructions, regardless of their purpose being educational, generally informative or academic.

Th1-29 Abstract 04
Using Archaeological Reconstructions for Outreach and Community Engagement
Author - Dr. Thomas, Ben, Archaeological Institute of America, Boston, United States of America (Presenting author)
Keywords: Archaeological Reconstruction, Community Engagement, Outreach
Presentation Preference - Oral

It has become increasingly more common, when presenting the results of archaeological projects, to include some form of digital or physical reconstruction of the artifacts and features uncovered at the sites. These reconstructions range from three-dimensional replicas of objects and buildings to virtual museums and exhibits. In this presentation, using information drawn from site preservation projects supported by the Archaeological Institute of America (AIA) in Belgium, Cyprus, Guatemala, Jordan, Turkey, and the USA, the author will present six examples of how reconstructions, both digital and physical are being used to present and disseminate archaeological information both to a local and global audience. The paper will also discuss how the projects are using archaeological reconstructions to inform and educate local communities about the significance of the sites and to engage them in the preservation and protection of the sites.

Th1-29 Abstract 05
The Reconstruction of three Roman Houses at the Archaeological Park at Xanten (Germany)
Author - Dr. Kienzle, Peter, LVR Archaeologischer Park Xanten, Xanten, Germany (Presenting author)
Keywords: Experimental Archaeology, Presentation, Reconstruction
Presentation Preference - Oral

In Roman times the Colonia Ulpia Traiana (CUT) located in the lower Rhine area of Germany was second only to the provincial capital Colonia Claudia Ara Agrippinensium (Cologne) in Germany inferior. In the late 1960s the extent of the Roman city was known and large areas of the Roman city were used by agricultural means. However, some parts of the archaeological site were scheduled to become an industrial estate. To prevent further destruction the Archaeological Park at Xanten (APX) was founded in 1973 at the site of the Roman Colonia Ulpia Traiana to protect and to present the remains of this major Roman city.

The APX employed physical reconstructions as one of several methods to explain the importance of the site and the Roman past to a wider audience. From 2007 to 2014 three Roman houses were reconstructed in the eastern quarter of the Colonia at the original site of the excavations. Strong emphasis was put on a careful protection of the historic remains with elaborate reconstruction work was got as close as possible to the original Roman building methods in order to understand the ancient construction processes and the time and knowledge necessary to execute the work.

The scholarly results of the building process will be published while the physical reconstructions will serve the visitors to learn more about the Roman past, the ancient building technologies and modern conservation methods and will serve the scholars to learn more about the long-term performance of the building materials and construction techniques from the Roman period.
TH1-29 Abstract 06

The "Arty" Way - Dutch Approach to the Presentation of Archaeological Heritage

Author: Dr. Kocken, Marc, MARC heritage consultants, Bemmel, Netherlands (Presenting author)

Keywords: Interpretation, reconstruction, visualization

Presentation Preference - Oral

Aim of this paper is to present a new approach in the Netherlands and discuss its pros and cons with the international community in order to contribute to the ICOMOS Debate on Permissibility and Standards for Reconstructions of Monuments and Sites and to answer some questions asked in the session proposal.

Early 2013 an online survey was presented by the ICOMOS ISC ICP to gather information within the ICOMOS community to start a debate on permissibility and standards for reconstructions of monuments and sites. This debate was called upon during the 17th ICOMOS General Assembly in Paris noting the increasing disregard of existing theoretical principles for the justification of reconstruction, and a need towards significant commercialization of reconstruction activities.

To contribute to the debate, I will present the Dutch approach on the subject of reconstruction with a specific focus on the archaeological heritage.

In contrast to most European countries, there is in the Netherlands no tradition in physically reconstructing archaeological sites due to the lack of visible substance.

In 1999 a National policy document examining the relationship between cultural history and spatial planning, was presented. Under the influence of this policy, progress was made to present the archeological heritage to the public. Due to the lack of visible substance a more artistic approach developed - with (landscape) architects, designers and planners in the lead - that can be described as the "arty" way of reconstructing/presenting the archaeological heritage on site.

In the context of this paper I will elaborate some examples of third-dimensional outdoor presentations in combination with in-situ conservation of archaeological remains, such as Hous Moerenburg in Tilburg.

These examples show an innovative design that makes the archaeological heritage both physically and mentally livable and adds to the identity, social significance and contemporary use of the place.

Two important lessons learned for success:

1. There has to be a multidisciplinary and participatory approach during the whole process in which heritage experts play a significant role, and dilemmas - such as What past to present? Where to put the emphasis, in the preservation of archaeological values or in the development of a place? Whose interest is being done right and to what extent? How much authenticity may be lost? - have to be discussed at the beginning of a project.

TH1-29 Abstract 07

Illustrating 8,000 years of environmental change and human impact in the Areuse River Delta

Author: Lic. phil. I Kraese, Jeannette, Office du Patrimoine et de l’archéologie du canton de Neuchâtel, Hauterive, Switzerland (Presenting author)

Co-author(s): Thew, Nigiel, Office de la culture (JCC), section d’archéologie et de paléontologie, canton de Porrentruy, Switzerland

Co-author(s): Von Burg, Alexandre, Federal Roads Office of Switzerland (FEDRO), Bern, Switzerland

Co-author(s): Elmer, Chloé, Office du Patrimoine et de l’archéologie du canton de Neuchâtel, Hauterive, Switzerland

Co-author(s): Rampaz, Katherine, Office du Patrimoine et de l’archéologie de Neuchâtel (OPAN), Hauterive, Switzerland

Keywords: environmental change, human impact, reconstruction drawings

Presentation Preference - Oral

The delta of the Areuse River lies between the foot of the Jura Mountains and the north-western shore of Lake Neuchâtel. Switzerland. Archaeological investigations were carried out there between 1995 and 1998 prior to the construction of the A5 highway. The site is one of the most important in central Europe, with over 12,000 years of continuous occupation from the Palaeolithic to the post-Medieval period. The aim of these investigations was twofold: to establish a detailed chronology of the human occupation of the site and to collect the necessary data to fill the research gaps in our knowledge of Neolithic culture in the region.

The discrepancies between visualisations, with on one side multi-period sites being ‘read like a plan’ and reconstructed environmental and archaeological data taken into account will be discussed as well as the issues of uncertainty and impression pertaining to these data, or absence of information. Finally, the composite drawing techniques used for the creation of the illustrations will be explained.

TH1-29 Abstract 08

Virtual communication at the great medieval Castrum Tunsbergis

Author: Archaeologist Gustavsen, Cecilia, Stiftsgelmuseet, Tonsberg, Norway (Presenting author)

Co-author(s): Fahe, Lena, Stiftsgelmuseet, Tonsberg, Norway

Keywords: Digital communication, interpretation, reconstruction

Presentation Preference - Oral

Since the first digital reconstruction of the castle of how it could have looked like in 1372 AD. New results from geophysical methods show new structures on the site, which is of interest for future reconstructions. In this paper we will discuss the advantages and drawbacks by virtual presentations in the light of our archaeological site, Castrum Tunsbergis.

TH1-29 Abstract 09

The Art of Perception in Archaeological Visualisations

Author: Wilson, Kelvin, Kelvin Wilson, Ridderkerk, Netherlands (Presenting author)

Keywords: Illustration, interpretation, phenomenology

Presentation Preference - Oral

When in the year 79 violent tremors pointed to something big about to happen near his house on the Gulf of Naples, Pliny the Younger nevertheless continued reading his book - and in the heat of the day, dozed off. It is a rather mundane reminder that our view of history finds direction by what we think important, yet that even past lives were lived by individual - and to past people, very present - concerns.

Most of the smaller human experiences of the past seems lost to us, yet other sensations are thought tied to places, and are recreated in landscapes and architecture. Indeed, a building may successfully copy plenty of details of past design. Yet an enquisitive visitor could have only ever had one perspective: a building’s interior scale determined by its walls, the appreciation of its exterior too often by the weather (and one person never under the spell of both at the same time). A tired Roman visiting his local bathhouse at the end of the day would need to know where to store his clothes, hope to find a seat in the crowded steam room, and be able to find a sponge - and not at all ponder the mechanics of the floors and drains as a present-day architect might do first.

Phenomenology, or sensory interpretation, was suggested over twenty years ago by professor Christopher Tilley as a useful technique in helping understand ancient sites. Though understandably considered subjective, the same is now well understood to be undermining its very opposite: reconstructions made to the dictate of data. To bring the two opposites together - whether in full-scale architectural visualisations, as reconstruction art in the media, or in future multidimensional developments - the central issue is to ask a plain question: “what did one need to know?”

There are instances where the answer has altered the interpretation of the archaeology - bringing back the focus to what might have been multiply occupied at the same moment of a person in the past, or merely pointing out the best place he might have left that sponge. The discrepancies between visualisations, with on one side multi-period sites being ‘read like a plan’ and reconstructed accordingly, and opposite the ‘one moment at a time’ view visual artists may help re-experience, were discussed in a series of English Heritage-funded workshops and conferences at the University of Southampton. This paper expands on statements and case studies made by the author there and in follow-up meetings.
TH1-29 Abstract 10
As Planned, as Built, as Found: Reconciling Written and Field Records at Ksar es-Seghir (Morocco)

Author - Elbi, Martin Malcolm, Portuguese Studies Review / Bayliss Press, Peterborough, Canada (Presenting author)
Co-author(s) - Leal, Ana, Instituto Superior de Arquitectura da Universidade do Minho, Portugal
Keywords: Islamic, Portuguese, Morocco, Ksar es-Seghir, methodology, reverse mapping, GIS, validation of data
Presentations Preference - Oral

The present study reflects the results of a multi-level forensic analysis of architectural written records, archaeological field data (pre-2000 and post-2000), and competing interpretive models (pre-digital and digital) relating to the colonial urban outpost of Ksar es-Seghir (Morocco). The primary written record baseline was extracted from a fresh critical paleographic reading (edition forthcoming) of the protocol of survey recorded in 1514 CE by a Crown-appointed team of Portuguese architects, administrative agents, and military engineers (Arquivo Nacional da Torre do Tombo (Lisbon), Nazaré Antigo 769). This baseline material was then set in the context of all other relevant written records, structural proposals, funding appropriations, Crown instructions, and other documents (1458 - 1549) germane to spatial and structural modeling of the locality. For broader context, the results were correlated with an area-wide (Strait of Gibraltar) analysis of related sites (partly forthcoming as “Keys to the Strait: Fortifications in the Strait of Gibraltar from Abd Ya'qub Yūsuf to Abū al-asam 'Alī”, in Stéphane Pradines, ed., Architecture militaire du littoral, de la conquête Arabe à l’Empire Ottoman (Cairo: IFAO, 2016) and partly published as “Contours of Battle: Chronicles, GIS, and Topography—A Spatial Decoding of the Portuguese Siege of Tangier, September to October 1437”, Portuguese Studies Review 21 (2) (2013, rel. 2016): 1-35 (Portugal and its Empire, 1129-1609: A Volume of Papers in Honour of Francis Dutta ). The resulting dataset was correlated, iteratively, in detail, and from a variety of critical perspectives, with data generated by past archaeological projects (1970s and 1980s) that had commenced with the 1974 field season, as well as with data resulting from the post-2010 resumption of work at the site under the auspices of CHAM / Escola de Arquitectura da Universidade do Minho and of the Direction du Patrimoine Culturel (Morocco). In the final stage, the project then proceeded to engage critically with various interpretive traps, possible omissions, likely flaws, or failures of coherence detectable in existing models of the locality (Ksar es-Seghir) as products of the long-run inter-disciplinary research covering Ksar es-Seghir. The goal was to shed light on the variety of processes through which diachronically cumulative errors of interpretation or modeling traps may arise. The conference presentation seeks to highlight issues of methodology and procedure, particularly with regard to interpretation, reconstruction, and resulting overall visualization.

TH1-29 Abstract 11
Reconstructing the Form of Late Neolithic Rondels

Author - Dr. Klára Jacoslav, Institute of Archaeology CAS, Prague, Praha, Czech Republic (Presenting author)
Co-author(s) - Varečka, Petr, Institute of Archaeology CAS, Prague, Praha, Czech Republic
Keywords: Enclosures, Neolithic, Virtual reality
Presentations Preference - Poster

The poster will present features of a circular ground plan, so called rondels, the function of which is assumed to be socio-ritual that appears in the Central European area in the first half of 5th millennium BC. Nowadays, we can only record the subterranean parts – i.e. one to four ditches, and one to three inner palisade trenches. Based on an intensive research that has been going on for almost 40 years, the ideas of the original form of rondels including wooden construction parts have changed in some aspects. Most common view is that a rondel is a solid palisade enclosure further enclosed by ditches. There are two, three or four entrances to the centre of the rondel.

Some researchers believe that from the centre of the rondel it was possible to observe the movement of the Sun, the Moon etc. during special occasions (e.g. summer and winter solstice). However, is this prevailing opinion right? What would rondels look like if they had a roof above the central area? The poster will present some original alternatives of rondel virtual reconstructions based on archaeological excavations.

TH1-29 Abstract 12
From archaeology to the restoration: the reconstruction of tile stoves in the New Jerusalem

Author - Glazunova, Olga, Institute of Archaeology of RAS, Moscow, Russian Federation (Presenting author)
Keywords: 17th century, New Jerusalem Monastery, the reconstruction of tile stoves
Presentations Preference - Poster

Workshops of the New Jerusalem Monastery are deservedly considered as one of the main sources of Russian production of the tile. During the excavations of recent years it was discovered a huge number (over 50,000) of previously unknown stove tiles. The tile workshops, kilns, stocks of finished products and remains of standing ovens were excavated. A lot of stove tiles were found near the base of these ovens.

Patriarch Nikon laid the foundations of a tile business in Russia. He invited artists from different regions and from other countries. Among ovens of the 17th century, we see the ovens, the roots of which can be found in Northern Europe, Italy, different regions of Balarus, in the Trinity-Sergius Lavra, Moscow. Later New Jerusalem craftsmen formed their own original style with special local appearance of tiles. At the beginning of the 18th century Peter I sent two Swedish prisoners for the organization of the tile production in the New Jerusalem. They, apparently, were the authors of tiles with symbolic scenes. Of particular interest is the oven, lined with tiles with heraldic church and state subject.

All of the above have created unique conditions for the reconstruction of the tile decoration of the New Jerusalem ovens of 17th – the beginning of the 18th centuries. Archaeologists and restorers implemented 16 projects. All ovens were reconstructed on the historical foundations during the restoration of the monastery buildings. Reconstructed ovens allow to present real interiors of 17th – the beginning of the 18th centuries in detail.

TH1-29 Abstract 13
3D modeling, RTI: non invasive and non contact methods for documenting a stamped amphora from Padova

Author - Tomai, Francesca, Università di Padova, Padova, Italy (Presenting author)
Co-author(s) - Ceres, Filippo, Università di Padova, Padova, Italy
Co-author(s) - Galeazzi, Gian, Università di Padova, Padova, Italy
Co-author(s) - Vellai, Danilo, Università di Padova, Padova, Italy
Keywords: 3D modeling, open-source, RTI
Presentations Preference - Poster

This work aimed to develop a non-invasive and non-contact approach for studying a stamped Dressel 6B amphora from an urban excavation in Padova (Italy). We created a 3D model of the amphora using two methods of acquisition, laser scanning and photography, and processed with an open-source 3D modeling software (MeshLab) and an image-based 3D modeling software (Agisoft Photoscan). Then we focused on the stamp on the rim of the amphora, taking a number of vertical photos to be processed with the open-source software RTIBuilder. We got a PTM file viewed with the RTIViewer, which permits to observe the images using various rendering modes. The realistic and measured 3D model of the amphora let archaeologists to analyze diagnostical parts, i.e. handles, neck, rim, the position and dimension of the stamp, in typological and technological researches. Moreover, the RTI image permits us to get a clear image of the shape and the letters of the stamp, useful for who is carrying studies on stamps and amphora workshops, without handling the object.

Further applications for both 3D models of amphoras and RTI images of stamps might be the creation of open online databases of amphoras and stamps from the Mediterranean; measured and scaled reproductions of amphoras using 3D printers, to be used for amphora conservation in museums or schools.
EVALUATING THE IMPORTANCE OF OSSEOUS TOOLS IN THE EARLY HOLOCENE: A EUROPEAN PERSPECTIVE

TH1-30

Friday, 2 September 2016, 09:00-13:00
Faculty of History, Room 214h
Co-author(s) - Colas, Naterre Cedex, Foros Islands
Co-author(s) - Luikoe, Centre for Baltic and Scandinavian Archaeology (ZBBA), Schleswig, Germany

Organic tools are an important aspect of prehistoric societies, especially in the Stone Age. Therefore the analyses of these can give deep insight into people's typological and technological constraints such as behaviours. Being widely available in hunter-gatherer communities osseous materials have to be considered as one of the main resources for tool production in the past.

However, in a European scale, the discovery of objects made with bone, antler and tooth is very irregular. Obviously, these contrasts are related to taphonomic issues but also to economical and cultural aspects.

The session "Evaluating the importance of osseous tools in the Early Holocene: a European perspective" is meant to deal with a wide range of topics related to the analyses of osseous material. Apart from classical approaches, especially technology and typology, we would like to integrate the results from other disciplines and approaches to discuss from a European perspective. For instance, archeozoology or use-wear analyses on bone and lithic tools can also be considered as crucial to a better understanding of the role osseous industries played in Early Holocene communities. This session will also be the occasion to debate taphonomic issues and various contexts of discoveries which influence the archaeological visibility of this group of tools. Consequently we encourage researchers to address these and comparable questions from their own perspective and contribute to our session.

TH1-30 Abstract 01
Evaluating the importance of osseous tools in the Early Holocene

Author: Groß, Daniel, Centre for Baltic and Scandinavian Archaeology, Schleswig, Germany (Presenting author)
Co-author(s): Colas, Naterre Cedex, France
Keywords: Bone, Typology, Technology, Taphonomy

Organic tools are an important aspect of prehistoric societies, especially in the Stone Age. Therefore the analyses of these can give deep insight into people's typological and technological constraints such as behaviours. Being widely available in hunter-gatherer communities osseous materials have to be considered as one of the main resources for tool production in the past. However, in a European scale, the discovery of objects made with bone, antler and tooth is very irregular. Obviously, these contrasts are related to taphonomic issues but also to economical and cultural aspects.

The session "Evaluating the importance of osseous tools in the Early Holocene: a European perspective" is meant to deal with a wide range of topics related to the analyses of osseous material. Apart from classical approaches, especially technology and typology, we would like to integrate the results from other disciplines and approaches to discuss from a European perspective. For instance, archeozoology or use-wear analyses on bone and lithic tools can also be considered as crucial to a better understanding of the role osseous industries played in Early Holocene communities. This session will also be the occasion to debate taphonomic issues and various contexts of discoveries which influence the archaeological visibility of this group of tools.

TH1-30 Abstract 02
Evolution in bone exploitation during the Late Mesolithic at Zamostje 2 (Russia)

Author: Toulilou, Julien, Panthéon Sorbonne University, Champagne au Mont d'Or, France (Presenting author)
Co-author(s): Lozovskaya, O.V., Institute for the History of Material Culture RAS, St Petersburg, Russia
Keywords: Bone technology, Central Russia, Mesolithic

In Central Russia, perhaps more than in other places in Europe, bone industries are one of the most important components of the last hunter and fisher communities. During the Late Mesolithic (7000-6000 B.C.), bone equipment held an essential place in the everyday life of these societies (Lozovskaya, O. V. 2003). Past typological studies have long stressed the importance of such productions (Lozovski, 1998, 1999; Xunne, 2001). Nonetheless, a more technological approach has to be undertaken, and the characteristics of these traditions linked to the bone equipment have to be detailed. The material connected to the elk (Alces alces) débitage at Zamostje 2 offers the opportunity to do so (Lozovska et al., 2013; Lozovski et al., 2014). Throughout this period, communities mainly hunted elk (Chaix, 2003, 2009). Their skeletons were then used to produce blanks. However, according to the way of life of these groups, they seem to gradually change their technical features by stopping to use breaking by direct percussion for the benefit of breaking by indirect percussion and grooving techniques. This aspect suggests interesting technical evolutions between the first and the second half of the Late Mesolithic, via a more important management of the osseous production. These question to other categories of material, it is possible to observe some fascinating technological and economical shifts around 6500 cal. B.C which in turn illustrate some considerable social evolutions at this time.
TH1-30 Abstract 05

Interpreting the Archaeological Record

Author - Dr. Groß, Daniel, Centre for Baltic and Scandinavian Archaeology, Schleswig, Germany (Presenting author)
Co-author(s) - Lübke, Harald, Centre for Baltic and Scandinavian Archaeology, Schleswig, Germany
Keywords: bone tools, Early Holocene, radiocarbon dating
Presentation Preference - Oral

Excavated in the 1950s, Hohen Viecheln 1, Lkr. Nordwestmecklenburg, is one of the most striking sites of the early Mesolithic in the German European Lowlands. The abundance of finds and good organic preservation characterizes the site, which is located north of Lake Schwerin in eastern Germany. Among German scholars, Hohen Viecheln is ranked alongside Bedburg-Königshoven, Fraschek, Duvensee, Mulerup, and Star Can, but internationally it usually is not accorded this significance. This relative obscurity seems even more surprising, given the abundance of finds made from different raw materials, but it is grounded in the site’s research history.

In this presentation we will present first results of an ongoing research project on Hohen Viecheln which aims at clarifying the prehistory of the site. By this it will be possible to adequately position the site within the Mesolithic and add valuable chronological and technological information to the understanding on osseous tool development in the Early Holocene. The re-evaluation also allows the accurate dating of the numerous bone points, for which the site is known.

The modern re-evaluation also renders possible to solve problems on the stratigraphic sequence. Due to the fact that the site represents a former shore area of the modern Lake Schwerin its stratigraphic sequence with different layers of peat, sand and gyttja is typical for overgrown lakes. The direct dating of several artefacts therefore allows us to understand when different areas were settling up.

TH1-30 Abstract 06

Not that simple! A debate about the apparent decrease of bone tools in the Paris Basin Mesolithic

Author - Post-doc, Guéret, Colas, Nanterre, France (Presenting author)
Keywords: Bone industry, Mesolithic of Paris Basin, use-wear analysis of lithic tools
Presentation Preference - Oral

In contrast to the Upper Palaeolithic period, it is widely admitted that bone industries have played a minor role in the economy of Mesolithic societies of Northern France. This fact is based on the scarcity of osseous tools and debitage waste discovered in the settlements and the spectacular decrease of lithic burins and borer generally associated with bone and antler working.

Nevertheless, for a long time, the archaeology of Mesolithic in Paris Basin has only excavated dry-land contexts where organic materials were not preserved. Since 30 years, rescue archaeology has allowed us to discover well-preserved sites in the valleys: evidence of osseous industries are now increasingly numerous, even if the data still remain occasional. In addition, in the last few years, the development of use-wear analysis of lithic tools give us new informations about the place occupied by osseous materials in the economy of Mesolithic groups. This communication will be the occasion to make an assessment about the available data from bone technology, archaeozoology and use-wear analysis. When all the approaches are brought together, the place occupied by bone tools seems to be a more complicated question than previously thought.

Taphonomic issues, as well as mobility patterns of Mesolithic tribes, have to be considered in order not to under-estimate the role of antler, bone and teeth in the daily life of humankind communities. Finally, we will compare the situation of Northwestern Europe with neighboring regions, in particular to the Maglemosian techno-complex, well known for its abundant bone industry.

TH1-30 Abstract 07

The use of osseous raw material of Vlakno cave (Croatia)

Author - Radović, Sinisa, Croatian Academy of Sciences and Arts, Zagreb, Croatia (Presenting author)
Co-author(s) - Vlazović, Selena, Institute of Archaeology, Belgrade, Serbia
Co-author(s) - Vuječić, Dario, Department of Archaeology, University of Zadar, Zadar, Croatia
Presentation Preference - Oral

Vlakno cave is located on Dugi Otok (Long Island), situated in the northern Dalmatia. Systematic archaeological excavations revealed rich stratigraphic sequence from the Late Upper Palaeolithic to Mesolithic. Excavated deposits yielded tens of thousands of vertebrate remains, mostly skeleton remains of large mammals. Considering the amount of available osseous materials it is natural to expect correspondingly high amount of tools made of bone, teeth and antler. Here we integrate results of archaeozoological analysis and the study of osseous tools. Raw material selection, technological and typological aspects were analysed. Availability of skeletal elements is compared with raw material choices. Recovered bone and antler tools show very little typological diversity between Epigravillan and Mesolithic layers. However there are some interesting small-scale temporal trends (e.g. retouchers and harpoons being almost exclusively present in older deposits). Authors debate this pattern in tool production as the reflection of environmental and subsequently subsistence changes corresponding to availability of targeted animal taxa.

TH1-30 Abstract 08

Osseous tools in the Mesolithic and Neolithic in the Iron Gates

Author - Dr. Selena, Vlazović, Institute of Archaeology, Belgrade, Serbia (Presenting author)
Keywords: bone industry, Iron Gates region, osseous raw materials
Presentation Preference - Oral

Osseous artefacts were very important in everyday lives of prehistoric communities, especially before the invention of metalurgy. However, they were long neglected area of study, particularly in some regions of Europe. For the Early Holocene period, the region of the Iron Gates is particularly interesting, because the presence of both Mesolithic and Early Neolithic sites enables analyses of traditions and innovations in raw material selection, technological choices, etc. Related rich finds were published in more detail for the sites in Romania. This paper will focus on the Mesolithic and Neolithic sites from Serbia (Kula, Velešina, Krippála, etc.). Technological and typological data will be discussed: raw material selection, manufacturing techniques, etc. Antler were the dominant raw material in the Mesolithic period and their importance continues into the Neolithic, when bone is more present in most of the Starčevo sites bones prevailed. Typological repertoire included heavy duty and small craft tools, rarely other types of artefacts. Certain techno-types introduced in the Neolithic sites are of Near-Eastern origin, in particular spatula-spoons from cattle metapodia. Manufacture debris is not abundant and the question is whether this is related to taphonomy, excavation and recovery techniques, or specific activities carried out at some of the sites. Overall importance of analyses of the osseous industries and comparative approach of different technologies will be discussed.

TH1-30 Abstract 09

Post-depositional alterations on the bone surfaces – experiments with different agents of abrasion

Author - Mgr Orthwein, Justyna, Nicolaus Copernicus University, Toruń, Poland (Presenting author)
Keywords: bone and antler, experimental archaeology, taphonomy
Presentation Preference - Poster

Taphonomic issues are one of the most important factors that must be considered during study of every archaeological bones or osseous artefacts. Especially, if our analysis is subordinated to technological or use-wear traces. Identification of human or nonhuman modifications is then crucial. Weathering, trampling, tooth marks, root etching or sedimentary abrasion are just the examples of possible nonhuman degrading agents. The main goal of presented study was to understand and describe changes resulting from the different kinds of sedimentary abrasion (among others bioturbation and movement in an aqueous setting) on the bone surface. The experiments related to the study have been divided into two main parts. One was connected with modifications observed on raw bone surfaces. The second one, with degradations raised on processed bone surfaces (among others scraped, polished) and their possible influence on the morphology of observed traces.

TH1-30 Abstract 10

A replication of Neolithic bone harpoon with engraved concentric circles from Šventoji, W Lithuania

Author - Gaidauskas, Lukas, Vilnius University, Vilnius, Lithuania (Presenting author)
Keywords: bone working, experimental archaeology, Stone Age
Presentation Preference - Poster

This poster presents an experimental study which was designed to replicate the manufacture of a bone harpoon with a certain type of engravings using only the tools and materials available for the Subneolithic societies at the environmental setting of the eastern Baltic. The harpoon with a pattern of concentric circles engraved on it was found at the site Šventoji 6, which is a refuse/waste area in the bed of an ancient lagoon lake and is dated to the end of 4th millennium BC. While concentric circles were widely used to decorate bone and antler tools and ornaments in different chronological and geographical contexts, there are no analogues for the find from Šventoji 6 from the same period even in the neighbouring regions. The problem is that this type of engraving is mostly associated with metal tools, which could have appeared in the area already in the Bronze Age, after 2000 BC. The foreign origin of the harpoon with concentric circles is confirmed by another find from the same site – a worked piece of bone, on which the manufacturer tried to imitate the same decoration of concentric circuits, but instead produced polygons with a dot in the center, which looks nothing like the engravings on the harpoon. However, a clue for the engraving of concentric circuits before the appearance of metals comes from a certain type of Native American stone tools in North America. In the single- and double-scribe compass gravers. In my experiment I try to replicate the harpoon using similar stone tools and then compare it to the production of the same artefacts using metal tools.
“BARBARIANS” OF EASTERN EUROPE IN THE SYSTEM OF CROSS-CULTURAL INTERACTIONS

TH1-31 Abstract 01
On the nature of Baltic impact in elaboration of eastern European enamelled style in Dnepr region

Author - Dr. Khomiakova, Olga, IA RAS, Moscow, Russian Federation (Presenting author)
Keywords: Eastern European enamelled style
Presentation Preference - Oral

Lecture reviewed a problem of Baltic impact in formation of eastern European enamelled style in Dnepr region. It can be considered by the analysis of stylistics and jewelry tradition. Multiple elements inspired by artifacts made in Roman provinces, Central European cultures and Baltic lands can be seen in morphology and decoration of ornaments from Central Dnepr: s.a. strong profiling, openwork ornamentation, filigree. A variety of artifacts: laminar neck-rings (headbands), bracelets, fibulae have been decorated by ornament, made by punches, stamps, chisels.

Strong profiﬁed elements are applied in production of fibulae of type I by G. Korzuhina and T–shaped crossbow fibulae. In A. Oblomskii and R. Terpolovskii's view their origin is connected with forms of Almegn group IV fibulae. The morphology of the body and tail narrow-width form of the comb most probably are close to fibulae of group IV of B2 period from Southeast Baltic, and forms relevant to Lithuanian territories in B2 and B2/C1 periods. Series of bracelets from Baltic lands dated to the same period are supplied with similar narrow-width formed combs. Drinking horns were furnished with strong profiﬁed endings.

Opework elements in decoration of enamal T-shaped fibulae, elements of pectoral ornaments, chains of drinking horns, lunulae pendants from Central Dnepr associated by similar ornamental motifs close to opus interrasile style. Closest analogies to these elements with geometrical motifs find in contact zones of Baltic lands, in artifacts dated to the beginning and the mid-third century. Artifacts supplied with opework ornamentation and strong profiﬁed elements find sustained conceptions in dress both in Dnepr region and Baltic lands.

In decoration of enamal artifacts from Dnepr jewelry technique with imitation of granulation and filigree has been used. Combs of drinking horns, neck-rings, chains of drinking horns are ornamented with punches and stamps. It could be an inspiration of Baltic artisans, who elaborated a peculiar variation of “ﬁligree”-style of 2nd century. A range of imitations of filigree ornaments are found in Central Dnepr and B2/C1 periods. Series of bracelets from Baltic lands dated to the same period are supplied with similar narrow-width formed combs.

In Central Dnepr region, the Dniepr hoards area is directly related to Kiev culture. In Eastern area 4 hoards were found (Zhuravka, Parkovets, Zamyatino-Yuryevo, the Labeysky district). Three of four complexes are hoards of scrap metal for recasting. It is unknown, which population used adomments with enamels in the Upper Don area. As well as in Western area complexes, the majority of artifacts from Don hoards relate to the middle stage of enamel style evolution. In the same complexes adomments of the degradation stage were also found. In Don hoards, as well as in Dnieper/Kosa complexes, hinged bracelets, "Oku" fibula, single late Sarmatian and Central European artifacts are known. So Don complexes belong to the same period, as Dnieper/Kosa hoards. Western area hoards are complexes of female dress accessories sets and items of men culture of prestige. The Don hoards are complexes of handcraftsmen raw materials. The two territorial groups are essentially different. The mass spread of adomments with enamels in the Don area may be explained by attacks of this region population on the Dnieper/Kosa territory. The Don population was not interested in adomments, but in scrap metal. Perhaps, these attacks were also the main reason for hoards holding in Western area. The Upper Don region was attacked by the third force soon after these campaigns, therefore, the Don hoards were hidden. This force could be the groups of Chernyakhov population. As a result of their advance to the Upper Don region in the middle of the 3rd century, Kashinka – Sedekli cultural group was formed.

The report is prepared on the RGNP project No. 14-01-00269.

TH1-31 Abstract 02
About two areas of adomments with champelev enamels hoards

Author - Doctor in hab. Obotomski, Andrei, Institute of archaeology of Russian Academy of Sciences, Moscow, Russian Federation (Presenting author)
Presentation Preference - Oral

Adomments with champelev enamels of the East European style are dated to the end of the 2nd – 4th centuries. Its area covers all Eastern, part of Central, and Northern Europe. There are 2 areas of hoards with these adomments: Western (the Dnieper and Upper Oka river basin) and Eastern (the Upper Don area). In Western area 10 hoards are known (Mezhigorye, Moschino, Bronza, Glazhevo, Bukryans Region, Shishko and others). The artifacts in these complexes have certain stylistic unity. In the majority of the hoards female artifacts of different preservation level are present. There are artifacts of men’s subculture of prestige (Bryansk, Novolukoml’, Moschino). The belts from Krasny Bor are unique, but they make a single ritual or ceremonial set. These artifacts were used as intended by their owners before they came to hoards. The majority of adomments in these hoards relate to the middle stage of enamel style development. Artifacts of decoration stage were found in two complexes (Moschino and Bryansk) together with them. Thus, all the 10 hoards belong to the same chronological period. In the wide framework they are dated to the end of 2nd – 3rd centuries, in the narrow – about the middle of 3rd century. In the Dnieper area attires with enamel adomments belonged to Late Zaporizhia and Kiev population. All hoards were found in the area of Kiev culture or near its border (Moschino). Thus, the Dnieper hoards area is directly related to Kiev culture. In Eastern area 4 hoards were found (Zhuravka, Parkovets, Zamyatino-Yuryevo, the Labeysky district). Three of four complexes are hoards of scrap metal for recasting. It is unknown, which population used adomments with enamels in the Upper Don area. As well as in Western area complexes, the majority of artifacts from Don hoards relate to the middle stage of enamel style evolution. In the same complexes adomments of the degradation stage were also found. In Don hoards, as well as in Dnieper/Kosa complexes, hinged bracelets, "Oku" fibula, single late Sarmatian and Central European artifacts are known. So Don complexes belong to the same period, as Dnieper/Oka hoards. Western area hoards are complexes of female dress accessories sets and items of men culture of prestige. The Don hoards are complexes of handcraftsmen raw materials. The two territorial groups are essentially different. The mass spread of adomments with enamels in the Don area may be explained by attacks of this region population on the Dnieper/Kosa territory. The Don population was not interested in adomments, but in scrap metal. Perhaps, these attacks were also the main reason for hoards holding in Western area. The Upper Don region was attacked by the third force soon after these campaigns, therefore, the Don hoards were hidden. This force could be the groups of Chernyakhov population. As a result of their advance to the Upper Don region in the middle of the 3rd century, Kashinka – Sedekli cultural group was formed.

TH1-31 Abstract 04
East European champlevé enamels: production technology and possible origin
Author - Rumyantseva, Olga, Institute of archaeology, Russian Academy of Sciences, Moscow, Russian Federation (Presenting author)
Keywords: Eastern Europe, enamelled ornaments, Roman time
Presentation Preference - Oral
East European enamelled objects appear in the Baltic, Upper and Middle Dnieper regions in the mid-2nd century A.D. From this area they spread rapidly over a wide territory, reaching the Crimea and the Caucasus at the South and the Kama region at the East. They were usually considered to be influenced by provincial Roman enamels and made by local or possibly itinerant craftsmen using glass beads as raw materials. The ornaments made in this style have drawn scholars’ attention for more than a century. Nevertheless, technological studies of such objects are quite a new research area, recently introduced by A. Bilner-Witblieszka and T. Stawiarska. The technological investigation of enamelled objects of the Briansk hoard aims to develop this line of inquiry.

The hoard discovered in the Briansk region (south-western part of Central Russia), is dated to the late 2nd – 3rd c. A.D. It contains 24 ornaments with enamelled decoration of red opaque or polychrome glass made in champlevé technique.

Techniques used for enamelling monochrome needles include the applying of wet glass powder or previously turned pieces of glass. Large fields were filled by powdered enamel in two stages: firstly the ground layer was heated, afterwards the upper layer was applied. Polychrome needles with combination of enamels of different colours without metal bars could be enamelled using juxtaposed blocks of glass, or, more likely, by a combination of blocks and powdered enamels of different colours. It cannot be also excluded that in some cases enamels were applied and heated successively colour by colour. Line- and wave-shaped elements were applied as wet enamel powder (possibly using stencil) and as pre-formed drawn rods. The choice of the technique seems to depend on the glass colour, special features of colour formation and difference of matting temperatures for enamels of diverse colours.

The following technological features of the studied objects should be highlighted: applying of glass working techniques (such as the use of drawn rods); complicated combination of different methods of enamelling, implying skills of a high degree; the use of cut blocks of glass demanding semi-finished products of a size exceeding one typical for beads. It enables to assume that the objects in question were not produced by local “Barbarian” craftsmen. It is likely that they were made by professional glass workers, possibly, of provincial Roman origin. Regarding the style wherein the ornaments were made it appears that the East European enamelled objects make part of artices, custom-made for Barbarian people by late antique craftsmen. Possible production centers for them have not been discovered so far. They were likely located in zones of the most active contacts between Barbarian and late antique population. It is very tempting to assume their location at the Barbarian settlements characterizing by the presence of late antique representatives, numerous imports and developed handicraft industry, interpreted as regional industrial, commercial and administrative centers, and also trading posts beyond the limes.

The funding for this project was provided by Russian Foundation of Humanities, № 14-01-00269a.

TH1-31 Abstract 05
Cultural and economic exchange in the Dnieper-Donets forest-steppe during Late Roman Time
Author - Dr. Schultz, Erdmute, DAI, Eurasia Department, Berlin, Germany (Presenting author)
Co-author(s) - Lubczew, Mikhail, Karazin University Kharkiv, Kharkiv, Ukraine
Keywords: Chernyakhov culture, cultural exchange, settlement activities
Presentation Preference - Oral

During the first centuries AD comprehensive settlement activities took place in the expanses of the watershed between the Dnieper and the Siverskyi Donets rivers, processes in which the Chernyakhov and Kievan cultures as well as nomadic Sarmatian tribes were involved. The interactions between these groups are considered on the base of recent investigations in this area. Special attention will be payed to material of the Chernyakhov culture concerning indicators for influences of other groups on the burial rites, the geographical position and structure of the settlements. Furthermore imported objects from the sites like amphorae, glass beakers and others will be discussed as evidences for the exchange between the “barbarians” and the ancient cities of the Black Sea coast.

TH1-31 Abstract 06
Glass vessels of the Chernyakhov culture – technology and origin
Author - Likhter, Julia, Archaeological research in construction business, Moscow, Russian Federation (Presenting author)
Keywords: ancient glass, chemical composition, manufacturing technique
Presentation Preference - Oral

There are different kinds of glass vessels – the study of the manufacturing technique alloweds to single out 13 schemes of making vessels which are connected with workshops of various types. It allows us to identify the places where the goods under investigation were manufactured. Glassmaking workshops where grind objects were produced were situated in big Empire towns. Vessels hot decoration were made in the common glass-house workshops which were situated somewhere in Empire.

TH1-31 Abstract 07
The commemorative gifts or immolating of items? (The New materials of Hun-Sarmatian time from the territory of Kazakhstan)
Author - Dr. Bogdanov, Evgeniy, Institute of archaeology and ethnography SB RAS, Novosibirsk, Russian Federation (Presenting author)
Keywords: ritual ceremonies, burial gifts, Mangyshlak Peninsula
Presentation Preference - Oral

A few stone constructions were investigated at the territory of Mangyshlak Peninsula (Republic of Kazakhstan) in 2014 – 2015. The space inside of stone fence contained the traces of varying ritual ceremonies: crushed crottery, vessels, embedded into the earth, and calcinative alters. In addition, the one small pit contained the bridle kit, another one – the belt kit consisted of incrustate items, and the third – the remains of saddle (silver margins and details of garniture). All components of material complex correlate with items of 5 – 6 centuries, found at the territory from Danube to Southern Ural. At the same time, the planigraphy and character of construction indicate the Sarmatian range of sites. An article considers the findings in association with theory of “burial gifts” among the Huns, offered by I. Bona, P. Tomka and supported by A.V. Komar. We made the case, which evidenced the appearance of developed cults, associated with sacrificial gifts of prestige items in Caspian Sea region.

The formation of these rider rituals are in account with nomads, who came to the new territory together with Hun invasions of West and South.

TH1-31 Abstract 08
Controversial problems of studying early medieval hoards in the Middle Dnieper region
Author - Doctor Shcheglova, Olga, Institute for the History of the Material Culture, St. Petersburg, Russian Federation (Presenting author)
Keywords: Hoards of metal ornaments, individual attire, interpretation of archaeological sources, Middle Dnieper region
Presentation Preference - Oral

Hoards of metal ornaments for a long time have been considered the sole archaeological source of the third quarter of the 1st millennium AD in the Middle Dnieper. After the discovery of settlements and cemeteries study hoards become secondary. Objective circumstances of the past 20 years, namely:
• The lack of systematic scientific field research as the settlements and cemeteries 7-8 centuries AD on the territory of the Middle Dnieper region
• Uncontaminated spread of exotic objects works with metal detectorists led to the facts that:
  1. The perception of saturation monuments of this time non-ferrous metal was radically changed- the number of findings has increased many times.
  2. The context of the finds of metal items is immediatly lost, they are removed from the complexes and the cultural layer.
  3. The only complexes in which can be credited trace co-occurrence of artifacts are fixed treasures.
  4. The accuracy of the information about the origin of these findings is low, but in some cases verifiable. The accuracy of the information about their composition is low too, they can be falsified. The completeness could be different from disparate up to fully taken.

We have accounted for about 100 complexes treasures of various origins. The following conclusions can be drawn on the basis of their study:
• The amount non-ferrous metals, which were in use, are very large. However, gold is not represented at all, and silver is poor-quality. In the complexes deposited or an individual attire, male or female, or a number of them, belonging to a small group (maximum 5-6 individuals). At the same time there are complexes with unpaired things and scrap. Deposition of these hoards was
not “hiding treasures”. The “wealth” of these complexes is alleged. Unification of the composition of a set of ornaments reflects the overall homogeneity and “egalitarianism” of material culture in the third quarter of the 1st Millennium in the region in question. On the basis of these materials, it is impossible to draw a conclusion neither an “elite” nor the “Potestarian structure”. The existence of such a usage (as a cultural norm), as a mass deposition of the elements of ceremonial costume in hoards, is a sign of the cultural unity of the ancient community. This community can not be correlated with “Antlas” described in written sources.

But the most important questions still remain unresolved: Were hoards complexes of prolonged accumulation? How can be characterized the deposition of hoards (gradual, one-time, deliberate, etc.)? What complicated to deposit the sets of elements of the traditional ceremonial dress in a plurality of treasures? What was the role of the “treasures of artisans”, containing serial thing, in the process of past memory?

The issue of defining the time and circumstances when the one of the largest early medieval archaeological cultures of the Eastern Europe ceased to exist is the most debatable one for the archaeology of the Middle Volga region. For years of Imenkovo culture studies, several completely opposite hypotheses on this issue were developed. The majority of the hypotheses are of historiographical interest, but the issue still remains debatable. According to various researchers, the cessation of existence of Imenkovo culture is related either to the leaving of population from the region at the end of the 8th - the beginning of the 7th c. (Alexey Bogachev) or at the end of the 7th c. (Evgeny Kazakov) or to the slow dissolution in the culture in the early Volga Bulgarian culture in the 8th-9th centuries (Galina Matveeva, Yuri Sermyln). As a result of the recent research, it became possible to determine at least two stages of the Imenkovo culture: the early one in the 4th-5th c. and the late one dated 6-8th c. The chronological framework of the last stage was determined according to details of heraldic-style belt-sets, Sassanian coins, several furniture and costume details.

The analysis of the collections allowed to determine the late Imenkovo materials from Komitmer 2 burial ground and Maklasheevka archaeological complex in trans-Volga area. ‘Osli-Pando’ hillfort in the Middle Sura region. These sites are very similar in culture and dated 6th - the first half of the 7th c. The common feature of this group is the mix of classic Imenkovo cultural complex with ‘eastern’ artefacts. The synchronous group of sites that is culturally distinct was researched in the Ulyanovsk region. Cremation burials of Komarovka burial ground contained relatively ‘rich’ materials of the 6th-the first half of the 7th c. The ceramics and artefacts found in the have visible traces of the ‘southern-western’ direction of cultural ties. The hillforts ‘Asna-Panda’ and ‘Shom’ in the Middle Sura region are related to the ‘final’ stage of the Imenkovo culture. The both of the sites are of the second half of the 7th c. (the beginning of the 8th c. is also possible). These sites have a significant difference in ceramics and artefacts, therefore, the Imenkovo population was inhomogeneous at the ‘final’ stage. The materials of the late Imenkovo sites have a clear local specifics conditioned by different directions of cultural relations. It is possible to define stable local variations of culture only on the late stage of the Imenkovo culture. The specific regional types of furniture and costume details and differences in ceramic complex appeared in the 6-7th centuries bear an evidence of this. The cessation of existence of Imenkovo sites in the different regions was taken place in different periods, possibly, due to different reasons. In the majority of regions with Imenkovo culture remains, the upper boundary does not exceeds the first half of the 7th century. However, sites in the eastern part of Imenkovo culture area remain later, probably even until the beginning of the 8th c.

The cessation of existence of Imenkovo sites in the different regions was taken place in different periods, possibly, due to different reasons. In the majority of regions with Imenkovo culture remains, the upper boundary does not exceed the first half of the 7th century. However, sites in the eastern part of Imenkovo culture area remain later, probably even until the beginning of the 8th c.

A new view on the chronology of fibulae of Dollkeim/Kovrovo type in the light of new research data

Author - Dr. Prasolov, Jaroslav Aleksiev, ZBSA, Schleswig, Germany (Presenting author)
Co-author(s) - Skvorzov, Konstantin, IA RAN, Kaliningrad, Russian Federation
Keywords: fibulae of Dollkeim/Kovrovo type, Kaliningrad region, former East Prussia, Sambian-Natangian culture, chronological frame
Presentation Preference - Oral

Further development of the existing line chronology of one of the most characteristic find categories - fibulae, remains an important task in the archaeological research of the Iron Age Sambian-Natangian culture (also known as the Dollkeim-Kovrovo culture) in the south-eastern part of the Baltic Sea basin. Actual investigation focuses primarily on the verification of the chronological frame of fibulae of Dollkeim/Kovrovo type. For this purpose examined mutual occurrence of several fibulae types as well as other characteristic artefacts (i.e. chronological markers) in the fibula complexes are discussed in detail in the artefacts chronology data. The transition from the Late Roman period to the Early Migration period and the diachronic typological tendencies within the framework of the later period are demonstrated by means of the comparative analysis results of the so-called big crossbow fibulae, characteristic for the Late Roman period/the very beginning of the Migration period, the so-called fibula with the star-shaped foot, fibulae of type Schönmäler/Skvorzov and Dollkeim/Kovrovo, which are found in the cremation graves in the area of Sambian-Natangian Culture starting from the Early Migration period. Comparative analysis results of further chronological markers of the periods in question (knife-daggers, shoulder strips, jewelry, belt ends, buckles as well as specific pottery forms) apply to the investigation as well. Most of the discuss causal complexes were discovered during excavations performed in the historical East Pрусian districts of Sambia and Natangia on the flat burial sites Bol’shoye Isakovo (former Lauth, Schossejnoe-1 and Schossejnoe-2 and are published for the first time.

Salt production in the Landscape of the Polish Lowlands in the Roman period

Author - Dr. Ruiz Del Arbó Moro, Maria, Institute of History, CSIC, Madrid, Spain (Presenting author)
Co-author(s) - Bednarczyk, Jozef, Institute of Prehistory Arnu, Poznan, Poland
Keywords: Poland, Roman period, Salt production
Presentation Preference - Oral

The aim of our paper is to present the recent developments and achievements of our project about the study of ancient exploitation and production of salt in Poland, which implies both the study of salt production processes and its role in the organization and articulation of the territory during the Roman period. The geo-historical framework for this study is the north western part of Poland (Kuyavia and Great Poland), during the period of the Roman influences (II-III AD). The essential underlying idea of our investigations is the role of salt as a structuring territorial resource and its importance to understand the complexity of social transformations of indigenous communities in the period of the contacts with Rome. Thus, this study involves both the examination of the archaeological evidence for salt resources and its historical interpretation within a regional context and the global perspective of the contacts between the barbaricum and Rome.

Salt production in the Landscape of the Polish Lowlands

Author - Co Dorothy, Federeca, Universit degli Studi di Trieste, Gorizia, Italy (Presenting author)
Co-author(s) - Bednarczyk, Jozef, Institute of Prehistory Arnu, Poznan, Poland
Keywords: Migrations, necropolis, society
Presentation Preference - Oral

During their migration from Scandinavia to Italy, the Lombards settled for about 40 years in Central Europe, in the Danube river area and Pannonia, between Vienna and Budapest, where a lot of burial areas have been found. Here, with Franks people at west, Gepida and Slavs at east, and a lot of autochthonous people of roman tradition, the Lombards feel threatened in their political and cultural independence. Their society was still heterogeneous and various and, to keep their social and political unit, they developed a strongest material culture, that is the expression of different social meanings. This development has a great reflection in the funerary practices. Here, will be analyse first Austrian and Hungarian cemeteries; the study and the analysis of burial customs and material culture of these sites are essential to understand how they developed their identity, through the diffusion of different customs and the integration of people of different origins. These sites, as well as illustrating the more important methodological problems of this type of approach, present the starting point and the further developments of Lombards’ culture, and allow to draw some important conclusions about the change of the society, and thus the construction of the ethnic identity of this people, that evolved in the middle of Europe during the migration age and that they to talk in 588.
The presentation is going to discuss results of our research, in which we explored the possibility that we can draw conclusions about the settlement of a certain cultural group indirectly from information about a settlement of another cultural group and also define possible dates of their settlement. It shall present a possible interpretation of events in the 6th century in the western Pannonia (i.e. north-eastern Slovenia) and propose a new hypothesis on dating the early Slavic settlement in the afore-mentioned region.

The general consensus among scholars is that the early Slavs did not settle in the area of the western Pannonian Plain prior to the departure of the Lombards into Italy, possibly after 568, but probably only around 580 or later. The historical interpretations in question were proposed mainly on the basis of written sources, since the material evidence for this area was absent.

The situation with the lack of material evidence changed at the end of the 20th century, when extensive excavations on the route of the motorway network were undertaken in north-eastern Slovenia. A whole series of archaeological sites located south of Murska Sobota revealed the previously little-known early Slavic lowland settlements. By studying the site Novo mesto near Murska Sobota and its archaeological material opened up new questions. A reconsideration was needed where it was least expected, in the absolute dating of these sites, which has allowed a new understanding of the timing and pace of settlement of the Prague type culture in the western Pannonian Plain.

We set out as a conclusion that challenges the previously well-established expert opinion about the timing of the early settlement of Slavs in modern-day Slovenia. The presentation thus presents results that suggest that the first settlement of the early Slavs in the Pannonian Plain already occurred in the first half of the 6th century. These conclusions were based on three lines of evidence: 1) the study of the pottery; 2) dates obtained from the analysis of the radiocarbon isotopes of carbon 14C, and 3) comparison with the spread of the allegedly contemporaneous Lombard settlement north of the Danube and in the Pannonian Plain.

The main argument that supports the possibility of early Slavic settlement in the first half of the 6th century is the Lombard colonization of Pannonia and its archaeologically proven gradual pace to the line Sombathyely-Kazelny-Pince and later colonization of central Slovenia. Unexpectedly, the area between Pannonian settlement and Central Slovenia, i.e. north-eastern Slovenia, was left unsettled by Lombards. Since the lowland settlement of indigenous Romanized inhabitants in the 6th century was still not discovered, it is strongly believed that Lombards encountered the early Slavic settlement west of the above-mentioned line. A further argument for the hypothesis is the archaeologically proven fact that both early Slavs and Lombards respected the borders between areas of their settlement north of the Danube, which is also supported by 14C dates.

TH1-31 Abstract 14

Cultural exchanges between Barbaricum and Roman Empire in Lower Danube Region

Author - Dr. Magureanu, Andrei; Mircea, Institute of Archaeology Vasile Parvan, Bucharest, Romania (Presenting author)

Co-author(s) - Dr. Ciprian Bogdan, History and Archaeology Prahova County Museum, Ploiești, Romania

Keywords: center and periphery, cultural interaction, historical ethnic groups

Presentation Preference - Oral

It is a long discussion about the influences between the Romans and barbarians, last one understand as the other. The Lower Danube area brings its contribution to this debate, even till now the main discussion was based only on the discoveries from Middle Danube, there being a lot of power of gepids, awers... and here, in today South and East Romania, being just a not so attractive periphery, a scandin man.

Is this image true? Can be a periphery excluded from this kind of discussion? Are important cross-cultural exchanges only centered on power? How can we track cultural interactions? What can be considered as an import? What are the ways that facilitate this kind of human interaction? It is only an elite privilege or all the community participates into this game of cultural exchanges? Those are only a few of the questions to be answer into our contribution.

Analyzing the discoveries known today as Ipolgi-Odorheiu-Cireșeni and Costișa-Botagna-Hansca Cultures, dated in the 6th – 7th centuries A.D., we intend to see the interaction both on a larger scale – eastern and middle Europe, but, also, to a micro-scale, particular the east and south Romania, trying to see both the forest and the trees.

TH1-31 Abstract 15

Barbarian Coins, Elite Identities and the Birth of Europe

Author - Dr. Wigg-Wolf, David, Römisch-Germanische Kommission des Deutschen Archäologischen Instituts, Frankfurt am Main, Germany (Presenting author)

Keywords: Coins, Goths, Imitations

Presentation Preference - Oral

A commonality of the cultures of “Barbarian” northern and Eastern Europe was the production of coins imitating the issues of the Roman Empire. Analysis of die-linked coins (i.e. struck from the same die and thus produced in the same workshop) has long demonstrated that there were wide-ranging exchange networks across much of the northern “Barbaricum” during the Roman and Migration periods. Furthermore, both official Roman coins and imitations, as well as their imitations, played an important role in the self-representation of the barbarian elites.

However, the discovery of large quantities of new material, above all from the Ukraine, has radically changed and extended this picture: we now know that the phenomenon was much more widespread and intensive than had previously been appreciated, and that such networks in fact stretched from Moldova and the Ukraine to Scandinavia. The new material allows us to produce a narrative that can be closely linked with the rise of the Gothic Kingdom and its subsequent displacement in the face of the Hunnic invasion.

The numismatic material is the subject of a 3-year joint DFG/NCN Beethoven project “IMAGMA: imagines maiestatis” by the University of Warsaw and the Römisch-Germanische Kommission that aims to understand how these imitations of Roman coins were produced and used by the developing elites right across the northern and eastern “Barbaricum” to demonstrate their status. The picture that is emerging is one of disparate groupings linked together by common elements of material culture and of a wide-ranging exchange network, but above all of the crystallisation of the Gothic power centre on the territory of the Chemnichow/Siltrana delMures Culture.

The coins not only paint a diverse and deep-ranging picture of how such elites saw and expressed there identity, both with reference to Rome and to each other. They also provide new and revealing insights into the interaction and communication between the northern and eastern barbarians, in particular the Goths on the one hand, and the imperial administration and the population of the provinces of the Roman Empire in Late Antiquity on the other.

TH1-31 Abstract 16

A Barbarian, meaning who?

Author - Dr. Narloch, Krzysztof, University of Warsaw, Chojnice, Poland (Presenting author)

Keywords: Identification, Relationship and influence, Romans and Barbarians

Presentation Preference - Oral

In late antiquity, due to a change in social relations inside the barbarian societies, perception of Barbarians themselves changed as well. As a result of the intensification of contacts which less and less frequently took a form of a one-sided diktat, the late-antique community was faced with the need to conceptualise the ethnicity of other populations, which led to reconsideration of meaning and to working out a new model of mutual relations. This change resulted in taking over certain cultural behaviours and was reflected in the material culture. All that, at least in the Danube area took place in the shadow of newly-organized system of fortifications, which can be considered a characteristic feature of the late-antiquity warfare. The war itself, on the other hand, was the factor which formed particular barbarian populations, which made them create permanent state organisms.

The paper includes deliberations concerning changes in perception of the Barbarians by the Romans in late antiquity and their mutual relations, exchange in cultural models and war as a factor shaping contemporary populations.

TH1-31 Abstract 17

Burials with weaponry of the upper Dnieper version of the Zarubintsi culture

Author - Voronina, Liudmila, The State Hermitage Museum, St. Petersburg, Russian Federation (Presenting author)

Keywords: upper Dnieper, weaponry, Zarubintsi culture

One of the specifics of the upper Dnieper version of the Zarubintsi culture making it different from the Polyezhy and middle Dnieper versions is a custom of placing weaponry in a grave. On the burial ground Chaplin 14 spear and dart heads (5%) were found in 282 burials, on Yurkovichi in 1 out of 19 (5.3%). On the burial ground Goriškovec spearheads have been found in six investigated burials out of 32. All the heads are of iron, socketed, with a leaf-like feather, and bear traces of having been in fire. On the outside of the socket of one of the heads of the Goriškovec burial ground (burial No.9) there are prints of fabric preserved. In Goriškovec the heads lay in different parts of the burial pit parallel to it. In most cases, the burials with weapons, apart from modelled bowels, contained horseshoe-like iron fibulae of syulgama type and (or) iron knives with hunched backs. What is more, the knives always lay with the point directed to the side opposite to that of the spearhead.

A unique element for the funerary rite of the Zarubintsi culture is an iron spearhead stuck almost vertically into the bottom of the burial pit with the socket facing upward (burial No.13 of the Goriškovec burial ground). The custom of driving spears into or labor implements through the remains of the buried person placed in an urn or a pit is widely distributed territorially and chronologically. It is noted in the Przeworsk and Jastorf cultures of Poland and Germany where it sporadically occurs in the late La Tene and Roman periods. Similar cases are known also in the late Celtic burials of the Danube zone. The vertical piercing (shining) of a spearhead into a burial pit had apparently some ritual or magical significance.

This custom is interpreted variously. On the one hand, there is a rich mythology existing about spears that pierce the vault of heaven and therewith give humans access to the sky. On the other hand, the weapons were driven into the remains of the buried man
in order to bind the deceased to the ground and prevent him from leaving the grave. Finally, this custom is viewed upon as a reflection of phalic cult symbolizing the re-fertilization of Mother Earth. Also for the first time for the Zaporizhian culture an iron scabbard of a sica, a battle knife (burial No.28) and the spiked head of a Scythian arrow (burial No.30) were found in Goroshtov.

On the basis of the finds of various versions of fibulae of the middle and late La Tène scheme, the burials with weaponry of the upper Dnieper version of the Zaporizhian culture are dated to 5th–3rd c. B.C. In general, the burial Goroshtov can be characterized as a monumental left by a militarized group of people at the turn of our era.

TH1-31 Abstract 18
Geoinformation methods in dealing with East European barbarian champlevé enamels
Author - Radysch, Oleg, Institute archeology of RAS, Moscow, Russian Federation (Presenting author)
Keywords: Champlevé enamels, Geoinformation methods
Presentation Preference - Poster

In the last decade the objects made with champlevé enamels have attracted the attention of many researchers once again. Increased volume of incoming information from different regions of East Europe has expanded significantly the current understanding of the spread of this category of things, its connection with different cultures and its history.

The source corpus by G.F. Korzukhina (1978) reflected the situation of the early 1970s. About 450 objects divided into 10 categories (Brooches, Bracelets, lunula-pendants, Chains, Plate items, Neck-rings, Charms, Linings, Rings, etc.) were taken into account in this corpus. In the Middle Dnieper region 173 of 184 findings came from "casual" ones found on the surface exploration and from private collections of the locals. Only 11 items were found during excavations. In the second part of the book devoted to the surrounding regions, the situation is slightly different: 192 items were found in the excavations, 74 were related to the "casual" finds. Totally 69 places with the finds in the Dnieper region were recorded. The author of the source corpus identified three regions where things with enamels spread: Middle Dnieper, Baltic and Volga-Oka regions.

In addition to the G.F. Korzukhina's corpus new one was prepared by R.V. Terzievsky and A.M. Obolomay (2007). It included 142 findings mostly from the Middle Dnieper region. This corpus has been carried on under the project "The archaeology of the Roman Period in the Lublin region (east of Poland)" (2008–2011) and it is continuing. New approaches in work with undocumented finds allow including them in statistical survey. The first results of such work allow eliminating the G.F. Korzukhina's hypothesis about three areas of distribution of objects with enamels. The newest mapping fills existing gaps in the Upper Dnieper region, on the left bank of the Dnieper, in the Neman region. The amount of finds in the Middle Don region has increased significantly. Many things from the right bank of the Dnieper and Western Ukraine became known. New categories of things unknown among a set of categories in Korzukhina’s book were allocated. Number of items in previously small categories of things significantly increased. Information from full database allows beginning the work on allocation regional and interregional series of things, based on statistically valid samples of items.

Work was financed on RGNF grant №14-01-00289

TH1-31 Abstract 20 Cross-cultural interactions in the light of wheel-made pottery from the cemeteries in Ulów (Poland)
Author - Dr. Nieszawelska-Wieńkiewska, Barbara, Institute of Archaeology, Maria Curie-Sklodowska University in Lublin, Lublin, Poland (Presenting author)
Keywords: the Wielbark Culture cemeteries, Ulów, SE Poland, wheel-made pottery Presentation Preference - Poster

In the vicinity of Ulów (Middle Roztocze, SE Poland) the complex of multicultural archaeological sites was found. Among them two bi-ritual cemeteries (site 3 and 7) originating from the late Roman Period and the early Migration Period were discovered. On the map of archaeological cultures, Ulów is located in the settlement zone F of the Wielbark Culture. Therefore, the features typical of this culture dominate over the cemeteries discovered in Ulów. However, no fewer is the number of features of funeral rite, location of the site, as well as grave goods possessing parallels in other cultural units from the European Barbaricum (e.g. Maroldem Group, Chernyatkov Culture). It is known that the Wielbark Culture has a small number of wheel-made pottery. Moreover, it has not yet been proved that the population of this culture produced such a ware (apart from one "episodic" from Wielkie). According to many archaeologists, wheel-made potteries from the Wielbark Culture sites are in most cases imported from the Chernyatkov or Sántana de Mureq Cultures. In the light of this fact, surprising is the extraordinary number of wheel-made pottery and its fragment discovered in Ulów. In site no. 7 they comprise more than a half of ceramic ware from the Roman and Migration Periods. In this case, it can not be ruled out local production of at least part of the wheel-made pottery beginning at the phase Ctb-C2 and connecting the ornamentation of hand-made Wielbark Culture pottery with the technology and morphology of wheel-made pottery characteristic for the Chernyatkov or Sántana de Mureq Cultures.

TH1-31 Abstract 21 The heyday and decline of settlement of the Przeworsk Culture in the Lublin Region, eastern Poland
Author - Cyran, Marta, Muzeum Lubelskie w Lublinie, Lublin, Poland (Presenting author)
Keywords: interdisciplinary studies, Przeworsk Culture, settlement reconstruction Presentation Preference - Poster

The disappearance of cultures stemming from the tradition of the Roman Period at the territory of Central and Eastern European Barbaricum emerges as a diverse process in time and space. For the most part of this territory, among others also for the territory of Poland, the existing literature records a "sudden and dramatic" fall in the number of sites associated with the cultures at the end of the 4th and at the beginning of the 5th centuries. Such view of the cultural and settlement evolution is presented in the last synthesis of the prehistory of the Polish territory, written some years ago, as well as in more recent fragmentary studies. The last years of the 20th and the first decade of the 21st century brought a number of significant discoveries for the archaeology of the Roman Period in the Lublin region (east of Poland), which brought numerous new materials, sometimes leading to crucial redefinition of the established views.

The state of the research allows us to distinguish in this part of Barbaricum not only settlements connected with the Wielbark culture but also the final phase of the Przeworsk culture which transpires from recent excavation carried out at a settlement in Nieszawa Kolonia, site S, Opolo Lubelska district.

This site is the largest archaeologically explored settlement of the Przeworsk Culture in the Lublin Region with relics of the Wielbark Culture cemeteries, Ulów, SE Poland, wheel-made pottery

The interdisciplinary studies carried out in Nieszawa Kolonia systematically fulfil the still up-to-date postulates of the internalization of studies over settlements of the Przeworsk Culture.
TH1-31 Abstract 22
The preparatory stage of pottery technology among the Russian forest-steppe cultures in IV-VII AD

Author - Nikitina, Anna, Samara State Technical University, Samara, Russian Federation (Presenting author)
Keywords: ancient pottery, East European Plain, Migration period
Presentation Preference - Poster

The time of the Migration period in the area the Eastern-Europe forest-steppe is associated with the spread the "crough-molded" flat-bottomed non-design ceramics. At this time in the pottery traditions abolished advanced technology associated with Scothian elements and imitations of Roman ceramics, as well as leaving the specifics of Iron Age sedentary cultures. The Migration period pottery is simpler and largely unified, despite the fact that the complex of findings, social and economic characteristics of different cultural groups are different.

Consideration area includes series of archaeological cultures: Prague-Korchak, Penkovo, Chernyakhov (in part), later Kiev and Kizhi, Moachatno, culture of Volga Finns, Imamkov. Studying of Eastern-Europe forest-steppe sedentary cultures ceramics as a single phenomenon has not been conducted, but there are a some works in separately. The main part of the special researches about ceramics are works devoted to the vessels shapes typology, based on the method of ceramics processing, which had introduced into scientific circulation by IP Rusanova and VF Gening in 1973. These typologies had arisen from the mid-1980s and still are working. These include typology of AM Oblomsky, OS Rymantseva, AM Vorontsov, VV Grishak. Besides them there are typologies based on the features, defined as type-forming by the researchers themselves (for ex. the functional features of vessels, features of profiling and others) - typologies of BY Magomedov, O. Petruaskas GO Mal'kova, GA Massalitina.

Thus researchers attention focused mainly on the vessels shapes. At the same time, about the pottery technology facts is bit. The first step in this direction has been made by AA Bobrinsky. He studied in detail the pottery of the Chernyakhov culture, in particular the selecting and procuring the raw materials, blending the pottery pastes, features of build, the study of pottery circles, the organization of the pottery industry. In addition, technical-and-technological analysis conducted by NP Salugina of the Imamkov culture pottery covered all stages of pottery production and gave a full presentation about the traditions of this population. In recent years, some ceramic sets of Chernyakhov culture began to be exposed to petrographic and X-Ray studies.

We believe the analysis of pottery technologies is the topical question of study of sedentary cultures of the Eastern-Europe forest-steppe, and this stage of our research work is devoted to the characteristics of the raw materials and pottery pastes. Our observations were made on fresh fracture sherds using stereoscopic microscope MS-1. Definition components of raw and paste composition was carried out by collation with a models collection, developed on the basis of Samara expedition to the experimental study of ancient pottery.

The research was identified the several traditions to varying degrees dominant in different territories. However, the general of most traditions are the selection skills potters of "low-fat" clays and adding a grogmade of splintered vessels in the composition. We suppose that the detected affinity of pottery traditions is reflecting the close connection within the studied population.

TH1-31 Abstract 23
Glass beads of Imenkov culture (on the materials from the Tetushskoe II settlement, Middle Volga)

Author - PhD Stolyarova, Elaterina, Institute of Archaeology RAS, Moscow, Russian Federation (Presenting author)
Keywords: glass, beads, Imenkov culture, Middle Volga region, imports, the Middle East
Presentation Preference - Poster

Tetushskoe II settlement is situated on the northeastern outskirts of the modern town of Tetushi (Tetush district, Republic of Tatarstan). Our investigations suggest that the glass beads which were found on the settlement are the imports from one region, the Middle East. The analogues to these beads within large geographical limits show their extremely long chronology. Nevertheless, we can say that on the sites of Upper Kama region, which is the closest territory to the Tetushskoe II settlement, such beads only appear from the 6th century A.D.

TH1-31 Abstract 24
'BBurakovo horseman': burial, hoard or imaginary assemblage? (concerning the status of the complex)

Author - Dr. Bugrov, Dmitry, Institute of Archaeology named after A.Kh.Khalikov, Tatarstan Academy of Science, Kazan, Russian Federation (Presenting author)
Keywords: early medieval archaeology, hoard, Middle Volga region
Presentation Preference - Oral

Every archaeological culture contains a site that becomes ‘an archaeological talk of the town’ in a positive or negative way. Komintern 2 burial ground became such type of site for the Middle Volga region sites of the 1st millennium AD. The site was heavily damaged by abrasion and excavations (1984-2003) were irregular and limited. Reports on Komintern 2 excavations were partly published (Kazakov, 1998; 2005), the historiographic tradition, mainly controversial has managed to developed in such difficult circumstances. Situation becomes more complicated due to existence of another complex, 'Komintern hoard' (also known as 'Komintern burial mound', 'Burakovo burial ground' or 'Burakovo horseman') that was similarly named and have close location to Komintern 2 burial ground. The 'hoard' has controversial historiography developed around it too. This work aims to find origins and define status of the 'hoard' and its relations to the burial ground.

According to the first publication (Izmaylov, 1990) the 'hoard' originated from the burial ground (nearby Burakovo) that was destroyed by water reservoir. Later publication (Mukhametshina, 1999) as well as documents of Bolgar Museum-Reserve argues that the artefacts were found by the resident of Burakovo, P. Levagin, in 1983 in Beganchik island (located in the place of eroded burial ground), 1 km far from Komintern. The first localization was inaccurate, as there is 5 kilometer distance between Burakovo and bank of the reservoir. The second is also inaccurate (as the island located to the west from Komintern and no burial mounds were found there earlier), however it may be more trustworthy. Attribution of all the artefacts to one complex is a random interpretation of P. Levagin, who had not give details neither about the place nor about the composition of the hoard.

The composition of the 'hoard' is chronologically and stylistically heterogeneous. The majority of the artefacts are dated from the end of the 6th - 7th centuries. A silver fibula dated the 5th century, a two-edged sword probably from Azaxino culture burial ground of the 3-4th centuries are beyond of this chronological frameworks. The iron stirrup and probably two silver belt plates are of the 8th century. In spite of the chronological entity of the group of other artefacts, stylistically they can be divided at least into three groups: (1) golden belt-set and two pommels of swords with torquoise inserts, (2) silver stamping belt-set with lead filling, characerous for 3rd horizon of Volga region heralidic-style, (3) two cast silver strap ends of Artybasheno type. Other finds can not be attributed to any of these groups. The presence of these artefacts in the one closed complex is considered to be extremely unlikely.

Apparently, 'Komintern hoard' is not the single complex and is an accidental selection of random finds collected from destroyed sites of the left bank of Akhtay stretched from 'Devichiy Gorodok' to Beganchik Island. The island is considered to be the most likely place of finding of the main part of the hoard and is related to the several destroyed burials of Komintern 2 burial ground.
Interpreting the Archaeological Record

Iron Making Techniques and Social Change in the Medieval and Early Modern Europe

Wrought iron has been produced with different techniques. The techniques have in diverse ways been adaptations to local raw materials such as the ore and the woodlands for charcoal production.

Various raw materials and furnaces required different social organizations. Collecting bog or lake one could easily be done within a family, while operating a mine was a much more complicated process, which required a larger group of laborers and several specialists. Especially when introducing new techniques skilled experts were needed.

Our aim is to analyze how sites of different technical processes reflect the working groups and their skills. The social complexities differed when running a small bloomy furnace, a high bloomy or a blast furnace. The last two techniques demanded highly skilled workers, a complicated social organization and larger funding in order to run the operations. This resulted in a division between those who operated the furnaces and those who owned the land and the industrial plants like notemen or monasteries.

There is also the question of the distribution of the products. Small scale production for household use is easy to explain. However, it is hard to understand any large scale production without knowing the demands or purposes behind. Reasons like export oriented trade or military preparations might explain the expansion of a technical development of the production. Analyzing the life course and use of iron objects helps us to understand the production as well.

Several methods can be used for studying these issues, like excavations, landscape archaeology and experimental archaeology.

We invite papers focusing on social organization and local techniques primarily related to iron production, but contributions on copper or silver production are also welcome. The main focus of the session is the Middle Ages and the early modern era, but papers dealing with earlier periods are welcome too.

TH1-32 Abstract 01
Basque Iron metallurgy, habitat and social complexity during the Middle Ages (7th-14th A.D.)

Author: - Dr. Jose Luis, Solak, University of the Basque Country (UPV/EHU), Vitoria-Gasteiz, Spain (Presenting author)
Co-author(s): - Azkorra, Agustin, University of the Basque Country (UPV/EHU), Vitoria-Gasteiz, Spain
Co-author(s): - Escalante-Ruiz, Sergio, University of the Basque Country (UPV/EHU), Vitoria-Gasteiz, Spain
Presentation Preference - Oral

The historiography of the Basque Country has traditionally related the Early and High Medieval iron and steel production with the mountainous areas situated in the Cantabrian coast. That is, with ironworks located generally on the top of flanks of mountainous terrain, equipped with one or more slag-tapping furnaces. These are the so-called haizeolak, which in the Basque language are wind ironworks, as opposed to the zeharkoak or hydraulic ironworks.

Just like by recent discoveries, it seems more likely that this impression is just a result of the nature of archaeological investigation itself which, traditionally, had been prioritizing very precise prospections and intervention in the mountainous zones of the Basque Country. Nothing, however, was known about the inland flatlands except, paradoxically, that there was a major metallurgical activity judging from textual information. The so-called "Reja de San Millan", dated 1025 A.D., gives the list of almost 300 villages of Álava from which the monastery of San Millán de la Cogolla (La Rioja) demanded the payment of iron taxes, an obligation that was maintained one century later in the so-called "Fallos votos de San Millán", but which did not extend to the rest of the Basque territories.

This apparent contradiction between archaeological sources and written text has begun to be resolved with the systematic application of new open-area excavation strategies with veritably surprising results. As opposed to the hackneyed historiographic view that has by medieval iron production located exclusively in mountainous terrains to date, the Basque archaeological record shows us a very diversified reality with large metallurgical establishments located in the flat areas of Álava, at the very heart of early medieval villages. The latter is, no doubt, the principal novelty: the location of iron factories in country villages. The development of this metallurgical activity can be divided into two extensive periods. The first, running between 600-950 A.C., is characterised by the existence of several settlements of a rural nature in which the same iron industry is developed, capable of englobing the entire operational chain: that is, from the reduction of the mineral up to the final forging of the ferramenta (iron). The second period, which runs from 650 to 1000 A.C., presents considerable differences between the sites. Thus, while some basically maintain the pattern of spatial and production organisation of the first phase, others develop rapidly towards fully urban forms. These transformations would bring with them a significant change in the iron production strategy, leaving behind the rural activities and only maintaining the forging activities.

Moreover, the archaeobotanical and metallographic studies undertaken have enable archaeologists to identify the type of iron mineral used, different models of exploiting woodlands, diverse technological changes in production (obtaining iron or steel according to needs) and other aspects relating to the operation of slag-tapping furnaces and forges.

TH1-32 Abstract 02
The Iron and the Smartphone: 'expensive' technologies at the verge of the millennium

Author: - Larreina-García, David, UCL Institute of Archaeology, London, United Kingdom (Presenting author)
Co-author(s): - Quirós-Castillo, Juan Antonio, Universidad del País Vasco, Vitoria-Gasteiz, Spain
Keywords: farming iron implements, medieval peasantry, technology
Presentation Preference - Oral

It is widely accepted that the fall of the Roman Empire had a negative impact on the iron industry across Europe affecting its production, distribution and consumption (e.g. Tylecote 1980). The metal production centers became closely linked to political, military or religious powers (Hinton 2005) mainly focused on providing to elites since 'iron objects were expensive items' (Jaritz 1995) not affordable for most of the possestas. Archaeological evidences contribute to this supposed scarcity of metals within the peasantry since agricultural implements of early medieval chronologies are infrequent: typically rather exiguous numbers of barely 1-2 items per site (e.g. Hameone 2011).

In stark contrast with these arguments, recent archaeological excavations on rural settlements from Early to Late Medieval times (Quirós Castillo 2011) carried out on the Basque Country area (north of Spain) point out that even during the earlier period the inhabitants of the villages enjoyed relatively large amounts of iron implements –counts by hundreds–, typically households or farming base tools. The metallographic analyses of thirteen iron implements reveals that these are very acceptable quality items made from low carbon steel by piling, employing occasionally sophisticated techniques such as sandblasting and even the complex pattern-welding technique for so far only seen in the decoration of high status weaponry (Pearce 2002).

This paper aims to investigate the engineering parameters behind the iron production and manufacture of iron utensils during Early Middle Ages as well as the accessibility of those by the peasantry; the concept of 'expensive' applied to technology is reviewed to point that medieval iron might be high-priced but still an affordable commodity same as the electronic technology nowadays. The conclusion is that 'expensive' is a very relative term depending not only on production and consumption parameters but also that geographical location, role within the society or political context had a considerable influence to access the iron production and manufacture, and offers a tentative reconstruction of interplay between iron models of production and peasant communities during EMA in the Basque Country area.

TH1-32 Abstract 03
Iron and Society in the Baltic 900 - 1350 AD

Author: - Assoc. Prof. Magnusson, Gert, Stockholm University, Stockholm, Sweden (Presenting author)
Keywords: Iron production, trade, urbanization
Presentation Preference - Oral
This paper is an attempt to describe the development in the Baltic during the period 900 to 1350 AD in a holistic perspective pointing out iron production as a force for changes in different societies around the sea. The Viking Age the societies around the Baltic underwent a remarkable development within agriculture, several towns were founded along the shores and in the river valleys and there was a change from pagan religions to different versions of Christianity. Supposedly there was an increase in a large scale trade with intensified contacts between the caliphate, Byzantium and the Carolingian empire, where the Baltic became a transit area. Iron might have been an important factor in the economy of the area, as the production increased significantly and was undertaken all around the Baltic. In the end of the period the island of Gotland became a center of smithing. Substantial iron production was initiated in the island of Saaremaa in Estonia and in the land of Raseborg in the Swedish east coast in the county of Finland. Here there was what has to be described as a mining area of lake and bog ore with over 1000 known bloomery sites with a minimum of 144,000 tons of produced iron. A production on such a scale during a period of 200 to 300 years evidently had a great impact on the whole Scandinavian and Baltic society, despite the fact a more efficient technique, the blast furnace, was to be developed in the mining area of Bergslagen further north in Sweden around AD 1000.

The bloomer processes of iron production survived the whole period and a regional specialization and social differentiation developed. As a result peasants on the plains founded their economy on grain production and peasants of the transitory regions between plain and woodland produced a surplus of animal products, while woodland peasants often sold handicraft articles, but iron opened up a new need for labor and produce, where the forests, lakes and bogs contributed with raw materials. Under these conditions iron production was introduced and raised within the peasant society linked to the emerging states, for example through towns like Kalmar, Gdansk, Kuressaare and other towns around the Baltic.

The role of the cities also grew in importance and urbanization became a vital part of these economic and social changes. Iron was traded from Kalmar during the 13th century under the name of Calmar iron. The iron production in Växjö was recognized by the Pope in 1299 as a serious political problem. As the people of Gotland traded arms to the Baltic tribes thereby threatening the Christianization of the region. The letters from the Pope show that trade and production in the Baltic area were a European issue and a part of a European modernization.

Changes in consumption, production and economic thinking require innovative environments and networks. Which settings, systems and actors enable innovation that can change the conditions for a whole society? In Sweden, the rapid emergence of Bergslagen was vital. The blast furnace was developed, perhaps as early as the 1000 AD, and around it extensive technical systems took shape, which then grew exponentially during the 11-1200’s. Metals were recovered from ore in a new way and on an unprecedented scale. In Bergslagen, Sweden’s economic base was built in a sparsely populated outland. This setting was characterized by diversity and flexibility which characterizes resilience. This paper will discuss Bergslagen as a system network focusing on innovation, expansion and resilience.

During the last decade several medieval rural sites has been under a research in the Western Nyland and from these excavations quite nice amount of objects telling about making, repairing and consuming iron objects has appeared. In this paper the aim is to consider the recent finds from a couple well researched villages as well as the castle of Raseborg, which was the administrative center of Western Nyland from the end of the 14th century to the middle of the 16th century. The question is, can the iron production, the trade of iron and making objects be reached by analyzing these objects? Also the life course and use of iron objects found from these sites are considered, as it can give us access to the production as well. The castle of Raseborg had of course a very special need for iron products. For example, the historical sources tell about making firearms and other weapons in the castle at least in the 16th century. Interesting question is, how the castle ensured the access to the raw material and how the production of iron objects was organized.

Was the organization of iron production and distribution somehow changed in the most critical moments during the history of the castle? The aim is also to consider, how the distribution of iron and objects in rural villages was related to the castle located in the same province. Were there perhaps some correlations between the organization of the iron production and distribution of the castle and villages? Just by researching archaeological finds these questions are hard to answer, but by combining the research of historical sources to the research of the material culture, the results might be fruitful.
THI-33 Abstract 01

The Avellino Event: investigating the migration resulting from the Bronze Age eruption of Vesuvius

Author - Dr. Van Leusen, Martijn, University of Groningen, Groningen, Netherlands (Presenting author)
Co-author(s) - Attema, Peter, University of Groningen, Groningen, Netherlands
Co-author(s) - Svein, Jan, University of Groningen, Groningen, Netherlands

Co-author(s) - Van Gorp, Wouter, University of Groningen, Groningen, Netherlands
Co-author(s) - Alessandri, Luca, University of Groningen, Groningen, Netherlands

Keywords: Bronze Age Italy, disaster impacts, migration

Presentation Preference - Oral

Around 1950 BC, during the Early Bronze Age, a giant eruption of Mount Vesuvius buried a flourishing landscape of villages and fields in the plains of Campania under more than a meter of ash. Inhabitants of sites such as Nola (the “Bronze Age Pompeii”) could barely escape with their lives. Italian archaeological research since the 1980s has conclusively shown that the population of the Campanian plain did not fully recover for several centuries after this so-called ‘Avellino Event’. Oddly, one has yet to wonder what might have happened to the fleeing population of Campania. They are not in the records. The authors present preliminary results of a new 5-year research program that pursues the hypothesis that they found refuge in the coastal wetlands of southern Lazia, the region immediately to the north of Campania. Long-standing Dutch geoarchaeological research in this region has already shown the presence of a continuous sedimentary record for the period of interest, and the team recently identified, besides the Avellino volcanics ash itself, two more ash layers that will function as chronometric markers for a Syrian, or possibly Levantine, refugee population. Using a combination of archaeological, artifactometric and palaeo-ecological approaches, the Groeningen/Leiden team is using these data to document the significant demographic, environmental and cultural impacts that are likely to result from the presence of the postulated Early Bronze Age refugee population in South Lazia. By September 2016, the project will have ended its first year and will be able to report on the results of its extensive coring campaigns and laboratory analyses of the environmental samples taken.

THI-33 Abstract 02

Phenomena of migration on Chalcidice

Author - Denk, Oliver, University of Basel, Basel, Switzerland (Presenting author)
Keywords: Chalcidice, colonisation, local identities

Presentation Preference - Oral

The Chalcidice, a peninsula in Northern Greece, formed since early times a transit area and can be interpreted as the endpoint of migrations. While it was called by the Greeks of the south “The peninsula in Thrace”, the toponym “Chalcidice”, which is used from the 2nd century AD onwards for the whole peninsula, was related before only to the area of the settlement of the Chalcidians. The origin of the name is controversial: from chalcos (copper), from the city Chalkis on Euboea or from the so-called Xalkidhes, a Greek tribe which settled in the area during the migrations of the 2nd millennium (Hdt. 7.185).

Beside the Chalcidians settled numerous populations on the mainland and the three prongs Pellone, Sithonia and Atke. The return of the heroes of the Trojan War which reflect the movement of tribes is displayed in the mythical founding of the Chalcidian cities Ainea by Aeaces and Solone by Proteus. The rich resources from the area (tinder, fertile land, mineral deposits) are central factors for the intensive colonisation in 8th/7th century BC. Settlers from Eubeoe, Andros, Corinith founded various apokaieti on the Chalcidice which shaped the region during the 8th 5th century BC. Cultural changes are connected through the history of the Chalcidice with the annexation to the Macedonian kingdom (349/48 BC) and when the Chalcidice became part of the Roman province of Macedonia (168 BC).

Based on this ethnic complexity the social dynamics of the microcosm of the Chalcidian peninsula should be investigated. The presentation provides on the basis of literary, epigraphical, numismatic and archaeological sources an overview of the methodical instruments which can be used to analyse the impact of new settlers on the local populations in this specific area. The aim is to analyse with a focus on the religious context the patterns of migration.
TH1-33 Abstract 05
Bone functional adaptation in the femur: a quantitative analysis in historical populations
Author: Dr. Simonit, Francesco, Monfalcone, Italy (Presenting author)
Keywords: computed tomography, migration period, moments of inertia
Presentation Preference - Oral
Bone is responsive to mechanical stimulation. Working aspects and social conditions are able to bring out significant skeletal alterations, which can be revealed in postmortem. Quantitative evaluations of the markers of occupational stress (MOS), in particular in the lower limbs, have been provided through the analysis of the cross section geometry of the diaphysis. Some historical populations of Friuli Venezia Giulia (North-Eastern Italy and Slovenia) have been studied with quantitative MOS methods. The activity patterns were already known for every group, especially about the loads to the lower limbs. Femoral cylindroids were obtained by Multidetector CT scan of mithand femur. Average values of the cross section geometrical properties (areas and second moments of area) have been calculated to evaluate bone functional adaptation in each cylindroid. Furthermore, the analysis of the metrics of the cylindroids have been assessed. This latter method has no evidence in current literature and its utility is object of study by our group. The analysis of the outcomes has shown that this methodology is able to give a good discrimination of the samples in respect of the different levels of mechanical usage of the lower limbs. In particular, moments of inertia have been turned out highly sensitive. This working and cost-effective technique might represent a useful non-destructive and operator-independent method in bioarchaeology and could be useful to evaluate and compare the MOS of historical populations.

TH1-33 Abstract 06
The investigation of Early Slavic sites in North-Eastern Germany in the last 25 years. A review
Author: Dr. Schneeweiss, Jens, Institute for the History of Material Culture RAS, Saint Petersburg, Russian Federation (Presenting author)
Keywords: Historiography, Slavic archaeology, Western Slavs
Presentation Preference - Oral
The development of Slavic archaeology in Germany is closely connected to political history. Thus, with the political turn in 1990 began a new period in the archaeological investigation of the Slavic past as well. The advancement of a new generation of researchers went hand in hand with re-evaluations of old paradigms and reorganisation of research. Dendrochronological data played a major role, especially in the discussions of two crucial issues: 1) the immigration of the Slavs between the rivers Elbe and Oder and 2) the dating and historical context of the numerous Slavic ringforts. Analyses of ceramics remained another important research topic. This period of intense investigations and acute debates came to a certain end at the turn of the millennium, when the majority are the product of various processes that bring together smaller or larger groups; in many cases, these groups are of substantially different traditions and cultural identities. Accordingly, as a result of group preferences and opportunities in regards to architecture and use of space, these settlements display a wide range of organizational variability. The spatial layout of the built environment and related activity areas at aggregated settlements may reflect social and economic complexity, and cultural heterogeneity, and these characteristics can be studied through the archaeological record in different temporal and geographic contexts. These comparative investigations also can contribute to a better understanding of present, pressing issues associated with increasing urbanization.

TH1-34 Abstract 01
From Temples to Towns: The Role of Sanctuaries in Urbanization Processes
Author: Dr. Fernández-Gótz, Manuel, University of Edinburgh, Edinburgh, United Kingdom (Presenting author)
Keywords: Identity, Religion, Urbanization
Presentation Preference - Oral
From the Mesopotamian ziggurats to the urban sanctuaries of the Greek poleis and the public spaces within the Late Iron Age oppida of temperate Europe, religion appears to be an essential element in most urbanization processes, being at the root of the fusion of previously scattered communities. In some cases it has even been determined that the existence of a place for cult activities preceded the concentration of a significant number of people or even the fortification of the area. Drawing upon different archaeological case-studies and historical comparisons, this paper will explore the crucial role of sanctuaries as focal points for social aggregation and collective identity construction.

THI-34 Abstract 03
How clustered were clustered settlements really?
A case study on the Gátahöyük West Mound

Author - Prof. Bahl, Peter F., University at Buffalo, Buffalo NY, United States of America (Presenting author)
Co-author(s) - Vargić, Jana, Flinders University of South Australia, Adelaide, Australia
Co-author(s) - Rosenstock, Eva, Free University Berlin, Berlin, Germany
Keywords: Architecture, Chalcolithic, Neolithic
Presentation Preference - Oral

This paper will demonstrate how modern, small-scale approaches towards architecture analysis question traditional views on the inner workings of a clustered settlement. Using our recent excavations on the gátahöyük West Mound as a case study, we will scrutinize whether a settlement that visually appears clustered to the archaeologists actually functioned like a house cluster in the past. After 6500 BC, the settlement of gátahöyük experienced fundamental changes in its socio-economic makeup, which are expressed in alterations of the settlement layout and organization. In the uppermost building levels of the Neolithic East Mound the settlement transformed from a tightly clustered and large agglomeration of houses into a series of individual houses or house clusters with open areas between them. At the same time, the tightly integrated social structure that characterized the site before 6500 BC loosened when households started to be economically more independent. During the following Early Chalcolithic period (ca. 6000-5500 BC), there seems to have been a return to dense clustering on the West Mound, suggesting another change in social structure. However, ongoing work on the formation processes of the built environment on the West Mound questions whether the buildings were actually all in use at the same time, which provides a new perspective on the use, function and meaning of settlement space of Neolithic and Chalcolithic settlement mounds.

THI-34 Abstract 04
Spatial and social patterns in LBK Neolithic settlement

Author - Michala, Katarzyna, University of Gdańsk, Gdynia, Poland
Co-author(s) - Polczynski, Lukasz, University of Gdańsk, Gdańsk, Poland (Presenting author)
Keywords: built environment, community organisation, spatial organisation
Presentation Preference - Oral

This paper focuses on the results of a study aimed at examining the relationships between neighbouring LBK houses based on analysis of location of activity zones related to the houses. The social and spatial organisation of LBK settlements is still under discussion. Usually the houses are perceived as independent, self-sufficient units within a village. Based on the research on 59 longhouses recorded at two large, multi-phase LBK settlements in southern Poland we would like to present more complex image of the settlement organisation.

Considering chronological relations between the houses, we analysed the spatial and functional diversity of features located around the longhouses and artefacts found there. This analysis allowed us to identify (1) "dirty zones" interpreted as possible places of household activities and intense deposition of waste, and (2) "kitchen zones" interpreted as places associated with processing and/or storing of food. The "dirty zones" are associated with accumulation of artefacts (pottery and flints) recorded usually in lateral pits and rubbish pits, and situated on one side of the house. The "kitchen zones" are characterised by the presence of features associated with direct use of fire, sunken-floored huts and grain remains.

The location of the zones around particular houses was varied. However in most cases we recorded a connection between the location of the zones and a neighbouring house of the same or earlier phase. The spatial analysis indicates that the activity zones have been probably used by inhabitants of more than one longhouse. This shared space can be an indicator of close social relations (e.g. kinship) between them.

THI-34 Abstract 05
Activity Zones and Community Formation: The Role of Spatial Structure in Early Nucleated Villages

Author - Dr. Salisbury, Roderick B., University of Vienna, Vienna, Austria (Presenting author)
Keywords: Neolithic Europe, social organization, spatial analysis
Presentation Preference - Oral

Spatial relationships are among the most important sources of archaeological evidence, and one of the most important aspects of social organization. Spatial structure, including the locations of built areas and activity zones, is an essential aspect of understanding the inner workings of early nucleated villages. Using our recent excavations on the Gátahöyük on the Great Hungarian Plain, we examine different types of sites, and if different types of sites, even if the differences are sometimes very subtle, show different spatial patterning of houses and activity zones. Furthermore, by increasing the social significance of identity while exposing people to a greater number of communities, these differences were instrumental in facilitating the socio-political changes that accompanied settlement and population aggregation.

THI-34 Abstract 06
Assemblages of material-social interaction and the creation of space at Polgár-Csoszhalom

Author - Raszkó, Pál, Eötvös Loránd University, Budapest, Hungary (Presenting author)
Co-author(s) - Andera, A., Eötvös Loránd University, Budapest, Hungary
Keywords: built environment, Carpathian Basin, Neolithic
Presentation Preference - Oral

The case study focuses on maturities and interactions as related to the built environment at the Late Neolithic settlement complex of Polgár-Csoszhalom in the Upper Tisza region (Hungary). House constructions and associated attributes provide particularly interesting contributions to the study of the site. Previous archaeological investigations have been concerned with the macrostructures ( built and horizontal settlement) of the Csoszhalom settlement complex. These studies were able to reconstruct two different reference systems of space: the building, and the physical setting of everyday activities. Both house construction and house burning on the tell were special actions, which were fundamental parts of the formerly reconstructed, complex feasting practices implemented in the enclosed section during its ca. 350 years long life-space, in the first half of the fifth millennium BC.

Regarding settlement organization, fundamentally new data were provided by a large-scale magnetometer prospection in 2014. The preliminary analysis of the measurements identified another enclosure system, composed of two ditches, as well as burnt house structures west of the tell, in the context of the horizontal settlement. Altogether, the results infer that interactions between human groups and various features in the Csoszhalom settlement complex may have been much more sophisticated than previously thought.

The presentation will provide a detailed contextual assessment of the currently available AMS dates from the site, in order to move beyond the duality of the enclosed tell and the horizontal settlement. In addition, we will examine the internal dynamics of interactions between houses, pits, wells and burials that represent the various physical loci of human activities and events. Finally, the spatial and functional associations of these loci and their social implications will be discussed. The project was funded by the Hungarian Scientific Research Fund (OTKA) Grant 108024.

THI-34 Abstract 07
What’s outside an Eneolithic tell settlement?

Case studies from the Balkans

Author - Craciunescu, Ionela, National History Museum of Romania, Bucharest, Romania (Presenting author)
Co-author(s) - Lazar, Catalin, National History Museum of Romania, Bucharest, Romania
Keywords: Eneolithic, spatial analysis, tell settlement
Presentation Preference - Oral

The aim of this paper is to investigate the surroundings of the Eneolithic tell settlements in the Balkans (Romania and Bulgaria), from the 5th millennium BC. The traditional biases are that the prehistoric habitation was limited to the tell area and that the
deceased were buried in the nearby cemeteries (most of them discovered by chance) or, in few cases, inside the settlement. This situation is a consequence of the actual state of research, with systematic excavations performed mostly on the mounds. Recently new post-dispersal research made in Bulgaria (e.g. Podpondis) and Romania (e.g. Pietrela, Sutuana) led to discoveries that revealed archaeological structures outside the tells that attest intensive activities and habitation. This situation brings a whole new perspective on the relationship between the nucleated tell settlements and the various activity areas from their vicinity, including the funerary areas. The research will focus on analysing these variables in searching for rules and exceptions, with the help for GIS analysis techniques. The main advantage of GIS approach is its ability to model and visualize spatial trends that would be hardly noticed and time consuming if only traditional methods were used.

This work was performed through the Partnerships in Priority Areas Program - PN II, developed with the support of MEN - UEFSCDI, project no. PN-II-P-PT-PCCA-2013-4-2352.

Nucleated settlements in the Eneolithic of south-eastern Poland?

Author: Dr. Nowak, Marek, Institute of Archaeology, Jagiellonian University, Kraków, Poland (Presenting author)

Co-author(s): Kozik, Konrad, Institute of Botany Polish Academy of Sciences, Kraków, Poland

Co-author(s): Dąbrowska, Wanda, Institute of Archaeology Jagiellonian University, Kraków, Poland

Keywords: Eneolithic, nucleated settlements, south-eastern Poland.

Presentation Preference - Oral

At the beginning of the fourth millennium BC, in south-eastern Poland (historical province of Lesser Poland – Polonia Minor) there appeared a new archaeological unit called Funnel Beaker culture (TRB), in the place where earlier units of the so-called Danubian Neolithic originally settled. From ca. 3600 BC, the growth of the area occupied by some settlements of this culture can be seen; this process seems to intensify with time. It is possible that such big settlements gained the status of micro-regional centers, around which the whole settlement network was organized. There are opinions that a two- or even three-tier hierarchical system of the TRB settlement was formed in that time. At the end of the fourth and in the first half of the third millennium BC, the biggest sites of the TRB reached a size of approx. 20 hectares. Because of this fact and due to the disappearance of most of the smaller sites, one can assume that a greater part of the local populations concentrated in these big settlements. Interestingly enough, such large sites are often characterized by architectural materials of a mixed character. The so-called Beaker-Baden Assemblages in western Lesser Poland are the classical example of such correlation; i.e. they are known from phases IV and V of the site at Bronocice, the Przecław district (ca. 3100-2700 BC). A phenomenon of this kind has also been observed in Lesser Poland beyond the TRB. For example, in the large settlement in Złota, the Sandomierz district (ca. 2900-2600 BC), the widespread coexistence of elements of the Baden culture, the Globular Amphora culture and the Corded Ware culture were recorded. It is significant that this site is actually the only settlement of the local archaeological unit called Złota culture. Other sites of this culture are cementaries and numerous single graves. Therefore, it can be assumed that this resulted from concentration of the whole population in one central point of the settlement area, this time of the mezo-region scale. The presentation has the objective of clarifying what kind of economic processes and social structures conditioned the emergence of big, Eneolithic settlements in south-eastern Poland. Some interpretative problems associated with such settlements will be also examined, e.g. questions of "invisibility" of houses within them and their relationship to the monumental, sepulchral structures of the TRB. For this purpose, a series of complementary analyses were performed including: 1) the internal arrangement of anthropogenic structures within big settlements, 2) the internal dynamics of their development, 3) the location of such sites in terms of environmental conditions, 4) their potential activity zones, 5) the degree of human interference in the environment around them, and 6) the relationship between them and other bigger settlement structures; these analyses have been recently performed i.a. at the TRB site at Močasta (Przecław district). They are based on the results of surface surveys, geomagnetic prospectations, excavations as well as palaeoenvironmental studies.

Spatial patterns of Nuragic sanctuaries inside settlements and in the countryside of Sardinia

Author: Dr. Steuing, Ruth, Römisch-Germanische Kommission, Frankfurt, Germany (Presenting author)

Co-author(s): Dr. Beusing, Ruth, Römisch-Germanische Kommission, Frankfurt, Germany

Co-author(s): ørskov, Jakob, Institut für Ur- und Frühgeschichte Universität zu Köln, Köln, Germany

Co-author(s): Dr. Ociepka, Jakob, Institut für Ur- und Frühgeschichte Universität zu Köln, Köln, Germany

Co-author(s): Dr. Cappenberg, Klaus, Professor für Umwelt- und Frühgeschichte Universität Leipzig, Leipzig, Germany

Keywords: GIS analysis, landscape archaeology, Nuragic culture.

Presentation Preference - Oral

Sardinian Bronze Age and Early Iron Age Nuragic monuments are renowned as impressive examples of a community effort. Nevertheless, the motivations and social organisation of the communities behind the joint efforts in creating those enormous and sophisticated built structures is still debated and barely understood. The Nuragic civilisation developed in the Middle Bronze Age and Early Iron Age, from about 1900 – 700 BC (IMBA to EIA). Nuragic settlements were spread over the entire island (more than 6000 are still visible in the landscape), and the Nuraghes can be subdivided into mono-tower and multi-tower. In later times (Final Bronze Age, MBA) the use of Nuraghes declined, while complex villages arise – most times nucleated villages distributed around Nuraghes, but also in new places in the landscapes.

In contrast, sacral monuments or areas are less frequently identified. While for the earliest phase of the Nuragic civilisation no more sacral places can be identified, they gradually become visible in the westside of giant tombs and in megalith tombs. From the beginning of the LBA a preference for fonts and wells can be observed, furnishing in water sanctuaries of finst mortar in the MBA and EIA. The sanctuaries are of different characteristics, some of them being quite remote while others were integrated with nuraghes and Nuragic complexes. A few of them are rather large, consisting of different buildings, partly surrounded by huts, built for large groups of visitors called 'federal sanctuaries', e.g. Santa Cristina- Paulatino or Santa Vittoria – Serri; others are more domestic, only suitable for smaller congregations. In the LBA the collective workforce seems to be shifted from the Nuraghes to the sanctuaries. Additionally, a change in the skills and preferences of masons can be observed. Though the actual building of the Nuraghes ceases, they survive partly in conversion and also as sculptured motifs of stone that was treasured in many of the sacral and/or meeting places. The refined religious practices observed somehow display changes in collective understanding of their surroundings manifest in the exploitation of fonts and wells. The processes are not fully understood, and were probably influenced by intensified contacts with different cultures of the Eastern and Western Mediterranean.

The study researches the interaction of the sanctuaries with different natural and cultural aspects within a GIS. The reference to water, other resources and infrastructural aspects are investigated, as well as the clusters of settlements they relate to, but also to other cultural patterns such as votive deposits (differentiating local and imported materials). In cases studies it also takes into account the patterns of sanctuaries located close to or within settlements, and the ways in which they were incorporated into new settlement foundations or added to existing settlements. Attempts to interpret the Nuragic civilisation and their features are numerous and manifold. Scholars claim models from elite structures to egalitarian systems. The study finally discusses the results in regard to different theories currently debated.

Organizationally variable of Bronze Age nucleated settlements in Hungary: a long-term approach

Author: Szeverényi, Vajk, Hungarian Academy of Sciences, Budapest, Hungary (Presenting author)

Co-author(s): - Ociepka, Jakob, Institut für Ur- und Frühgeschichte Universität zu Köln, Köln, Germany

Co-author(s): Dr. Beusing, Ruth, Römisch-Germanische Kommission, Frankfurt, Germany (Presenting author)

Co-author(s): Oral

Co-author(s): Dr. Dr. Cappenberg, Klaus, Professor für Umwelt- und Frühgeschichte Universität Leipzig, Leipzig, Germany

Co-author(s): - Korczyńska, Marta, Institute of Archaeology, Jagiellonian University, Kraków, Poland

Co-author(s): - Ociepka, Jakob, Institut für Ur- und Frühgeschichte Universität zu Köln, Köln, Germany

Keywords: Bronze Age, fortified settlements, Hungary.

Presentation Preference - Oral

Large, nucleated settlements – tells, hilltop sites, fortified settlements – are ubiquitous phenomena in the Bronze Age of Europe and specifically the Carpathian Basin. Recent research on microregional settlement patterns in Hungary has revealed a great variety of such settlements in varied regional contexts with apparently varied internal structure and connections to the wider social and natural landscape. Building on an earlier paper where we reviewed the history of Early Bronze Age and Middle Bronze Age fortified settlements in Hungary, the aim of our presentation is to provide an analysis of the changes of such nucleated settlements throughout almost 2000 years of the Bronze Age (2600/2500 – 800/700 BC) with regard to their internal structure, built remains, and internal and microregional organization principles. Data on changes in settlement structure and changes in the locations of major centres and populated areas will provide a wealth of information on the socio-economic history of Bronze Age communities in Hungary.

Our goal is to examine the settlement networks in this longer period in the central, southwestern and southeastern part of the Carpathian Basin Hungary, with special attention to: (1) the function and position of the fortified sites in the landscape, (2) their role within the settlement or economic units of the period and (3) their role in the cognitive and symbolic systems of the period, to decide whether their foundation was accidental or the result of a premeditated/intentional decision.

In recent years, in the area of Lower Silesia in Poland, several structures dated to the Hallstatt period, called chieffain's farmsteads were found. They were settlements composed of several buildings arranged around an empty square enclosed by a palisade or a ditch. The number of discovered sites suggests that this was a commonly used form of rural space organization. The comparative analysis showed that these settlements were characterized by repeating structure and layout. A metronological analysis was also undertaken. It was found that a repeating length measurement unit, which was approximately 0.785 m, was applied for both the layout of individual buildings as well as for the arrangement of the whole farmstead. It was also noted for the layout of the buildings, the dominating modules were used: a square with side of 4 x 4 units long and a rectangle with sides of 4 x 3 units long. Meanwhile, for determination of the farmstead size only square modules with side of 12 x 12 units were used. Similar rules of spatial organisation have also been used in the construction of ornaments on pottery and objects of everyday use, the different being that a triangle was the dominant figure. In both cases modularity was the basic paradigm of the style. It is also possible to observe the same rules in other regions habituated by people of the Hallstatt Culture. The genesis of this style is uniquely associated with the culture of antique Greece of the geometric period. The main question concerns the purpose of

Settlement mounds: A long-term analysis of the settlement organization in the Iron Age
Author - PhD Haue, Niels, Historical Museum of Northern Jutland, Aalborg, Denmark (Presenting author)
Keywords: Iron Age, settlement mounds, socio-economically organization
Presentation Preference: Oral

The settlement mounds in Denmark dates to the Pre-Roman Iron Age and the Roman Period, and the excavation of these complex village offers detailed analysis of the long-term social organization of rural villages in South Scandinavia. The paper will present a case study from northern Jutland, Denmark to discuss how spatial divisions within nucleated settlement mounds could regulate the socio-economic patterns and dynamics of prehistoric villages. In particular, the paper focuses on the ways that the best “addresses” of the village could maintain their dominance for several centuries, and how architecture was used to express and manipulate identity within the village.

TH1-34 Abstract 17
Structured villages from the Early Roman Iron Age in central-southern Jutland, Denmark
Author - Dollar, Scott, Søndereskov Museum, Brøndby, Denmark (Presenting author)
Keywords: Early Roman Iron Age, farmsteads, nucleated settlements
Presentation Preference: Oral

During the Danish Late Pre-Roman Iron Age in parts of western and southern Jutland there was a shift from a dispersed to a more nucleated settlement structure. This is best illustrated by a handful of villages that were enclosed by common fences. At the start of the Early Roman Iron Age there is a dramatic increase in the number of nucleated settlements, some of which seem to emerge rather suddenly, often where there has been little or no previous occupation.

Rescue excavations have brought to light a number of structured villages from the beginning for the Roman Iron Age that were composed of several individual enclosed contemporaneous farmsteads laid out in a linear plan. The layout of individual farmsteads and the buildings within them were themselves architecturally uniform giving these villages, as a whole, a relative homogenous character. When comparing different settlements to each other, there are variations in settlement and farmstead layout. However, there are similar regional similarities than there were differences. This may indicate that there were underlying social-cultural norms or rules in how these village communities should structure their settlements and farmsteads which were maintained by these communities over several generations. In this paper, I will present several Early Roman Iron Age settlements excavated by Søndereskov Museum in a limited geographical area of southern-central Jutland.

TH1-34 Abstract 18
What does settlement layout tell about the community?
Author - PhD Yalman, Emine Nurcan, Cultural Awareness Foundation Istanbul, CIE-Center for International Heritage Ac, Istanbul, Turkey (Presenting author)
Keywords: ethnoarchaeology, interpretation, settlement
Presentation Preference: Oral

The layout of a settlement reflects long-term processes and mutual interactions that occur among many variables. Sometimes the factors that shape a settlement are the result of various deliberate decisions, but indirect effects also play a role in these processes. In an archaeological site, we usually excavate and observe only parts of settlements, and thus we find that many of the components are missing. Therefore, especially in prehistoric sites where there is no predictable site plan, it is difficult to interpret the community by studying the site. This paper will discuss the relationship between the structure of a community and the settlement layout and the factors that make a settlement nucleated, dispersed or agglomerated, with an ethnoarchaeological study in Central Anatolia.

TH1-34 Abstract 19
The creation of powerful places in Etruria
Author - Dr. Stoddart, Simon, University of Cambridge, Cambridge, United Kingdom (Presenting author)
Keywords: Etruria, Genealogy, Hierarchy
Presentation Preference: Oral

The paper will examine the processes underlying the construction of powerful places in Etruria. On the one hand, the landscape of much of Etruria was dominated by what have been defined as prime centre in studies of political geography. On the other hand, burial evidence indicates the retention of counterweighing political genealogies that apparently contrasted with the apparent centralisation of power in the large centres. The paper will examine the resolution of this tension by matching emerging evidence from the nucleation of settlement (layout and organisation) with evidence for succession amongst political elites and their individual participants (the sequence and content of graves). The variation of this pattern at an interregional level will be added to the complex, often hierarchical, pattern of Etruria.

TH1-34 Abstract 20
Communication network structure in Latium vetus and Etruria: Two faces of the same coin?
Author - Dr. Fumianita, Francesca, University Roma Tre, Roma, Italy (Presenting author)
Co-author(s) - Prof. Guidi, Alessandro, University Roma Tre, Roma, Italy
Co-author(s) - Dr. Lozano, Sergi, IPHES, Tarragona, Spain
Co-author(s) - Dr. Prignano, Luce, University of Barcellona, Barcellona, Spain
Co-author(s) - Morer, Ignacio, University of Barcellona, Barcellona, Spain
Keywords: central Italy, communication networks, urbanism
Presentation Preference: Oral

Communication infrastructures are emerging complex structure: they are not completely random, neither are they entirely planned according to a predefined project especially when there is no unified political framework. Transportation networks can be regarded as an epiphenomenon of social interactions and interactions between societies and environments. At the same time, they influence the development of past societies (they enhance trade dynamics affecting the prosperity of a civilization) and their complexification (e.g. emergence of urbanism). There is a feedback loop. By analyzing and comparing fluvial and terrestrial communication networks in Etruria and Latium vetus between the Final Bronze Age and the Archaic Era with a newly developed Network approach this paper shows the similarities and differences between the two regions and contributes to explain why in the Late Etruscan and Latium vetus prevailed over the rival. Moreover, this analysis suggests a relationship between the hierarchical dynamics of city-states organization (and its corresponding influence on infrastructural decision-making) and the structure of terrestrial routes networks.

TH1-34 Abstract 21
The Analysis of Changes in Post-Chalcolithic Settlement at Gathohiyuk
Author - MA Hordeski, Jędrzej, Adam Mickiewicz University, Kościan, Poland (Presenting author)
Keywords: gathohiyuk, Hellenistic, settlement
Presentation Preference: Oral

Gathohiyuk is one of the most well-known archaeological sites. This farm is largely the result of Neolithic strata excavated there. However, this place was occupied in other periods as well. Evidence for this are registered both as on-site finds and, more importantly, remains of buildings from post-Chalcolithic periods. Because of its particular position, both at the regional scale of the Konya Plain and within Anatolia, Gathohiyuk played a special role. Excavations at the site revealed strata and remains of settlement from Bronze Age, Phrygian, Hellenistic and Muslim Periods. Evidence for the first and the last periods were relatively scarce. However, finds and strata from the Phrygian and Hellenistic Periods indicate uninterrupted settlement from the 5th to 2nd century. Because of this, Gathohiyuk is a very good example of settlement characterized by diachronically visible social and economic complexity and cultural heterogeneity. The theme of my paper is to present the results of an analysis of late archaeological strata registered in the TP Area. Phases of settlement presented in the first part will become a base for further interpretations. From this,
it will be possible to show organizational variability of space, which will be a starting point for interpretations focused on changes in perception of this place. In the result in my paper, I will indicate the most important economic and social changes that took place in Cătăhăryuk. That will be the answer not only for the question about the role of changes on site or in the region but also at the wider scale of Anatolia.

**TH1-34 Abstract 22**

**Comparative Study of Settlement Systems in the Bronze Age and the Medieval Age**

**Author:** Dr. Pusztaíné Fischl, Klára, University of Miskolc, Miskolc, Hungary (Presenting author)  
**Co-author(s):** Puszti, Tamás, Herman Dittrich Museum, Miskolc, Hungary  
**Keywords:** Bronze Age, Middle Age, comparative study, settlement structure and using of space  
**Presentation Preference:** Oral

Comparative studies on built environments between prehistoric and historic times at different geographical scales have yielded important results in various parts of the world. In particular, analyses of complementary datasets contributed to a better knowledge of similarities and differences in socio-economic developments at the local scale. However, less effort has been devoted to the matter concerning how abundant historic datasets can facilitate in understanding prehistoric settlement dynamics.

The aim of our paper is to examine settlement nucleation processes at the regional scale during two periods in Northeast Hungary. Two geographically distinctive, neighbouring regions, the Borod Plain and the foothills of the Bükk mountains, will be included in this study, with particular focus given to the settlement patterns for the specific periods of the Bronze Age (between 2200 and 1600 BC) and the Middle Ages (14-15th centuries AD). We will explore the topography, settlement networks, space and land use, as well as house construction methods in a comparative regional and temporal framework. The economy of these two periods is based on agriculture and the exploitation of the immediate environment. The historical and cartographical sources, landmark inspections, and the well-known road-networks make possible to determine central sites contra villages in the 14-15th century AD in the micro-region. Based on the analysis of building methods, communal spaces, spatial organisation of the homes and the villages, and economic activities in these two periods, we propose a model that will determine critical factors about the Bronze Age settlement pattern (roads, central places, distribute places and activities between settlement).

**An exemplification of the socio-political make-up of the Late Bronze Age polities from Hungary**

**Author:** Czukor, Péter, Móra Ferenc Múzeum, Szeged, Hungary (Presenting author)  
**Co-author(s):** Minkevičius, Karolis, Vilnius University, Vilnius, Lithuania  
**Keywords:** Bronze Age Hungary, fortified settlement, landscape, hierarchy  
**Presentation Preference:** Poster

In the area of the Békés-Csanád loess table and the Bánátin, SE Hungary and W Romania, a series of large fortifications enclosed by ramparts and ditches emerged in the period of 1300–1100 BC (Rei. BrD–HaA1). These huge structures, often hundreds of hectares large, got into the focus of Hungarian and Romanian research only in the past decade (have got into the focus of Hungarian and Romanian research only from the past decade). The fortifications are surrounded by a series of smaller rural settlements, forming a three-tiered settlement hierarchy, indicating a fairly complex society. The function of these settlements is debated to some degree, as they have not yet yielded substantial domestic remains, and their interpretation as refugia or ritual centres is also possible. This new type of settlement indicates significant although, up till now hardly known social and economic transformations in the last centuries of the 2nd millennium BC, in the Late Bronze Age. In my paper I will summarise the results of the research focusing on one of these fortifications, Makó-Róka-Chaşcnar and its hinterland. This small, 42 hectare large fortified site is investigated within the framework of a wider, microregional settlement study and will be interpreted in terms of the socio-political make-up of the Late Bronze Age polities.

**TH1-34 Abstract 24**

**More than meets the eye: burial monuments and “landscapes of power” in late Iron Age Britain**

**Author:** Mineikaita, Karolina, Vilnius University, Vilnius, Lithuania (Presenting author)  
**Keywords:** GIS, Iron Age, Landscape Archaeology  
**Presentation Preference:** Poster

As human beings, the desire and necessity to “change” landscape has been with us from the beginning of our existence. From the basic acts such as hunting or setting a campfire, to a more complex ones like constructing a transcontinental canal, our actions have been constantly changing the landscapes we inhabit. In prehistoric Europe these changes usually were an unintentional by-product of other activities. However, it is becoming increasingly evident that this was not always the case. Landscapes play an active part in societies, rather than being a passive reflection of (some of) their actions. They influence and are influenced by, social interaction and social structure. Throughout the history numerous societies have used this phenomenon to their advantage. Here it is being suggested that such landscape control strategies can also be observed in the later Iron Age in eastern Britain. During this period the re-emerging cremation burial monuments of social elites were used in the creation of “Landscapes of Power”. Some of them were used to visually dominate the social and political landscapes of the late Iron Age oppida. This hypothesis has been explored using GIS-based visibility analysis. By presenting case studies of Folly Lane, Leaden and Stanway it is argued that the role these burial monuments was not only to pay tribute to the deceased, but also to assist in establishing, developing and maintaining social and political power at the oppida.
TH1-35 Abstract 01

Some remarks about the role of environment and society in building technology

Author - Peinetti, Alessandro, UMR 5140, Paris, France (Presenting author)
Keywords: building technology, earthen construction, ethnoarchaeology

Most often, the archaeologist underline the role played by environmental constraints in the elaboration of architectural models, in particular for the employed raw materials. This paper wants to explore the complex relationship between environment, cultural choices, building traditions, socio-economical context and technical constraints, presenting ethnoarchaeological and archaeological examples of earthen constructions in different European contexts. First of all, the observation of modern wattle and daub in norther France allows some remarks about the relation between employed raw materials and techniques. The results of the Neolithic wattle and daub analysis from different sites in Piemonte (Northwest of Italy) stress the role played in tradition building practices. Some case-studies from the Italian Bronze age, focused on earthen walls and floors building techniques, could be used to study some cultural choices, guided especially by socioeconomic needs.

In prehistoric contexts, as in vernacular architecture, the employed building materials are often local and show a good adaptation to the ecological environment. That's sort a constant, but the identification of raw materials is just a first analytical level for the archaeologist. We need to make an effort and explore in deep the relationship between raw materials, technical choices and social context. In fact, each peculiar technical solution is often a solution among various other possibilities. The aim is to turn the archaeological reasoning and stress the technical variability in our approaches, to show the limits of the environment-related nature of the technique in the history of the building choices and choices in the ancient communities.

TH1-35 Abstract 02

The Aftermath of Mud Houses: Degradation and archaeological site formation

Author - Dr. Friess, David, University of Cambridge, Cambridge, United Kingdom (Presenting author)
Keywords: archaeological site formation, ethnoarchaeology, mud structures degradation

Presentation Preference - Oral

A major interest in archaeological research of mud structures since the Neolithic is associated understanding and reconstructing human activity which took place within archaeological mud structures. Yet, rarely archaeologists encounter mud structures preserved to similar conditions as they were during their initial habitation phase in the past. It is therefore crucial to understand the post-depositional processes involved in mud structure degradation and how they form the contemporary archaeological setup. This paper presents an ethnoarchaeological study, conducted in recently abandoned mud structures in two distinctive environmental regions: arid South Israel and temperate Northern Greece. The taphonomy of earth floors, mud brick walls, thatched roofs and microscopic activity remains was studied. Field observations and excavations were coupled with various microscopic laboratory-based analyses. The paper supplies guidelines to the identification of assemblages, occupation deposits, thatched roofs and degraded mud brick material. The results of this study presents the importance of combining macroscopic and microscopic analytical methods to distinguish between various infill sediments in order to enable better interpretation of archaeological mud structure.

TH1-35 Abstract 03

Burning Down the House – Experimental Chalcolithic house construction and destruction by fire

Author - Johnston, Stuart, Durham University, Durham, United Kingdom (Presenting author)
Co-author(s) - Gaydarska, Bisserka, Durham University, Durham, United Kingdom
Co-author(s) - Chapman, John, Durham University, Durham, United Kingdom
Keywords: building with mud in the Neolithic, Chalcolithic, experimental, Trypillia

Presentation Preference - Oral

During the summer of 2014, two 2/3rd-sized timbers-famed wattle-and-daub houses similar to those constructed on Cucuteni-Trypillia settlements, including the Trypillia mega-sites, were built in Nebelivka, Kirovograd Oblast, Ukraine by a joint British and Ukrainian team of archaeologists and craftpeople. One of the houses was deliberately destroyed by fire in May 2015 to study the process of its collapse and the potential formation of the ceramic-like burnt daub remains so often found during archaeological excavation of Cucuteni-Trypillia sites from the Balkan Chalcolithic period.

Observations of the collapse of the two-stone houses have given new insights into the processes forming the archaeological record and cast doubt on accepted theories of the formation of artefacts comparable to the collapse patterns, which are as large as 320 ha. The most surprising result concerned the very large quantities of firewood needed to burn the house completely. Coupled with experimental work carried out in the United Kingdom using the same materials, this experiment has presented evidence which challenges existing theories of house construction. By adapting test methods to the strength of concrete, masonry, and rammed earth construction materials, the effect of heating on the material strength of daub construction material was investigated in a series of compression and shear tests. The results challenge the theory that controlled burning of wattle and daub structures was used deliberately as a construction technique in Tripolye-Cucuteni houses. The Nebelivka house burning and -burning experiment is the latest in a long line of experiments that supports the notion of deliberate house-burning at the end of a house’s use-life.

Co-author(s) - Guidorzi, Giulia, GEA s.r.l. Ricerca e documentazione archeologica, Parma, Italy
Keywords: building technology, eneolithic, soil micromorphology

Presentation Preference - Oral

The eneolithic settlement identified at “Ca' Nova di Minerbio” (B0) in 2015, whose excavation has not yet finished, can be dated to a Copper Age phase, during which there was a massive presence of the so-called ceramic “a squame”. The archaeological excavation shows how different construction techniques have been used to realise the identified structures: a wooden planking and microscopic analytical methods to distinguish between various infill sediments in order to enable better interpretation of archaeological mud structure.

Observations of the collapse of the two-stone houses have given new insights into the processes forming the archaeological record and cast doubt on accepted theories of the formation of artefacts comparable to the collapse patterns, which are as large as 320 ha. The most surprising result concerned the very large quantities of firewood needed to burn the house completely. Coupled with experimental work carried out in the United Kingdom using the same materials, this experiment has presented evidence which challenges existing theories of house construction. By adapting test methods to the strength of concrete, masonry, and rammed earth construction materials, the effect of heating on the material strength of daub construction material was investigated in a series of compression and shear tests. The results challenge the theory that controlled burning of wattle and daub structures was used deliberately as a construction technique in Tripolye-Cucuteni houses. The Nebelivka house-burning and -burning experiment is the latest in a long line of experiments that supports the notion of deliberate house-burning at the end of a house’s use-life.

The eneolithic site of “Ca' Nova di Minerbio” (Bologna – Italy)

Author - Dr. Friess, David, University of Cambridge, Cambridge, United Kingdom (Presenting author)
Keywords: archaeological site formation, ethnoarchaeology, mud structures degradation

Presentation Preference - Oral

We present here the rectangular “structure 1” (2 meters wide and over 6 meters long), formed of at least two closed spaces, and burnt with earthen materials. The employed technique is probably similar to cob, coupled with a wooden load bearing framework. The residential function of the structure 1 is still not sure, mainly for the small size of the spaces (2 rooms, sized only 2x3 m).

The building shows traces of fire. A technological analysis has been carried out, using a geoarchaeological approach, in order to understand the differences in raw material selection and the employed building techniques. After an accurate characterization of the stratigraphy on the field, several micromorphological samples has been collected on both preserved
Interpreting the Archaeological Record

TH1-35 Abstract 05

Hearth structures and plasters from the Bronze Age settlement of Oratino: the dark side of the mud

Author - Dott. D'Oronzo, Cosimo, Università Sapienza, Roma, Italy (Presenting author)
Co-author(s) - Copati, Valentina, Dipartimento di Scienze dell'Antichità, Roma, Italy
Co-author(s) - Minotti, Vittorio, Dipartimento di Scienze dell'Antichità, Roma, Italy
Co-author(s) - Danesi, Michela, Dipartimento di Scienze dell'Antichità, Roma, Italy
Co-author(s) - Forte, Vanessa, Dipartimento di Scienze dell'Antichità, Roma, Italy
Co-author(s) - Medeghini, Laura, Dipartimento di Scienze della Terra, Roma, Italy

Presentation Preference - Oral

The Bronze Age site of Oratino – La Rocca is located on a small terrace beside the southern slope of a rocky hill that dominates the eastern side of the high Biferno river valley, along an important route that penetrates the inland region of central-southern Italy from the Adriatic coast. The research conducted so far on the site allows us to recognize different moments of occupation mainly from 15th and 12th century B.C. During the final phase of occupation a series of six layers, characterized by the presence of hearths and cooking structures is attested. They can be related, mostly, to food preparation/treatment and consumption activities, repeated in a short lapse of time. Moreover, these activities were performed in an open area and are not linked to specific domestic structures, but probably in a collective sphere, by a restricted number of people.

Several plaster fragments, related both to the cooking platforms and with other accessory structures, were found in these layers of occupation. A broad use of mud for coatings or covers of huts and an exploitation of raw materials macroscopically different for the manufacture of small structures, as cooking platforms, is observable from the macroscopic analysis of morphometrical and technological features of archaelogical materials. The application of compositional analyses, as petrographic analyses on thin sections allowed to characterize composition and firing temperatures allowed to identify potential sourcing areas of clays that have been compared with archaeological material composition to establish the provenance of raw materials.

Keywords: Bronze Age, cooking platform, plaster

TH1-35 Abstract 06

Technical evolution of adobe building materials and work specialisation at Ra'a al-Hadid HD-6 (Oman)

Author - Dr. Azzurra, Valentina, UMR 7041 ArScEn - Vegro, Narente Cedex, France (Presenting author)

Keywords: Adobe composition, Grain size distribution, Work specialisation, Early Bronze Age, Oman

Presentation Preference - Oral

Earthen materials are introduced in Oman at the end of the 4th millennium BCE, when a series of technological evolutions mark the transition to the Early Bronze Age. The very beginning of such transformation, however, remains scarcely understood from the point of view of settlement life and activities, as the Half period is mostly represented by thousands of graves, whereas the few settlements are known throughout the area. The site of HD-6 has been the object of a detailed large-scale excavation, showing both the emergence of solid architecture and a diachronic evolution in adobe building materials.

Aiming at a better understanding of such evolution, chemical-mineralogical and granulometric analyses of earthen building materials related to the different occupations of HD-6 have been performed on a series of samples. The results suggest that the differences in mud-brick fabrics were a result of mixing and tempering and are not indicative of different raw material sources. Together with the technical characteristics of buildings, such differences show the evolution of building technologies and methods of construction used on site, hinting at increasing specialisation of work and of the workforce.

Keywords: architectures, mudbrick, neolithic

Presentation Preference - Poster

For the most part the researchers the house is the main important social, ideological and economic unit of the society in Copper Age in S-E Europe. The materials used to built, the form, the inner space structuring, were seen like being representative of...
for different archaeological cultures. The moment of building, the utilization and the abandonment are the most important markers of the final chapters of a building's life time.

The excavations from Hîrova and Borduani, both tells in S-E Romania, provided important information concerning the Copper Age lifestyle, more precisely the history of the Gumelnita housing.

The most frequent construction technique though consists of a trench in the bottom of which are driven a number of wooden stakes, fairly close together, supporting a lattice of branches to receive the clay. The walls and the floors are plastered with layers of different clay preparation. Usually having two rooms, each has its own rectangular oven. During their lifetime the houses have often been repaired and sometimes, modified. Disposed in rows, the buildings are separated by passageways.

Generally, the final period of their evolution started with the moment when the dwelling ceased to be used by its inhabitants on that purpose. The archaeological information demonstrates that the end of their evolution is not the same for all dwellings. Some of them were abandoned and decayed in time, others were intentionally destroyed and others were intentionally fired. The diversity of all these situations can be interpreted like the result of different causes, and suggest a more complex spiritual life of the communities of the Gumelnita culture in Vth mil. BC.
Archaeological practice reveals a remarkable diversity of approaches to the management of archaeological heritage. Starting with increasingly complex methods of field research and survey, management approaches use laboratory-based analytical approaches and integrate interpretative models. These define the nature of archaeological sites, the natural decay and human processes that influence their survival, the evidence used for reconstruction and for methods of interpretation and display. From single case studies to more general, developed concepts of heritage management, an increasing spectrum of meanings and values engage and inform academic, managerial and social concerns. Financial restrictions and archaeological project limitations create new challenges for all, sometimes frustrating the development of archaeological heritage management practice. Archaeological agency is now faced with old and new constraints together with requirements and pressure to ‘perform’. This suggests an increasing and important role for the profession in cultural heritage management.

The theme invites discussion on issues regarding heritage management: defining cultural value, conservation methods, rationale for restoration, risk management, illicit trade, preventive and rescue archaeology, museum presentation and virtual museums. There is room for discussion on issues related to cultural-heritage regulation, management approaches, legislative and institutional aspects, interpretation, presentation and tourism development, etc.
Managing the archaeological heritage

Integrated Cultural Landscape Planning at Ancient Corinth, Greece

While crimes against heritage are no new thing, the focus within academic debate and policy development has taken something of a centre stage recently. The concept of ‘heritage crime’, or ‘cultural heritage crime’ has come to the fore in literature that draws on input from archaeologists, museologists cultural heritage managers, criminologists, law and policing specialists and others (e.g. Korsell et al 2006, Grove and Thomas 2014). Furthermore, national heritage agencies such as Historic England have prioritised ‘heritage crime’ prevention and prosecution of offenders. This is encouraging on the one hand, since it serves to raise awareness of the impact of crimes that affect cultural heritage both with the wider public and – importantly – with decision-makers.

On the other hand, it is clear that the term is still very broad in its definitions, and used in a variety of contexts with which not all observers agree – sometimes revealing quite varied ethical and ontological standpoints. The risk of conflating ‘heritage crime’ with a relatively narrow range of activities, such as the looting of archaeological sites, whilst ignoring other crimes that may also usefully be referred to as ‘heritage crime’ also continues to be an issue.

In this session we invite contributors from different jurisdictions and different disciplines to debate the definition(s) of heritage crime, document how the concept has been developed and applied in different contexts, and ultimately approach this area of research and policy in a way that neither compromises the safety and integrity of cultural heritage nor purports to define what kinds of cultural heritage matter to different communities.

Who commits ‘heritage crimes’?

Archaeology, the law, and civil rights in Austria

Archaeologists frequently accuse others (that is, non-professionals) of committing ‘heritage crimes’. But is it a ‘heritage crime’ if no law is broken? Is it not a ‘heritage crime’ if a heritage law is broken by professional archaeologists? And would it be a ‘heritage crime’ if, say, a heritage agency were to excessively apply a heritage legislation to prevent entirely legal activities, and thus unconstitutionally restrict fundamental civil liberties? This paper examines who actually commits ‘heritage crimes’; and whether it is truly those who archaeologists normally suspect, or whether the worst serial offenders are to be found much closer to home.

Heritage Crime, Heritage Protection, Interdisciplinarity

Who commits ‘heritage crimes’?
states, cities, and...neighborhoods” (Ludwig and Kling, 2007, p. 49). The aim of our essay is to explore the concept of "heritage crime" in Italy, a country that, despite several international conventions and its national jurisdiction, continues to suffer from looting and destruction of archaeological sites. In addition, this situation is exacerbated by the presence of organized crime (like Mafia and Camorra), in particular in Southern Italy regions, where are located a large number of UNESCO’s world heritage sites. So, considered this peculiar situation, the Italian law "archeo-mafia" has been created in order to explain the connection between heritage crime and organized crime networks. Using new evidence and focusing on recent events that took place in the city of Vibo Valentia (Calabria), where an entire archaeological area with Roman temples has been recently looted, we present, relying on criminological and archeological backgrounds, the paradoxical Italian situation; in spite of the extension and the importance of its extraordinary cultural heritage - Italy counts 50 UNESCO World Heritage Sites the most of any country on the World Heritage List- the legislative instruments are still unsuitable because they are distant from the correct interpretation of the entire problem and so related with an anachronistic vision. Specifically, there isn’t in fact a specific type of offense about crimes against the cultural heritage, while at least 16 typology of criminal enterprises are recognized in the Italian legislation. Finally, we discuss the problems arising from this lack in the law related with the difficulty of punishment the culprits.

TH2-02 Abstract 03
Good Intentions and Bad Practice; conflicting values in heritage protection
Author - Campbell, Stuart, National Museums Scotland, Edinburgh, United Kingdom (Presenting author)
Keywords: Heritage Crime, Heritage Management, Portable Antiques
Presentation Preference - Oral
The concept of heritage crime is often summed up by the image of the experienced and professional looter, motivated by financial gain and with some level of technical knowledge. While this model may apply to high profile cases of looting this paper will concentrate on less obvious sources of harm to the historic environment, in particular that grey area where bad practice or carelessness on the part of an individual can cross the line into criminal behaviour. This paper will focus on cultural attitudes, or different cultural perceptions of harm and importance which can lead to damage being downplayed or not seen as serious on the part of the perpetrator. This paper draws on experience of working directly with members of the public who find objects, not least metal detector users, and will draw on experiences which are often not discussed or considered at policy level. This paper will explore the assumed role of the market in driving legally based looting, arguing instead that much behaviour is driven by ‘single actors’, the finder or looter also being a collector, and the desire being to keep rather than to sell an object. Individuals motivations include a complex mix of culture and preconceptions which might mean a site is damaged or an object not reported, often by individuals who act with good intentions. The cultural considerations which make an individual consider the law of little importance (while not considering themselves a criminal) will also be discussed. Running through all these issues are divergent and competing perspectives of why the past is important, and how legislation that seeks to protect the past may be perceived by third parties in a wholly different light.

TH2-02 Abstract 04
Museum Security: How big a threat is crime?
Author - Dr. Thomas, Szuja, University of Helsinki, Helsinki, Finland (Presenting author)
Co-author(s) - Grove, Louise, Loughborough University, Loughborough, United Kingdom
Keywords: Europe, Heritage crime, Museum security
Presentation Preference - Oral
Museums are an integral part of the cultural life of societies. Many house archaeological material, functioning as repositories for the archaeological record, as well as sites of public education and dissemination. In addition to their intangible value, many collections may also have considerable financial value, and pose a temptation to thieves. In recent years, high profile art thefts from museums, embellished by museum staff, and even, regretably, acts of terror, have drawn attention to the vulnerability of museum institutions as sites of crime and catastrophe. Museum security professionals are seriously challenged to respond to such potential threats, often working with less than ideal resources and budgets. There is a also a developing scholarly literature around the heritage crime in the context of museums (e.g. Benson and Fouc'h 2014, Hardy 2015, Grove and Thomas 2016). Yet threats from crime - perhaps the most visible in terms of media attention - are only a category of security issue that museum professionals must be aware of. Personal security, safety threats from accidental damage, risk of fire or natural disaster, digital security, and often specific conservation requirements (for example for many archaeological specimens and samples) are all pertinent to museum security. Furthermore, ethical considerations such as the ICOM Code of Ethics guidelines on discussing security issues potentially pose a barrier to researchers trying to understand and analyse museum security. In this paper I present the results from a study of a sample of museums in Finland and England, describing our research methods, key findings, and theoretical context. I position crime and crime prevention within the context of the larger spectrum of museum security considerations. I conclude by looking forward, and identifying future research avenues that would strengthen our understanding of museum security issues.

TH2-02 Abstract 05
The fight against archaeological looting in Spain. One research and development project
Author - Professor Yáñez, Ana, Universidad Complutense de Madrid, Madrid, Spain (Presenting author)
Co-author(s) - Rodriguez Temiño, Ignacio, Conjunto Arqueológico de Carmona, Carmona, Spain
Keywords: Archaeological looting, Punitive power
Presentation Preference - Oral
In 2014, a group of archaeologists and lawyers began to work together in a research and development project, funded by the Spanish Ministry of Economy and Competitiveness. This research project was primarily aimed at improving the basis for an effective legal response against archaeological plundering. Archaeological looting represents a serious threat to the survival of fragile and vulnerable special heritage. This threat is deployed both in sites on land and underwater wrecks. In Western societies, this iniquitous property loss creates social alarm because of the common interest in this property. Therefore, public authorities are constitutionally obliged to prevent it, or at least, to try to do so.

However, in Spain the response provided by the State and the Autonomous Communities in the fighting against archaeological looting seems to lack the sense of unity required. The inadequacy of many legal instruments, such as the Spanish Historical Heritage Act, other cultural legislation, and the Penal Code is very well known, as there are claims to reform this legislation. However, to achieve this and to improve the State’s response to this issue, the analysis of new data on real archaeological looting is required.

Archaeological looting, as with any other illegal activity, is difficult to quantify precisely. Therefore, in order to improve the State’s response to it, the Project that we presented seeks to collect, sort and analyze data that should be of use to the State authorities. The level of importance of this data is not: the filing of complaints about archaeological spoils. At present, in Spain there is a tragic ignorance about what happens to these complaints in each region, how many are concluded, how many are not, and what the causes of each complaint are. From the collection and analysis of this data, the Project proposes improvement measures.

The project’s main objectives are:
A) To improve the response to archaeological looting, both on land and underwater, through the adoption of minimum standards by the agencies involved in the fighting against this wide spread social problem, made as a result of the research project.
B) To make public a structured body of data from different geographical areas referring to the handling of complaints about archaeological looting from what, for the moment, are only available in administrative, judicial, police files that are difficult to access.
C) To provide tools to facilitate the fight against underwater and land archaeological looting, such as training the staff involved (members of the Security Forces of the State, judges, officials, managers, etc.) and social awareness. Improving the public response to archaeological looting involves ensuring access to these goods for future generations.

In this communication the most important research results conducted in recent years will be presented.

TH2-02 Abstract 06
Greater awareness as prevention measure against illegal turnover of archaeological artifacts
Author - Kairis, Latvian Academy of Culture, Riga, Latvia (Presenting author)
Keywords: archaeological artifacts at risk, crimes against cultural heritage, looting of archaeological sites
Presentation Preference - Oral
Although Latvian official criminal statistics does not contain data on illegal obtains of archaeological artifacts, significant amount of illegal excavations (especially in the ancient burial places) and publicly available information regarding Internet trade of protected artifacts implies that national archaeological heritage is endangered. According to data provided by State Inspection for Heritage Protection every year about 20-25 criminal proceedings are started regarding looting of archaeological sites.
Different methods are being used in order to prevent and combat illegal obtainment and trade of archaeological artifacts – from explaining the significance of cultural heritage until improvement of legislative acts and introducing more severe punishment for correspondent offences. Proper implementation of any method could lead to positive results, however it is usually hard to find relatively efficient and at the same time speedy solution.

One of practical solutions of the problem has to do with enhancing awareness regarding protected archaeological artifacts and related issues because it would not be correct to assume that legislative acts already contain all the information needed for different audiences (e.g. buyers and traders of artifacts, persons who are interested in history, law enforcement officers etc.). Thus in December 2015 several cultural, law enforcement institutions and other institutions controlling turnover of cultural objects, under the guidance of Latvian Academy of Culture, started the development of “Digital catalog of Latvian archaeological artifacts at risk”.

The “Digital catalog of Latvian archaeological artifacts at risk” contains graphic and textual information regarding the most endangered national archaeological artifacts, as well as other information deemed to be useful for different audiences which could come into contact with archaeological artifacts.

The presentation will give insight into aspects of illegal obtainment of Latvian archaeological artifacts, characterize the “Digital catalog of Latvian archaeological artifacts at risk” and opportunities of its usage.

**TELLING STORIES: ARCHAEOLOGICAL MUSEUMS, HERITAGE AND RESEARCH CENTRES: ACHIEVEMENTS AND FUTURE PROSPECTS**

Saturday, 3 September 2016, 14:00-18:30
Faculty of Philosophy, Room 107

**Author** - Hall, Mark, Western Isles Council, Scotland, United Kingdom
**Co-author(s)** - Lins, Jette, Mosegaard Museum, Denmark
**Keywords**: heritage, interpretation, museum

**Presentation Preference** - Regular session

Recent years have seen a swathe of new museums and heritage centres opening and exploring aspects of Europe’s past through a rich diversity of both sites and finds. These include, most recently, the Mosegaard Museum, Aarhus, Denmark and before that, for example, the LWL Museum for Archaeology, Herne, Germany; ARCHÉA, Archeologie en Pays de France, nr. Paris; Lödöse Museum, Sweden (now 50 years old); South Tyrol Museum of Archaeology, Bolzano, Italy; the Museum of Innocence, Istanbul, Turkey; Creswell Crags Museum & Visitor Centre, Nottinghamshire, UK and the Shetland Museum, Lerwick, UK. For this session we want to encourage a Europe-wide response that will bring together a cross-section of these projects, both opened and closed and those still at the planning stage, to facilitate a sharing of success and failures. We also want to consider how the future might look for this critical practice that creates a space where science, curation and citizen engagement interact. We want to explore scale, diversity, purpose, financing, community engagement, local vs. tourism and archaeological value through a combination of papers, some of them case studies and some of them thematic.

**TH2-03 Abstract 01**

**ICOMOS’ Charter on Interpretation of Cultural Heritage Sites: The Global Strategic Approach**

**Author** - Hodges, Sue, ICOMOS ICIP, Port Melbourne, Australia (Presenting author)
**Co-author** - Deufel, Bonnyrigg, United Kingdom
**Keywords**: Cultural Heritage, ICOMOS ICIP, Interpretation

**Presentation Preference** - Oral

ICOMOS’ Scientific Committee on Interpretation and Presentation of Cultural Heritage Sites (ICIP) is responsible for the review and promotion of the ICOMOS charter of the same name, adopted by the General Assembly of ICOMOS in 2008. Interpretation is defined as all activities intended to heighten public awareness and enhance understanding of cultural heritage sites, including publications, online content, and on-site installations such as panels and immersive multi-media experiences. As such, interpretation plays a key role in facilitating people’s engagement with heritage and telling diverse heritage stories in an attractive, informative manner. However, public and private decision-makers around the globe have varying degrees of awareness of interpretation as professional heritage practice, and there are varying professional standards in different countries too. The aim of ICIP is therefore to define and promote the basic objectives and principles of interpretation and to be a global advocate for professional interpretation of cultural heritage sites.

At the end of 2015, having appointed a new board of officers, ICIP began a strategic review of the Charter and the committee’s main activities. This session will discuss the charter in the context of this review and wider developments within the fields of interpretation and heritage more broadly. In particular, the session will contextualise the principles and objectives of the charter for interpretation, and consider recent challenges to what has been described as a Western approach to heritage management and their implications for the Charter and the discipline of interpretation.

The session will outline the strategic priorities established by ICIP for the next three years on the basis of the review, and introduce participants to the activities that have been planned in response. A specific consideration of the session will be the global application of interpretive principles to meet local requirements. The purpose of the session is to familiarise participants with the ICOMOS Charter for the Interpretation and Presentation of Cultural Heritage Sites and the discourse of interpretation, and to highlight where ICIP’s work may link in with participants’ own professional practice and organisations.
Local and Global Educational Enrichment from Corinth Excavations and museums.

Medieval culture with future generations. In the meantime, it is a project that is changing the role of archaeological excavations is something new, innovative, and unparalleled for an excavation in Greece. But the successes have shown the power of objects: Greek, Roman and Medieval culture. There have been successes and failures in the process of creating educational outreach as it new and exciting results with the general public; and to inspire outside audiences to continue to learn about the legacy of Ancient

achievements of the Roman Empire, pottery designs and styles of the Byzantine Empire, the development of Christianity, covered include water management, healing practices, mysterious rituals, analyzing evidence from the Classical period, cultural

however, suggestions for educators are provided in the lessons for adaptations for younger or older learners.

Over the last 120 years, research at Corinth Excavations in Ancient Corinth, Greece, conducted by the American School of

Classical Studies at Athens (ASCSA), has produced a wealth of academic publications. Part of the mission of the ASCSA, however, in addition to producing research, is to disseminate the results to wider audiences. Just nine years ago, Corinth Excavations began facilitating occasional educational programs in the museum and on the site of Ancient Corinth for Greek schoolchildren and teachers on a variety of subjects. For example, a program held at the Asklepieion included a dramatic interpretation of Epidaurian healing inscriptions.

Corinth Excavations now has a dedicated staff member for educational outreach thanks to the generous support of the

Steinmetz Family Foundation Fellowship; the Museum Fellow is creating enriching lesson plans for Greek and American curricula. In this way, Corinth Excavations can reach learners locally and globally to tell stories about the past. The lesson plans are designed to fit American learning standards for the sixth grade, when students spend one year learning about the entire Eastern Hemisphere; however, suggestions for educators are provided in the lessons for adaptations for younger or older learners.

The lesson plans are based on objects from Corinth Excavations representing periods from antiquity to the present. Themes include water management, healing practices, mysterious rituals, analyzing evidence from the Classical period, cultural achievements of the Roman Empire, pottery designs and styles of the Byzantine Empire, the development of Christianity, interpreting Frankish skeletal material, and taking a digital field trip.

The purpose of the outreach effort is twofold: to create communication between archaeologists and historians who produce new and exciting results with the general public; and to inspire outside audiences to continue to learn about the legacy of Ancient Greece, Roman and Medieval culture. There have been successes and failures in the process of creating educational outreach as it is something new, innovative, and unparalleled for an excavation in Greece. But the successes have shown the power of objects: they tell stories, they inspire curiosity, and they extend learning beyond the classroom and into museum and archaeological site.

Corinth Excavations is offering educators something they literally cannot get anywhere else: access to hundreds of thousands of images, videos, notebooks, drawings, plans, maps, artifacts, publications – that tell the story of our collective past.

In order to highlight over a century of research, the uniting message of our educational enrichment efforts is that Corinth was and continues to be a crossroads of cultural, religious, and economic activities for thousands of years. Outreach in Ancient Corinth aims to communicate these interactions among peoples through time and share the legacy of Ancient Greek, Roman and Medieval culture with future generations. In the mean time, it is a project that is changing the role of archaeological excavations and museums.

On the south bank of the River Clyde stands the church of St Constantine, a place of worship for approximately 1500 years. It is the oldest church in Glasgow and one of the oldest in Scotland. In archaeological terms it is most remarkable for a large collection of sculpture, dating from the 10th and 11th centuries, when Govan was the seat of the kings of Strathclyde. Subsequently during the Industrial era, Govan became famous for ship building and at the end of the 19th century was the leading centre for marine engineering in the world. Although Govan has enjoyed two periods of greatness, for nearly a century it has experienced a prolonged economic decline and accompanying social disintegration.

Perhaps the clearest sign of social decay has been the collapse in church attendance and associated social activities. Formerly the church provided a community focus that extended far beyond the Sunday service. As a consequence of this decline Govan Old Church is no longer the main parish church and has recently been taken over by a charitable trust. The aim of the trust is to use the historical and archaeological assets of the church as a tool to promote urban regeneration. This paper will discuss the steps already taken to utilise Govan's historical resources (http://www.thegovanstones.org.uk/) and the plans for building a cultural centre which will provide a new social hub for the community. Special emphasis will be placed on the constructive role of archaeology in stimulating community interest and responding to government agendas of sustainability and economic growth.

The purpose of the outreach effort is twofold: to create communication between archaeologists and historians who produce new and exciting results with the general public; and to inspire outside audiences to continue to learn about the legacy of Ancient Greece, Roman and Medieval culture. There have been successes and failures in the process of creating educational outreach as it is something new, innovative, and unparalleled for an excavation in Greece. But the successes have shown the power of objects: they tell stories, they inspire curiosity, and they extend learning beyond the classroom and into museum and archaeological site. Corinth Excavations is offering educators something they literally cannot get anywhere else: access to hundreds of thousands of images, videos, notebooks, drawings, plans, maps, artifacts, publications – that tell the story of our collective past.

In order to highlight over a century of research, the uniting message of our educational enrichment efforts is that Corinth was and continues to be a crossroads of cultural, religious, and economic activities for thousands of years. Outreach in Ancient Corinth aims to communicate these interactions among peoples through time and share the legacy of Ancient Greek, Roman and Medieval culture with future generations. In the mean time, it is a project that is changing the role of archaeological excavations and museums.
TH2-03 Abstract 08
Open up again: a local museum by the lake and the strategies to connect it back to its community

Author - Dr. Cella, Elisa, Museo Civico Etrusco Romano di Trevignano Romano, Trevignano Romano, Italy (Presenting author)
Keywords: Community, Diversity, Local Museum
Presentation Preference - Oral

More than others, local museums are deeply connected both to their territories and their communities: their role in education and the high potential in reflecting and influencing cultural practices is a well known issue, offering guidelines for any strategy aiming at turning any museum into an example or a good practice. It has been recently said that Museums should be “involved not simply in presenting or preserving but opening up a space for dialogue – about art, about culture, about humanity” (T. Golden 2016); in other words, the challenge seems to be one related to the creation of a new asset, mainly based on the social and educational role of these institutions.

For those archaeological Italian museums traditionally created and intended as defences of their collections, the need of a Copernican revolution, the shift from a point of view mainly focused on the multiple ways of fruition, rather than those of mere protection, seems to be the only successful guideline today. If, on one hand, this seems to be the main issue of recent Cultural Heritage, on the other hand the pattern seems to less consistent at a regional and local level, where different political, economic and cultural strategies create a multifaceted and changeable reality. Is it possible to turn this element of weakness into a strength, considering differences as the chance for plural narratives?

The management of the Etruscan and Roman Museum of Trevignano Romano, located by the touristic shore of the Bracciano lake, North of Rome, recently changed its strategic assets in the name of diversity and inclusion. That is challenge for a local museum that just a few years ago has been defined as a “silent” institution, not in contact with its people and its territory. It is positive and recent evidence, turning it into one of the voices of its community, and at the same time into a bridge, the trigger for a wider inclusive and equal process to access the local archaeological heritage? Trevignano Romano has 10% of its population made of Eastern European citizens, and is the birthplace of the Abbot Tommaso Silvestri, the founder in the late 18th century of the first Italian school for the deaf: inclusion and accessibility seem to be the natural keywords of its mission. The paper aims at presenting and analysing the needs, the goals, the risks, the achievements and the failures of the renovation project of a local museum with the ambition of playing an active role at both social and identifier level, intending the process of audience engagement not just as a mere economic tool.

TH2-03 Abstract 09
Curing the Vilnius Museum of Antiquities

Author - PhD Vigli, Maria, Tei of Western Greece, Athens, Greece (Presenting author)
Keywords: Cultural Identity, Cultural Policy, Etruscan Pottery
Presentation Preference - Oral

In this presentation, we seek to historicize the curing of the Vilnius Museum of Antiquities (today’s National Museum of Lithuania) in order to highlight the role museums played in the challenge between nationalism and imperialism in the nineteenth-century Russian Empire. Debates about display and curation were central to the rise of archaeology in that epoch, and in Russia, they were also closely associated with the fifteen archaeological congresses, meeting every three years from 1869, were the singular academic and/or professional conferences held in Tsarist Russia; the 9th was held in Vilnius in 1893.

In the 1840s, when archaeology was first beginning to blossom, beginning as more of a vocation than a science, Count Eustachy Tyszkiewicz and his brother Konstantin moved from simply collecting Italian art to excavating approximately 200 barrows around their native Logopieck, in present-day Belorussia. The Russian word for what we call “archaeology” has historically been literally as “lovers,” and this better captures the sense of this first generation of essentially noblemen who combined a passion for archaeology with similar fascination with ethnography and history. In 1842 the Tyszkiewich brothers opened three rooms in one of their palazzos into the first local Museum of Antiquities, more than a curiosity shop. It was visited by many tourists, and became a popular local loaf place in its first year. In 1856, in concert with the anticipated liberalizing policies of new Tsar Alexander II, the collection was transferred to more space in the Library of the former University, which had been closed in 1832 following the Polish rebellion. Unfortunately for them, the second Polish rebellion of 1863 prompted the closing of this Commission, thereafter designated as only intended to be “temporary” and the redistribution of much of the museum to others, primarily Moscove’s Rumiantsev Museum, a critical repository of historical artifacts.

One of the first orders of business following the rebellion was to re-curate the museum. Count M. N. Murav’ev, who would receive an honorific “Vilenščik” added to his surname in recognition of the favor with which he instigated the de-Polonization of the Northwestern Region (Lithuania and Belarus) organized a commission for the inspection of the objects on display in the Museum of Antiquities. The clash between Tyszkiewicz and the Commission, and the subsequent congress, illustrate the use of archaeological artifacts to dispute an identity during the Age of Empire.

TH2-03 Abstract 07
Future Perspectives of Greek Archaeological Museums.

The Archaeological Museum of Olympia

Author - PhD Vigli, Maria, Tei of Western Greece, Athens, Greece (Presenting author)
Keywords:Archaeological Museum of Olympia, Greece, future perspectives, museological practices
Presentation Preference - Oral

The Greek archaeological museums of the 19th century, as well as their European counterparts are related to the development of the national states, constituting one of the key institutions as places where the nation could “weave” its “history and cultivate the archetypes of its people.” Nonetheless, the archaeological museum in the last decades of the 19th and early 20th century becomes public, by giving the possibility of access to others than the managers and collectors. Thus, the current museum concept is defined as a creation of modernism as this was shaped during the Renaissance and survives until, approximately, the mid-20th century. On the other hand, along with trying to establish through collections and exhibitions an empirically documented truth, the museum seeks to elevate the past to an introduction of the present and the future. This intention is characterized by a holistic approach that will not examine the archaeological museum individually as a tool of the upper class, or an educational mechanism, a storage of precious artifacts, a space of national pride and individually, a field of developing a specific professional and scientific activity, exhibiting technique or local development lever. Instead, it will endeavor to highlight the field where all the above engage and collaborate through reciprocal support or even conflict. The future museum will be an integral part of a uniform process that starts by identifying an archaeological trail and ends in the exhibit cabinet or in storage. In this context, archaeologists should meet with a number of other specialists-all in distinctive roles-in order to promote the composite knowledge of the past. This process should be guided by professional ethics and respect. Our proposal concerns the application of such a project in one of the most important museums in the world, the Museum of Olympia, as a vehicle of sophisticated museological practices that will contribute to the creation of the future museum.
Community archaeology as empowerment for a struggling society

Author: Granh Danielson, Benjamin, Pieca kulturav, Fins, Sweden (Presenting author)
Keywords: Community archaeology, Empowerment, Heritage as heritage
Presentation Preference - Oral

In 2015 “Dagens samhälle”, a magazine for decision makers in the public sector wrote: “The trend is hopeless. 19 Swedish municipalities have shrunken every year for two decades. Twelve of them may have died out before the turn of the century. In 2010, Ljusnarsberg and Strömstad will be the first in line for the precipice, if the population continues to decline at the same rate as now.” Imagine being a citizen in Kopparberg, the small town in the municipality of Ljusnarsberg, and waking up to that announcement! Well, you probably wasn’t surprised, but still. My municipality has a sentence, a death sentence and a given date when it’s all good, by, time to pack the things and leave.

Several of the inhabitants in Kopparberg weren’t asked at all when national media called out the message. And the inhabitants in the other small municipalities in the former so mining district of Sweden is not asked for any opinion either. Meanwhile, a group of eleven artists that bought an old mine in the area thought “Hey, what about the locals, asylum seekers, art, music, heritage and the future of this place?” And suddenly, one year afterwards I was standing on an ice cold day with a director, journalist, artist, biker, a 23 year old dentist from Syria, an old man from Iraq, the local drunk, councillor and a bunch others, making an archaeological excavation of a public pinnboard, with the overall theme: excavating the future of Kopparberg...

In this presentation I will give two examples of empowering the local community using heritage. The first example above is in great contrast to the other, where local school children excavates an old cottage where the ferryman once lived. But both are examples of how heritage and archaeology can be used to revive history and let the locals be proud of their cultural heritage, weather or not they have lived there for generations or came there last week.

JASA – the road from ‘irrelevant luxury’ to ‘archaeological jewel’

Author: Balen, Jacqueline, Archaeological museum in Zagreb, Zagreb, Croatia (Presenting author)
Co-author(s) - Borca, Joze, Zagreb, Croatia
Keywords: Archaeological deontology, heritage management, public archaeology
Presentation Preference - Round table

Archaeological research most often includes the influx of experts into a new community where research is conducted, inevitably leading to new relations. In 2014 and 2015, a similar situation occurred in Croatian Baranja, where archaeologists worked on the future AD motorway, discovering new and reviving old data on the region’s cultural heritage.

The region under study has been under tremendous amounts of financial, political and social stress, especially in the last 20-30 years due to its position next to two Croatian borders and its role in the Croatian War on Independence. Deprivation of all possible sorts can, to this day, be noted in the area where jobs are sparse, where most entrepreneurs get swallowed up by larger companies and where culture is seen as an irrelevant luxury, no longer enjoyed even by the people who work to develop it.

From an archaeological point of view, Baranja is an extremely rich and valuable region. However, as with all other aspects of society, certain well-known and systematically excavated sites always cast a shadow on the smaller ones which rarely get a chance to be properly excavated and/or presented to the public.

The aim of this contribution is to show how all of this can be changed by applying the ‘where there’s a will, there’s a way’ approach in a situation where the local community never saw culture as something important and potentially lucrative, both financially and socially.

The site of Jauhov salaš (JASA) is an example of how archaeologists employed by the Archaeological museum in Zagreb helped reanimate culture-related activities in the community which, just like the team of experts, realized that this site is a jewel in the region, and that their region is an archaeological jewel in the entire country. We will focus on the many months of work conducted by about locals and about 20 archaeologists, and the impact the latter made by raising awareness on the area’s rich cultural heritage, along with financial benefits experienced by everyone included in this complex process. We will show how the archaeologists blended into the local community by supporting the local art and music scene, and by participating in public events such as bean cooking contests.

Finally, we will highlight the fact that, if experts take time to raise awareness about cultural heritage in the local community and support the existing tourist offer, cultural tourism can be reanimated, or even created, to the mutual benefit of experts in the field and local stakeholders, thereby creating conditions for presenting and promoting research to the public, as well as for presenting the local heritage to archaeologists, ultimately leading to more research and prosperity on a plethora of levels. In the case of JASA, the ongoing communication resulted in a project conducted by both archaeologists and local stakeholders - the first archaeological exhibition ever held in Beli Manastir, a conical cross-section of the knowledge procured in the excavations, and a milestone from which we can move forward into future collaboration.
amount of research being undertaken by the voluntary sector, an assessment of its research potential and benefit for inclusion into our research resources and a direction for promoting the active participation and involvement of community groups in the development of professional research resources.

TH2-04 Abstract 02
The impact of local archaeology societies in England
Author - Roberts, Hayley, Bournemouth University, Poole, United Kingdom (Presenting author)
Keywords: Amateur Archaeology, Community Archaeology, Professional Archaeology
Presentation Preference - Oral

Non-professional archaeology was an integral component in the development of the archaeological profession in England. As the profession developed it distanced itself from the amateur sector and, on occasion, the relationship became fractious. However, now both sides have matured and harmony is reining more widely, although the relationship is still complex. Local archaeology societies played, and still play, a key role in the historic mediation process, bringing these two parties back together, but what are local archaeology societies, what do they do and why do they do it? They are rarely discussed or credited in archaeological literature but in order to bring total harmony it will be crucial to understand them and the impact that they have. Local archaeology societies in England range from county societies, who produce journals and manage museums to small ‘hobby’ groups with a primary interest in excavation and from metal detector clubs to groups that focus purely on archival research. Often they use elements of professional practice but sometimes components are missing. This can have a crucial effect on their impact. Using case studies gathered from the perspective of both amateurs and professionals in the south of England, this presentation will discuss archaeological discoveries made by and the research processes used by local archaeology societies. It will also consider the impact of their communication within the profession as well as the wider public.

This will demonstrate that not only do local archaeology societies have significant impact on archaeological understanding and on the archaeological profession but that they have even greater potential. By bringing clarity of understanding about local societies, this presentation will also demonstrate that the distinction between amateur and professional archaeologists is a little blurred in ways that professional archaeologists might not expect.

TH2-04 Abstract 03
Issues of metal detecting in Finland
Author - Dr. Wessman, Anna, University of Helsinki, University of Helsinki, Finland (Presenting author)
Keywords: communication, metal detecting, public engagement
Presentation Preference - Oral

In Finland, the use of a metal detector is usually allowed without a separate permit, even though it is regulated by such laws as the Antiquities Act (1986). The Antiquities Act protects ancient monuments, including a protected area around monuments of 2 meters. According to this same Act, finds over 100 years must be delivered immediately to the National Board of Antiquities (NBA) or a Provincial Museum. The finder must also provide information regarding the location of the find. The NBA can then decide if they want to redeem the find to their collections or not.

Even though there have been reports in the media of “nighthawking” in Finland I argue that most hobbyists want to detect responsibly. However, it’s clear that the legislation is out of date. The law and regulations are also difficult to interpret, creating frustration on both sides.

At the Espoo City Museum the growing interest in archaeology and metal detecting was understood in the beginning of 2012 when a series of projects were launched in order to engage the public in learning more about cultural heritage. During 2012-2015 metal detectorists recovered a range of finds from the Iron Age and the medieval period and some of them are displayed in the Museum’s permanent exhibition. Many of these finds have a significant scientific value and have after recovery been both studied and published as professional archaeologists need to communicate better with the public and the media. A lot of media reports still focus only on the value of the finds and not on the cultural historical significance. A good example of this is a medieval gold ring found by a detectorist in Espoo in autumn 2013. After recovery it received international media coverage, resulting in a debate over redemption fees. Many finders also report their finds to the media themselves. Thus the archaeological community needs to be more involved with the media and take more responsibility.

It’s also important to note that engaging with the public needs to go both ways and that it is an ongoing process. Mutual trust is a key issue when collaborating with different groups and individuals, especially metal detectorists.

TH2-04 Abstract 04
Aspects of metal detecting in Finland
Author - Niukainen, Marianna, National Board of Antiquities, Helsinki, Finland (Presenting author)
Co-author(s) - Katunen, Jutta, National Board of Antiquities, Helsinki, Finland
Keywords: Finland, metal detecting, stray finds
Presentation Preference - Oral

Metal detecting has become a popular hobby in Finland. No permission is needed to use a detector, and there is a lot of material easily available on the Web that can lead to new archaeological findings. The amount of archaeological artefacts and sites found every year by detectorists is significant, and now also foreign “treasure hunters” have shown interest in detecting in Finland.

The presentation deals with metal detecting against the Finnish legal background, the questions of heritage management and depositing stray finds in archaeological collections as well as the challenges in communication between the authorities and detectorists.

TH2-04 Abstract 05
Stone shaft-hole axes: between professional and non-professional archeology
Author - Linievich, Siarhei, Institute of history NAS Belarus, Minsk, Belarus, Republic of (Presenting author)
Keywords: archaeological collections, museum, stone shaft-hole axes
Presentation Preference - Oral

The role of non-professional involvement in the development of archeology and the importance of public participation in the creation of the data base for archeological researches will be considered by the example of such category of archeological finds as a stone shah-hole axes. The study is based on the history of creation collections and researching of stone shah-hole axes at the territory of Belarus.

The first collections of the stone drilled artifacts in Belarus dates back to the middle of the XVI century. But they had a little connection with scientific approach and they explain the influence of the ideas of the Renaissance era to the magnate clans. The main way of replenishment of these collections was redhead or confiscation.

Another relationships with stone shaft-hole axes formed in the rural environment. Peasants have seen their pragmatic and magic sense in this category of artifacts. Since the XVIII-XXI centuries ethnographers noted the existence of different popular legends about the origin of the stone axes, described their used by peasants.

There was a surge of interest in archaeological finds in the 19th century and as a result an increase of a private archaeological collections in Belarus. It should be noted that the archeological studies were rare and sporadic. But the number of stone shah-hole axes in private collections was more than 2 thousands.

After the fall of the Russian Empire and the creation of the USSR the system of museums was founded. The main function of them was accumulation of all sorts of antiquities. The private collections became the basis of the museum collections of stone axes was. The additional source of replenishment of museum collections was the work of professional archaeologists. Simultaneous the private collections continue to exist.

After the WW2 the additional source of accumulation of archaeological artifacts became school museums. Today, the school museum sometimes has better collection of stone axes than the state than the public museums.

TH2-04 Abstract 06
Blunt instruments or intelligent solutions?
Author - Moeller, Katharina, Bangor University, Bangor, United Kingdom (Presenting author)
Co-author(s) - Karl, Raimund, Prifysgol Bangor University, Bangor, United Kingdom
Keywords: heritage laws, metal detecting
Presentation Preference - Oral

Compared to the UK the heritage laws in Germany and Austria are much more restrictive when it comes to metal detecting. But are these stricter laws really an effective deterrent? If so, the number of metal detectorists should be higher in the UK than it is in Austria and Germany. However, due to the stricter laws, the actual number of metal detectorists in the latter two countries is unknown.

To compare numbers of metal detectorists in the countries mentioned above, this case study looks at metal detecting online fora, especially their membership numbers. These indicate that there are more metal detectorists in Germany than there are in the UK. This suggests that laws alone do not prevent people from looking for archaeological material. Laws do, however, influence other patterns of behaviour, particularly the reporting of finds to the authorities by their finders. Stricter laws do not seem to deter metal detecting, they deter finds reporting.
Managing the archaeological heritage

Sight from the East Europe

There are a lot of communities and events, which present their information and materials in the Internet. Thanks to them non-archaeologists, users, could learn a lot about archaeology. The Directive is an important EU-wide legal instrument, that prompts comparison of approaches in methods and practice. The manner of its implementation in the different EU member states reflects a key issue for the EAA. How to achieve the common societal goal of archaeological heritage protection and management against a background of widely varying local situations, approaches and pressures. The Directive therefore has potential implications for the archaeological profession that extend beyond the body of individual development projects that require EIA. The Round Table will aim to establish the future scope and work programme to examine specific EIA issues, with a view to setting up an EAA Working Party (see TEA 46). At this stage, the following activities are proposed: To review the Directive in relation to archaeology and cultural heritage, and to make recommendations on how the Directive itself, its implementation, or both could be improved; to identify whether the Directive would benefit from future amendment to reflect the provisions of the Faro Convention; to see how far EIA regulations can be used to improve the integration of the needs of spatial planning and heritage research; to contact other heritage organisations and projects to discuss possible collaboration on this issue; to establish a network of EAA members to report on the application of EIA to spatial planning and heritage protection in their countries.

The road to a working party is paved with good intentions

The road to a working party is paved with good intentions. More importantly, the introduction should provide a structure for discussion and debate within the Round Table. It is hoped that the session will lead to a general consensus on a work programme that we can submit to the EAA Board for approval.

The EIA Directive and Archaeology: the example of England

The EIA Directive on ‘Environmental Impact Assessment’ is a Europe-wide instrument, but it is given effect through the legal systems of individual member states. Implementation ‘on the ground’ is then affected by the organisational arrangements and professional approaches in each country. This paper will examine how the EIA Directive has been ‘transposed’ into English law, and how it is implemented in practice in England, and how this has affected the professional practice of archaeology there. The paper will also consider whether there is scope for future improvements of the Directive itself, or of the ways in which it is implemented.

It is hoped that this paper, focusing on one country, will stimulate discussion of how the Directive is being implemented across Europe, and of what improvements might be sought in the future.
In values-based approaches to heritage management, some form of assessment of significance of the heritage asset, and of the impact on that significance of any proposals for development or change is essential. If it is not understood why something is important, it is not possible to judge what will harm it or enhance it, and to take appropriate decisions to protect heritage or mitigate damage. Environmental Impact Assessment (EIA) is one methodology for doing this and one that is mandatory for some types of development within the EU. Its scope includes heritage alongside other environmental aspects and many other things. The extent to which this works for heritage in various parts of Europe is sometimes debated and there are concerns that inclusion of heritage within a wider assessment system does not do it any favours. It has been argued that, in the EIA system, the overall heritage significance is often subject to a process of disaggregation, for example into archaeology, protected buildings and landscape, and that impact on it is not assessed holistically. EIA is also applied very selectively and many smaller development proposals will not require formal evaluation.

Alongside EIA, therefore, the practice of Heritage Impact Assessment has developed with its own published guidance. It is now recommended for all developments affecting World Heritage properties and HAIs are frequently requested by the UNESCO World Heritage Committee. At the other end of the scale, national systems (for example in the English National Planning Policy Framework (NPPF) and Planning Practice Guidance (PPG)) often now ask for assessments of impact on heritage for many cases which will never require EIA. They can recommend use of existing HA guidelines or request simpler heritage statements.

The de facto existence of two parallel systems which can apply to the same site can be counterproductive to good decision-taking as well as wasteful of resources. There is currently considerable research interest in Europe on the use and effectiveness of HA. One clear avenue for research is the interaction between HA and EIA and at how lessons from HIA might improve the effectiveness of EIA in assessing and giving due weight to impacts on the heritage. Any proposal to improve treatment of archaeology in EIA needs also to look more widely at developing a more holistic approach to heritage as a whole. Working with existing initiatives on HIA could be a fruitful way to proceed.

Since year 2000 the management of the archaeological heritage in Romania had to face a new and challenging reality: the large-scale rescue/preventive archaeological excavations occasioned by the construction of the motorway networks developed along the Pan-European corridors. The National History Museum of Romania was involved since the beginning in coordinating a series of major archaeological projects developed in such situations. The presentation will briefly address a series of key aspects related to the round table’s topic, namely an overview of the most important archaeological projects undertaken in connection with motorway construction projects, the operational framework for preventive archaeology in such cases according to the national legislation and the correlation with the EU regulations, as well as a series of necessary improvements still required for drafting and implementing a valid archaeological management strategy in order to mitigate the impact on the archaeological heritage in the context of road infrastructure projects.

TH2-06 Abstract 03
Environmental Impact Assessment and Heritage Impact Assessment: improving the relationship

Author - Dr. Young, Christopher, Christopher Young Heritage Consultancy, Bicester, United Kingdom (Presenting author)
Keywords: cooperation, Environmental Impact Assessment, Heritage Impact Assessment

Presentation Preference - Oral

Through a discussion of projects subject to the Environmental Impact Directive as well as projects undertaken within the context of a DCO application or Hybrid Bill, this paper intends to explore the influence of EIA requirements on spatial planning and cultural heritage in England and how they shape our understanding of the English archaeological record.
TH2-07

25 YEARS LATER: CHANGES AND CONJUNCTURES IN PREVENTIVE (DEVELOPMENT LED) ARCHAEOLOGY IN FORMER ‘EASTERN’ EUROPE

Thursday, 1 September 2016, 14:00-18:30
Faculty of Philology, Room SP2

Author - Novaković, Predrag, University of Ljubljana, Faculty of Arts, Ljubljana, Slovenia (Presenting author)
Co-author(s) - Dr. Milan, VIA MAGNA Ltd., Vrbovský, Slovakia

Presentation Preference - Regular session

Due to the previously uncompetitive economies and outdated technological infrastructure, a great deal of former 'eastern' countries still remained largely undeveloped. Compared to the average of the EU 15 in 1990 and 2014, only a few CE countries improved their GDPs from 40% to 80%, while others (Balkan countries, countries which stemmed from the former USSR) did not reduce the relative distance at all, their GDP on average remained less than 15%. This should not be ignored when reflecting on the preventive archaeology in the countries in question. Prior to 1990s all heritage services were the domain of public/state institutions and the overall disciplinary structure and practice was greatly dominated by the academic institutions with institutes at national academies at the top (the Soviet-based model). In most cases this structure has survived until the present day, and is still exercising influence (formal and informal) on preventive archaeology. One of the consequences is the view that preventive archaeology to a certain degree still needs to serve academic agendas (and institutes). On the other hand, in some countries, though they kept to the Soviet-based model of national institutes, preventive archaeology achieved a much greater level of autonomy, with its own priorities and new practices and forms of organization, and some countries made even more radical changes. While, in general, all former 'eastern' countries ratified the La Valletta convention, the status and practice of preventive archaeology varies so greatly that it can hardly be observed through a single theoretical framework. The session is aimed at exploring reflecting the conceptual trajectories and practices developed in preventive archaeology the last 25 years. Papers presenting major changes in legislation, economic status of preventive archaeology, changes in its social role, labour markets, level of technology and expertise, and about the profession of archaeology in general, are invited.

TH2-07 Abstract 01
Introduction. From rescue to preventive archaeology: 25 years of difficult journeys

Author - Prof. Novaković, Predrag, University of Ljubljana, Faculty of Arts, Ljubljana, Slovenia (Presenting author)
Co-author(s) - Dr. Milan, VIA MAGNA Ltd., Vrbovský, Slovakia

Keywords: Eastern Europe, preventive archaeology, rescue archaeology
Presentation Preference – Oral

Until 1990s and the abolishment of socialist/communist regimes in ‘eastern’ European countries, archaeological service (institutions and practice) in protection of cultural heritage was fully in the hands of state bodies which had to plan funds in their state budgets for operational, other duties. These funds were normally coming from taxes, and then redistributed. The principle privy-tenant was rare, only occasionally used, and normally not aimed at complete cover of the costs of archaeological protection. There were no clear and stable state preventive strategies since the role of archaeological protection service was mostly seen as ‘reaction’ on newly discovered heritage, and not in the initial phases of spatial planning and development. The reasons for this were many, and not only associated with the fact that the ruling socialist regimes were highly centralized and bureaucratized. There were also reasons in prevailing cultural attitudes – culture or tradition of state ruling itself and cultural attitude towards the past and heritage. The latter was subject to public control and planning (not only in ideological terms but in terms of pronounced atavism as well), while the latter saw culture and heritage as special value of state (and public) which could not be let autonomous in its development. Political and economic changes after 1989 had very different consequences in different countries in the field of preventive archaeology, and even the countries which shared similar or even equal systems of organization and practice of heritage protection (e.g. in former Yugoslavia or in the USSR) soon developed quite different systems which ranged from very ‘liberal’ to very ‘conservative’. In this respect it is interesting to note that it was ‘liberal’ systems of heritage protection which adopted more concepts of preventive archaeology and coupled them with the emergence of private market of archaeological services, while countries with ‘conservative’ systems openly (or in disguised form) expressed opposition to preventive strategies. The two conjunctures – ‘liberal’ and preventive attitude associated with heritage and development of private market of heritage services – are not necessarily directly correlated (e.g. case of preventive archaeology in France), but this correlation seems higher in the case of former ‘eastern’ countries. However, looking at different experiences in the last two decades, another set of questions should be posed here – who, in what status, and to which degree, participates in the market of preventive archaeology as private entrepreneur? Do we speak of real entrepreneurs or ‘disguised’ public institutions? Is ‘open’ participation of public actors (e.g. model of NRAP in France) securing better control? And, what are, in the end of the day, the benefits for heritage, and benefits for actors, and public?

TH2-07 Abstract 02
Archaeology management in the heart of Europe. Legislation and institutional basis in Slovakia

Author - Dr. Michalík, Tomas, Cultural Heritage Consulting Ltd. / Slovak Association of Archaeologists, Trinciín, Slovakia (Presenting author)
Keywords: archaeological heritage, law, Slovakia
Presentation Preference – Oral

There is no doubt that Slovak republic belongs to examples of dynamic legal, economic and social changes since the Velvet Revolution in 1989, which were reflected also in the archaeology and archaeological heritage management. Formerly fully governed, managed and covered by the state, this field became much more heterogeneous during last decades. Although necessary changes were needed and therefore expected, their quickness caused a lot of important consequences. From the point of view of legislation, all important laws were adopted after 2000, although there were previous laws, of course. First of all, adopting of new Monuments and Historic Sites Act N. 49/2002 Coll. is definitely the most relevant change. Under this act, major responsibility for the archaeology was transferred from Archaeological Institute of Slovak Academy of Sciences (which is in fact scientific body, without decisive competences) to state administration. Monuments Board of the Slovak Republic was established, with its 8 regional branches, which are most relevant actors in the archaeological heritage management, due to their strong position and deep and detailed competences. Regional Monuments Boards are the first-contact institutions not only for field archaeologists, but also for landowners, developers or other persons conducting activities with a potential to influence archaeological heritage. They decide on necessity of conducting of research, its conditions and time frame as well as on offences or other illegal activities. Monitoring and supervision behind.

This hierarchy of state administration is covered by the central state body for cultural heritage – the Ministry of Culture of the Slovak Republic, which has 2 important advisory bodies: Archaeological Council (where all sectors from Slovak archaeology are represented) and Licence Commission (preparing opima for the Ministry in the field of research licenses). The Monuments and Historic Sites Act also deals with archaeological cultural monuments, protection of archaeological sites in spatial decision-making process, individual finds and other relevant archaeological issues. Legal regime of archaeological finds in museums is regulated in Museum Act N. 206/2009 Coll. Malta Convention was ratified by the president of the Slovak Republic in 2000 and published in Collection of Laws in 2001.

In order to fight against treasure hunters and their illegal activities, a lot of legislative work was done since 2011, when amendment of Penal Code with its strict ban of unauthorized use of metal detectors came into force. On the other hand, institutional support for this legislation is still not satisfactory as it’s built mainly on individuals. However, there is a number of persons who were solved by the police.

TH2-07 Abstract 03
25 years of Preventive archaeology in the Czech Republic

Author - Mgr. Kucharcík, Milan, Labry o.p.s., Praha 9, Czech Republic (Presenting author)
Co-author(s) - Sirnice, Radka, ZP o.p.s., Praha, Czech Republic
Keywords: Czech Republic; Preventive archaeology, private sector
Presentation Preference – Oral

The situation in the Czech Republic is characterized by the beginning of the economic crisis in year 2008 boom in the number and financial volume of archaeological researches and development of private companies in the archaeology. In the years 2008 - 2015 passes through the whole archaeology crisis, which is characterized by strengthening the influence of the central institutions, especially the Czech Academy of Sciences (CAS), based on Soviet-type research organizations.

Development of the private sector in archaeology is limited by inadequate and outdated legislative framework. The last law regulating the archaeology is from year 1987. This law has been amended several times. The law does not give sufficient legal framework for preventive archaeology and in practice frequently updated customary legal principles. It is to try to interpret the present framework as a system of dual authorization, which represents one step permits the Ministry of Culture and a kind of second stage authorization with the CAS. It is part of the CAS effort to actively exercise control of the territorial jurisdiction of archaeological organizations and their burden is disproportionate control ambitions. Yet completely lacking standardization of archaeological activity and standard of archaeological research.

Maltese convention is in the Czech Republic interpreted by the authorities as a binding international treaty and by archaeologists as support for strictly archaeological preservation. Typical is the small proportion of archaeologists on the
preparation of building and development projects. In the structure of private sector in the Czech archaeology we find large and small companies, nonprofit organizations exclusively. The companies are purely archaeological and also joining other professional activities (for example environmental research, building history). Irreparable is a role of private entities in improving the quality of standards, especially in the case of development-led archaeological projects (final reports). Gray zone without a clearer anchoring represent service companies without expertise stuff, which are working for public and government institutions.

After 25 years in the Czech Republic still completely absent the existence of conditions for private sector activity in archaeology. Preventive archaeology in the Czech Republic so far been rather limited.

**TH2-07 Abstract 04**

**Archaeological Heritage in Lithuania after 1990s: Defining, Protecting, Interpreting**

Author: Dr. Poškienė, Justina, Vilnius University, Faculty of History, Vilnius, Lithuania (Presenting author)

Keywords: archaeological heritage, assessment, protection

Presentation Preference: Oral

Legislative decisions facilitated notable changes in the field of cultural and archaeological heritage protection in Lithuania after 1990s. National legislation was essentially modified twice: in 1995 and in 2005. Significant changes can be observed in the field of defining (accounting, assessment and listing), protecting (regulations on excavations' procedures or "protection through documentation", preservation of archaeological remains in situ), as well as interpreting (by state bodies and public) of the archaeological heritage.

There are approx. 3000 archaeological heritage objects listed in the state Register of Cultural Property. The procedure of listing has been changed several times after 1990s. Since 2005, a heritage object is listed in the state Register of Cultural Property after an assessment council decides that a property is in the need of legal protection. The significance, the valuable properties of objects or sites of cultural heritage are assessed, and the boundaries of territories are defined by the immovable cultural heritage assessment councils as well. The specialized assessment council for archaeological heritage was established in 2012. State administrative and technical resources were concentrated mainly on preparation of new documentation type for already listed heritage objects, and thus led to a certain stagnation of inventorying of new archaeological objects. Nevertheless, data exchange between the state Register of Cultural Property and the Real Estate Register should be mentioned as an important achievement in maintaining relevant information on restrictions of land use available for archaeological heritage managers and users.

Archaeological excavations, or "protection through documentation", can be identified as the main strategy of archaeological heritage protection. Development-led archaeology became the main form of scientific enquiry. As the contract archaeology system was developed, great attention is paid for excavations' quality control procedures. Formalized requirements for archaeological excavations (where and how archaeological excavations should be conducted) became a legal norm since 2011. These requirements also demand to protect archaeological heritage constructs in situ. Formalized requirements have to adjust conditions for contract archaeologists' competition as well. Nevertheless, objectification of criteria of archaeological research is modeling a situation "of typical archaeological excavations", and thus in the professional community raises discussions concerning the scope of scientific information obtained during the archaeological research.

Interpreting of archaeological heritage can be seen as means of constructing of local and national identity by various social and cultural groups. Nevertheless, interpreting of archaeological heritage by state bodies and subsequent reorientation of management perspective from "archaeological object" towards its "user" is still needs to be developed.

**TH2-07 Abstract 06**

**Commission for archaeological research (CAR) in Slovenia**

Author - Bribnik, Danijela, Zavod za varstvo kulturne dediščine Slovenije, Celje & Maribor, Slovenia

Co-author(s) - Kaiser Cafnik, Mihaela, Zavod za varstvo kulturne dediščine Slovenije, Celje & Maribor, Slovenia

Co-author(s) - Prof. Novakovič, Predrag, University of Ljubljana, Ljubljana, Slovenia (Presenting author)

Presentation Preference - Oral

The role and significance of the Commission for archaeological research (CAR) in the system of preventive archaeology in Slovenia is still not turning in that direction, this paper will be focused on consideration of factors which can fulfill the requirements for implementation of efficient preventive archaeology, but also the ones which are currently preventing Croatian archaeology in changing attitude towards sustainable heritage management.

As Croatian archaeology is still not turning in that direction, this paper will be focused on consideration of factors which can fulfill the requirements for implementation of efficient preventive archaeology, but also the ones which are currently preventing Croatian archaeology in changing attitude towards sustainable heritage management.
It is not easy to say, where exactly Montenegrin archaeology is today. The old (‘Yugoslav’) concept in heritage protection remained in use until 2011 when Montenegro attempted for the first time to establish its own system and reform the institutional structure towards a more institutionally centralized and ‘nationalized’ organization. Unfortunately, this had a rather negative impact on the development of archaeology, especially its service in the field of preventive strategies, which were never properly reflected and attempted in archaeological circles since they were established ‘from above’. It is still common practice, that most of the large projects in spatial development (e.g. highway constructions) almost completely evade preventive archaeology, while the situation regarding the booming tourist and construction industry in the coastal areas is even more difficult than it used to be 25 years ago.

TH2-07 Abstract 09
Bosnia and Herzegovina: preventive archaeology still recovering
Author - Hadižhašanović, Jeseño, Faculty of Philosophy of University of Sarajevo, Sarajevo, Bosnia-Herzegovina (Presenting author)
Co-author(s) - Kalićan, Adnan, Faculty of Philosophy of University of Sarajevo, Sarajevo, Bosnia-Herzegovina
Keywords: Bosnia and Herzegovina, recovery, preventive archaeology, heritage protection
Presentation Preference - Oral
Organization of archaeological heritage services, museums and education in Bosnia and Herzegovina, after the end of Yugoslavia, and especially after the establishment of the post-Dayton peace agreement (1996) radically changed the situation until 25 years ago. Four major determinants can be seen today, closely connected with the general state of the country itself are: Highly fragmented territorial and administrative organization: One organization on state level, two on lower, entity, level; as well as on one level of BiH district. Entity of Federation of BH is further divided in 10 cantons, of which 5 have cantonal institutions responsible for protection of heritage, while the other 5 have these responsibilities entrusted to the cantonal ministries. Because of disharmonized laws on state, entity and cantonal levels, there are possibilities for overlap of jurisdictions during protection of certain monuments, and potential for mismanagement. Entity of Republika Srpska is divided on municipalities, and has a centralized institution responsible for heritage protection. General economic situation (BiH is among the lowest ranked countries in Europe regarding the GDP) prevents any substantial investment, employment in services in public sector (heritage services included). Most of museum institutions on local level have barely sufficient financing for basic operation. Inadequate (outdated) infrastructure: lack of trained people, equipment, unfilled institutional development. Political situation: Because of the political deadlock over financing of 7 cultural institutions on state level, National Museum of Bosnia and Herzegovina was closed for almost 3 years, and other institutions that previously enjoyed state sponsorship in former state of Yugoslavia, have lost most of funds necessary to function properly.

TH2-07 Abstract 10
Practice of Archaeological Heritage Management in the Motorway Constructing Programme in Poland
Author - Prof. Dr hab. Rospecto, Seweryn, Instytut Archeologii Uniwersytetu Łódzkiego, Łódź, Poland (Presenting author)
Keywords: Poland, rescue archaeology
Presentation Preference - Oral
One of the effects of political transformations in Poland of the last 25 years was a necessity of confrontation with huge infrastructural problems. One of them was, and still is, a poor state of motorways development. An aim of the speech is an analysis of this problem in reference to last ten years.

The above time limit is not a matter of chance. Till 2005 a system of selection of archaeological excavations on the motorway lines contractors was based on non-economic criteria – connected with scientific experience of contractors. Universities and archaeological museums were preferred. From a scientific point of view this system was effective and enabled realisation of research at a high level. Unfortunately, it also brought temptations. In 2006 a Polish nationwide archaeology corruption scandal broke out, in which both archaeologists and people responsible for granting concessions for research were accused. It was a real turning point in the history of Polish rescue archaeology. Over the next years a radical ‘marketization’ of contractor selection took place. This launched mechanisms of competition, in which service was, as a matter of fact, the only criterion of evaluation. The mentioned change admittedly ensured transparency of the procedures but it however turned out to be killing for archaeology. In this new situation archaeological research became an object of a market game. Sometimes, a victim of this game is social interest, and research are conducted at the lowest acceptable level.

TH2-07 Abstract 11
Motorways and archaeology. What does it means to be a contractual archaeologist in Romania?
Author - Dr. Simion, Mihaila, Romanian National History Museum, Bucharest, Romania (Presenting author)
Co-author(s) - Vasilescu, Florela, Vanderlay Arheo, Hunedoara, Romania
Keywords: Heritage Legislation, Preventive Archaeology, Romania Motorways
Presentation Preference - Oral
This paper aims to provide an overview of the current situation in Romania regarding infrastructure projects in front of constraints and obligations relating to heritage protection. In this moment, archaeological permits are also a source of frequent complaint among contractors in the road sector. The “in-principle agreement” granted by the Ministry of Culture consists of a simple statement that the issuer is not opposing the project, subject to all relevant archaeological research procedures being undertaken as per the legal obligations in force.

The challenges with preventive archaeological projects stem from these sources: lack of clarity in the legislation itself, capacity constraints among project promoters; and institutional incentives related to the financing of such work.

These premises and a number of other factors, have made that, in the last years, in Romania, Preventive Archaeological Research to be seen as an obstacle to the implementation of infrastructure projects and not as an extraordinary opportunity to research and capitalization of the heritage, as it would have been normal.

At the same time, these premises generated a series possible abuses or unprofessional approach from all the actors involved, with important consequences on the perception of the concept of archaeological heritage, some examples being the object of the present paper.

TH2-07 Abstract 12
Towards a new Horizon: development-led large scale excavation policy in Hungary post 1990’s
Author - Csilla, Szabolcs, Hungarian National Museum, Budapest, Hungary (Presenting author)
Co-author(s) - Kóth, Zsófia, Hungarian National Museum, Budapest, Hungary
Keywords: large-scale excavations, management, methodology
Presentation Preference - Oral
In our presentation we will give a brief review of the changing national concept of large-scale excavations in Hungary during the last 25 years. Heritage services in Hungary have traditionally organized on a partly decentralized structure, in which the 19 county museums and the Budapest Museum acted independently within their territories. Other institutes, e.g., Hungarian National Museum, universities with archaeological department and the Archaeological Institute of the Hungarian Academy of Sciences, carried out centrally funded research projects excavations.

The upswing of motorway construction and private industrial developers challenged this system and forced Hungarian archaeology to apply new approaches, develop or adopt new methodologies and management for preventive excavations. Although a uniform protocol for archaeological process was crystallized by the mid 2000s, the other relevant elements of largescale excavations’ management are still widely debated. We would like to concentrate on developments of the last half decade, during which period radical changes in legislation, in financial and in the institutional background have been taken by the Hungarian government. We attempt to summarize the experience of the consequences of these turbulent central acts and outline the present status and practices of preventive archaeology in Hungary.

TH2-07 Abstract 13
Management of rescue archaeological research performance in Slovakia
Author - Dr. Homak, Milan, VIA MAGNA s.r.o., Vrútky, Slovakia (Presenting author)
Keywords: management, preventive archaeology, Slovakia
Presentation Preference - Oral
Archaeological research has transformed during the last 25 years into a complex of legal regulations defining the course of field research. The current reality is that the biggest share of the field activity is not aimed at targeted scientific research, but at rescue archaeological researches. As a consequence, field archaeologists are becoming producers of findings reports and, in general, they have no time left to be what they studied to be - i.e. scientists. In case of positive archaeological research the subject of professional and non-professional discussions is the quality of performed research, treatment and processing of findings. It can be also assumed that rescue and advance archaeological researches will be on the wave in relation to transformation of building
activity. It is therefore necessary to prepare the archaeological community for the transformation of its activity towards targeted scientific and research activities.

Our paper will show how the Slovak professional community responded to this status.

TH2-07 Abstract 14
The settlement of Krahes: From a chance find to an archaeological protected site

Author - MA Počí, Enina, Archaeological Service Agency, Tirana, Albania
Co-author(s) - Klejdi, Zguro, Archaeological Service Agency, Tirana, Albania (Presenting author)
Co-author(s) - Tata, Ilira, Archaeological Service Agency, Tirana, Albania
Co-author(s) - Porja, Arjol, Archaeological Service Agency, Tirana, Albania
Co-author(s) - Zoto, Rudina, Archaeological Service Agency, Tirana, Albania
Co-author(s) - Gj. Luli, Archaeological Service Agency, Tirana, Albania

Keywords: Preventive archaeology
Presentation Preference - Poster

The archaeological resource management as elsewhere in Europe after the review of the European Convention for the Protection of the Archaeological Heritage (1992), has drastically changed the whole system of the archaeological heritage management in Albania. The cultural heritage law of 2003 was amended further in 2006, 2008, 2009, 2013 and is currently under full revision.

The amendments of 2008 led to the creation of the ASA and National Council of Archaeology. ASA is assigned with a highly complex task that includes both the supervision of the archaeological projects and the undertaking of rescue excavations across the country.

ASA is also responsible for any chance find, that possibly appear during agricultural, construction or engineering projects around Albania. Their appearance sometimes may only represent the beginning of a long evaluation process to be finalized with full revision.

The settlement of Krahes: is situated in the district of Tepelenë (Albania). Two graves were discovered occasionally during agricultural works by a farmer who informed the local authorities (Regional Division of National Culture, Gjirokastër) prior to the foundation of ASA, these tasks were undertaken by the Archaeological Institute of Tirana and in cooperation with the Albanian Rescue Archaeology Unit (a non-governmental organisation) and by the Rescue Archaeology Section (abolished with the establishment of ASA) affiliated with the Institute of Cultural Monuments. Since 2008, ASA have followed the procedure for 9 archaeological chance finds.

The village of Krahes is situated in the district of Tepelenë (Albania). Since 2008, ASA have followed the procedure for 9 archaeological chance finds.

Our paper will show how the Slovak professional community responded to this status.

Since 1990 major social, economic, conceptual, and technological changes greatly affected heritage sector in former ‘Eastern Europe’, and heritage labour market in particular. In this sector, previously fully dominated by public institutions, gradually emerged entrepreneurial practices. The major boost for this process and transformation of the roles came from intensive development which generated large quantities of development driven archaeological research in the framework of heritage protection and management Non-invasive archaeology, in two recent decades, greatly benefited from the development of ICT and other digital technologies. These technologies (combined with new concepts of preventive archaeology) had major impact on economy in archaeological heritage sector, providing a set of new and highly efficient tools for facing the scientific and business challenges. Moreover, not only that ICT and other digital technologies provided cost-efficient tools, they also boosted development of new kinds of archaeological research and manipulation with large data sets.

Four partners from Slovakia, Czech republic, Slovenia and Serbia (2 SMEs: VIA MAGNA s.r.o. TerraVerita, and 2 Departments of Archaeology from the universities of Ljubljana and Belgrade) joined in the project CONPRA (Industry-Academia Partnerships and Pathways: FP7-PEOPLE-2012-IAPP) with the principal aim of developing and disseminating recent concepts, methods and technologies adapted to the conditions of development driven archaeological research (3D scanning and computer modelling of architecture, sites and objects, aerial reconnaissance, manipulation with large data sets and virtualization of heritage). Until very recently, all these techniques were greatly lacking in every days practice of preventive archaeology, or there were limited to the academic research. Poster will present the results and case studies of the CONPRA project.
MANAGEMENT OF ARCHAEOLOGICAL SITES IN TURKEY: PROSPECTS AND FUTURE

Friday, 2 September 2016, 14:00-16:00
Faculty of History, Room 217

Author: Baouissake-Khan, Didier, METU/UTF Turin—Archeologia Antiqua; Ankara, Turkey
Co-author(s): Prof. Erciyas, Deniz Barut, METU/UTF Turin—Archeologia Antiqua; Ankara, Turkey

Presentation Preference: Regular session

Which sites to manage and why managing them? • How to manage an archaeological site and what to manage? • Community involvement and public archaeology in Turkey. • Participatory management • Impact assessment of archaeological projects. • Rural development • Local/regional development.

In this session it is proposed to ask participants to consider the shortcomings in the management of archaeological sites by archaeologists involved in Turkish archaeology; we hope to argue for a greater need for structured organisation and involvement in the management process. The session envisages to place a special focus on archaeologists and sites directors involved in field archaeology in Turkey; their involvement not only as stake holder on the management of archaeological site during the field seasons but also pre- and post-excavations and survey. The aim of this session would be to create awareness for the needs for site management for archaeologists in association with local authorities. It is also hoped that cross-fertilisation between archaeologists and heritage managers would lead to fruitful exchanges on the variety of processes and methods for managing archaeological sites. The session organiser hope to attract participation to the session from Turkish and international archaeologists and practitioners concretely involved in archaeological field work in Turkey. The ambition is to select the best papers to be published in a specially edited volume of CMAS Journal (Conservation and Management of Archaeological Sites).

The call for paper proposal for the session shall target work conducted at key sites such as Sagalassos, Aspendos, Nemrut Dağ and Pergamon, but shall not be limited to it. Junior and up-coming archaeologists as well as more established scholars shall be given the opportunity to confront their ideas and experiences, from a national and international perspective.

TH2-09 Abstract 01

Archaeology for Management: New Cycle of Archaeological Research at Ani

Author: Asst. Prof. Dr. Aktüre, Zeynep, Izmir Institute of Technology, Izmir, Turkey (Presenting author)
Co-author(s): Bayram, Fahriye, Pamukkale University, Denizli, Turkey

Keywords: Archeology, archaeological research, site management

Presentation Preference: Oral

Among numerous archaeological research projects in Anatolia since the nineteenth century by foreign institutions, the one at Ani is exceptional in having started under the auspices of the Russian Imperial Academy of Sciences when northeast Anatolia was under control of the Russian Empire in 1878-1898. Excavations by an international team resulted in careful documentation of numerous well-preserved churches that provided unqualified evidence of an "Ani school" of medieval Armenian architecture. While part of the excavated material has been preserved in the Museum of Antiquities of Ani and later in the History Museum of Armenia in Yerevan, several of the documented monuments were later devastated in wars, earthquakes and by vandalism.

After the establishment of the Republic of Turkey, sporadic excavations in the oldest-dating settlement layers and ramparts were followed by a new cycle of research under Turkish excavation directors, revealing the later Islamic layers of the city, while parallel efforts of foreign experts expanded knowledge on rock-cut architecture beneath Ani plateau and in the surrounding lake ravines. Devoid of later settlement, Ani currently stands as an exemplary relic historic city of the medieval period that consist almost all the building types of its region, including rock-cut caves and passages, however in an active seismic zone and a harsh continental climate.

This proposal aims to share the efforts, in the past two decades, towards the protection of this highly vulnerable heritage property, since the inclusion of Ani’s Cathedral in the inaugural watch list of the World Heritage Fund in 1998. International restoration and conservation activities undertaken at the site since then have involved several nongovernmental organisations that provided expert and funding support. Urgent interventions have followed the recommendations of an advisory committee of experts from the Middle East Technical University (METU) of Ankara, established in 2006 by Turkey’s Ministry of Culture and Tourism. The third cycle of archaeological research that has started in 2011 follows these priorities, in context excavations around the monuments subject to urgent measures, instead of an independent research programme.

The Ministry also initiated a site management plan for Ani, through a participatory process that was pioneering in Turkey when it first started by two capacity building workshops in 2009 and 2010. Priorities in the plan include visitor management and sustainable development of the Ocaklı village at the entrance to the site. This vision recently officialised by the approval of the plan in view of Ani’s nomination for the UNESCO World Heritage List. These priorities extend responsibilities of the excavation director beyond the archaeological site, requiring additional management skills to train an archaeologist normally acquire during their professional education and career, involving active collaboration with international bodies such as the Armenian institutions in Yerevan, international NGOs and researchers who have contributed in the on-going urgency interventions, local and central administrations as well as local communities.

The proposed paper aims to offer a working ground to exchange on these and complementary topics around the case of Ani.

TH2-09 Abstract 02

Elaiussa Sebaste: safeguarding & valorization of a south-eastern Anatolia archaeological site

Author: Prof. Equini, Eugenia, Sapienza Università di Roma, Rome, Italy (Presenting author)
Co-author(s): Frangipane, Marcela, Sapienza Università di Roma, Rome, Italy

Keywords: Elaiussa Sebaste, safeguarding, valorization

Presentation Preference: Oral

During the archaeological research that has been carried on out a continued basis since 1995 at Elaiussa Sebaste in the South Eastern coastal part of Turkey, extensive restoration activities were realised on all of the structures brought to light to assure the conservation and safeguarding of the site’s archaeological heritage. These interventions have achieved in arresting the deterioration of the site and the impounding real estate speculation while allowing to open three monumental complexes to the public (theater, agora and proto-byzantine palace) with the setting out of visitor’s paths with view points offering more complete visibility, with panels located at the entrance of the archaeological area and inside, displaying plans, reconstructions and drawings that help understand the stratification of the complexes and the visible structures.

However safeguarding and valorization are necessarily linked to the creation of an Archaeological Park with different itineraries, to be realised in collaboration with the Local and Regional Administrations that will allow to enhance in a sustainable way the extraordinary cultural heritage of this area of Turkey. This project must impose the indispensable town planning bonds in order to protect the precious archaeological and physical landscape of Elaiussa from new building constructions in sensitive areas and from illegal waste dumping.

At present 4 different itineraries have been designed—on the basis also of interviews to visitors of various nationalities—of which the 1st concerns the necropolis, one of the most spectacular burial complexes in Turkey due to the good state of conservation, the monumentality and the richness of the funerary buildings.

The valorisation project of the Necropolis road between Elaiussa and the near ancient city of Korykos (modern Kızkalesi) was started during the 2015 campaign with bush clearing and careful cleaning carried out by the Mesin and Erdemli Environment Agency. The results that have been obtained so far are very promising for the pursuing of the program to extend the visitor’s itineraries and to valorise it.

2nd itinerary is to be in the Public Quarter; the 3rd will concern the structures investigated on the promontory which is the most difficult to implement due to the morphology and extension of the terrain, the 4th will be related to the Temple area on the hill, granting the site of Elaiussa Sebaste.

The complete implementation of this program with the realization of the infrastructure necessary for the valorisation of this archaeological area will favour the development of sustainable tourism that will become an important part of the community’s cultural heritage and economic growth.

TH2-09 Abstract 03

Protecting and communicating Arslantepe: work in progress to save and narrate an early state centre

Author: Dr. Balossi Restelli, Francesco, Sapienza University of Rome, Rome, Italy (Presenting author)
Co-author(s): Frangipane, Marcela, Sapienza University of Rome, Rome, Italy

Co-author(s): Tuna, Ayşin; İnönü Universitesi, Malatya, Turkey

Keywords: conservation, site management, Turkey

Presentation Preference: Oral

The archaeological mound of Arslantepe, in the outskirts of the city of Malatya, has been included in the UNESCO tentative list of world heritage sites in April 2014. The site is under regular archaeological excavation since 1981 and has yielded unprecedented data and findings concerning various periods of its history, but mostly that of primary state formation (end of the IV millennium BCE). An early palatial structure still standing and in excellent state of preservation is the main testament left by this community and is today unique in its kind worldwide. For this reason an open air museum has been designed by the Italian Archaeological Expedition and inaugurated in 2011. Since then the site is officially open to the public and local awareness has increased significantly: in 2015 a
TH2-09 Abstract 04

Multiple layers and multiple players: management practices and archaeological conservation in Turkey

Author - Öz, B. Nügön, Istanbul, Turkey (Presenting author)

Keywords: archaeological conservation, collaboration and inter-disciplinarity, management

Presentation Preference - Oral

Conservation management at urban and rural archaeological sites in Turkey is usually spearheaded by accredited architects and planners. As in other countries, archaeologists have often tended to work in isolation, away from the responsibilities of the longer-term management and conservation of their sites. It is becoming more common, however, for archaeologists, architects and other conservation professionals to work more collaboratively in the name of site management/conservation. But what are the driving forces behind these initiatives? Is it the interests of a specific director or a team member? Or is it triggered by the local authority or a funding body? Or perhaps a new national discourse? The Ministry of Culture and Tourism’s recent requirements that all archaeological excavations include conservation measures, and their quest to have more sites inscribed on the World Heritage List, have certainly had influence.

Another issue is the significant differences in the way conservation is viewed and practiced in sites across Turkey. While some concentrate on building conservation and site presentation, others may go beyond and look for ways to engage local communities in conservation processes. This paper will discuss the changing approaches and practices in the conservation and management of archaeological sites in Turkey by focusing on inter-disciplinarity, collaboration and participation in archaeological conservation through past and current foreign-run projects at several sites across the country including Aphrodisias, Göbekli Tepe, and Kaman-Kalehöyük among others.

Management of large archaeological projects in a competitive environment: the French case

Author - Dr. Depaepe, Pascal, INRAP, Amiens, France (Presenting author)

Co-author(s) - Kerouanton, Isabelle, INRAP, Poitiers, France

Co-author(s) - Plailly, Gilles, INRAP, Amiens, France

Co-author(s) - Talon, Marc, INRAP, Amiens, France

Keywords: Major Development Projects, Preventive Archaeology, Public/Commercial Archaeology

Presentation Preference - Oral

In 2001, following the ratification of the Malta Convention (1995), France adopted a legislative system, entrenching the realization of archaeological evaluations and excavations to public service bodies. However, following a political change in 2003, excavations were opened up to private companies and even though after several years of implementation the system now seems fully established, it is still challenging. One of the specificities of developer funded archaeology in France is its involvement in major development projects: motorways, railways, canals, industrial estates, etc., which raises questions on how archaeologists handle these major archaeological projects in a competitive environment, the organization put in place, how results are disseminated to the scientific community and what type of cultural enhancement is presented to the general public?

These issues will be addressed via two large archaeological projects: the high-speed rail line between Tours and Bordeaux and the Canal Saine-Nord Europe. Methodological proposals will also be presented.
Excavating England: Development and developments in archaeological fieldwork since 1990

Author - Victoria Donnelly, University of Oxford, Oxford, United Kingdom (Presenting author)
Keywords: big data, development-led archaeology, modern fieldwork practice

Excavating England: Development and developments in archaeological fieldwork since 1990
Archaeological fieldwork in England has changed significantly since the introduction of Planning Policy Guidance (PPG) 16: Archaeology and Planning which introduced the principles of the Valetta Convention into the English planning system. There has been an explosion of development-led archaeology which initially overwhelmed the traditional systems of analysing and disseminating the results of archaeological investigations and which required an evolution in the systems and methods relating to archaeological research design and fieldwork investigation. But are these new modern systems really as different as we think they are? How does the nature of development-led archaeology impact the results of archaeological fieldwork investigations? Do these new systems reflect the basis of our interpretation and understanding of the archaeological record?

The European Research Council funded English Landscapes and Identities Project based at the University of Oxford is a 'big data' project that combines local, regional and national datasets to illuminate continuity and change in settlement and use of the English landscape over a 2500 year time span, from the Middle Bronze Age to the Domesday Survey. The project database currently holds over 900,000 records relating to archaeological fieldwork in England; the vast majority of these records have been generated since 1990. It quickly became apparent that the English Landscapes project was not just documenting the archaeological record but also introduced the principles of the Valetta Convention into the English planning system. There has been an explosion of development-led archaeology which initially overwhelmed the traditional systems of analysing and disseminating the results of archaeological investigations and which required an evolution in the systems and methods relating to archaeological research design and fieldwork investigation. But are these new modern systems really as different as we think they are? How does the nature of development-led archaeology impact the results of archaeological fieldwork investigations? Do these new systems reflect the basis of our interpretation and understanding of the archaeological record?

Problems and solutions in large scale rescue excavations as seen from Saxony, former East-Germany

Author - Dr. Steuble, Harald, Heritage Office Saxony, Germany, Dresden, Germany (Presenting author)
Keywords: large scale excavation, Neolithic
Presentation Preference - Oral

Archaeological excavations normally take place in connection with infrastructural development such as building construction, laying cables and pipes, and installing tanks. I suggest that the changes in the management of the medieval towns has had an impact on both the way the rescue excavations has been carried out and the scientific research. Until 1990 the research was focused on the medieval objects and the development of the towns, with the remains of houses, property boundaries and roads. Since 1990s the Norwegian Directorate for Cultural Heritage has had a policy to preserve medieval archaeological remains in situ and allowing piling through the layers as a fundamentation for houses and roads. This has encouraged research on monitoring culture layers in situ and the development of research related to nondestructive methods. Since 2013 a new railroad project in Oslo has resulted in a huge rescue excavation across the medieval town. New methods are applied in the field. How will this impact a new generation of researchers and the future management of the medieval towns?

Managing the archaeological heritage

TH2-10 Abstract 07
Modern technologies in Polish Archaeology – A Case Study of Central Masovia 2009 – 2014
Author - MA Wiśniewski, Mariusz, Wojewódzki Urząd Ochrony Zabytków w Warszawie, Warszawa, Poland
Co-author(s) - Glech-Stil, Agnieszka, Institute of Archaeology, University of Warsaw, Warsaw, Poland (Presenting author)
Keywords: UDBAR, Photogrammetry, technology
Presentation Preference - Oral

The aim of this paper is to enrich academic discussion about broadly understood "modern" or "new" technologies in Archaeology by assigning actual facts and statistical information to various claims and propositions circulating in Academia. Further, to inform exactly how many research of what kind took place in the 2009-2014 period and in each year of this period, which method is most popular, and if there are any general tendencies to be noticed in usage of particular methods. Authors use as a base for this case study a certain area of nine counties in central Masovia region (Poland), which is moderately enriched by objects of archaeological importance, yet where a consistently high number of private and public investments causes steady, high number of archaeological projects to be carried out in recent years. These are conducted on different scale from one day watching briefs up to road scheme projects covering large previously underdeveloped areas around the city of Warsaw, and are carried out both by local archaeological teams and units from other parts of the country. A common factor is almost exclusively commercial character of work, an important background is created by the EU funds inspired boom in infrastructural investments, that will most likely be the largest event of such scale for many years to come. Data presented here is collected from all field reports and documentation collected on a base of art. 31.3 of Polish Monument Care and Protection Act by Masovian Voivodship Heritage Office for the period of 6 years (2009 - 2014). Article does not aim to discuss quality of such work or validity of chosen methods for the projects they have been used in – this is a matter for another study. Neither it is the authors aim to qualify, which method is more suitable for future use in the field archaeology in this region. This report should be treated as factual base for future discussion and an attempt to present the condition of Polish Archaeology in its certain aspect.

TH2-10 Abstract 08
Rescue Archaeology in Romania. Past and perspectives
Author - Magureanu, Despina, Institute of Archaeology Vasile Parvan, Bucharest, Romania (Presenting author)
Co-author(s) - Dr. Magureanu, Andrei Mircea, Institute of Archaeology Vasile Parvan, Bucharest, Romania
Keywords: academic research, cultural management, rescue archaeology
Presentation Preference - Oral

1989 represented a turning point for Romania not only from political point of view, but from cultural management also. Romania, willing to be integrated into the European structures, adopted a brand new strategy regarding historical patrimony in concordance with European legislation and not only. From this point of view this was a dramatic change, suggesting that all is going into one direction fast. But one is theory and other is practice. Did the practice evolve into the same direction and with the same speed?
Preventive archaeology or rescue archaeology was part of archaeological practice before 1989, also. Today, both represent a more and more important way to produce historical knowledge. So, there are differences? What those differences are? Importance into cultural strategy of government? Technology applied in the field? Interpreting the data? It is the reflection of the legislation or just to be a pure reflection of it? Can this way of research be done in order to provide information for an academic archaeology?

This kind of questions and to many others we intend to respond and to presents the state of link between the preventive/ rescue archaeology and the academic scientific research.

TH2-10 Abstract 09
Rescue Archaeology in Russia: the radical shift of the 1990s, and its consequences
Author - Dr. Engvatova, Aya, Institute of Archaeology of Russian Academy of Sciences, Moscow, Russian Federation (Presenting author)
Keywords: change in legislation, rescue archaeology, Russia
Presentation Preference - Oral

In Russia, the beginning of the 1990s was a turning point in the history of the nation. Massive changes took place in the political, social and legal spheres over an area which made up one-fifth of the world’s landmass, with a population of over 170 million people (including the USSR, Bulgaria, Hungary, Poland, Czechoslovakia and other nations). The resulting shift to a market-based approach in the cultural sphere (including archaeology) was both significant and controversial. During the period of the economic and political crisis in the early and mid-1990s, the amount of archaeological research being conducted fell overall, including rescue archaeology – primarily due to the situation which had gripped the entire country. In 2004, the Federal Law 73-FZ came into force: “Concerning sites of cultural heritage (historical and cultural monuments) of the peoples of the Russian Federation”. In 2011 Russia adopted the European Convention on the Preservation of Archaeological Heritage. In the 2000s, the situation changed rapidly, due to the fast pace of economic growth. These changes were clearly demonstrated by the pace of issue of permits for carrying out archaeological works. This inevitably raised questions about revising the methodology with which such rescue archaeology was conducted, and ways of optimising it. A system of regulation had evolved over many years, in which scientific regulation underpinned the methods employed when researching archaeological sites – identification on-site, and a method for presenting the scientific documentation which applied across the entire country. These norms apply to rescue archaeology too. There are no ‘short cuts’ available in these methods. Attempts to bring in systems of ‘observation’ as a subset of ‘rescue’ archaeology methods can be considered successful only in the case of research into later, mixed-up deposits. Alongside this, the system by which the state funds scientific research has also changed. The proportion of rescue archaeology work conducted in the 2000s rose to above 80%, whereas it had only accounted for 25% in the 1990s. The development of private, including small business accounted for a considerable rise in the proportion of research being conducted by non-state firms involved in rescue archaeology – from 1% in the early 1990s, to 40% in 2012. This pace of change is intrinsically connected with the way in which the tax system operates in Russia. For state organisations (departments of the Russian Academy of Sciences, museums, universities) the system of taxation remains in place, in which there are no tax-breaks. However, in 2004 the Russian Federation brought in a tender scheme for a wide range of different services – including archaeological services. The primary consideration under which such tenders were won or lost, was the price quoted for their completion. Non-state organisations were placed at a significant financial advantage under these arrangements. During the period of the Russian economic crisis of the 1990s (and especially arising from ‘black holes’ in legislation) a significant Black Market developed for archaeological artifacts. In 2013 a new Federal Law came into force, No 245 "Concerning amendments to Particular Legislative Measures of the Russian Federation which prevent illegal activity in the field of archaeology."
that the preventive archeological excavations are obligatory on the sites where construction works are planned. The investors are ready to fund archeological works. But how does the Law operate? It obviously operates through an archeologist. A rapid development of the construction business led to a great amount of preventive excavations. Tyver State University solved a problem of the necessity of young archeologists training. About 10 state and commercial organizations dealing with the preservation of the archeological heritage work in the Tyver Region nowadays. To summarize, there are two components of the archeological heritage protection system in Tyver Region. Department on State Protection of the Cultural Heritage and archeological organizations. This system is effective. In the territory of the historical centre of Tyver there were rescue excavations carried out on the territory of more than 400000 m². Archeological works were also carried out during the construction of the new roads, oil and gas pipelines. However, there are still prospects for further development - a collaboration with society and civil society organizations on the protection of the cultural heritage is necessary. It is crucial to realize the value of the archeological heritage as well as the importance of improving the scientific relevance of the preventive archeological works.

TH2-10 Abstract 11

“Amateur” archeology, legal or not?
The experience of a legislative practice in Russia
Author - Sapyrnya, Irina, Institute of archaeology RAS, Moscow, Russian Federation
Co-author(s) - Zelenkova, Olga, Institute of archaeology RAS, Moscow, Russian Federation (Presenting author)
Keywords: heritage, law, Russia
Presentation Preference - Oral

Hoard hunting has been actively developed since 1990s in Russia and all over the world. It is connected with dramatic changes in social and economic life of the country and availability of metal location. It took 20 years of a purposeful activity of the specialists in archeological heritage conservation for a society to realize the value of the lossess of the pilage of archeological sites. In 2014 in Russia the federal act №315 was adopted, directed to the heritage rescue and consisted of the assets on criminal liability of “grave robbers” (up to 6 years). Apart from the asset of the encouragement of the persons doing the illegal excavations on the territory of archeological sites, this law contains norms and regulations new to the Russian legislative practice: about the territory of an object of an aracheological heritage, about the state historical and cultural expert evaluation, about the mainstreamification of the objects of an archeological heritage, about the state national objects’ register and the encourage of the liability of archeologists. The report is about the analysis of the practice in the application of the federal act 315 for the last two years from the moment of its adoption.

TH2-10 Abstract 12

Moscow Monasteries: new stage of the archeological investigations (2003–2015)
Author - Beliaev, Leonid, Institute of Archaeology of RAS, Moscow, Russian Federation (Presenting author)
Co-author(s) - Grigorian, Svetlana B., Institute of Archaeology of RAS, Moscow, Russian Federation
Keywords: Late Medieval Ages, Early Modern times, Moscow monasteries, new investigations
Presentation Preference - Oral

Archaeological investigations of the Zachatievsky Alekseevsky monastery (Dolotschensky) that were started in 2003 laid the foundation of the new stage in the monasteries investigations which at the present time is recognized as one of the most important stages in the archeology of the Late Middle Ages and Early Modern times in Russia. Until the last third of the 20th century monasteries of the Moscow period haven’t been investigated by the archeological methods, the understanding of its structural peculiarities as archaeological objects hasn’t been developed. Monasteries were regarded as too “late” objects.

In the late 1970s, the architects-restorers have teamed up with movement for the monuments protection. The first large excavations in the monasteries were held in 1980s. For two decades (mid 1970s – mid 1990s) three key monumets of Moscow monastic archeology – the Bogojevskiy, Danilo and Hrj-Petromonsky have been investigated and become standard objects. The monasteries of the Moscow Russia were understood as a new type of monuments.

In the beginning of the XXI century the situation has changed cardinally. At the moment archeology is capable of solving large variety of problems first of all thanks to the development of the fundamental scientific research. Detailed examples of such works are provided by the investigations in Zachatievsky Alekseevsky, Sretenki, Novospasskiy, Novodevichy and Donskay monasteries in Moscow and in the Troitse-Sergiyeva Lavra and New Jerusalem monasteries (near Moscow).

The report present the main results that have been achieved for the last 12 years works, in comparison with the investigations of the 1980s and 1990s.

Growing Living Landscapes
Author - Dr. MacGregor, Gavin, NorthRicht Heritage, Glasgow, United Kingdom (Presenting author)
Co-author(s) - Dr. Stagno, Anna Maria, University of Basque Country, Spain
Co-author(s) - Dr. Murtagh, Paul, CAVP Heritage, New Lanark, United Kingdom
Presentation Preference - Regular session

The management of archaeological and historic environment assets increasingly articulates with other tools which seek to deliver more sustainable rural landscape management. A range of landscape scale planning and management tools are currently being applied in Europe including Biosphere Reserves, Ecomuseums, Landscape Observatories, Landscape Partnership Schemes, Landscape Plans, Landscape Programmes and World Heritage Sites.

We wish to critically explore how archaeology, historic environment and cultural heritage currently sit within such tools:

• How are archaeological, historic environment and cultural heritage assets weighted and prioritised (e.g. in contrast to ecological or social values)?

• What opportunities does archaeology and historic environment offer for sustainable economic development in rural landscapes?

• How can archaeological (and historical ecological) research help to historically characterize environmental resources management practices, based on local actors and local knowledge, to offer new tools for management of rural areas?

• What are the benefits and challenges of living traditions and heritage produce in sustaining resilient cultural landscapes?

• What opportunities do archaeological assets provide for building broader sustainability and legacy?

• Are there examples of past land tenure and stewardship from which lessons (both negative and positive) can be learnt in future management of landscapes?

• How successfully have communities been engaged and involved in the development and delivery of such tools?

• How successful have such landscape planning and management tools been at creating legacies and sustainable approaches to more integrated landscape management?

We welcome papers which address some of the questions above, either through case studies on experiences, broader critical reflection on landscapes management policy and tools, or by exploring opportunities for future innovation.

TH2-11 Abstract 02

Cultural landscapes in the Cantabrian Mountains: rethinking the future of rural Europe
Author - Dr. González Alvarez, David, Universidad Complutense de Madrid, Madrid, Spain (Presenting author)
Co-author(s) - lvarez, David, Universidad Complutense de Madrid, Madrid, Spain
Keywords: Cultural Landscapes, Heritage, peasant communities
Presentation Preference - Oral

In the region of Asturias (North of Spain), local government chose thirty years ago a terrific successful slogan for promoting rural tourism: “Asturias, Natural Paradise” (from Spanish “Asturias, Paraiso Natural”). The logo of this famous campaign shows an-stylized rural drawing with green meadows which are sight through the arches of the early medieval church of Santa Maria del Naranco
in Oviedo. We could imagine herds of cattle grazing in the green landscape which is commonly associated with Asturias, but, nevertheless, there is no people in the image. Accordingly, most of the campaigns made since then by the regional institutions and tourism agencies have focused on creating a picturesque image of the natural landscape of the Asturian countryside. Thus, the bears are the main characters in advertising and TV spots, while local peasants or the long cultural heritage of landscapes are kept silent. Only few outstanding monuments, such as Paleolitico art caves or some medieval churches, stand out among the forests in the mountains or the cliffs in the coast.

However, recent Landscape Archaeology studies and palaeoenvironmental research have shown the relevance of human activities in the formation of European landscapes, even in the most remote or liminal areas. At least since the Neolithic, the labor and the efforts deployed by peasant communities in taking advantage of the soil potentialities has determined the anthropogenic construction of the landscapes. In addition, the last debates in Social Sciences point out that society, political systems, individual and collective identities mediate all together in the cultural construction and the perception of the environment. Thus, it might be assumed that the landscapes are now invested by the local communities in working the land is the main agent in the modelling processes of landscapes in these mountains through the last 6000 years. At the same time, cultural narratives, the sociopolitical contexts, and their historical roots are central in the relations we (contemporary Europeans) establish nowadays with the rural landscapes. But, are these ideas sufficiently considered by state and regional-level governments in the management of European landscapes?

It seems clear that, rather, this ‘natural paradise’ is actually an artificial image in which the cultural aspects should have a more significant weight. The rural landscape is reified, while the experience and efforts made by local communities are muted. This way, peasant families become subaltern actors who barely can speak, since they are marginalized from the policy making processes. So, the aim of this paper is in the first place to evaluate the consequences of this sort of naturalistic narratives for the local peasant communities. Second, I think we (archaeologists) should deconstruct the official speeches made by public institutions on the management and promotion of tourism and the Asturian cultural Heritage. In fact, we could disseminate alternative narratives which may reinforce the local peasant positions as stakeholders for the future of rural landscapes.

Landscape Archaeology can provide more comprehensive narratives about cultural landscapes which would strengthen the role of Archaeology as a valuable Social Science for rethinking the future of rural Europe.
Across Europe rural areas are suffering, in term of loss of biodiversity, cultural landscapes and traditions, as the consequence of depopulation and increasing abandonment of their management. This problem is particularly evident in mountain areas, where the presence of common-lands and common access rights was crucial in shaping settlement patterns and rural landscapes, nowadays often protected as natural heritage.

This paper will consider, through presentation of the first results of a project focused on the archaeology of common-lands in Southern Europe, how archaeology could contribute to the creation of more synergies between research and management of mountain and rural areas.

The study is centered on the connection between social structures and related material evidences of local practices. The investigation pays specific attention to the practices of management and production of agro-forestry-pastoral resources. This approach has clearly shown, on one side, the historical dynamism of rural areas (and in particular of common-lands) for transformation of uses, organization and access rights and, on the other, the contribution of local knowledge to the construction and preservation of historical rural landscapes.

The paper will reflect on how archaeology and historical ecology could help to connect historical reconstruction and present management of landscapes. This line could offer new approaches to better define landscape management policies, based on local actors and local management of environmental resources, in the framework of actions for the conservation of rural areas as a part of European Cultural Heritage.

The Community of Madrid (this is the name of the administrative region of Madrid) is one of the main tourist regions in Spain, where a part of the regional landscape is also considered as a cultural heritage. This cultural heritage, both of a rural and urban character, is protected by several laws and articulated into several typologies. As in other parts of Europe, this heritage constitutes an important factor for the quality of life of local people and, at the same time, needs to be transformed into a resource for regional development. Our proposal presents the way in which have been done in Madrid in recent years. The Community of Madrid is a part of the process of territorial management. This link could offer new approaches to better define landscape management policies, based on local actors and local management of environmental resources, in the framework of actions for the conservation of rural areas as a part of European Cultural Heritage.

TH2-11 Abstract 09
Etnoarchaeological heritage and cultural landscapes: a case-study from the Western Alps

Author - Dr. Carrer, Francesco, Newcastle University, Newcastle upon Tyne, United Kingdom (Presenting author)
Keywords: Etnoarchaeology, Cultural landscapes, Tourism

Presentation Preference - Oral

Landscape management is a key-aspect of European policy. Cultural landscapes are described in the European Landscape Convention as bearers of important identity values, and their protection is expected to have a crucial impact on environmental sustainability (preservation of biodiversity and traditional products, prevention of soil erosion and geomorphological instability, etc.) and the safeguard of local communities.

Etnoarchaeology is placed at the core of this cultural and political framework. Etnoarchaeological inferences provide crucial insights to understanding archaeological landscapes and their evolution, but they can also contribute to the protection, management and planning of traditional landscapes in Europe and abroad. Despite these potentials, the impact of etnoarchaeology is still quite limited outside archaeology and outside academia.

This paper wants to address all these theoretical and methodological issues, using a case-study from the Western Alps: Val della Brignola, an upland valley (>1800 m asl) in the Cuneo province (Italy). The local traditional landscapes in the territory of the Sella Brignola are examined in the light of the research work within the project “The heritage ensembles as touristic active of the Community of Madrid. Problems and opportunities in a territorial perspective”. We want to contribute to the TH2-11 session with an approach to the case study of the archaeological landscapes of the region of Madrid. Nowadays different areas are considered by the regional ‘Historical Heritage Law under the denomination of “cultural landscape” or other classifications of territorial character (such as “historical place” or “archaeological area”). As such, these have been identified and protected as exceptional examples of the human environment and relationships during time. The protection of such “areas” or “landsacpes” means a qualitative change in the conception of the character of the heritage and facilitates connections and links with the global process of territorial management (through links with environmental laws, or normative of environmental impact). This is both a challenge for the public administrations and an opportunity to increase the benefits (social, economical, environmental) of archaeological heritage. Our proposal aims to classify these areas and to analyze the accessibility that the archaeological past offers for sustainable economic development in rural areas. Our approach will focus on the tourism use of these heritage areas and its role in the context of the environmental and social politics of the region. On the background we aim to make a critical reflection on landscapes management policy and its convergence with promotion and valorization strategies.

TH2-11 Abstract 10
From the loss of a city, to the discover of Archaeological Heritage: the modern story of Palestina

Author - Pintucci, Alessandro, University of Rome- “LA Sapienza”, Roma, Italy (Presenting author)
Keywords: Heritage, Italy, Protection

Presentation Preference - Oral

Modern archaeological history of Palestina, city of ancient origin near Rome, started in the mid 1700s, when the first discoveries of tombs and archaeological materials were carried out in the territory; after a successful brackets linked to the promulgation in 1800 of one of the first laws of Italian protection, the Paccia’s Edict, in the second half of the 800 the city became a popular destination of Italian and foreign antique dealers, in particular French and Germans, who devoted to systematic excavations, almost never scientific, to recover the precious fabric of the Colombella necropolis. This pirate-logic excavations and recovery of materials went on until the middle of 900, when, after World War II, the city, like the whole of Lazio Region, was the scene of uncontrolled speculation that put a strain on the protection of Archaeological Heritage, especially in so-called Low-city and in the countryside: in the 1960s Palestina became famous in the newspapers as an example of poor land protection, culminating in the 1970s, with the opening of a painful legal case, which led to important arrests of staff of the Ministry of Culture too, turning the spotlight on the low, even zero, control that had threatened to destroy the heritage of the city and its territory. Since then a wear management of the municipality, with a plan that has managed to create buffer zones in areas considered at archaeological risk, has allowed a more fine-grained control of the territory and the execution of archaeological excavations in areas hitherto little studied or known. Being the city that threatened to destroy its goods in the 1960s, with the last elections in 2013 the Municipality has allowed a more fine-grained control of the territory and the execution of archaeological excavations in areas hitherto little studied or known. Being the city that threatened to destroy its goods in the 1960s, with the last elections in 2013 the Municipality...
The siege of \textquoteleft s-Hertogenbosch in 1629 has been an important moment in the war between Catholic Spain and the Dutch Republic, and the arise of the Netherlands. \textquoteleft s-Hertogenbosch was the main Spanish base and a well-fortified city protected by an experienced Spanish garrison and by formidable water defences. The Dutch army led by Frederic Henry, prince of Orange, chose a young archeologist as Commissioner for Culture and now it is rediscovering the importance of its archaeological and natural heritage as an economic resource.

In \textquoteleft s-Hertogenbosch the foundation \textquoteleft De Groene Vesting\textquoteleft (The Green Stronghold) is established. It is a local initiative of inhabitants of \textquoteleft s-Hertogenbosch and surrounding villages to visualize and experience the lines of Frederic Henry of 1629 around the town for a broad public. By opening up the many historic sources people are invited to research and discover what was and is happening around the lines of 1629 in the past and nowadays.

The choice of an alternative approach to displaying urban remains could have new opportunities for the local community and the public. The key element is the transformation of a landscape of ruins into a living landscape. What was and is happening around the lines of 1629 in the past and nowadays.

The EAA-lecture will present the work of the foundation \textquoteleft De Groene Vesting\textquoteleft as well as the results of the archaeological research of the lines of \textquoteleft s-Hertogenbosch 1629. Example are given how archaeological and historic research can contribute to the development of the landscape around the town, how a foundation of volunteers from the local community can start and support local environmental concepts and how these plans are accepted by the municipalities, local community and several entrepreneurs. And also how commitment for many years results in great plans and ideas for the future.

**TH2-11 Abstract 11**

The Landscape of Via Appia Antica: From a panorama of ruins to an Archaeological Park

**Author:** Dr. Habib, Dubbini, Rachela, University of Rome \textquoteleft Sapienza\textquoteleft, Rome, Italy (Presenting author)

**Co-author(s):** Curcio, Marilatesa, University of Rome \textquoteleft Sapienza\textquoteleft, Rome, Italy

**Keywords:** Archaeological Park, Landscape of ruins, Via Appia Antica

**Presentation Preference:** Oral

The landscape of Via Appia Antica, characterized by ruins of imposing monuments immersed in the vast countryside, doubtlessly preserves some of the richest cultural heritage of the ancient world, whose fascination has been celebrated by artists and writers since the Renaissance. For centuries these archaeological ruins have played the role of generic memories, beautiful fragments creating romantic panoramas, findings decontextualized from their environment, waiting to be looked at, dreamed of, but uninterpreted, except by specialists. The lack of reception of their historical value by the community has led to the abandonment of archaeological sites; and, therefore, the past has been seen as an immovable, faraway, meta-historical, idealized, unattainable reality that can only desperately store or regret, or even (as has been the case so far) simply be ignored. For these reasons, although since Napoleonic times different plans have envisaged Via Appia as becoming a great archaeological park between the Roman Forum and the Alban Hills, this idea has been threatened by private interests, such as housing construction. Even after the creation of the Park in 1988, the aims of which are, however, at most naturalistic, 95% of the area has remained in the hands of private entities. Moreover, the traditional approach of Italian institutions to the cultural heritage, based on the concept of preservation, constant, and protection, has increased the gap between archaeology, on the one hand, and communities, on the other, over the past decades.

In occasion of the decision taken by the Italian Ministry of Culture to finally transform this area into a national archaeological Park, the paper will participate in critical reflections on an urban landscape management policy and tools analysing the significance that archaeology could have for local communities in the creation of a shared identity based on a common landscape and focusing on the inescapably public use of archaeology, which as such must be defined, properly designed, and clearly explained to define new opportunities for building broader sustainability and legacy. In view of the future management of Via Appia Antica as an archaeological Park, inhabitants\textquoteleft s current aspirations and needs in the negotiation of what they feel to be \textquoteleft their own\textquoteleft past and culture with institutions and politicians will be examined. This political perspective will be used to develop a critical reading of the state of archaeology in the Park, illustrating practical examples of \textquoteleft active protection\textquoteleft of its landscapes by the citizens and identifying, in institutions and politicians, the inescapably public use of archaeology, which as such must be defined, properly designed, and clearly explained. This dialogue will inform new opportunities for building broader sustainability and legacy. In view of the future management of Via Appia Antica as an archaeological Park, inhabitants\textquoteleft s current aspirations and needs in the negotiation of what they feel to be \textquoteleft their own\textquoteleft past and culture with institutions and politicians will be examined. This political perspective will be used to develop a critical reading of the state of archaeology in the Park, illustrating practical examples of \textquoteleft active protection\textquoteleft of its landscapes by the citizens and identifying, in institutions and politicians, the inescapably public use of archaeology, which as such must be defined, properly designed, and clearly explained. The municipal archaeologists have marked the defence and forefront lines on the archaeological characterization maps. The research of the lines of the Seige of \textquoteleft s-Hertogenbosch 1629. Example are given how archaeological and historic research can contribute to the development of the landscape around the town, how a foundation of volunteers from the local community can start and support local environmental concepts and how these plans are accepted by the municipalities, local community and several entrepreneurs. And also how commitment for many years results in great plans and ideas for the future.
The interest in the study of cultural landscapes has grown considerably in recent years. Several strategies have been developed in this field in Europe, marking it as a priority area of interest in Community policies as landscapes combine elements that affect both the cultural, environmental, economic identity and political heritage. In this context, we present the first results of THALES project (University of Alicante, Spain). The main challenge of the project is the combination of different methods to study the ibero cultural landscapes for more advanced purpose: to contribute to a deeper understanding of the territory, in order to achieve development that respects the legacy of the past and its conservation. It is used a multidisciplinary approach (archaeology, geography, ethnography, soil science, agronomy), from a multi-scale (from local to European level) and with a diachronic perspective (from antiquity to the present day). In order to consider the various mechanisms of appropriation and transformation of the environment by the societies, the project focus on the analysis of various types of cultural landscapes of the Iberian Peninsula, especially selected by the morphology of their agrarian systems: one of the most homogeneous expressions of the interaction between man and territory: 1) mountain landscapes of Sierra del Segura (Albacete) and Sierra de Atana (Alicante), characterized by small height villages of Islamic origin with an agropastoral economy. The element that characterizes the agricultural systems of these communities is the terrace farming: plots created to take advantage of the mountain slope where are developed infrastructures for the exploitation and distribution of water resources (cultural landscapes generated from the Islamic period to the present day, still in use). 2) plain landscapes of Campo de Hellin (Albacete), the Valle del Vinalopó (Alicante) and Vega Baja del Segura (Alicante), characterized by exploited agricultural environments without interruption from antiquity to the present day, but with different strategies (Roman villas, early medieval rural villages and farmhouses, medieval fiefdoms, contemporary agrarian colonized). Our study focus on understanding how historical societies have occupied and administered this space, characterized by a shortage of water resources.

Landmarks and landscape in the South Eastern Sicily

South-Eastern Sicily provides a privileged view for the analysis of the impact on the culture of “Sikelis”, thanks to its huge variety of indigenous settlements dated to the Iron Age and concentrated around the Ionian coasts, which were early visited and occupied by Greek colonies. Nonetheless, the archaeological debates and researches have been always concentrated in a Greek point of view, leading indigenous archaeology as a “niche archaeology”, where sites are even not well preserved and inserted in the archaeological potential resources.

For these reasons, I would like to focus on the analysis of the indigenous sites of the Hyblean Area. The portrait that has been revealing forces me to leave the well-known ethnic classifications and characterizations, getting close to the concept of “hybridity”. In fact, Greeks and indigenous people have developed an interactive dialogue that highlights the creation of a “third space” or “middle ground” that is not indigenous nor stranger, rather a cultural melange generated by the meeting between the two parts, well visible in the social exchanges, osmosis of ideas and material culture.

Re-centring the specificity of the indigenous archaeology could be an important way to reconsider also the archaeological landscape nowadays and promote new strategies of development of the area. In fact, the case of the South eastern sites is emblematic to describe a shared situation for a considerable number of sites in the Region that are affected by lack of funds and absence of great managing plans. Investigating further the relationship between sites and their natural landscape might be very interesting. Prehistorical sites in Sicily (e.g. Pantalica, Cassibile, Thapsos, Monte Ficochito) are set on beautiful and breathable scenery and the boundaries between archaeological landscape and natural-rural landscape are full of overlaps and possible links. This fact could suggest the idea of possible integrated landscapes where naturalistic tracks, rural traditions and archaeological sites are linked together in unified managing plan for preservation and tourism.

It is still delectable the complete harmonisation of archaeological remains into the rural landscape and the landmarks of rock-cut architecture, still used nowadays in agriculture, as a reference for the ancient deep relationship between humans and landscape and an ancestral proof of the respectul use of the land that the rural civilisation of the area has been promoting since its origins.
TH2-13 Abstract 01

Protect or perish: On the outlook for the young and the old in a museum’s collections

Author - Head of dep. Hoegestad, Mari, University of Stavanger, Stavanger, Norway (Presenting author)
Co-author(s) - Denham, Sean Dexter, University of Stavanger, Stavanger, Norway
Keywords: bio-archaeology, childhood; relations, ex-ante preservation

Mother-child relations in Early Bronze Age Lower Austria

Author - Mag. Dr. Rebay-Salisbury, Katharina, Austrian Academy of Sciences, Vienna, Austria (Presenting author)
Co-author(s) - Appleby, Jo, University of Leicester, Leicester, United Kingdom
Keywords: Austria, Early Bronze Age, motherhood
Presentation Preference - Oral

The Early Bronze Age inhumation cemeteries of Lower Austria belong to three cultural groups (Jingalic, Unterwölbling and Wieselburg) with distinct burial practices. They differ in particular in terms of how bodies were placed and buried in relation to each other. In this contribution we scrutinise the archaeological record for evidence of mother-child relations. We will begin by presenting graves of pregnant women and graves of women and children buried together, in order to understand how such individuals were treated by their societies in death. We investigate the most likely ages for life-transitions such as first motherhood and menopause, as well as explore material markers of such transitions. Social responses to pregnancy, birth and early childhood rearing, as well as the link between women’s reproductive status and social status in Bronze Age central Europe, give insights into the conceptualisation of motherhood in the Early Bronze Age in general, but also into the variability within three closely connected, yet different groups.

TH2-13 Abstract 03

Grandparents in the Bronze Age?

Author - Dr. Appleby, Jo, University of Leicester, Leicester, United Kingdom (Presenting author)
Co-author(s) - Rebay-Salisbury, Katharina, Austrian Academy of Sciences, Vienna, Austria
Keywords: Austria, Early Bronze Age, Grandparents
Presentation Preference - Oral

Grandparenting has been critical to the development of human life history. It has even been suggested that the role of grandparents in childcare is the reason for the extended lifespan seen in modern humans. However, the roles and functions of grandparents have not previously been investigated in later prehistoric contexts. Ethnographic studies show that grandparents take on an extremely wide range of roles worldwide, whether this is teaching knowledge and skills, providing childcare, or even taking on parental roles and titles. In many cases, grandparents play a critical role in the support and socialization of children. Understanding the roles of grandparents thus has the potential to transform our understanding of prehistoric household and family structures. In this paper, we examine the potential impact of grandparents in prehistory. We will use demographic data to explore how ‘common’ grandparents might have been, whilst bringing in a variety of ethnographic examples to identify potential activities and relationships of grandparents and grandchildren. We will then use a case study from the Early Bronze Age Treisental in Austria to show how prehistoric mortuary data might inform us about grandparenting in the Early Bronze Age. The existence of a series of large, well excavated cemeteries from this area makes it possible to investigate how the idea of the ‘grandparent’ might have been constituted both in life and death. In addition, we will investigate the extent to which grandchildren may have had a reciprocal role in caring for grandparents who became incapable either physically or mentally through diseases of old age.

TH2-13 Abstract 04

The white-haired and the feeding bottle: Exploring children-elderly interactions in LBA Aegean

Author - Dr. Gallou, Chrysanthi, The University of Nottingham, Nottingham, United Kingdom (Presenting author)
Keywords: childhood, elderly, aging, Prehistoric, Aegean
Presentation Preference - Oral

Scholarship on age and gender in prehistoric Greece has taken an adult-centric approach (with focus mostly placed on young to middle-age men and women) and, as a result, two significant age groups - infants/children and the elderly – have been widely neglected. However, lacking a strong insight into attitudes towards these two age groups, archaeologists do not really harbour a concept of the whole span of life in the Greek-speaking and the non-Greek speaking societies that developed in the Aegean region during the 2nd millennium BC. Making children and the elderly visible in the archaeological record, examining
their social roles, agency and interactions, and integrating them into a holistic analysis of the prehistoric world is vital for a better understanding of the workings of these early Aegaean cultures. Integrating ethnographic data with a systemic study of material remains spanning from the study of burials (including simultaneous adult-child ones) to iconographic sources and textual references, the aim of this paper is two-fold: a) to provide a comprehensive account of the diverse attitudes towards childhood and the elderly in the region during the Late Bronze Age; and, b) to shed light on the interactions between children and the elderly both at household level and in the context of the medieval to contemporary period.

TH2-13 Abstract 05
Family constructions and adult-child relationships in the Ancient Greek oikos
Author: Sommer, Maria, Skanderborg, Denmark (Presenting author)
Keywords: Adult-Child relationships, Ancient Greece, Childhood Archaeology
Presentation Preference: Oral

The presentation will focus on family constructions in the ancient Athenian oikos with special attention to children age 0-7 years. Research points to the fact that children in the ancient Greek household – the oikos - grew up in an extended family with multiple relationships with parents, grandparents, siblings, friends, slaves and caregivers. The theories of age separation and multiple caregiving are introduced to give insight to the complex world of children and their peers in the ancient Greek oikos.

This research has been published in: Sommer, M. & Sommer, D. (2019). Care, Play and Socialization in Ancient Africa – A Developmental Childhood Archaeological Approach (DK: Aarhus University Press).

TH2-13 Abstract 06
Circle of Life? Aspects on youth and old age in Viking Age and Medieval Scandinavia
Author: PhD Mejsholm, Lotta, Uppsala, Sweden (Presenting author)
Keywords: Age construction, Burials, Viking Age
Presentation Preference: Oral

In Viking Scandinavian society, people were to a high extent defined and commemorated by their deeds. The productive, freeborn, preferably male, adult formed a societal norm, to which children, slaves, outcasts, unproductive elders and “others” were contrasted. Consequently, and as a result of contemporary academic paradigm, children, and elderly has often been tagged as “invisible” in the records available. Nothing could be more wrong.

In this paper, the sphere of children and elderly in Viking Age and Medieval Scandinavia is explored, as a specific culturally and socially defined construct, contrasted to the normative adulthood, as displayed in textual and archaeological records. In medieval provincial law codes, a clear distinction between man slaughter (killing an equal, a free adult man) and killing children or elderly persons, unable to defend themselves, is made. In case of the latter, the killer was charged with a significantly more severe penalty. The defencelessness of these household dependents is expressed in terms of limited capabilities, which, is argued, is a relevant definition also in academic discussion.

In the burials records from Late Viking Age and Early Middle Age, graves of elderly, impaired, sick people and children in many cases differ from those of the productive adults. One specific phenomenon is approached in this paper, namely the use of amber beads amulets. Amber has been used as protective agent in Viking Age, i.e. as amulets attached to swords. A similar understanding could be used considering the burial arrangements for elderly and young. Characterized by a state of dependence and limited capabilities, but also specific legal and magical protection, the young and the old seem to represent a distinct social category within the household. Likewise evident, the youngest family and household members, the unbaptized and newborn infants, were yet to enter this specific sphere.

Is it possible that this correspondence between age identity of the young and the old represent a Viking Age cyclic view of life? Perhaps so, but there might be reasons to simplify our interpretation of the complex ecclesiology interacting with reality in Viking Age society.

TH2-13 Abstract 07
The old and the young in the Icelandic early Christian household cemetery
Author: Zoega, Gudhý, Skagafljótur Heritage Museum, Saudarkrokur, Iceland (Presenting author)
Keywords: Bioarchaeology, Household, Medieval
Presentation Preference: Oral

In recent years a number of early Christian cemeteries have been excavated in the region of Skagafljótur, North Iceland. These cemeteries belonged to, and were managed by, occupants of individual farms and were in use from around AD1000-AD1100. The household cemeteries differ from the sparse pagan burial record in that they are all inclusive, i.e. include several or both sexes and all ages, essentially representing all the inhabitants of a household. An interesting feature of these cemeteries is the large number of interred infants and relatively large number of “older” individuals. The Icelandic sagas rarely mention children, and the old hand not to be in viewed in a favourable light. By looking at the osteological data in conjunction with spatial data an analysis a more detailed picture emerges providing information on the possibility of three familial generations and the role and perception of the young and the aged within the medieval household. This paper discusses how this unique material can add to the predominantly philological and historical discussion on the nature, makeup and social interactions of the medieval Icelandic household. It also touches on how the data may be used to create a fruitful discourse on how the “traditional” Icelandic household is presented and disseminated at a rural heritage museum. By comparing and contrasting the medieval bioarchaeological material and the historical/ethnographic research pertaining to the museum’s collections and exhibitions, a new light may be thrown on historically “inconspicuous” social groups such as the aged and the young, irrespective of time periods.

TH2-13 Abstract 08
Interpreting Multiple Interments in Irish Medieval Burial Grounds
Author: Dr. Murphy, Eleanor, Queen's University Belfast, Crumlin, Northern Ireland, United Kingdom (Presenting author)
Keywords: funerary archæology, relationships, skeletal remains
Presentation Preference: Oral

Burials that contain the remains of two, three or even larger numbers of individuals are occasionally discovered during excavations of medieval Christian burial grounds in Ireland. In the majority of cases the remains are those of neonatal infants – perhaps indicative of a multiple birth – in which the infants did not survive, while other examples may comprise the burial of two or more adults. In other instances a full-term foetus remains within the mother’s abdominal region and clearly died prior to delivery. Cases also arise in which a neonate has been interred with an adult female, and it seems likely that many of these may represent cases where both a mother and her baby had died shortly after delivery. Other examples have been discovered in which an adult male was buried with an infant or an older child was buried with an adult. This paper examines the evidence for multiple burials derived from medieval burial grounds in Ireland. Drawing upon information gleaned from oral history and contemporary historical sources attempts will be made to propose possible scenarios to account for such burial configurations and to explore the nature of the potential relationships apparent within these various interments.

TH2-13 Abstract 09
Infants and elders: a bioarchaeological investigation of a Reform Church in Hungarian Transylvania
Author: Dr. Bethard, Jonathan, Boston University, Boston, United States of America (Presenting author)
Co-author(s): Gasterholtz, Anna, Mississippi State University, Starkville, United States of America
Co-author(s): Nyárad, Zsolt, Haaz Rezso Muzuem, Szekelyudvarhely, Romania
Co-author(s): Gonzalez, Andre, University at Buffalo, Buffalo, United States of America
Keywords: bioarchaeology, Reform Church, Transylvania
Presentation Preference: Oral

Bioarchaeologists have added a great deal to what is known about past peoples from numerous time periods and geographical periods. Recent contributions to the field have pushed scholarship in exciting new directions thanks to theoretical and methodological frameworks which include both the youngest and oldest members of society. Bioarchaeologists are now exploring questions related to both infants and the invisible elderly; however, few archaeological contexts present scenarios where both cohorts have been recovered together. Indeed, few scholars have addressed questions related to the interactions of people who lived at the extremes of the human lifespan, as these contexts seem to have alluded bioarchaeologists until now. In this talk, a unique mortuary context from an excavation at a Reform Church in Hungarian Transylvania will be discussed. In 2007 archaeologists participating in a salvage excavation recovered remains of 70 individuals buried beneath the floor of a Reform Church in the community of Tékaş (Teszk), Romania. The majority of these individuals were interred until the 17th century and do not appear to have survived long after birth. In addition to the neonatal individuals, the remains of an elderly female individual were recovered from the same stratigraphic context. In this talk, the relationship between these individuals will be explored and tied to a growing body of literature investigating the archaeology of the Reformation.
The search for the elderly: using osteological data to divide and join age identity

Author - Pechock, Sabine, Bradford, United Kingdom (Presenting author)
Co-author(s) - Maaranen, Nina, University of Bradford, Bradford, United Kingdom

Keywords: age identity, elderly, old age

Presentation Preference - Poster

Inquiries into age identity have only recently received attention, despite the recognition of gender identity in archaeology. Particularly elderly individuals are often ignored or treated with the assumption of a universal experience of old age. Traditional age estimation methods have failed to provide more accurate estimates to aid in the identification of aged skeletons. Individuals of 45+ years are often lumped together, ignoring any potential social differentiations in the later stages of the life course. In this study, the Transition Analysis has been utilized on the Iron Age cemetery collection of Wetwang Slack, East Yorkshire, UK, using the method's statistical approach to provide more accurate age estimates for older individuals. Additionally, data on sex and age- progressive conditions including osteoarthritis, general spinal degeneration and dental health has been collected to investigate the social identity of elderly adults in comparison to younger adults. Using a sample of 150 individuals, the Transition Analysis provided a more dynamic age profile which shows that age differences are found across gender lines and in terms of disease likelihood. Elderly females have especially stood out since they showed a substantial increase of spinal degeneration of the vertebral bodies, caries and tooth loss as compared to elderly males who show a significant decrease or stagnation in these conditions. Older females however have in common with younger adult females the severity of spinal osteoarthrits in the facet joints in comparison to the young male - elderly male grouping which is less affected. Females generally appear to be more affected by disease, yet elderly females of this population are particularly haunted by ill health which ultimately may have made their deaths and presence in this cemetery more likely. Death also is an important aspect of these women's identity. Other forms of identity are highly important in gauging age differences and relationships between young and old. Age only becomes visible through the growing, gendered or diseased body as a medium in the social experience of age. The archaeological interpretation of osteological data shows that Wetwang Slack age groups have various relationships to one another depending on sex, health or even affected body location. This trait of age estimate, sex affiliation and disease status has proven useful in separating the elderly social identity from that of young adults in a way which provided especially elderly Wetwang Slack females with a kind of personality without ignoring their relationships to other age-sex groupings. In life as in death, elderly women stood out physically from the younger individuals of their community, while their relationship to younger females may indicate greater success in surviving the adversities associated with the female experience at Wetwang Slack.

Detecting the elderly - Exploring age using Transition Analysis

Author - Maaranen, Nina, Helsinki, Finland (Presenting author)
Co-author(s) - Buckberry, Jo, University of Bradford, Bradford, United Kingdom

Keywords: Adult age-at-death estimation, Life history, Transition Analysis

Presentation Preference - Poster

The absence of elderly in research is not simply a question of attitudes but of methodological limitations. Intrinsic and extrinsic factors govern the skeletal changes in relation to one another, their importance fluctuating during the life course of the individual. The young are much more dependent on the intrinsic (i.e. genetic) factors however with age the extrinsic factors (such as habitual and environmental) gain influence, spreading the skeletal morphological features to a wider age range. Due to the lack of a perfect age indicator methods used to estimate age-at-death, we must accommodate for the variation using age ranges which often lumped together, ignoring any potential social differentiations in the later stages of the life course. In this study, the Transition Analysis has been utilized on the Iron Age cemetery collection of Wetwang Slack, East Yorkshire, UK, using the method's statistical approach to provide more accurate age estimates for older individuals. Additionally, data on sex and age- progressive conditions including osteoarthritis, general spinal degeneration and dental health has been collected to investigate the social identity of elderly adults in comparison to younger adults. Using a sample of 150 individuals, the Transition Analysis provided a more dynamic age profile which shows that age differences are found across gender lines and in terms of disease likelihood. Elderly females have especially stood out since they showed a substantial increase of spinal degeneration of the vertebral bodies, caries and tooth loss as compared to elderly males who show a significant decrease or stagnation in these conditions. Older females however have in common with younger adult females the severity of spinal osteoarthrits in the facet joints in comparison to the young male - elderly male grouping which is less affected. Females generally appear to be more affected by disease, yet elderly females of this population are particularly haunted by ill health which ultimately may have made their deaths and presence in this cemetery more likely. Death also is an important aspect of these women's identity. Other forms of identity are highly important in gauging age differences and relationships between young and old. Age only becomes visible through the growing, gendered or diseased body as a medium in the social experience of age. The archaeological interpretation of osteological data shows that Wetwang Slack age groups have various relationships to one another depending on sex, health or even affected body location. This trait of age estimate, sex affiliation and disease status has proven useful in separating the elderly social identity from that of young adults in a way which provided especially elderly Wetwang Slack females with a kind of personality without ignoring their relationships to other age-sex groupings. In life as in death, elderly women stood out physically from the younger individuals of their community, while their relationship to younger females may indicate greater success in surviving the adversities associated with the female experience at Wetwang Slack.
greater community participation in caring for this resource the Heritage Council of Ireland has launched a pilot Adopt a Monument Scheme in 2015-16. The experience gained from this will be shared at the round table. At the time of writing this scheme, learning from work in Scotland, has progressed from an open public call for entries to selecting monuments and communities. Further details will be available in September.

TH2-14 Abstract 03 Community Outreach and Engagement through Archaeology Fairs

Author - Dr. Thomas, Ben, Archaeological Institute of America, Boston, United States of America (Presenting author)

Co-author(s) - Langlitz, Meredith, Archaeological Institute of America, Boston, United States of America

Keywords: Community Engagement, Heritage Education, Partnerships

Presentation Preference - Oral

Since its founding in 1879, the Archaeological Institute of America (AIA) has worked to create an informed public interest in the cultures and civilizations of the past through its many outreach programs. The Institute educates people of all ages about the significance of archaeological discovery and encourages community-based outreach. In 2001, the AIA hosted its first archaeological fair. The fair brought together independent archaeological organizations representing a rich array of archaeological subfields to present their programs and resources to a local community in an interactive and engaging manner. Through the fair, the partnering organizations, presented activities that combined the excitement of discovery with sound archaeological thinking; emphasized the idea that archaeological discoveries are resources that help us better understand how people lived in the past and how human societies and communities functioned, developed, and grew; and informed attendees about archaeology and cultural heritage by having them participate in hands-on activities, by observing demonstrations of ancient technologies, and by talking to the experts presenting these various programs. Since 2001, the AIA has organized 23 more archaeological fairs and informed thousands of people through this popular outreach activity. The overall aims of the archaeology fairs are to promote a greater public understanding of archaeology, raise awareness of local archaeological resources, and bring together proximate archaeological groups with a shared outreach goal. In this presentation, the authors will discuss how the AIA fair model was developed through feedback cycles that include evaluation, data analysis, reflection, and trial and error, how it evolved, and how it is spreading to other groups around the world. To date, 28 AIA local societies have hosted fairs and the popularity of this program is increasing among other archaeological groups across the USA as well as in Belize, Canada, Colombia, the Czech Republic, Iran, and Myanmar. This growth in popularity and implementation presents us with unique opportunities to collect and reflect upon data essential to conducting archaeological outreach around the globe.

TH2-14 Abstract 04

The “archaeological paradigm” in the interdisciplinary research in Polish Jurassic Highland

Author - MA Majerek, Magdalena, Nicolaus Copernicus University Toruń Poland, Toruń, Poland (Presenting author)

Co-author(s) - PhD Lawrowicz, Olgerd, University of Lodz, Lodz, Poland

Keywords: archaeological, XX-XI century, interdisciplinary research, places of memory and forgetfulness

Presentation Preference - Oral

The project, called Places of memory and forgetfulness: interdisciplinary research in northern areas of the Polish Jurassic Highland, involves carrying out research in areas that can provide impetus to multi-faced cognition the history, cultural reality, social climate, local and family memory, the heritage of generations, and contemporary identity the inhabitants of the northern part of the Polish Jurassic Highland, i.e. in the area of five communes: Janów, Leśle, Misłów, Olszyn, Pryrów. The project adopts an interdisciplinary perspective on the problem, combining the methods of modern cultural anthropology, and refers to the new trend in archaeology focused on the study of modern times (XIX-XXI centuries). Reflection these two disciplines is supplemented and verified through the knowledge of local history and the history of art.

The project distinguished three complimentary research path: anthropological, archaeological, historical/archival and a common path. Cultural anthropologists use the photographs, written materials, archives, documents and available publications. For them, the source of knowledge about the past and the present is primarily oral history, heard stories from encountered people. Within the queries historical researchers collect general information about the regional history, as well as about specific places and objects, often not adequately developed in the academic literature.

In the discussed archaeological path aim is to attempt to answer the following question: whether in a particular place are material elements of culture capable to confirm, deny or modify the knowledge of the past emanating from collected sources. Archaeological diagnosis was divided into two stages: reconnaissance and non-invasive research (including aerial surveys). In the first stage of the archaeological diagnosis, archaeologists investigate the available source base and makes an initial reconnaissance of the municipality. Then divide objects (places), which have been proposed for research by anthropologists, into three categories: A - objects studied non-invasive methods, which does not require detailed documentation; B - objects studied non-invasive methods, requiring accurate documentation; C - objects studied non-invasive methods, requiring accurate documentation subjected to additional investigation using a metal detector, drill and survey trenches.

Established in the course of archaeological field research documentation (ie. the description card of places, photographs, drawings, moveable monuments: artifacts and relics and their inventories, provides a database for a detailed analysis of the results of archaeological research at the level of a single place (object), as well as the analysis of a set of places in the municipality.

The project is implemented under the National Programme for the Development of Humanities funded by the Ministry of Science and Higher Education in Poland.

TH2-14 Abstract 05 Role of archaeology in rise and fall of local tourist industry. A warning example from Finland

Author - Laulumaa, Vesu, The National Board of Antiquities, Helsinki, Finland (Presenting author)

Co-author(s) - PhD Ławrynowicz, Olgierd, University of Lodz, Lodz, Poland

Keywords: Local involvement, Media, Tourism

Presentation Preference - Oral

In June 1996 paleolithic stone tool was found in Susiliuola-cave in western Finland. As the first known paleolithic site in Scandinavia it received plenty of attention in national media. Soon after the first find was revealed and reported in media, the site was visited by thousands of people and local economics was boosted by the visitors. Tourism flourished. Hats, t-shirts, food, exhibitions, bars and restaurants were named after the site. Archaeologists, on the other hand, were not happy that their precious archaeological site harnessed for a tourist story and were criticising local efforts as pathetic. Local communities were planning to invest millions for the future attractions, like Ice Age Centre and even an opera. In meanwhile there was a growing debate among archaeologists if the finds and the site was paleolithic or not, it was also accused to be a hoax. Critics grew stronger also in the media. Debate cast a long shadow over the site and affected the public opinion. Attraction faded away and tourism collapsed. Last excavations season was in 2008. The debate concerning the authenticity of the finds and cave as a paleolithic is still unsolved.

Now discoveries in archaeology get usually attention from media and public. Growing interest can turn archaeological site to tourist attraction and raise local tourist businesses. In the best cases this will lead to fruitful co-operation between archaeologists, local officials, entrepreneurs and public. It is also possible, that overenthousiastic start can lead to very disappointing end for all parties involved.

TH2-14 Abstract 06 My Home Ground - past and present

Author - Hylén Madsen, Lene, Museum staderborg, Standerborg, Denmark (Presenting author)

Co-author(s) - Dr. Thomas, Ben, Archaeological Institute of America, Boston, United States of America

Co-author(s) - Purup, Marianne, Visit Standerborg, Ry, Denmark

Keywords: Art, Ownership, Storytelling

Presentation Preference - Oral

Escape is a concept that adds energy and historical context to newly developed suburban sites. When an excavation site has been “emptied” for historical data by the archaeologists and the area has been developed for modern life, it is important to tell the unique story of the place to newcomers as well as the people who already live around the site. This can be done in many ways. Our experience is that bringing in Art into the process lifts the story telling - and a work of art as well as the presence of an artist at Work - result in increased local communication and also make the site a point of interest for tourists. The concept etScape combines art, archaeology, past and present and creates and communicates art on sites with strong archaeological evidence combined with the scientific excavations. Specialists in Tourism, Art and Archaeology work together and combine the three on equal terms with the participation of locals and children. Escape makes a crucial difference from non-participation to ownership.

TH2-14 Abstract 07 Giving is having! Everybody is winning!

Author - Adel, Vadim, Pirkanmaa Provincial museum, Tampere, Finland (Presenting author)

Co-author(s) - Mohlissen, Ulla, Pirkanmaa Provincial museum, Tampere, Finland

Co-author(s) - Adel, Vadim, Pirkanmaa Provincial museum, Tampere, Finland

Keywords: cooperation, local people, openness

Presentation Preference - Oral
Pirkannaa Municipal Museum has conducted excavations on a very unique Late Iron Age / Early Medieval dwelling place during the past years. The first discoveries were made by the local people, who have been familiar with the place for decades. The site has attracted an extraordinary amount of interest from various operators: a large museum centre and a small local museum seeking to enhance its activities; a university and independent researches with personal interest in the site and its material; local authorities wishing to develop tourism. Pirkannaa Municipal Museum has made research material and information freely available to all, and established contacts with many different operators and experts. With a little effort from everybody, the enthusiasm is clearly spreading. But how well do the different players cooperate? Will the outcome be a large-scale exhibition, a new tourist attraction, and a new multidisciplinary research project, as planned? The paper deals with archaeological excavation project as a societal concept, which creates working interfaces between different operators and sectors of society. The current and potential role of the museum as an enabler of new kinds of activities and projects will be discussed. It is noted that transparency, publicity, contacts, and efficiency are the most important basis for cooperation, and required in managing a research project with lower level of resources than normally.

Co-author(s) - Mele, Marko, Universalmuseum Joanneum Graz, Graz, Austria
Co-author(s) - Črešnar, Matija, University of Ljubljana, Ljubljana, Slovenia
Co-author(s) - van Kant, Marit, Vrije Universiteit Brussel, Brussel, Belgium

Keywords: ILlicit trafficking, Illicit finds, Acquisitions, Acquisitions policy, First line of defense

Acquisition policy- first line of defense

The legislation of the Republic of Croatia allows for the sale of individual archaeological finds or entire collections to museums. If the seller can prove the origin of the cultural good in the sense of family legacy or heritage. In practice, the easily obtainable confirmation of a notary on the origin of the good is the only thing required to prove the legality of such possession and to enable such sales.

The Archaeological museum in Zagreb possesses a certain amount of finds acquired in this way and which have a questionable origin, and, as the parent institution, it works on entire collections which were subsequently seized from the same collectors which could, only a few years back, make legal trade with the Museum and were legally protected by the aforementioned notary confirmation on family heritage.

What are museums doing to prevent illicit trafficking, archaeological excavations and trafficking?

It is understandable that archaeological museums cannot change the legislation, but their social role is to point out legislative flaws, and I feel that they should individually label collectors outside the law, sellers and malicious metal detector users by highlighting finds obtained in this way in permanent exhibitions and publications, just like they highlight well-intentioned donors. But this is only a cosmetic touch up.
Illicit trafficking of archaeological heritage in Croatian post-war and transitional context

The looting and illicit trafficking of archaeological heritage has a long tradition in Croatia, though most of these illegal activities have been concentrated in a few key areas. One of these black spots is the city of Sisak, which developed on the ruins of the Roman provincial center Siscia and has provided seemingly inexhaustible archaeological material for all sorts of dealers and smugglers since the second half of the 19th century. The attitude of professional institutions, primarily museums, towards these activities varied between the 19th and 21st centuries: from tacit approval and cooperation by purchasing illegally collected items, to ignoring the issue, and finally limited, loud advocacy for legal punishment. Unfortunately, throughout this period, these institutions mostly failed to encourage a wider public debate on the issue of destruction wrought by the illicit trafficking of archaeological heritage. What makes the Croatian socio-political context unique among Central European and Mediterranean countries are the war and post-war periods of the 1990s and 2000s. The beginning of the '90s saw a wide range of problems concerning the preservation of archaeological resources, including the direct destruction of sites and museum institutions, the looting of archaeological material by the Yugoslav Army and Serbian paramilitary units, and the mining of large areas that, in the long-term, has made archaeological sites inaccessible for research. The post-war period brought even more problems. For example, there was no institutional cooperation, except in some individual cases, during the process of clearing thousands of square kilometers of land from mines with metal detectors. We can imagine that great numbers of objects have been found but only a small portion ended up in museum collections while the majority of “treasures” stayed in the hands of war veterans. "The systematic and inspiring raising of social awareness through the educational (equally pedagogy and andragogy) museum function about the flaws of decontextualized archaeological material and the inestimable (non-material) value of archaeological heritage is certainly the best long-term protection method because, frankly, lack of knowledge jeopardizes heritage the most. However, my praxis taught me that this approach, in which I firmly believe and on which I actively participate for years, will never fully eradicate malicious predators who will, despite everything, continue to use archaeological heritage for personal profit. It seems that the combination of constant development of social awareness with the sharp and well-defined legislative is the closest we can get to the ultimate annihilation of misusing archaeological heritage.

TH2-16 Abstract 02

The formation of a universal national (or wider) acquisition policy in archaeological museums is the first preventive step. The non-profit sector is such a policy only partly present, but encourages sale of archaeological finds and secret and non-expert excavations which result in individual decontextualized finds acquired/recorded by the museums with public funds.

A policy on collecting written through a consensus in the archaeological profession could deter all potential malicious collectors, not leaving room for them to manipulate ‘family heritage’ and, on the other hand, should not discourage well-intended donors and legal possessors to give their finds over to museums. A high-quality and publicly available collection policy of archaeological museums, made in cooperation with legal experts, is a key step in preventing illicit behavior regarding archaeological heritage, and is a strong appeal to state legislature to redefine the legal framework for such activities.

I hope to share my experience and specific proposals for how to win this fight by participating at this round table.

Can local people preserve cultural heritage?

Cultural heritage has fallen under the threat of being of damaged due to armed conflicts, and destruction has increasingly become a major part of daily news all over the world. This phenomenon is not limited to specific geographical areas, but it includes various countries as much as it contains different ways and tools of destruction such as looting, bombing, illegal excavations, occupation of armies, and illicit trade. In response to these disgraceful actions, procedures have been taken to protect cultural heritage from being damaged. However, the preservation process cannot be done individually, but it has to be through institutional order. As it is well-known, governments are the main responsible stakeholder of preserving cultural heritage - as they are representing the people and protecting their properties especially in times of conflict. Local people have been considered as one of the most important stakeholders of cultural heritage.

TH2-16 Abstract 03

In the meanwhile, local populations are not able to preserve cultural heritage without theoretical overviews, practical information or even being informed about the value of their heritage. Hence, the necessity of creating a combination of benefits among the different stakeholders became an urgent necessity.

The ongoing armed conflict in Syria and Iraq has progressively damaged numerous of cultural heritage sites, especially in the cities of Aleppo – Syria and Mosul – Iraq. The escalated violence did not avoid the museums, immovable and movable sites and even intangible cultural heritage was either damaged or completely demolished.

In this paper, the author is going to present samples of cultural heritage destruction in Syria and Iraq. Also, he will present a plan to increase the awareness of local people – as one of the stakeholders - in a way that helps to protect cultural heritage under threat.

Metal Detecting on Dutch WWII conflict sites

TH2-16 Abstract 04

Dutch academic interest in the heritage of World War II (WWII) has been limited until recently. Attention for the subject is much greater in the wider community. Unfortunately, this interest is also expressed in many illegal searches and excavations. Metal detecting is a hobby that has been vilified by many archaeologists as an uncontrollable threat to the proper study of the past. During this presentation I will discuss if an effective cooperation is possible between archaeologists and metal detectorists concerning this fragile heritage. What are the benefits and drawbacks?

Much of the WWII material in the Netherlands (and abroad) is collected with metal detectors, used both by professional archaeologists and amateur metal detectorists. Without an archaeological methodology underpinning the use of the device, a metal detector can lead to the incorrect assessment of a site’s archaeological potential and even damage the site.

A policy on collecting written through a consensus in the archaeological profession could deter all potential malicious collectors, not leaving room for them to manipulate ‘family heritage’ and, on the other hand, should not discourage well-intended donors and legal possessors to give their finds over to museums. A high-quality and publicly available collection policy of archaeological museums, made in cooperation with legal experts, is a key step in preventing illicit behavior regarding archaeological heritage, and is a strong appeal to state legislature to redefine the legal framework for such activities.

Without an archaeological methodology underpinning the use of the device, a metal detector can lead to the incorrect assessment of a site’s archaeological potential and even damage the site.

Groups of metal detectorists and other enthusiastic amateurs have often tried to research conflict-related sites as responsibly and ethically as possible, but in previous decades the work has remained fragmented and was not always reliable. There is also a strong suspicion by professional archaeologists that films and television series such as Saving Private Ryan (1998) and Band of Brothers (2001), as well as significant aniversarys can intensify the problem. During this presentation I will discuss if an effective cooperation is possible between archaeologists and metal detectorists concerning this fragile heritage. What are the benefits and drawbacks?

TH2-17 Abstract 01

Threats to Heritage and the Distributed Observing Network of the Past: A Northern View

Author - Prof. McGoey, Thomas, Hunter College CUNY, New York, United States of America (Presenting author)

Keywords: Climate Change and Heritage; Impact and Strategies; Climate Impact; Heritage Loss; Northern Presentation Preference - Oral

Climate change is impacting archaeological sites all over the world, as rising sea levels, increasing storminess, wind erosion, and a range of extreme weather events damage sites and monuments. These processes are ongoing, and in northern and alpine regions the threat of rising soil temperatures and "melting middens" broadens the threat to take in sites far inland. In SW Greenland, recent survey data indicates only a handful of sites retain once excellent conditions of organic preservation (three of nearly a hundred sampled). In the Bering Sea and N Alaska sites spanning thousands of years are going into the sea across broad coastlines. This loss impacts both cultural heritage and the scientific value of "a distributed observing network of the past" of great value to modern resource managers, climate modelers, and planners for a sustainable future. A host of new techniques including aDNA, stable isotopes, and trace element analyses are now broadening our understanding of past food webs and biogeography-just as some of our most valuable archives are being destroyed forever. However, multiple agencies and communities are coming together to address these threats, combining disciplinary science and humanities within the full engagement of local communities. This paper presents some of the strategies for collaboration being developed in cooperation with the Society for American Archaeology's Climate Change Strategies and Archaeological Resources committee and the IHOPE Threats to Heritage and the Distributed Observing Networks of the Past program.

TH2-17 Abstract 02

Mitigating Climate Change Effects on Heritage Sites?

Author - Drs Martens, Vibeke Vandrup, RIKU - Norwegian Institute for Cultural Heritage Research, Oslo, Norway (Presenting author)

Keywords: In situ preservation, mitigation, Northern Norway Presentation Preference - Oral

Future climate change is expected to raise sea levels, increase temperatures and change the overall precipitation patterns, with a potentially great negative effect on preservation conditions. How should cultural heritage management respond to these threats? In order to prepare adequate mitigation schemes, it is necessary first to know exactly what the site is trying to preserve, what state it is in now, and what the conditions for in situ preservation are. Degradation of archaeological remains depends on environmental conditions. Which measures may be taken to mitigate the predicted climate changes and ensure continued in situ preservation of heritage sites? Should they be covered, or can changes in soil chemistry be stopped? Studied sites in Northern Norway are used to demonstrate impacts and possible mitigating actions.

TH2-17 Abstract 03

Climate Change and its Impact on Cultural Heritage

Author - Dr. Davies, Mairi, Historic Environment Scotland, Edinburgh, United Kingdom (Presenting author)

Co-author(s) - Tracey, Emily, British Geological Survey, Edinburgh, United Kingdom

Keywords: Adaptation, Climate Change, Conservation Presentation Preference - Oral

As a large public body, Historic Environment Scotland (HES) has duties under Part 4 of the Climate Change (Scotland) Act 2009 that require it to contribute to climate change mitigation and adaptation, and to act sustainably. Ministers have identified HES as a ‘Major Player’ because it has a larger influence/impact on climate change than other public bodies. A Climate Change Action Plan for Historic Scotland 2012-2017 sets out how HES will fulfil its duties under the Act. The UK Climate Change Risk Assessment 2012 identified a range of risks and opportunities that climate change may present. Many of these have the potential to impact on the historic environment. HES is key to the delivery of Climate Ready Scotland: Scottish Climate Change Adaptation Programme, which takes it with the following: • quantifying heritage assets affected by climate change using GIS • developing a methodology for assessing climate change risk to historic sites • creating a risk register for the ‘Properties in Care’ that are managed by HES (to assist with management planning and resource allocation).

In response, HES has undertaken a research project in partnership with the British Geological Survey (BGS) that sets out to identify the threats associated with climate change (such as slope instability and flooding) that have the potential to impact on the HES Estate. The results are assisting HES in preparing a risk register for the properties across the HES Estate and in shaping and prioritising on-going conservation and maintenance programmes. The research will also inform the development of a methodology for the broader historic environment.

TH2-17 Abstract 04

A Climate Change Impact and Risk Assessment for the Historic Environment Scotland Estate

Author - Dr. Davies, Mairi, Historic Environment Scotland, Edinburgh, United Kingdom (Presenting author)

Co-author(s) - Tracey, Emily, British Geological Survey, Edinburgh, United Kingdom

Climate change and the effects on cultural heritage in the Netherlands

Author - Kars, Eva, EARTH Integrated Archaeology B.V., Amersfoort, Netherlands (Presenting author)
Co-author(s) - De Moor, Jos, EARTH Integrated Archaeology B.V., Amersfoort, Netherlands

Presentation Preference - Oral

Climate change is a fact. A fact is also that the knowledge of the impact of climate change on the parameters in the soil is very limited. Knowledge on the behavior of soil parameters is very important within in-situ conservation programs and therefore we have to work on finding measures to adapt to climate change in relation to conservation of the archaeological heritage.
Moreover, for the coming decades the expansion of the infrastructure, for example the directive of renewable energy (see abstract in session Abstract nr. TH2-12), confronts and challenges us how to deal with the known and still unknown climatic impacts on cultural heritage. In this presentation we will discuss known parameters of climate change and the possible impact on the cultural heritage in the Netherlands, such as more and heavier rainfall, alternating with periods of drought, temperature rise and a predicted sea level rise.

Expected consequences of climate change are higher groundwater levels in general, but also very strong changes in water levels between dry and wet periods. A temperature rise will give longer warm periods, which in turn will prolong the growing season and lengthen the decomposition process of organic material in the soil. Sea level rise can have effect on the salinity of the groundwater, which will result in a more rapid degradation of some of the archaeological data.

Both sea level and intensifying peak flows of rivers, require precautions to be taken in the Netherlands. Therefore, the national Flood control program foresees a reinforcement of 700 km of levees within the coming 10 years. Particularly the pumping systems in the Netherlands contain historic dike remnants. In addition, long the rivers, the shores are being made “natural” again to let the water flow over land to prevent uncontrolled flooding.

These engineering projects give us possibilities to study not only the adaption of man to changing environmental conditions through time, but they also give us a possibility to create different strategies for cultural heritage to be preserved for the future, in relation to expected climate changes. In the presentation some examples will be presented.

**TH2-17 Abstract 10**

**Sustainable energy versus sustainable heritage**

In The Netherlands

**Author** - Kars, Eva, EARTH Integrated Archaeology B.V., Amersfoort, Netherlands (Presenting author)

**Co-author(s)** - Van Rooijen, Cees, Cultural Heritage Agency of the Netherlands, Amersfoort, Netherlands

**Keywords:** In situ preservation, spatial planning, sustainability

**Presentation Preference - Oral**

The Netherlands is not only a small country but also a country with large storage of archaeological remains dating from all periods, from ancient times until our recent industrial period. In The Netherlands is also one of the densely populated areas in the world which means that the archaeological heritage is under severe pressure and is always threatened.

It is a big challenge already to combine the exploration of infrastructure and other expansion and the in situ preservation of the cultural heritage. The increased pressure of the implementation of the Renewable Energy Directive gives an even larger pressure and a challenge for the culture heritage sector. Now, the Renewable Energy Directive puts new pressures on the peripheral regions, both onshore and offshore.

A hot topic is the Dutch approach for combining all functions, characteristics, consistency into one subsitu spatial planning policy vision called STRONG. This emphasizes more and more the involvement of archaeology for the sustainable planning and vice versa.

In this presentation we will discuss how the exploration of green energy, both offshore and onshore, will challenge the care for archaeological heritage within the Netherlands. What areas are/will be explored? When analyzing the maps of exploration and the positions of the entire Alpine front during the First World War, close to the frontier between the Kingdom of Italy and the Austro-Hungarian Empire. Archaeological excavations have led to the recovery of the artefacts and uncovered the whole context of the site of Punta Linke, characterised by the presence of a tea canteen. All the original structures freed from the ice and the material found there, have been relocated. In summer 2015 more than 2170 people visited the site during 55 days of opening.

**TH2-17 Abstract 12**

**An integrated approach to sustainability: eco-cultural heritage practice at Aktöprüklük, Turkey**

**Author** - Curtis, Caitlin, University at Buffalo, Buffalo, United States of America (Presenting author)

**Keywords:** community, heritage, sustainability

**Presentation Preference - Oral**

Community participation and sustainability are now widely recognized as crucial strategies in heritage practice. This paper thus presents a case study that utilizes an ethnographic methodology, including interviews with over 70 residents in Akpınar, Bursa, Turkey, the local context of Neolithic-Chalcolithic Aktöprüklük Höyük. With the initial aim of trying to understand sustainability and heritage within the terms of the community, newly gained information can now aid in forming a symbiotic relationship between archaeological sustainability, environmental sustainability, and community sustainability.

When discussing what was most valued locally, many noted that Uluabat Gölü was among the most cherished assets in town. The lake, upon which the town is located, has long been a site for traditional community festivals, and is now used as a family picnic venue for locals and outsiders alike. The lake also attained Ramsar status in 1998 for its rich wetlands and extraordinary waterbird population. However, Uluabat Gölü was also the initial site of industrial development in town over 30 years ago, with the first factories to open setting on the lake edge. These factories deposited waste in the lake, and with time, a place that had been a local source for recreation, fishing, and irrigation became nearly unusable.

In recent years, local government measures to more strictly regulate factory pollution, as well as efforts to clean the lake spearheaded by a local university, have begun to improve the water quality in the lake. However, at the same time, many note that the local government has not made a significant effort to maintain and develop the shore of the lake for the public or for visitors, with littering a continuing problem. Indeed, many locals noted the untreated potential of the lakeshore in Akpınar for attracting tourists, especially considering the existing tourist attraction of Golyazı island just a few kilometers away at the center of the lake.

As a result, as Uluabat lake is a valuable resource for local and regional sustainability, it is important to support additional measures for its maintenance, protection, and management, there are clearly pathways here toward the parallel dialogue of archaeological heritage. Similarly, the archaeological site has been threatened by factory development and can be a valuable community and touristic resource. There is therefore significant potential for archaeologists to engage in this broader dialogue of sustainability that includes environmental resources and community concerns. By including the lake in our management strategies, with such simple measures as a litter collection campaign by the excavation team, we can make headway in sustaining a valuable natural and community resource. Moreover, we can open up our site and the region to the benefits of not only heritage tourism but also ecotourism. Consequently, with an integrated approach to not only the sustainability of heritage, but also climate, environment, and community, we can make greater strides toward success in sustainability strategies overall.

**TH2-17 Abstract 13**

**Local Heritage Societies Adapting to Climate Change**

**Author** - Archaeologist Grahn Danielson, Benjamin, Picea kulturarv, Fors, Sweden (Presenting author)

**Keywords:** climate change adaptation, Dalstrand, Local heritage societies

**Presentation Preference - Poster**

During the autumn 2015, SMHI – Swedish Meteorological and Hydrological Institute, published new Climate Scenario Reports for all counties in Sweden. As one of the county archaeologist at the County Administrative Board in Dalarna I was involved in a project about climate change, crisis and cultural heritage, and I suddenly realized how climate change will impact my everyday life.

I live in a southern and central boreal region where there will probably be no more snow during winters, the sea level will rise up one meter until 2100, precipitation will increase with approximately 25%, there will be more torrential downpour, greater risk of flooding, risk of drought (all year), more frequent severe forest fires etc. And all this will also threaten the cultural heritage! Suddenly my bad conscience was not just a sense and I realised if we would also impact my working life. Forest fires, horizontal rain and flooding will be a real threat churches, old houses and protected buildings.

Less frost in the ground will make windfalls, damaging ancient remains in the forests.

In Dalarna, the County Administrative Board, started to inventory the cultural values that could suffer most, and create action plans, and communicate them to the emergency services. As a part of the course Integrated Conservation at Gothenburg University I would like to explore what was happening in other parts of Sweden. The authorities was probably on the track all over the country, but how about the local heritage societies? In this poster I present the results of a survey about climate change and adaptation among local heritage societies in Dalarna, in the western part of Sweden.
PREVENTIVE ARCHAEOLOGY, SCIENTIFIC RESEARCH AND ECONOMIC DEVELOPMENT

Saturday, 3 September 2016, 09:00-18:30
Faculty of Philosophy, Room 214p

Author: Demoule, Jean-Paul, Université de Paris I Sorbonne, Arles, France (Presenting author)
Co-author(s): Guermandi, Maria-Pia, Istituto Beni Culturali - Regione Emilia Romagna, Bologna, Italy

Presentation Preference - Regular session

Is it possible to reconcile three seemingly contradictory requirements that are 1) infrastructure works and their economic implications, 2) preventive archaeology as set out in national legislations following the Malta convention, and 3) structured and genuinely scientific archaeological research? While legal systems have been put in place in different countries after the signature of the 1992 Malta convention, numerous problems of implementation and reconfiguration still remain, often exacerbated by the 2008 economic crisis. In fact, legal positions have actually been eroded in some countries, and additional constraints such as shortened delays and narrower margins have been imposed on archaeological organisations and operations. Moreover, in countries where archaeology is predominantly conceived as a commercial activity, the crisis has thrown numerous organisations into a cost-cutting spiral, with as a side effect, in many cases, the reduction of standards both in terms of employment conditions and of scientific production.

The current session, building on related sessions and round tables regularly promoted by the “Committee on Archaeological Organisation and Legislation” at previous EAA meetings, seeks to present the current state of affairs with regards to preventive archaeology, legislation and scientific research in various countries. Our intention is not only to critically appraise a range of case studies, but also to provide some more general arguments and tools for thought to those seeking to promote, towards the third decade of the 21st century, this challenging reconciliation of scientific, patrimonial and socio-economic aims.

TH2-19 Abstract 01
Rescue and Preventive Archaeology in Europe: Public Service or Commercial Activity?

Author: Demoule, Jean-Paul, Université de Paris I Sorbonne, Arles, France (Presenting author)

Keywords: preventive archaeology, scientific research

Presentation Preference - Oral

While the term heritage normally refers to the transmission of property within a family, the term Cultural or Archaeological heritage refers to a national or ethnic community. Although national identities in the modern sense of the term only appeared in the early 19th century, there have for some time been two different conceptions of the State in the western world. In countries based on Roman law such as France, the State, even if it is disliked, is central to the conception of society. In “common law” Anglosphere countries, and especially the USA, the State has never been completely legitimate. This view was further reinforced in the mid-nineteen-eighites through the domination of Milton Friedman’s free-market ideology and the Reagan and Thatcher governments. In a sense, there is no real society any more, only a juxtaposition of consumers, buying or not buying goods and services in a market controlled by an “invisible hand”.

As we know, the State was rediscovered in 2008, when the western banks had to be rescued. Yet this ideology also partly affects the conception of Heritage. Developers are not economic agents threatening our shared archaeological heritage, who should pay for excavation to conserve it. They become “clients” who chose between different producers, in this case the private companies doing archaeological excavation. This view has had disastrous consequences in terms of research, since many excavation carried out through Cultural Resource Management have never been studied or published. It also has ethical and political consequences for our conception of our common past. France offers a good (or sad) example of such an historical evolution, since commercial competition was introduced in archaeology in 2003.

TH2-19 Abstract 02
25 Years of Development-led Archaeology in England: Strengths, Weaknesses, Opportunities and Threats

Author: Trow, Steve, Historic England, Southampton, United Kingdom (Presenting author)

Keywords: Archaeology, development-led, planning

Presentation Preference - Oral

While the issuing of a piece of technical planning guidance may seem like limited cause for celebration, it did in fact mark a new era in the archaeology of the UK and far beyond. Beforehand “rescue archaeology” was funded by the UK’s central government: thereafter it became the responsibility of developers. It is estimated that, in the intervening period, some 75,000 archaeological investigations have been supported by this system, recording many thousands of archaeological sites that would otherwise have been destroyed by development, without record.

The quarter-century anniversary of this change provides an opportunity moment to reflect on the changes that have been wrought in the intervening period. In terms of resources directed to the study of archaeology, the revolution in understanding that has generated and the growth in professionalism in our discipline, the change in policy has been a major success. But it has also created challenges.

This paper will review the achievements of the last 25 years and the balance of benefit and problem that now faces the archaeological profession in England.

---

TH2-19 Abstract 03
Identifying research aims at the earliest stage of large development plans, first thoughts matter!

Author: Allan, Tim, Historic England, Northampton, United Kingdom (Presenting author)

Keywords: early assessment, major development, research priorities

Presentation Preference - Oral

‘Development led’ (preventive) archaeology is still regularly contrasted to ‘research archaeology’. In the UK the former is done largely by commercial organisations (contractors), the latter mainly by universities and community groups with public or charitable funds. This use of language belies a considerable shift in intent over recent years, from both archaeological curators and contractors, and considerable crossover with many contractors undertaking both commercial and not for profit projects.

The development of national and regional research assessments, agenda and strategies (e.g. in England ‘Regional Research Frameworks’) has sought to ground archaeological practice in an explicitly aims and objectives based approach. For archaeological assessment and mitigation to produce meaningful results it must work iteratively, we need therefore to formulate initial questions from first sight of a project. Archaeological curators are mostly public employees working for local and national governments, agencies and institutions, they have limited time and relationship capital to spend. To influence outcomes, key research questions must be identified early in process (especially concerning absence of knowledge). If an archaeological impact, in particular a setting impact, is to be mitigated or eliminated (or for a planning outcome influenced) both the affected historic asset’s significance and the impact must be understood. Focused research is required to understand these issues, their gravity and what might be done, and it is rarely tenable to raise them late in a project options and design process.

How can archaeological curators and contractors integrate research into large scale development projects and avoid slipping into mechanical processes which simply translate and transform remains to archive? We know what we ‘should do’ but require an understanding of practice and an articulation of the narrative in which our jobs are situated. Without being able to tell to ourselves the story of our role in the archaeological research process we can neither defend our position nor critically assess our success.

Where across complex landscapes with patchy existing information should archaeologists deploy their time and other people’s money and attention? This paper discusses the application of professional judgement and expertise to the identification of key research issues both within and outwith areas of proposed development, at the earliest stages of professional engagement.

It draws upon case studies from the English East Midlands (UK). This initial view of a project should not pre-speak an evidence based and iterative approach but is crucial to support a robust Environmental Impact Assessment (EIA) which avoids a reductive approach based upon research. This paper will examine the planning process to minimise harm. Archaeological assessment and mitigation requires a research based approach from day one, for better or worse we never have as little information or as much potential influence as we do at that point.

TH2-19 Abstract 04
Trends in Scandinavian cultural heritage management in the 2010s

Author: Professor Hakon, Glorstad, University of Oslo, Oslo, Norway (Presenting author)

Keywords: development-led archaeology, Heritage management, Scandinavian models

Presentation Preference - Oral

‘Development-led’ (preventive) archaeology is still regularly contrasted to ‘research archaeology’. In the UK the former is done largely by commercial organisations (contractors), the latter mainly by universities and community groups with public or charitable funds. This use of language belies a considerable shift in intent over recent years, from both archaeological curators and contractors, and considerable crossover with many contractors undertaking both commercial and not for profit projects.

The development of national and regional research assessments, agenda and strategies (e.g. in England ‘Regional Research Frameworks’) has sought to ground archaeological practice in an explicitly aims and objectives based approach. For archaeological assessment and mitigation to produce meaningful results it must work iteratively, we need therefore to formulate initial questions from first sight of a project. Archaeological curators are mostly public employees working for local and national governments, agencies and institutions, they have limited time and relationship capital to spend. To influence outcomes, key research questions must be identified early in process (especially concerning absence of knowledge). If an archaeological impact, in particular a setting impact, is to be mitigated or eliminated (or for a planning outcome influenced) both the affected historic asset’s significance and the impact must be understood. Focused research is required to understand these issues, their gravity and what might be done, and it is rarely tenable to raise them late in a project options and design process.

How can archaeological curators and contractors integrate research into large scale development projects and avoid slipping into mechanical processes which simply translate and transform remains to archive? We know what we ‘should do’ but require an understanding of practice and an articulation of the narrative in which our jobs are situated. Without being able to tell to ourselves the story of our role in the archaeological research process we can neither defend our position nor critically assess our success.

Where across complex landscapes with patchy existing information should archaeologists deploy their time and other people’s money and attention? This paper discusses the application of professional judgement and expertise to the identification of key research issues both within and outwith areas of proposed development, at the earliest stages of professional engagement.

It draws upon case studies from the English East Midlands (UK). This initial view of a project should not pre-speak an evidence based and iterative approach but is crucial to support a robust Environmental Impact Assessment (EIA) which avoids a reductive approach based upon research. This paper will examine the planning process to minimise harm. Archaeological assessment and mitigation requires a research based approach from day one, for better or worse we never have as little information or as much potential influence as we do at that point.

---
Since the 1990s the Scandinavian countries have in various ways tried to adjust cultural heritage management and development-led archaeology according to national policies. However, the ambitions of preventive archaeology have been affected by more general political trends. In other words, the most radical modernist reforms have been implemented. The success of these reforms has however been questioned. Still, far-reaching changes are nevertheless introduced. Local, Scandinavian solutions are challenged by organizational models from the larger European countries and by EU legislation. This paper addresses some of these trends and the potential role of the application of preventive archaeology as a scientific discipline. Theoretical trends undermining the importance of human actors may enhance or describe the power of EU directives as an inevitable destiny of Scandinavian archaeology. This thus makes the fact that archaeological engagement with politics on a national level is of major importance for the future of European Archaeology.

TH2-19 Abstract 05
Development in preventive archaeology in Slovenia: a view from the field
Author - MA Novak, Matjaž Ahej d.o.o., Ljubljana, Slovenia (Presenting author) Keywords: preventive, Slovenia Presentation Preference - Oral

Slovenia has rather long tradition of architectural heritage protection, dating from the early 1850's when the Imperial/Royal Central Commission for the Research and Protection of Artistic and Historic Monuments was established in Vienna (at that time Slovenia provinces belonged to the Austrian Empire). Since then, Slovenia has passed through great political changes to become independent country in 1991 with the end of former Yugoslavia. More than 150 years of legislation in heritage protection is an important factor also when considering the development of preventive archaeology today. General institutional framework and doctrine of protection was for decades tied to the Austrian tradition (even after 1918), and Slovenia kept probably the best organized and efficient heritage service in former Yugoslavia with well developed regional network of heritage protection institutes. Legal transformation of old “Yugoslav” system started early in the 1990s, but it was not these changes which are directly associated with the introduction of preventive (rather than rescue) archaeology. In fact, it was great pressure posed by national program of motorways construction in the early 1990s, which considerably challenged the existing (traditional) system of protection, and required answers in terms of preventive strategies. It is in this context in which also the Malta Convention became rather more used and implemented. Here, it is possible to see two major and parallel trends in changing the system of protection: a) positioning archaeology (and its preventive role) in obligatory procedures in spatial planning and b) emergence of private market of archaeological services. For the period 1994–2008 one could speak of a hybrid system of organization of preventive archaeological services with public (regional) institutes officially directing large scale excavations and surveys (on motorway sites mostly), but hiring private SME for the actual job in the field. Existing public institutions simply could not meet the requirements for fast and efficient archaeological preventive practice. In 2008, situation changed again, when new Cultural Heritage Act (which introduced the term preventive research) limited the issuers of protection conditions and recommendations (i.e. heritage institutes) to monitoring of archaeological field research. The actual research was undertaken by SMEs or by public instructions which have a right to compete in the market (e.g. museums, academic institutions). There is also another important issue associated with this act. Prior to 2008, it was the heritage institutes which negotiated the extent and also finances of the research, and have legal powers to force the developers to accept certain measures; while, afterwards, there were possible direct negotiations between developers and private researchers. Such liberalization of negotiations had in many cases negative consequences, especially in the context of recent economic crisis, which in Slovenia affected the most the investments in spatial development and construction, and consequently also all ‘players’ in preventive archaeology.

TH2-19 Abstract 06
In search of a common space: (sharing) the spatial data of preventive archaeology
Author - Noura, Federico, Sassari, Italy (Presenting author) Co-author(s): Moreau, Anne, Inrap, Paris, France Keywords: GIS, Preventive archaeology, Webmapping Presentation Preference - Oral

According to the Article 7 of the “European Convention on the Protection of the Architectural Heritage”, the parties have to «make or bring up to date surveys, inventories and maps of archaeological sites» and «take all practical measures to ensure the drafting, following archaeological operations, of a publishable scientific summary record before the necessary comprehensive publication of specialised studies». Furthermore, the Article 8 of the same “Convention” commits the parties «to facilitate the national and international exchange of elements of the architectural heritage for professional scientific purposes» and «to promote the pooling of information on archaeological research and excavations in progress». 25 years after the “Malta Convention”, we need to come back to this text and make a debrid of the current situation: is the article 7 just applied? If it is the case, how do the operators of preventive archaeology do in Europe? This issue underlay is that of the harmonization of the spatial data appears to be one of the answers: Archaeology is, above all, a spatial science and it seems thinkable to find a general agreement on the way of representing the spatial data. The issue of production, harmonization and management of archaeological data has become by now central, in relation to the huge diffusion of GIS and Web Mapping. Basing on this premise and on two practical experiences developed in very different contexts, this paper aims to give a contribution toward the definition of a minimal spatial and archaeological value, useful to the production of cartographical data on a European scale. On the one hand, it will be presented the case study of the formalization of a Spatial Database Catalogue at the French National Institute for Preventive Archaeology (Inrap), on the other hand, the experimentation of the STAN-MODI Dataset (National Archaeological Geographic Information System) at the Department of Architecture, Design and Urbanism of the University of Sassari (DAGU).

The common goal is to realize a spatial data catalogue dedicated to archaeology (preventive and not), open and shared, useful on one hand for the land development and, on the other hand, for the archaeological research. Archaeological spatial data then would become the central element towards logic of openness and sharing of historical knowledge; and the historical knowledge becomes the engine of the protection and preservation of places: the first concrete “preventive” action that archaeology should put in place throughout Europe.

TH2-19 Abstract 07
Preventive archaeology in current Slovakia
Author - Dr. Michalík, Tomas, Cultural Heritage Consulting Ltd./ Slovak Association of Archaeologists, Trenčín, Slovakia (Presenting author) Keywords: archaeological heritage, preventive archaeology, Slovakia Presentation Preference - Oral

Cultural heritage and its protection is regulated in the number of laws in Slovakia. Basic mentions in the Constitution refer to individual laws, regulating cultural monuments, historic sites, archaeological heritage, museums, galleries, libraries, archives, artistic works or intangible heritage. From the point of view of archaeology, archaeological heritage, its protection and management, the Act on Protection of Monuments and Historic Sites No. 48/2002 Coll. is the most important law, fully regulating the preventive archaeology as a whole. Administrative competences are applied by the Slovak Republic and its regional branches. They monitor and supervise all activities with potential impact on the archaeological heritage, then they decide on necessity of conducting of research, its conditions and time frame as well as on offences. Their legal position in the Act is very strong, but their personal capacities usually there are 2 or 3 archaeologists for one region) are low. Since the last important amendment of the Act in 2014, there is express provision defining and regulating the preventive research. Previously there was no definition of preventive nature of the research, although this kind of research was often assessed as one of the conditions of the research, especially for long-term and spatially large projects. Preventive archaeology is conducted by licenced organizations in Slovakia; the licence is granted by the Ministry of Culture of the Slovak Republic, taking into consideration opinion of Licence Commission, its advisory body. Currently (February 2016) the Ministry has 38 licenced organizations, representing museum, private companies (14), universities (4), civil association (1), town organization (1) and state (2, but important actors – Archaeological Institute of Slovak Academy of Sciences and Monuments Board of the Slovak Republic) in Slovakia. Although museums is the most numerous group, they focus especially on local, less difficult projects. Majority of excavations is conducted by the private sector, what is interesting fact as the first licence for private company was granted only in 2007. Independently on the quantity or quality of archaeological finds, they must be stored in the museum after the finish of the research and elaborating of documentation. The economic crisis caused substantial consequences in the preventive archaeology sector, but the impact on the practice was probably not so hard than in other countries with different legal situation and research tradition.
management initiatives. Such deleterious effects can also affect countries which are less affected by the economic crisis. Thus we have to develop strategies to maintain or preserve preventive archaeology whilst its establishment has not been considered as accomplished. At the same time, through the crisis of preventive archaeology, new debates appear about the relation between science and heritage.

Finally, we can ask these questions: What do we really have to maintain? What exactly should we accomplish?

This presentation proposes an analysis of the historic development of preventive archaeology in Switzerland since the end of the 1950’s. The particularity of preventive archaeology in Switzerland is its early development under the impetus of a long-term motorway construction programme that has been in progress for 60 years. Another particular characteristic of preventive archaeology in Switzerland is the framework of the Swiss political system in which a Federal State with significant autonomy within the 26 cantons and half-cantons which make up the country. Thus Switzerland can be considered as a “Tiny European Union” in the centre of Europe, making it an interesting case for comparative study.

Through this historic analysis we will see that preventive archaeology is the result of a continuous and irregular evolution of different practices and numerous processes. They come from different origins: methodology, science, technique, administration, politics and economics. Consequently, the practice of preventive archaeology has been planned through different organizational structures and different political entities responsible for its application. Therefore, preventive archaeology is an ad hoc multi-ideal model to be established. On the contrary, preventive archaeology consists of several pragmatic principles related to heritage preservation. Moreover, these principles can be applied very differently from one political state to another.

In conclusion, if we accept that the current state of preventive archaeology is not an end in itself that need to be protected, but that it constitutes a paradigm of research concerned with the preservation of cultural heritage, we should then recognise that the manner in which preventive archaeology is organised can be regularly re-negotiated within civil society so that it is adapted to the evolution of the research context and, last but not least, to our scientific ambitions.

TH2-19 Abstract 09

The Archaeologies of different times and contexts, as seen from the east part of Western Europe

Author: Dr. Staabulle, Harald, Heritage Office Saxony, Germany, Dresden, Germany (Presenting author)

Keywords: after 1990, East Germany, large scale projects

Presentation Preference: Oral

After 1945 many new large infrastructural works were necessary in all parts of Europe but only very few development-led large scale projects were accompanied by appropriate rescue excavations. The major political changes around 1990 had a similar impact on economy resulting in a huge amount of new construction activities, first mainly in the east part of Europe. But from the point of view of the archaelogical management of large scale invasive developmental projects the economic conditions as well as the societal acceptance after the 1990s differed in comparison with post-war Europe. This may partly be an effect of the Valetta Convention from 1992, which was itself a result of many years of convincing work, but it also coincides with the socio-political and economic changes in East Europe, which surely helped the signature and the later ratification of it. Anyhow the early 1990s represent a radical change in preventive archaeology and the management of large developmental scale projects in all Europe. As Germany has more heritage laws than countries it is impossible to speak for all. Some aspects, activities and problems of development-led large scale archaeological projects will be presented thus from the point of view of Saxony, a former part of East-Germany.

TH2-19 Abstract 10

Enabling Archaeological Research

within a Heritage Management Context: A View from the United States

Author: Dr. Helen, Michael, Statistical Research, Inc., Haymarket, United States of America (Presenting author)

Co-author: - Coxe-Torcello, Richard, Statistical Research, Inc., Redlands, United States of America

Co-author: - Grenda, Donn, Statistical Research, Inc., Redlands, United States of America

Keywords: archaeological research, economic development, preventive archaeology

Presentation Preference: Oral

In the United States, preventive archaeology is governed largely by Section 106 of the National Historic Preservation Act, which requires consideration of heritage resources that may be affected by an undertaking involving the federal government. Section 110 of the Act further requires federal agencies to identify and manage heritage resources within their jurisdictions. A large and robust heritage resource management industry has developed in the United States around these requirements. The thousands of archaeologists employed each year as a result of the Act have resulted in tremendous stores of data and in some cases spectacular research findings. Yet, the vast majority of projects are small and disconnected from larger research programs, with their purpose, location, schedule, and level of effort determined by development and other needs, rather than scientific research. Moreover, project planning and management is often focused on reducing costs within a competitive environment. While many projects are largely compliance-driven, some organizations have managed to develop research-driven approaches that allow for cumulative research to be conducted within a preventive context. In this paper, we discuss our approach at Statistical Research to conducting research within two different regions of the United States – coastal southern California and the desert Panpape of southern Arizona – by developing regional research programs, accumulating data from numerous small projects to achieve appropriate samples and contexts for research, focusing on projects with strong research potential, developing analytical and database tools, cultivating research-oriented staff, and seeking, as a company, to address long-term research goals in the regions we investigate.

TH2-19 Abstract 11

The system of organisation of Czech archaeology

Author: - Marik, Jan, Institute of Archaeology of the CAS, Prague, v. v. i., Prague, Czech Republic (Presenting author)

Co-author: - Unger, Jiri, Institute of Archaeology of the CAS, Prague, v. v. i., Prague, Czech Republic

Keywords: Czech Republic, Legislation, Preventive Archaeology

Presentation Preference: Oral

The currently effective heritage law in the Czech Republic entered into force already in the year 1987. Even though the law was created in the environment of socialist state, it was designed in a very progressive way. Despite the fact that the law was not significantly revised since it had become effective it still fulfills the majority of obligations that the Czech Republic undertook to do by joining the Valetta convention in 2000.

However, lawmakers in the year 1987 cannot envision the fundamental political as well as social transformations that occurred in the Czech Republic two years later, in the year 1989. The changeover to a market economy as well as significant increase in building activities brought much higher demands on conducting rescue archaeological field works. This process has resulted, among other things, in increase in number of applications for issuing new licences entitling to conduct the archaeological field work. Besides museums and universities, private companies appeared. So far, altogether 110 public as well as private companies possess the licence to conduct the archaeological research. Implementation of the principle “the polluter pays” has caused that the licenced organizations are using the rescue archaeological field work as one of their major financial sources. The Institute of Archaeology of the Czech Republic holds in Organisation of the Czech archaeology a privileged position. The Institute is the only organization entitled to conduct archaeological field work directly by the law. Furthermore, it has the right to significantly influence the issuing of a new licence to conduct archaeological research (the power of veto), collect information regarding the ongoing archaeological field works, archive Excavation reports and, to a certain degree, to control their quality. However, the effective law does not stipulate any evident standards of archaeological research and, thus, its quality varies very significantly in the Czech Republic.

As far as law-making process is concerned, unclear specification of regulations, rights as well as obligations on the side of not only licensed organizations but also developers, property owners and state administration represents fundamental problems of the Czech archaeology. This state of affairs can be solved only by passing of a new law.

TH2-19 Abstract 12

Rethinking Preventive Archaeology: classification of the land as a starting point

Author: - Querol, A., Spain, Complutense University of Madrid, Madrid, Spain

Co-author: - Castillo, A., Complutense University of Madrid, Madrid, Spain (Presenting author)

Keywords: Interpretation, Land planning, Mediation

Presentation Preference: Oral

Around 30 years ago we started researching the topic of archaeological heritage management in Spain and the necessity to adopt preventive measures concerning archaeological studies in the context of civil works. We used the adjective “preventive” for the archaeological activities in this context, and we developed a specific model (preventive archaeology) for compliance with the proliferation of uses abuses of the “preventive archaeology” (PA) term as a synonym for salvage archaeological, rescue archaeological, emergency archaeological, as a result of preventive policies, etc. We argue once again here, the idea of Preventive Archaeology as a planned strategy. Land classification (in an urban sense), including its archaeological potential, is the first and most important step. In our model of preventive archaeology, it is possible to combine research, development infrastructures and the contributions of the Malta Convention. Our proposal is based on the European standards on Environmental Assessments (Strategic Environmental Assessment Plan and Environmental Impact Assessment for project) to establish Reserve Zones (“untouchables”) and Caution Areas (for interim protection of construction projects) in the territorial planning of European territories. The implementation of this model will not only achieve a decrease in the number of archaeological rescue or emergency interventions, but will also allow to design archaeological research based on its knowledge, without it being the decision of the public or private civil work.
Today, the challenge is to implement the model more (there are some examples in Spain, but very few), and to improve it to include other kinds of measures such as mediation techniques in front of social conflicts with interventions or adequate interpretation systems for this type of archaeological heritage that usually is more difficult to spread than other archaeologies.

TH2-19 Abstract 13
Preventive archaeology from 2010 onwards in Hungary – legal background and the reality

Author - Bódoki Emrej, Katain, Government Office of Budapest Capital, Budapest, Hungary (Presenting author)
Co-author(s) - Volitik, Katalin, Gyula Forster National Heritage and Asset Management Centre, Budapest, Hungary
Keywords: development-led excavations, legal system, reforms
Presentation Preference - Oral

Hungary has signed the Malta Convention among the first countries (1992), built the Convention’s main principles already into the first cultural heritage law (1997. CXL) issued after the political turn (1989), nonetheless the Convention itself just later (2006) became part of the national legislation. Preventive archaeology – in modern terms – appeared around the 1990s and quickly became the dominant way of excavating, the number of development-led excavations was the highest around 2006/2010. The history of this “evolution” from a few aspects was already discussed by archaeologists mainly in foreign publications, conferences (e.g. EPAC, EAC volumes, ACE project) – unfortunately such a debate is still missing on national level, the characteristic elements of this process, the special interest of the different actors have not yet been analysed. In this paper we focus on the period from about 2010 till now, the period that is characterised by a radical re/disorganisation of heritage administration under the aegis of the overall government-reform, the shutdown of the INRAP-like field service (established in 2007). The recent changes (including the accreditation of excavation institutions and firms) foster the building up a free-market like system in case of development-led large scale excavations; legal “reforms” were introduced in favour of better predictable excavations and investments and for the “benefit” of the citizen. We try to confront theory and practice to outline the problems that should be resolved.

TH2-19 Abstract 14
French preventive archaeology in a European context

Author - Salas Rosennbach, Kai, French national institute for preventive archaeological research, Paris, France (Presenting author)
Co-author(s) - Pion, Patrick, French national institute for preventive archaeological research, Paris, France
Keywords: development-led, European, preventive
Presentation Preference - Oral

Since 2001 French state decided to create a national institute to lead preventive archaeology. With more than ten years of exercise, through crisis and political changes, the Institute evolved and learned from these changes. Looking across Europe, French model still looks singular both from its accomplishments and failures. This presentation, comparing European situations with the French one, consists of a critical analysis of the French example. From this base, it proposes some common lines to be discussed at a European level. Each of these lines seem to take us to a central starting point question: why is preventive archaeology done in our countries and how can we collectively answer this question?

TH2-19 Abstract 15
Is Preventive Archaeology viable in time of crisis?

The Greek experience

Author - Kotsakis, Konstantinos, Aristotle University Thessaloniki, Thessaloniki, Greece (Presenting author)
Presentation Preference - Oral

The paper presents the state of preventive archaeology in Greece within the context of the most serious economic and social crisis since the end of the Civil War in 1949. Archaeology in Greece is traditionally and legally closely involved in the State apparatus, a reality which is enhanced by the corporatism of the state archaeologists. However, the urgency of the economic crisis hitting Greece hard since 2009, and the recently added huge refugee crisis is putting a dangerous strain on archaeology. Is state archaeology going to survive the crisis?

TH2-19 Abstract 16
Is preventive archaeology compatible with scientific research?

Author - Dr. Depaepe, Pascal, Inrap, Amiens, France (Presenting author)
Keywords: Economic Crisis, Preventive archaeology, Scientific Research
Presentation Preference - Oral

Preventive archaeology is now, in Europe, certainly the main source of archaeological data, about 90% in some countries, and each European country has a more or less strong legislation about archaeology and cultural heritage. A common point of these laws is the possibility of a commercial archaeology beside an academic one. Today, many private companies have emerged especially since 2000. But preventive archaeology has been strongly affected by the global economic crisis since 2008.

In this paper I will examine if preventive archaeology is efficient in a scientific point of view, not only in a cultural heritage point of view, in western Europe and especially in France.

TH2-19 Abstract 17
Birth and infant death of preventive archaeology in Italy

Author - Dr. Guerandi, Maria Pia, Istituto Beni Culturali, Bologna, Italy (Presenting author)
Keywords: archaeological heritage safeguarding, Preventive archaeology, Public administration reform
Presentation Preference - Oral

The consequences of the crisis - far from being outdated - led to profound rethinking of the methodological, social and institutional framework in which archaeological discipline has operated in recent years on a European level. For a large majority of EU countries, this framework had its political and legislative basis in the Malta Convention of 1992.

A profound change has occurred in the 24 years since the Convention, particularly in the past 19-20 years, which have witnessed a rapid change in the framework of reference from multiple points of view.

The philosophical-political context has changed: with the beginning of the new millennium, the policy documents concerning cultural heritage, on both a European and international level, have made a radical shift away from the previous approach focused on objects, sites monuments towards a conception of heritage founded upon the demands, expectations, interests and needs of the populations.

Almost simultaneously, a gradual, but extensive redefinition of the spaces of public intervention in all sectors has taken place throughout Europe. This has made it necessary to redesign the institutional framework of archaeological practices in many EU countries.

The situation in Italy is at the same time specific and exemplary: the grotesque delay in the ratification of the Malta Convention, which took place only recently - May 2015 - reflects how far behind legislation is in general when it comes to archaeology. There is no specific legislation and archaeological practices are governed by directives that are highly ambiguous, when not downright conspiratorial, archaic, manifestly insufficient and ridiculously and pointlessly restrictive (e.g. the limitation of prior verification procedures to public works only, the only case in Europe). The drafts of the guidelines on preventive archaeology, which we have been waiting for since 2006, do not appear likely to fulfill the expectations of an entire sector that has been struggling for years amidst a deep economic crisis affecting all the players involved: from developers to professional archaeologists, from universities to the Ministry of Cultural Heritage.

In this situation the Italian Ministry of Cultural Heritage undertook since 2014 a reform of its internal structure. A new step of which has been undertaken in January 2016.

This new Decree radically changes the structure of the protection and conservation Offices. Archaeological Superintendencies lose their autonomy and come unified with Landscape and Arts Superintendencies.

As regards the preventive archaeology, the synergy between the Ministry reform and the revision of the Procurement Code could mean the totally deregulation of this sector with a devastating impact on landscape and archaeological heritage safeguarding.

Despite the different national contexts, these are phenomena of a transnational nature. They must thus be addressed on a European level, at least from a cultural and political perspective, if we are to have a hope not only of grasping the underlying reasons for the changes that have occurred and are still underway, but also of coming up with some proposals for orienting the evolution of future processes in a direction favourable (or less unfavorable) to our archaeological heritage.
Generally, commercial archaeological units in the United Kingdom perceive field archaeology in general; and osteological, zoological, ceramic and of course geophysical analysis as tried and trusted good things. The basic dig it collect what is there as finds, wash the finds and have experts look at them and give dates and functions for the various layers and a real interpretation can be applied satisfactory to all.

None of this of course relies on good scientific techniques, it is a comparison archaeology and relies on experience and gained know how and personal interpretation. Modern archaeology has made great strides in adopting a more vigorous approach to the process of interpretation. Thus Specialists and technician capable of performing Geochemical, X-ray, Geological, Landscape and Environmental analysis are viewed with suspicion and are perceived as being expensive, confusing in the ambiguity, and perceived as costly and not commercially justifiable.

Commercial units want cheap labour, trained in a few cost effective techniques that lead to lower costs and higher profits based on archaeological methodology that would not have seemed out of place in the 1960’s. This paper aims with the aid of a few case studies to show that this perspective is incorrect and in fact good and thoughtful application of scientific archaeology can not only establish where and what archaeology is on the site with minimal intervention, but in combination with geophysical analysis can establish the best and most cost effective way to investigate and evaluate it. This is not to say the numerous 30m or 50m x 2 m trenches across a site on a consultant whom doesn’t work but I will argue that a targeted environmental and scientific preliminary investigation will lead to a more cost effective and beneficial method of examining our historic environment to the benefit of all.

TH2-19 Abstract 19
Preventive archaeology in Austria

Author - Mag. Dr. Kriemm, Martin, Bundesdenkmalamt, Krems, Austria
Co-author(s) - Dr. Steigberger, Eva, Bundesdenkmalamt, Krems, Austria (Presenting author)
Presentation Preference - Oral

The present article deals with the structural changes that have taken place within Austria’s archaeological heritage management in the last few years. Issues such as the current state of human resources and general tasks of the Federal Monuments Office’s Archaeological Department are covered. Special emphasis is placed on the rise of commercial archaeology as well as on the "Guidelines for Archaeological Measures" introduced in 2010.

The presented data clearly show that the restructuring of archaeological heritage management in Austria since 2010 has shown positive effects. The concentration on core competencies, the abandonment of direct excavation activity and the assignment of archaeological personnel to each of the respective state departments has intensified the level of regional supervision and has lead to a considerable increase in archaeological measures taking place. Furthermore the quality of excavation documentation and their data integrity has improved through the introduction of the “Guidelines for Archaeological Measures”.

TH2-20 Abstract 01
Destination management of heritage sites and towns in Croatia

Author - IA Mihelec, Sanjin, Archaeological Museum in Zagreb, Zagreb, Croatia (Presenting author)
Co-author(s) - Komiš, Darko, Archaeological Museum of Istria, Pula, Croatia
Keywords: Archaeological tourism, Destination management, heritage sites
Presentation Preference - Oral

The paper focuses on the present state regarding integrated destination management of heritage sites and towns in Croatia, reviewing a number of recent attempts at broad-scale participative approach integrating needs, wishes and particularities of different stakeholders. In certain cases, the general collaborative framework introduced by a few key stakeholders in the circle including archaeologists, conservators, tourism specialists, local administrative units, civic sector and local community proved an excellent guiding light toward a common goal of integrated management aimed at sustainable development of archaeological sites as dynamic factors in the tourism business at local, regional and national levels. In certain other cases, in which these different voices were not fully heeded and particular interests took precedence, archaeological tourism as a practice often left much to be desired. The authors, directors of two major Croatian archaeological museums (in Zagreb and Pula respectively) draw on their experience in the project management of heritage attractions, with a view to contributing to the discussion towards creating European guidelines for archaeological tourism, as proposed by the session organizers.

TH2-20 Abstract 02
Bridging the gap: archaeology in tourism at the Archaeological park Emona (Ljubljana, Slovenia)

Author - Zupanek, Bernarda, Museum and Galleries of Ljubljana, Ljubljana, Slovenia (Presenting author)
Co-author(s) - Bregar, Tamara, Museum and Galleries of Ljubljana, Ljubljana, Slovenia
Keywords: archaeological heritage management, archaeological park management, archaeology, tourism
Presentation Preference - Oral

Archaeological Park Emona (Ljubljana, Slovenia) exhibits remains and presentations of a Roman Colonia Iulia Emona. The park consists of several locations in the center of modern Ljubljana, the Slovenian capital. The park developed gradually from 1930-ties on. As a product of specific context, tied to the idea of Antiquity and its heritage as civilized and inherently understandable, and to Roman archaeology as elite oriented, it was less interesting for the general public, and gradually became obsolete and unknown even to the inhabitants of Ljubljana.

During the project of renovation and revitalisation of the Archaeological park Emona in 2011-2012, carried out by the Museum and Galleries of Ljubljana, several key changes and improvements have been made. The primary goal of the project was to include
the heritage of Emona into the life of modern Ljubljana, and to enable this, the renovation of infrastructure in the park was carried out, together with interpretative aids and public programmes. As tourists were one of the weakest groups of our visitors, we designed a marketing plan with them in mind, and started to collaborate with the local tourist board, Tourism Ljubljana, and designed a tourist programme together. We also included local entrepreneurs and artists in some other programmes and workshops. Owing to these changes and endeavours, we had a 25% growth in foreign visitors to the Park. However, we did experience tensions and misunderstanding due to differences in understanding archaeological heritage as a source, in ways of exploiting it, and the scope and size of the possibilities. We think those conflicts and solutions employed make a good starting point for a debate, and a very useful experience for planning the development of Archaeological Park Emona and similar enterprises in the future.

TH2-20 Abstract 04

Crossing borders along the Dutch Limes - How the famous Roman barges of Zwammerdam support people with multiple disabilities

Author - Haasberg, Tom, Hansenberg Archeologe, the Netherlands (Presenting author)
Co-author(s) - Rooymans, Linda, Complutense University of Madrid, Madrid, Spain
Keywords: Limes, visitor center, unique collaboration, Tourism
Presentation Preference - Oral

The Roman frontier fort of Zwammerdam is one of the sites along the Lower German limes, along the river Rhine in the west of the Netherlands. Beside the military fort six Roman shipwrecks are discovered. The ships represent the typical character of the Lower German limes as a river frontier, built in wetland, serving as a main transport route connecting the Germanic and Gallic hinterland with the North Sea basin. For this reason the ships play a principal role in the tourist-oriented development of the Lower German limes connected to the UNESCO nomination programme.

The ships were found on the estate Hooge Burch, now owned by Ipse de Bruggen, an institute for people with multiple disabilities. Due to new medical insights and growing individualism, ideas have now changed regarding the relationship between clients and the rest of society. Cuts in health care also influence local changes and the treatments available. This and other developments made Ipse de Bruggen decide to realise more interaction between clients and visitors on the Hooge Burch.

The ambitions of both the Lime network and Ipse de Bruggen resulted in a joint venture on the Hooge Burch, with the objective of establishing a first-class visitors’ center combining an exhibition with a Roman trail on the Roman part of the estate.

After forty years, the discovery of the Roman barges has led to the realisation of a first-class limes visitor center, partly run by people with mental and physical disabilities. Limes Visitor’s Centre NIKVRI PULVIRI opened its doors at April 15th 2016.

TH2-20 Abstract 03

Looking for archaeology in an official tourism sustainable method.

Examples from two Spanish villages

Author - Castilfito, Alicia, Complutense University of Madrid, Madrid, Spain (Presenting author)
Co-author(s) - Domínguez, Marta, Complutense University of Madrid, Madrid, Spain
Keywords: cultural heritage, sustainable tourism, ETIS, university-enterprise collaborations
Presentation Preference - Oral

One of the most important topics to analyze the relationship between Archaeology and tourism is the study of its role under the parameters of touristic agents. In this context, our research team has had the opportunity to collaborate with an enterprise in an experimental project to the Spanish Ministry of Industry. The methodology is based on other European systems, especially The European tourism indicator system for sustainable destinations (ETIS), which is being experimentally tested in several towns along all Europe.

This project tries to validate the utility of an official method to analyze sustainable tourism in towns. The work is coordinated by enterprise in urban regeneration and participatory processes who has tested this methodology in two villages with a rich cultural heritage, Cazorla (Andalusia) and Sigüenza (Castilla La Mancha). As part of a strategy of collaboration between the University Madrid and an enterprise to introduce innovation and research, we have proposed and introduced some novelties to the official methodology. Specifically, we are trying to improve the role of cultural heritage to measure sustainability of these two touristic destinations. Unfortunately, in both the European and Spanish methodology archaeology or archaeological sites are highly overlooked. In contrast to this situation, the Spanish cases of study here considered as other European destinations attract large numbers of tourists due to their past, tangible and intangible Heritage. The conclusion reveals a negative consideration for archaeological values, however, from a proactive point of view, we have started to work with this methodology and to introduce new parameters that we hope will be considered in future implementations of this methodology. At the same time, it is an opportunity to show a touristic tool in experimental use in many European countries and the attempts to adapt it to archaeological sites or archaeological management in a project where tourism is an objective.

TH2-20 Abstract 05

From the ground up: Experiencing Romania through excavations at Halmyris in the Danube Delta

Author - Harascanu, Emily, Durham University, Durham, United Kingdom (Presenting author)
Co-author(s) - Acero, Guillermo, Paisaje Transversal, Madrid, Spain
Keywords: Authenticity, Heritage, Volunteer
Presentation Preference - Oral

The concept of archaeological tourism, or tourism based on the experiencing of an 'authentic' past through the viewing of archaeological sites (Timothy and Boyd 2006), is a distinctly Western phenomenon derived from nationalism which encourages heritage consumption (Rowan and Baram 2004). There are obvious challenges in the display of heritage specifically for monetary profit, a practice which often silences alternative versions of the past (see e.g. Watt 2000). This does not, however, negate the potential benefits for archaeological tourism, rather it gives us an opportunity for finding new ways of encouraging a more holistic cross-cultural interaction. This paper presents one potential good practice example—an ongoing project in Romania advocating for cultural awareness by encouraging a participatory version of archaeological tourism through field school attendance.

Since 2012 an international management team has run a not-for-profit archaeological field school at Halmyris, a Roman legionary fort in the Danube Delta. The costs for student volunteers are kept minimal and with an average of 25-30 participants each season we are able to independently finance the excavations and sustain the program. We do attract a number of undergraduates, MA students, and PhD students from archaeology and related disciplines; however, since 2014 we have had 10 volunteers who are decidedly atypical. Ranging from 54 years old to 77, and hailing from New Zealand, Australia, North America, France, and the UK we find our project decidedly enhanced by the presence of retired folk eager for new life experiences. They have chosen to help excavate a site which goes a step past comparatively passive tourism to what I term participatory archaeological tourism. By engaging directly with excavations at Halmyris this demographic is able to not only live alongside rural Danubian fishermen, but gain new skills and most importantly a newfound understanding of heritage displays and the social context of the past. In this paper I will examine both the challenges and the benefits for the project in welcoming this demographic of field volunteers, and reflect on the unique experience of Romania as they are able to gain through participatory archaeological tourism.

TH2-20 Abstract 06

Unexpected experiences

Author - Hjel-Madsen, Lene, Museum skanderborg, Skanderborg, Denmark (Presenting author)
Co-author(s) - Dissing, Nina Bangsbo, Municipality of Skanderborg, Skanderborg, Denmark
Keywords: Art, Co-creation, Cultural Tourism
Presentation Preference - Oral

Creating meaningful experiences for the general public should be the primary aim of cultural tourism. When securing quality in these meaningful experiences it is crucial to start cooperating with the specialists so that this side is also involved in the project making. Actually we choose to take the challenge one step further by creating a project that combines archaeology, art and tourism on equal terms.

The project is called escape and can be seen as a concept that is all about combining art, archaeology, past and present. Creating and communicating art on sites with strong archaeological evidence in combination with the scientific archaeological excavations.

The location and the landscape is the raison d'être of the project - and locals as well as tourists are given the opportunity to experience landscape storytelling combined with world history interpreted by modern art.

Escape brings out art and cultural heritage “on location”, away from the walls of the museum, creating a phenomenological space where nature, art and cultural heritage meets and communicate with one another, giving visitors unique and unexpected experiences.
TH2-20 Abstract 07
A journey through time: sensory tourism in the context of archaeological museums in Poland

Author - Dr. Pawełta, Michał, Adam Mickiewicz University, Poznań, Poland (Presenting author)
Keywords: archaeological museums, Poland, sensor tourism
Presentation Preference - Oral

Whereas previous studies in tourism promoted vision, current research claims a holistic approach to sight, hearing, smell, taste and touch in order to develop effective communication with visitors and create conditions to enhance tourist experiences. Consequently, sensory aspects of tourism have recently been in focus as an important dimension in the process of facilitating positive tourist experiences. Among others, also the archaeological museums embrace resources rich in multi-sensory stimuli that are more often utilized in the planning and marketing of appealing tourist experiences.

This paper aims to present the “sensory site” of archaeological museums in Poland. The key axis of considerations is the degree to which these museums respond to the sensory tourism tendencies.

The trends discussed are illustrated by selected examples. I am referring here to the long-established archaeological museums in Poland as well as newly-open exhibitions as “Following the traces of the European Identity of Dracow,” as well as innovative trends such as those realised in the “World of the Slavs and Vikings” or “The Slav Myth.” It is not a systematic analysis, but shows certain noticeable trends in archaeology museums: in the presentation of the artefacts, in educational projects, including the introduction of reconstructions, reenactments, museum lessons, etc. It also addresses the issue of a modern technology offering a visitor a different perspective on the confrontation with archaeology and monuments.

It also raises some crucial questions, for example, how contemporary archaeological museums support the multi-sensory nature of tourist experiences? If the measures undertaken are to make the exhibited artefacts more attractive, or whether they are competing with it? Are the new ways of exhibiting and presenting knowledge about the past drawing society closer, encouraging aesthetic experiences with relics of the past, the discovery of ancestors and increasing scientific knowledge? Or do they turn attention away from the items on display? Finally, what is the real purpose of the “sensory” development of contemporary museums?

TH2-20 Abstract 08
Museums in Central Asia: The Role of Cultural Institutions in disseminating Information

Author - Dr. Jaroz, Katarzyna, University of Logistics, Wrocław, Poland (Presenting author)
Keywords: digital divide, museum, tourism
Presentation Preference - Oral

The countries of Central Asia, Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, or Uzbekistan have great tourist potential both for foreign visitors and companies who might be interested in investing in tourism. A key factor making the place so attractive for tourists is its history, starting with the Silk Road, which dates back to Roman times (Buyers, 2003), continuing with renowned historical events, and also for the general public, willing to know more about this period of our history, the popular festivals, the historical recreations, etc.

As part of an ongoing project devoted to the planning, design and digitalization of materials called Touring the Battlefields: The Peninsular War in Castilla y Leon, our proposal covers language use, cultural knowledge and intercultural competence, while contributing to the valorization and management of our region cultural landscapes.

TH2-20 Abstract 09
One’s destination is never a place, but a new way of seeing things: Touring a Heritage trail

Author - Leonor, Perez Ruiz, University of Valladolid, Valladolid, Spain (Presenting author)
Co-author(s) - Rojo de Pinto Otero, Catalina, Complutense University of Madrid, Madrid, Spain
Co-author(s) - Ruiz de Arbol Moro, Maria, CSIC, Madrid, Spain
Co-author(s) - Bezares Bertrán, Cristina, University of Burgos, Burgos, Spain
Keywords: Cultural Landscape, Historical routes, Language learning
Presentation Preference - Oral

The aim of the paper is to present an investigation of the potential role of a historical route as a language learning and culture acquisition tool. The Route of the Bridge Bridges refers to Wellington’s retreat in 1812 from Burgos to Portugal after the month long siege of Burgos had proved to be too tough a target. While retreating, and to avoid being trapped by the French army, Wellington ordered that several bridges on the Cantón, Pisuerga, Duero and Tormes rivers were blown. Through “the worst scrape I was ever in...”, as Wellington put it, the allied army gained a moral dominance over the French not renouncing to it ever again.

We identify, categorize and analyze the route and its highlights in order to create materials which may serve as a means to gain a deeper sense of the Spanish culture and heritage. These materials will be used to foster this touristic route which may be useful to students interested in learning Spanish L2 while experiencing the country’s historical heritage.

The analysis of the museography and other landmarks of the route will demonstrate how fascinating the itinerary is as a means to relive the historic epic of the Napoleonic Europe both for the foreign contemporary traveler, often learned and with great interest in historical events, and also for the general public, willing to know more about this period of our history, the popular festivals, the historical recreations, etc.

One’s destination is never a place, but a new way of seeing things: Touring a Heritage trail.

TH2-20 Abstract 10
Exploring the touristic image on World Heritage Archaeological Sites of Europe through the Web

Author - Babili, Bogdan, Móstoles, Spain (Presenting author)
Co-author(s) - Pérez González, María Luisa, Complutense University of Madrid, Madrid, Spain
Co-author(s) - Martínez Fernández, Andrea, Complutense University of Madrid, Madrid, Spain
Co-author(s) - García Enriquez, Natalia, Complutense University of Madrid, Madrid, Spain
Co-author(s) - Álvarez López, Metx, Complutense University of Madrid, Madrid, Spain
Keywords: Perception and Interpretation, Tourism, World Heritage Site
Presentation Preference - Poster

Within the context of collaboration of the cultural heritage management research group of the Complutense University of Madrid and according to the interest awaken by the Archaeology and Tourism Working Party, we present this poster with the intention of making a first approach of how the touristic agencies operating on the Web treat the archaeological visit. Following the UNESCO criteria regarding the world’s regional division and the reasons for declaration, we selected the settlements recognized for their archaeological dimensions as World Heritage Sites in the European context and which are accessible to visit. Through a series of charts and quantitative analysis we are going to present which ones are the main references for the touristic industry when encouraging the visit and how much of that quantity is similar to the discourse transmitted by those who work in the research of these archaeological sites. The poster aims to show the differences or the confluences between the scientific discourses and those generated by the tourism sector so that proposals of improvement can be made for the social transfer of archaeology through these means and at the same time, improve the touristic experience related to the appreciation of the research efforts behind these places and that justify their conservation and opening to the public.

The research-presentation multidisciplinary approach - Symbiosis in Starigrad, Croatia

Author: Domiter, Ozren, Archaeological museum in Zagreb, Zagreb, Croatia (Presenting author)
Co-author(s): Radman- Linea, Ivan, Archaeological museum in Zagreb, Zagreb, Croatia

Keywords: interinstitutional-multidisciplinary cooperation, needs of local community and stakeholders, research-presentation concept

Presentation Preference - Poster

Bearing in mind the positive results of the cooperation between the Starigrad Tourist Board, the Starigrad primary school, the Institute of Archaeology and the Archaeological museum in Zagreb (e.g. publications of research results, a series of lectures for students, the creation of interpretative boards and a preliminary presentation plan, presentational activities, the active involvement of the local community), and considering plans for future spatial research and thereby connected presentation of zones round the site of the Sr. Trojica hill fort, the Museum succeeded in its intention to raise awareness of the local population and the governing bodies about the rich natural and cultural heritage of the area, and to actively include the community into the forming of its presentation through education activities. In the long run, the Museum wishes to include all potential stakeholders - cultural and natural heritage-related institutions (Palenica Nature Park, Velabli Nature Park, Archaeological museum in Zadar), as equal partners, in order to act in synergy to enrich the existing tourist offer of the Starigrad Municipality, to achieve their own Missions, and, through a contemporary and innovative approach, to enable for the creation of a kind of museum in the open which would, inside its invisible walls, inseparably connect and communicate the rich natural and cultural heritage of the entire Starigrad area in an interesting and inspiring way.

The Museum, as the initiator of the idea of this sort of research-presentation multidisciplinary symbiosis, would use its research work not only as a key step in the collecting and interpretation of scientifically-based data, but also as an exceptional presentational potential, enabling all interested persons to see the site, witness archaeological excavations via the best interactive presentation method – personal experience.

Even when local community and stakeholders are not aware of, or for any reason, able to communicate their needs, the Museum constantly strives to offer a broad frame of possibilities, ideas, cooperation models in which such needs of local community and local stakeholders are detected, recognized and outspoken and, after all, always treated with special attention and respect, and, whenever possible, fulfilled in a whole for the benefit of all included participants.

This synergetic, general-heritage and interinstitutional approach includes all three functions of heritage-related institutions (research, preservation and communication) for the overall benefit of the local community and society as a whole.

TH2-21 Abstract 01

Sustainable Heritage and archaeology: a blessing or a curse?

Author: Dr. Andersson, Anna-Carin, University of Gothenburg, Gothenburg, Sweden (Presenting author)
Keywords: Archaeology, Heritage, sustainability

Presentation Preference - Oral

This aim of this short and reflective presentation is to encourage to even more reflectivity. The paper has been encouraged after a vivid and constructive debate on the academia.edu site initiated by the session organisers. Many people within archaeology and heritage management have commented and given their experiential point of views on the matter of Sustainability. What is "Sustainable Archaeology"? Or even a Sustainable Heritage? Is it really a matter of Heritage? Who’s Heritage? Or is it a matter of how we can protect and ensure the survival of the discipline of archaeology for future generations?

In various societal circumstances it is possible to come across the concept of Sustainability: "sustainable education", "sustainable child-care", "sustainable society", "sustainable development", etc. Who are the stakeholders that have initiated the hankering or demands of Sustainable archaeology in the first place? What is the origin of this concept? In this paper it is argued that it is an awkward “phrase” which occupies valuable time, blurs, which prevents the heritage management sector from more important societal issues to discuss. For instance, how do we make Heritage and Archaeology a more interesting concern for people in contemporary societies?
For most archaeologists, archaeological heritage management concerns major construction works, such as motor- and railways, airports, etc. This idea, implicitly present in the Valletta Convention, doesn’t make sense anymore today. Big public works are getting rarer and rarer in Northwestern Europe. New data on all types of development, which have a destructive impact on archaeological sites, are getting available and demonstrate that these big public works represent less than 10% of archaeological destruction. In France, an inventory of all destructive works was made. It appeared that housing and agricultural works are the two main destructive factors far ahead industrial and linear (roads, etc.) works which are far less important. A lot of new types of land development, often linked with the green economy, are also important. Preventive archeology of this mass of small scale earthworks is something wholly different from archaeology of large infrastructure works. It should be adapted at all levels, from the theoretical level, through the practical and administrative level. In the long term, its public impact and sustainability are however much better.

---

**TH2-21 Abstract 03**

**An Archaeology of Stains. Sustainability and Responsibility in Facing Painful Heritage**

**Author:** Zalewska, Anna, Institute of Archaeology and Ethnology of Polish Academy of Sciences, Warsaw, Poland (Presenting author)

**Keywords:** archaeology of recent past, painful heritage, Stains Black and White

**Presentation Preference:** Oral

While thinking about the archaeology’s capacity to endure at the time when it is facing as well old as new constraints together with requirements and pressure to ‘perform’ and to ‘be socially useful’, two aspects demand discussion and comparative studies: the actual participation and efficiency of archaeologists in ‘cultural heritage management’ and tackling (I) impact of archaeology on that, what is perceived as ‘the Heritage’ by the local and global communities. Unfortunately, we are not the perfect one in taking into account social preferences. At least in Eastern Europe.

However, starting from what I have available, and treating symptoms as informative, I assume that it is worth to focus archaeological attention on the material remains of the XX Century. Some of them already became or soon will become the actual participation and efficiency of archaeologists in ‘cultural heritage management’ and tackling (I) impact of archaeology on that, what is perceived as ‘the Heritage’ by the local and global communities. Unfortunately, we are not the perfect one in taking into account social preferences. At least in Eastern Europe.

In my presentation I would like to present archaeology as a field which strongly refers to the living communities, their memories, experiences and needs, and which relates to the problems of the contemporary world (e.g. migrations, ecology, war, industrialisation) – the so-called ‘contemporary archaeology’.

In this presentation I would like to present contemporary archaeology as a field which, in Poland, aroused from the societal expectations and is a way of responding to them. I also would like to describe strategies of experiencing the past and heritage that are undertaken in the contemporary societies which strictly relate to contemporary archaeology and research questions which this field asks (here the Polish perspective will be especially stressed). Therefore, topics of the meaning and value of heritage in the contemporary world, as well as, social needs towards our discipline within the context of contemporary archaeology will be raised here.

---

**TH2-21 Abstract 05**

**Galicia and the Basque Country (Spain): Sustainable Archaeology in small sustainable countries?**

**Author:** Professor Xurxo, Ay, Universitat de Barcelona, Barcelona, Spain (Presenting author)

**Co-author(s):** Garca Rodriguez, Sonia, University of Basque Country, Vitoria-Gasteiz, Spain

**Keywords:** Community Archaeology, Spanish Archaeology, Sustainable Archaeology

**Presentation Preference:** Oral

Spanish Commercial Archaeology lived its golden age between 1990 and 2007. This activity was closely linked with the current model of economic development in Spain, based on speculation and enormous, both private and public constructive activity. The strongest sector for the Evaluation and Correction of archaeological impact served to absorb the skilled labor force formed by the new generations of archaeologists from the universities.

The economic crisis of 2008 had dire consequences for the Spanish Archaeology. The State paralyzed research, universities were left without resources, scientists emigrated abroad and the archaeological market virtually disappeared by paralyzing the construction boom. Although this fact has hurt the archaeological profession, in these seven years have also emerged process served as an opportunity for Sustainable Archaeology. Thus, the economic crisis led to a political crisis that has led to social movements claiming an active role as a tool for sustainable development. Politicians, residents, associations and patrons need archaeologists to start projects enhancement of Heritage.

To analyze this phenomenon in our communication we show how it is developing this renewed Community Archaeology in two similar contexts, yet very different. The Basque Country and Galicia are two historic nationalities that make up the Spanish State, two small Atlantic countries do not reach 3 million people, with a culture that differentiates them from the rest of Spain. At both sites the Archaeological Heritage has played a key role as a marker of identity and tourist resource. Galicia is a country that always has been the poorest of Spain; its countryside and its industrial structure are disappearing and survives thanks to European subsidies. After decades of failed policies of sustainable rural development in these years of crisis local governments and civil society are the Community Archaeology a useful tool for the enhancement of Heritage. This reality has opened a new market for archaeologists of Galicia and the Basque Country, who lived since the Industrial Revolution in the late nineteenth century, is the richest region of Spain. The political weight of Basque nationalism has resulted in the strengthening of public policies that encourage the development of local production. Basque politics supports research to enhance and internationalize its economy. Such as livestock, wine production, fishing and tourism, Cultural Heritage is a strategic sector. In turn, today, the development of public policy for reports on the political violence of the twentieth century has opened a whole field of work for the Archaeology of Contemporary Past becomes a tool for sustainable development (and peace).

---

**TH2-21 Abstract 04**

**Contemporary archaeology - a response to the crisis and social approach towards heritage**

**Author:** PhD Kaja, Kornelia, Univerzitetet i m. Adama Mickiewicza w Poznaniu, Poznań, Poland (Presenting author)

**Keywords:** contemporary archaeology, heritage, social expectations

**Presentation Preference:** Oral

Are we all archaeologists now? – the question asked by C. Holtorf (2015) in Journal of Contemporary Archaeology clearly describes the expandability and transformation of what archaeology is thought to be today. It is no longer just a discipline which deals with the past and the present and its material remains, nor is it a field of knowledge which is interested only in the ancient or prehistoric societies. Researchers became more aware that archaeology to be sustainable must respond to the problems and needs of the contemporary world and that it cannot be a closed academic discipline understood only by them. Therefore, noticing that the strict binary oppositions of nature and culture, heritage and rubbish, preservation and ruination as well as past and present are questioned nowadays, archaeologists must have adapted their research questions to the changing world. Thus some of them turned to the field which strongly refers to the living communities, their memories, experiences and needs, and which relates to the problems of the contemporary world (e.g. migrations, ecology, war, industrialisation) – the so-called ‘contemporary archaeology’.

In this presentation we discuss some methodological experiences carried out in Barcelona with the intention to study and better understand the interactions between archaeology, heritage and its public(s) with the intention to provide a space of reflexion about participatory research in the field of heritage and archaeology. Our main objective is to analyse and explore different methodologies that can allow us to draw up new participative and sustainable strategies for heritage management. Systematic
observation, surveys and participatory walks have been used as methods to enable us to expand into new contexts in which interactions between individuals and heritage could be examined. In this presentation we describe some of the methodological strategies used; preliminary results will be presented in order to reflect on the difficulties in encompassing the different agents – government, academia, ruins and people – that interact in the urban context.

TH2-21 Abstract 07
The past in the future: archaeology, heritage and sustainable development in Laconia, Greece

Author - Prof. Voutsaki, Sofia, University of Groningen, Groningen, Netherlands (Presenting author)

Keywords: public archaeology, sustainable development, theory
Presentation Preference - Oral

In the last three decades, the realization that archaeologists have to engage in dialogue with the local communities is growing, and new fields such as Public Archaeology or Community Archaeology are establishing themselves as separate sub-fields of practice and theoretical reflection. At the same time, the current financial crisis (especially felt in southern Europe, but also in the Humanities and the Arts sector) forces us to find alternative and responsible ways to boost local development.

The main argument presented in this paper is that archaeology can contribute to sustainable local development, but it should do so as part of a theoretically informed, socially engaged and carefully researched multidisciplinary project which combines archaeology, history, ethnography and social theory. This can be achieved if we investigate the social and political conditions within which attitudes to the past have been formed and within which notions of local, national, or world heritage have defined, if we engage with social problems in the present, and if we contribute to the formulation of a vision for responsible growth in the future, by means of a dialogue with the local communities and the policy makers responsible for the study and management of the archaeological heritage in the area. The discussion will focus on Laconia, a region of southern Greece. The argument proceeds in four stages:

1. The exploration of local perceptions of the past by means of a programme of archaeological (visual) ethnography. Special attention is given to educational programmes for school children presented in the local museums and archaeological sites, as these are the foundation of local perceptions of archaeology and archaology.

A discussion of the main problems faced by the local communities, the endemic causes of exclusion and underdevelopment as well as the further deteriorating in the current financial and political crisis.

The formulation of a vision for sustainable growth and for alternative forms of tourism (e.g. agrotourism, ecological tourism, cultural tourism, etc.), and the need for the creation of collaborative structures which can unleash local creative potential and act as a platform for the exchange of ideas.

To summarize, it will be argued that a sustainable future for the archaeological heritage is only possible if we understand the historical conditions of its formation, but also explore its potential to mobilize new forms of action and formulate new readings of the past.

TH2-21 Abstract 08
Here I live - interpretations of the past present and future

Author - PhD Synne Vogtvedt, Anita, University of Gotenburg, Gothenburg, Sweden (Presenting author)

Keywords: heritage, interpretation, public archaeology, migration, sustainability
Presentation Preference - Oral

In the suburban area Bergsjön in Gotenburg you will find an ancient remain – a stone Age chamber grave from about 1800 B. C. This subfield is considered one of the most troublesome within the city of Gotenburg. It is dominated by different groups of immigrants and there have been a lot of incidents of shooting and criminal activities in the area. There are also a high number of youngsters from this area that have joined ISIS. There is therefore a great need of supportive and positive actions and perspectives considering sustainability in this area. According to The Swedish Heritage Conservation Act heritage belongs to everyone, and protecting and preserving the historic environment is a responsibility shared by every member of society. But, the question is if anyone living in the area of Bergsjön today is aware of this and if the pile of stones matter to anyone living close to the remains.

An experimental signage and interpretation project will take place during spring 2016 involving the children the area, the housing company and others. An aim of the project is to make a place for storytelling and pedagogical activities for the schools and the inhabitants in the area and to make archaeology a part of the local society for a sustainable future.

TH2-21 Abstract 09
Integration of cultural & natural heritage management, developing content for blended learning

Author - MA Travadila, Andrea, University of Amsterdam, Amsterdam, Netherlands (Presenting author)

Keywords: vocational and educational training, archaeology, nature domains, heritage
Presentation Preference - Oral

Frequently, heritage management professionals are not all too familiar with topics that are not directly related to their own domains. The binary separation of ‘natural’ and ‘cultural’ landscape results problematic in national and international legal and administrative frameworks involving planning and development.

The improvement of knowledge for landscape management and protection of archaeological and natural heritage is a necessity. In this context, the Archaeological & Natural Heritage project (ANHER) focuses on increasing knowledge and skills for professionals working in the archaeological and natural heritage sectors in Europe. The project aims to fill a gap that is not covered by traditional forms of training. Within the project, six European partners develop a variety of integrated educational e-learning materials designed to train important facets of both sectors. The project contributes to the development of improved methods and content of higher education and vocational training in the field of heritage. The digital method ensures that the ongoing changes that concern the protection and management of archaeological and natural heritage are connected with education that is useful and up-to-date. The online modules address the rapidly changing modes of protection and management for the archaeological and natural heritage sectors, as well as the significance of integrated heritage in spatial planning and regional development policies. This includes the role of built heritage in urban planning and local and regional heritage policies in Europe.

The basic principle is that through a better understanding of the importance of archaeological and natural heritage, for a variety of different environments, sustainable landscape management can be realised. This project aims to provide an organisational structure for continuous training and a technical infrastructure for blended learning that will benefit the various labour markets.

TH2-21 Abstract 10
Linking efforts towards a new vision: new learning methods in Heritage

Author - Dr. Cubas, Mireia, University of York, York, United Kingdom (Presenting author)

Co-author(s) - Etxe, Mikel, Societad de Ciencias Aranzadi, Donostia-San Sebastian, Spain

Keywords: Archaeology, heritage, vocational and educational training, Natural heritage
Presentation Preference - Poster

Contemporary thinking about heritage incorporates a wide range of realities with important economic consequences and which create new socio-economic relationships. Frequently, heritage management professionals are not familiar with the topics that are not directly related to their professional domains. In this context, the development of the project Innovative format of education and training of the integrated archaeological and natural heritage (AnHer) funded by the European Commission (Erasmus + 2014-1-PL-KA202-003985) aims to improve skills relating to this wide vision of heritage for practitioners working in both the archaeological and natural heritage sectors. This objective means that the project aims to fill a gap not covered by traditional training systems.

The project is producing a range of innovative didactic materials which bring together an integrated vision of heritage. The binary separation of “natural” and “cultural” landscape results in problematic regional, national and international legal and administrative frameworks and complicates the practice of planning and development.

The project will explicitly address challenges and needs of a vocational education and training (VET) using different methods of distance learning. The didactic content is being produced by applying innovative practices in education and training and providing the opportunity for personalised learning approaches and collaborative learning methods. All newly produced didactic materials will be stored in an online Content Repository. Flexible content authored supporting the web-based Content Repository software enables the storage and processing of distance learning content in a SCORM standard, to facilitate its further expansion and enhancement.

The training materials aim to cover the needs of rapidly changing practices in the protection and management of archaeological and natural heritage, as well as recognising the significance of integrated heritage in spatial planning and regional development policies. These materials have been produced following the detailed analysis of the state-of-the-art of training in both heritage fields and the analysis of existing training courses. These analyses made it possible to define the didactical needs of these groups and to apply this in terms of the design of new training contents and methods. The didactic materials cover the most important issues of an integrated approach to conservation and management of archaeological and natural heritage and its impact upon planning policies and development. The e-learning modules will aim to improve the competence of professionals employed in both heritage sectors and local administrations, who may not have been previously trained in the area that they have to make important decisions about.
**TH3**  THEORETICAL AND METHODOLOGICAL PERSPECTIVES IN ARCHAEOLOGY

Humanities research perspectives on contemporary society are currently “hot topics” on the European scientific agenda. This theme seeks to examine how archaeological knowledge is used and re-used in contemporary society; how archaeological heritage is valued; how additional values are created; how archaeologists can participate in creative cultural life, activity and business. The theme seeks to define how solutions for contemporary societal challenges are promoted and supported by the role of IT based networks of knowledge in society. In that context the theme seeks to define what current questions are important for understanding the social role of archaeology.

This theme invites scientists, researchers and practitioners interested in the current and potential use of archaeology as a tool for informing positive societal change. The theme seeks to extend beyond the archaeological sciences, examining a long list of topics. These include: the role of not-for-profit organizations and communities; issues of social engagement and exclusion; links to creative and cultural industries; social and cultural innovation; current definitions of social capital and broader economic impact; participatory culture and creative collaboration; medias and social networking; school education and interests of Y and Z generations; narratives, identities, participatory culture and creative collaboration; medias and social networking; innovation; current definitions of social capital and broader economic impact; exclusion; links to creative and cultural industries; social and cultural innovation; current definitions of social capital and broader economic impact; participatory culture and creative collaboration; medias and social networking; school education and interests of Y and Z generations; narratives, identities, and how archaeological knowledge is used and re-used in contemporary society; Participatory Culture and creative collaboration; Medias and Social Networking; Innovation; Current Definitions of Social Capital and Broader Economic Impact; Exclusion; Links to Creative and Cultural Industries; Social and Cultural Innovation; Current Definitions of Social Capital and Broader Economic Impact; Participatory Culture and Creative Collaboration; Medias and Social Networking; School Education and interests of Y and Z generations; Narratives, Identities; and Practical Skills Training in Archaeology.
FROM THE COLOSSEUM TO PALMYRA.

APPROPRIATION AND OWNERSHIP OF ARCHAEOLOGICAL HERITAGE IN A GLOCAL WORLD

Saturday, 3 September 2016, 09:00-13:00
Faculty of Philosophy, Room 209
Author - Goi, Maja, University of Heidelberg, Heidelberg, Germany (Presenting author)
Co-author(s) - Ravello Lam, Martina, University of Amsterdam, Amsterdam, Netherlands
Co-author(s) - Celli, Elisa, Museo Civico Etrusco Romano di Trevignano Romano, Trevignano Romano (Roma), Italy
Co-author(s) - Pintucci, Alessandro, University of Rome La Sapienza, Rome, Italy
Co-author(s) - Pecchi, Paolo, University of Southampton, Southampton, United Kingdom
Keywords: appropriation, conflict, identity
Presentation Preference - Regular session

Over the last decades, there has been substantial research into the relationship between archaeology and politics. Early research explored the interaction between archaeology and State focusing on nationalism, and demonstrating that there is no such thing as non-political, value-free archaeology. Nationalism stimulated the very creation of archaeology as a science and has informed the organization and infrastructure of archaeological knowledge. However, more recent trends focus on archaeology’s relation to Modernity, insisting on the concept that archaeology has to be viewed as cultural product. As every cultural product, archaeology as a discipline is inherently a practice of cultural appropriation. Archaeologists perceive themselves as officially entitled by the society to use archaeological material as resource for understanding the cultural past in pursuit of the “truth”. The vision of the past emerging from analyzing the dynamic nature of appropriation of the past as an intentional process - whose mechanism affects social change - is that uses of the past have to be considered as pointers to competing visions of the future at both individual and group levels. Scientific archaeology also adopts such a vision. The debate on the notion of appropriation and ownership, the role of heritage in a globalized society, scientific archaeology and the impact of archaeological practice on local and global communities are issues that this session wants to address.

This session aims at:
• understanding the typology and levels of archaeological appropriation;
• understanding whether archaeology as discipline is able to overcome its predatory aspects to become more inclusive e.g. facilitating the appropriation of national archaeological heritage by minorities, immigrants, different religious groups, etc;
• exploring uses of archaeology in present-day conflicts (e.g. as peace keeping tool, stone of contention, etc.);
• comprehending the role of archaeology in European policy at both State and European Union levels (e.g. in identity building, ethnic conflicts, etc.).

TH3-02 Abstract 01
Cultural heritage between intrinsic values and communication strategies in the time of Daesh
Author - Dr. Iacomì, Veronica, Confederazione Italiana Archeologi, Roma, Italy (Presenting author)
Keywords: archaeology and propaganda, Daesh, endangered heritage
Presentation Preference - Oral

The dreadful videos and photos issued by the alleged Islamic Caliphate of Daesh about the destruction of archaeological and historical monuments in the Middle East shocked not only the restricted circles of scholars but the whole world for brutality and terrifying violence. In a recent lecture on these topics, renowned Italian scholar prof. A. Gardina stated that in a long-term historical perspective the correct approach to such eventsuality is neither indignation nor the search for consolation. He invited to reflect through the lens of historical comparison: nowadays, as also historian G. Bowersock noted, religion is such a political and terrifying violence. In a recent lecture on these topics, renowned Italian scholar prof. A. Gardina stated that in a long-term historical perspective the correct approach to such eventsuality is neither indignation nor the search for consolation. He invited to reflect through the lens of historical comparison: nowadays, as also historian G. Bowersock noted, religion is such a political

TH3 Abstract 02
Archaeological border studies: the impact of the Roman Frontier on the present immigration crisis
Author - Harscam, Emily, Durham University, Durham, United Kingdom (Presenting author)
Keywords: Border studies, Immigration, Romania
Presentation Preference - Oral

The immigration crisis is one of the greatest modern day conflicts currently affecting Europe. In 2015, 1,294,000 migrants and refugees crossed into the EU and claimed asylum. Identity politics significantly impacted their reception, resulting in an often hostile landscape- a landscape in which the relevance of the past is fundamental. The theory of differential inclusion argues that as migrants cross the borders into Europe, they will experience a setting which is open to some but closed to others (Richardson 2013). Archaeology is complicit in the creation of this setting, and archaeology as a discipline needs to address border studies-some have already begun to draw comparisons between modern borders and the frontiers of the Roman Empire (see e.g. Lafrance-Samuels 2008; Hingley 2015). There must be a multi-disciplinary attempt to access and understand all the cultural and ideological barriers resulting in differential inclusion, particularly that occurring in the areas of Europe which still hold something of a liminal identity. Romania is one such place, which although the nation has yet to draw the same numbers of migrants as Hungary or Bulgaria, is a space uniquely set up for such an attempt. This paper will analyze the ideological foundations of Romania as a European nation, the impact of the Roman Frontier on the lower Danube as a modern border, and start to provide a general methodology for archaeological border studies.

TH3-02 Abstract 03
Developing Politics and Attitudes towards Cultural Heritage in Turkey
Author - Dr. Daniel, ELF, American Research Institute in Turkey, Ankara, Turkey (Presenting author)
Keywords: Cultural heritage, Turkey
Presentation Preference - Oral

The efforts of protection, preservation and conservation cultural heritage in Turkey are largely dictated by The Ministry of Culture and Tourism. Growing economic investment on the construction of new public museums emphasizes the importance placed on the protection and the display of the nation’s historical and cultural wealth. These pristine contexts, however, stand in juxtaposition to the complex dynamics among Turkey’s southeastern neighbors where the calculated destruction of cultural heritage has prompted new initiatives of protecting sites and artifacts across the region. Working with the American Research Institute in Turkey (AIRT) and the US Embassy in Ankara, the Ministry of Culture and Tourism has recently addressed these dynamics and with a series of new programs and projects addressing the increasingly important issues of security and protection. This paper focuses on these efforts as they contribute to the growing importance and necessity of responses on heritage security and protection in the entire region.

TH3-02 Abstract 04
Valuing Rome’s Dough & other policies: economic use of the Colosseum or cultural experience for visitors?
Author - Dr. Iacomì, Veronica, Confederazione Italiana Archeologi, Roma, Italy (Presenting author)
Co-author(s) - Dr. Celli, Elisa, Museo Civico Etrusco Romano di Trevignano Romano, Trevignano Romano (Roma), Italy
Co-author(s) - Dr. Appeltachia, Agostina, Indipendent Researcher, Roma, Italy
Keywords: Colosseum, Cultural tourism, Heritage exploitation
Presentation Preference - Oral

The Colosseum is a world heritage site renowned for its architectural and historical significance. However, the management and utilization of the site have been controversial. The Colosseum has long been a symbol of Roman power and is one of the most visited attractions in the world. This has led to debates over the impact of tourism on the site, including concerns about over-crowding and wear and tear on the structure. The site is also home to several archaeological remains, including the cellars and underground passageways, which are not open to the public due to safety concerns.

Over the last years, there has been substantial research into the relationship between archaeology and politics. Early research explored the interaction between archaeology and State focusing on nationalism, and demonstrating that there is no such thing as non-political, value-free archaeology. Nationalism stimulated the very creation of archaeology as a science and has informed the organization and infrastructure of archaeological knowledge. However, more recent trends focus on archaeology’s relation to Modernity, insisting on the concept that archaeology has to be viewed as cultural product. As every cultural product, archaeology as a discipline is inherently a practice of cultural appropriation. Archaeologists perceive themselves as officially entitled by the society to use archaeological material as resource for understanding the cultural past in pursuit of the “truth”. The vision of the past emerging from analyzing the dynamic nature of appropriation of the past as an intentional process - whose mechanism affects social change - is that uses of the past have to be considered as pointers to competing visions of the future at both individual and group levels. Scientific archaeology also adopts such a vision. The debate on the notion of appropriation and ownership, the role of heritage in a globalized society, scientific archaeology and the impact of archaeological practice on local and global communities are issues that this session wants to address.

This session aims at:
• understanding the typology and levels of archaeological appropriation;
• understanding whether archaeology as discipline is able to overcome its predatory aspects to become more inclusive e.g. facilitating the appropriation of national archaeological heritage by minorities, immigrants, different religious groups, etc;
• exploring uses of archaeology in present-day conflicts (e.g. as peace keeping tool, stone of contention, etc.);
• comprehending the role of archaeology in European policy at both State and European Union levels (e.g. in identity building, ethnic conflicts, etc.).
A hot topic of debate in the agenda of institutions and associations in the field of both tourism and cultural heritage, the present-day administration of the Colosseum and other archaeological sites of Rome may represent a meaningful model for analyzing the value acquired by heritage and archaeology in contemporary Italian society. The Italian word “valorizzazione” (enhancement and promotion), in the mind of lawmakers, is meant to connect the intrinsic value—historical, archaeological, cultural—in a wider sense—of the heritage with the economic return of its exploitation. During these recent years, though, in the wake of mass tourism, marketing strategies (“exploitation”) are growing in importance with respect to the cultural issues which should appeal visitors (“valorizzazione”); for instance, temporary exhibitions of questionable scientific contents are promoted as a way to increase entrance fees, while panels and other educational tools seem to be inadequate to the audience needs. As a result, in other words, is there the strong risk of a mere economic use devoid of real cultural contents and intentions? On the other hand, what does the general public (in this case study meant as foreigner tourists in Rome) perceive when visiting Rome? Is the Colosseum simply a “must-see” destination or a real “cultural experience”?

This speech is aimed to boosting the situation as per public commitment of institutions, real or presumed enhancement of the heritage in cultural terms, expectations of visitors and their fulfillment. At the purpose, the authors propose an investigation about more recent policies of investment and enhancement: a statistical analysis of the perception of the public through a survey held on site will be presented. In conclusion, considerations about the role archæologists may and should play in these various regards will be drawn, under the peculiar perspective of the authors who experience archaeology both in an academic and scientific way, and working as official tourist guides of Rome.

**TH3-02 Abstract 05**

**Interpretative appropriation as religious utopia: Illyrian mythology after communism**

**Author:** Bekteshi, Arba, University of Tirana, Faculty of History and Philology, Tirana, Albania (Presenting author)

**Keywords:** Illyrian mythology, interpretive appropriation, material encounters

**Presentation Preference:** Oral

In trying to shift the discourse of Albanian spiritual identity away from a democratic revival of main religious traditions and possible political institutionalizations of culture, a fragment of the academic world hypothesizes for historical spiritual independence. A “[s]pirituality [that] has to do with the personal; that which is interior or immaterial; that which is one’s experienced relationship with the sacred; and that wisdom or knowledge which derives from such experiences (Heelas, 2001).”

In this paper I maintain that Albanian analysts are fashioning a post-communist academic discourse in favor of the construction of a unique vernacular transcendential tradition. To highlight the above-mentioned causality, I reconsider the present day focus on Illyrian origin-mythology as informative of distinctive heritage and ancient Greek syncretism. To this aim, I contend that efforts for the creation of a discursive platform on vernacular traditions are paradoxical due to the fact that they make the case for a new utopia, similar to the Albanian experience of what Schumpeter asserted to be a Marxist religion. The latter made reference to the everyday life, while constructing evidence for historical pasts that recalled its ideology and values (Qendro, 2014). Moreover, a focus on the vernacular is purported as inclusive of Albanian “metaphysical believers (Heelas, 2011)” into global postmodern discourses on faith, while it provides a rationale for dissociative “apostolic respiritualization (Haynes, 2011).”

---

**TH3-02 Abstract 06**

**Alatri in the Sky with Diamonds**

**Author:** Pinuccio, Alessandro, University of Rome “La Sapienza”, Roma, Italy (Presenting author)

**Co-author(s):** Gori, Maja, University of Heidelberg, Heidelberg, Germany

**Keywords:** Alatii, polygonal walls, pseudoarcheology

**Presentation Preference:** Oral

In the last decades, thanks to stratigraphic excavations and associated pottery analysis, many Italian opus quadratae monuments have been correctly dated to the Republican era, deconstructing thus the idea of their belonging to the Archaic period or even earlier. Alatri, a well-known archeological site close to Rome, is a paradigmatic example of new scientific methods proving wrong old chronologies and theories. The polygonal walls of the city and its acropolis, indeed, date to the 3rd century BC proving against the traditional Archaic or even Pelasgic chronology. This new chronological and cultural framework for the old city sparked a passionate debate amongst local historians, who believe that the construction of the Alatii complex pre-dates the Roman arrival in the region. Local archeologists amateurs, thus, opposed new dates and interpretations by having recourse to different theories, mainly based on archaeoastronomy. Alatii was associated to sites traditionally connected to pseudoarcheology, like the Egyptian pyramids, and to the alleged presence of linguistic signs from other parts of the Mediterranean, linking also the prehistoric of the walls to ancient Middle East civilizations, like the Hittites, authoritative and mysterious enough to replace the hated Roman invaders and enough far away not to be perceived as invaders themselves. This paper will focus on Alatii and will address cultural, social, and psychological aspects connected to the denial of the Roman paternity of Alatii monuments. Why the inhabitants of a city of Latium Velux need to seek different and older origins for their city from the ones provided by official archeology? We will also try to explain why—in addition to communicate the scientific results to the society at large—it is important for mainstream archeology to engage with non-professionals amateurs even if the debate occurs in the archeofantasy arena.
OPEN ACCESS AND OPEN DATA IN ARCHAEOLOGY: FOLLOWING THE ARIADNE THREAD

TH3-03

Thursday, 1 September 2016, 09:00-13:00
Faculty of History, Room 218

Academic poster - Oral

Co-author(s) - Richards, Julian, University of York, York, United Kingdom (Presenting author)
Co-author(s) - Dr Gattiglia, Gabriele, University of Pisa, Viareggio, Italy (Presenting author)

Abstract 01

Requirements for open sharing of archaeological research data

Author - Dr. Gasser, Guntram, Salzburg Research, Salzburg, Austria (Presenting author)

Co-author(s) - Gasser, Guntram, Salzburg Research, Salzburg, Austria

Keywords: open access, open data, repositories

Presentation Preference - Oral

There are several good arguments for open research data and over the last few years expectations of open sharing of publicly funded data have increased. For example, re-use of data in further research (e.g. based on combined data) is expected to provide much return on investment.

Considerable progress has been achieved with regard to e-infrastructures and services for data sharing, access and re-use, but the institutional requirements are lagging somewhat behind. Such requirements include the extension of open access mandates from papers to research data, available repositories adequate for research data, and making sure that data sharers receive the credit they deserve. Researchers still perceive more obstacles than incentives for opening up their data, including additional effort, lack of academic reward, concerns that data might be misused, and more. Indeed, clear evidence of benefits of data publication, re-use and citation – both on the community and individual levels – is crucial for pushing forward the open data agenda.

The paper will give an overview of the current landscape of e-infrastructures and open access resources for archaeological and other cultural heritage, highlight institutional and other requirements for further progress and innovation through open data over the next 5 to 10 years.

Abstract 02

The Reputation effect

Author - Dr. Gattiglia, Gabriele, University of Pisa, Viareggio, Italy (Presenting author)

Co-author(s) - Ancheri, Francesca, University of Pisa, Viareggio, Italy

Keywords: open access, open data

Presentation Preference - Oral

Archaeologists recognise the potential impact that the sharing and re-use of data can bring: the benefits of accessibility, both as open access and open data, are evident for archaeology, given the primary and unrepeatable status of most data sets. Nonetheless, archaeologists have sometimes been reluctant to share their primary research data. An explanation for this could be a research system, both academic and professional, driven by individual reputation expressed in ranked publications. This system could be labelled as a reputation economy. In a reputation economy, it is necessary both to provide adequate formal recognition and to foster network-based interaction.

The recognition for making data available to other researchers means to provide data citations, so on January 2015, the MAPPA Lab of the University of Pisa promoted the first peer review Data Book dedicated to Italian archaeology. The idea was based on the assumptions that data need to be treated as a relevant part of the archaeological record (and not only data paper) should be connected to primary data. These biannual volumes called MAPPA Data Book are conceived as a series of archaeological monographs designed with a dual level of publication: a paper, in which the archaeologists can analyse the data recorded, and the data set published as open data in the MOD (MAPPA Open Data), the open data repository of Italian archaeology. The volumes are published as open access and in a print on demand mode.

As for fostering network-based interaction, we are going to launch a communication campaign aimed to promote the use of academic social network, such as academia.edu and researchgate.net, for embedding the links to the data sets archived in our repository. In this way, on the one hand the archaeologists that share their data can take advantage of the academic social network realised by these platforms and of the metrics that reflect the impact of a contribution, on the other hand the repository can focus on data publication and long term preservation.

Thus archaeological data sharing becomes a way for researchers to collaborate and thereby meet the needs of an increasingly complex research landscape, and the reputation effect becomes a way to foster data re-use.

Antiquarians in the 21st Century: Opening up our data

TH3-03

Author - O’Riordan, Emma Jane, Society of Antiquaries of Scotland, Edinburgh, United Kingdom

Co-author(s) - O’Riordan, Emma Jane, Society of Antiquaries of Scotland, Edinburgh, United Kingdom (Presenting author)

Keywords: open access, publishing, research

Presentation Preference - Oral

The Society of Antiquaries of Scotland has been an active publisher of Scotland’s history and archaeology since 1792; the Proceedings of the Society of Antiquaries of Scotland (PSAS), has been the primary journal dealing with Scotland’s past in its British and European context since 1851. Publication in PSAS has often been seen by many archaeologists as the ‘end’ of the research cycle: excavation is followed by publication, and the process is complete. However, there is increasing awareness that the final report alone does not tell the whole story, and many readers would also like to examine raw data. In 2001, the Society created a new, fully peer reviewed, freely available online journal, Scottish Archaeological Internet Reports (SAIR), so was an early adopter of Open Access in an archaeological context. SAIR was intended to provide a new, lower- cost publication outlet for detailed archaeological reports; over the last fifteen years it has evolved to include the publication of many different types of projects – including large-scale surveys, gazetteers and conference proceedings – which would not be possible or desirable to publish in print for various reasons.

The Society also runs the Scottish Archaeological Research Framework (ScARF). Launched in 2012, this collaborative project brought together experts from a range of disciplines to compile a peer-reviewed summary of our archaeological knowledge up to that point and agree where future research should be directed. The entirety of Scottish archaeology was split into nine panel reports, all of which are available for free download from the project website or can be viewed on the wiki- style website itself. As such, it is the first framework of its kind in archaeology. The Society is contemplating how best to take PSAS, SAIR and ScARF forward in an Open Access world. Our audiences are increasing, both in number and in variety. There have been over 400,000 downloads from Society’s publication archives held by the Archaeology Data Service (ADS) since 2011, and over the past three years ScARF has seen over 262,000 page views. And yet these final reports are only the tip of the archaeological data mountain.

As an archaeological publisher, if we aspire to the true aims of Open Access, we should be making the original data available for re-use, data mining and new interpretations. But how can these aspirations be carried out in practice when the data is so vast and varied? As a small independent organisation, we must look to collaboration. How best to do this? One possibility is drawing from the models created by computer scientists and scientific publishers more used to dealing with raw data rather than ‘coffee-table books’. However, making the data available is not only a technological issue – there are already data downloads available in parts of ScARF and SAIR, for example - but a cultural one. Many archaeologists are cautious about openly sharing raw data and we must consider how best to reconcile the needs of authors and remaining true to our own aims of truly open knowledge.
Beyond the Pale: grey literature as a method of publication

Keywords: grey literature, open access, publication
Presentation Preference - Oral

TH3-03 Abstract 04

Digitizing Early Farming Cultures: integrating resources from Neolithic Greece and Anatolia

Author: - Adaplick, Edeltraud, ÖAW, Vienna, Austria (Presenting author)
Co-author(s): - Nasr, Aria, ÖAW, Vienna, Austria
Co-author(s) - Stuchl, Setal, ÖAW, Vienna, Austria
Keywords: Neolithic sites and finds, open data
Presentation Preference - Oral

The aims of the project ‘Digitizing Early Farming Cultures’ are to create standardized and integrated research data of Neolithic and Chalcolithic sites and finds of Greece and Anatolia (c. 7000–3000 BC according to Greek terminology), two neighboring and archeologically closely related regions usually studied in isolation of each other. The data will be made available online concerning compliance to standards in data production for data sharing (metadata and mapping) and interoperability with related initiatives. The resources that form the basis for the new dataset include digital resources (site- and potter- and bibliographic- databases in different formats) and also analogue resources such as unpublished manuscripts, site gazetteers and a pottery collection. The resources result from different projects that span over the last four decades and where different terminologies, typologies and chronologies have been used. In the project we use various methods to integrate the data: creation of a new site database, mappings to CIDOC CRM and digitizing of finds (3D pottery models) and attribution with relevant metadata. Data are currently published on a new project page and at the end of the project we will also talk about the working process and our experiences as archaeologists in a project where we present an interface between archaeologists specialized on the subject area of Neolithic archeology and technicians.

TH3-03 Abstract 07

The SITAR project (Rome).
Achieving interoperability and opening data: practical implementation

Author: - Boi, Valeria, archaeological consultant, Rome, Italy (Presenting author)
Co-author(s) - Di Giorgio, Sara, Istituto Centrale per il Catalogo Unico delle biblioteche Italiane, Rome, Italy
Co-author(s) - Sertorelli, Mirriëa, Soprintendenza Speciale per il Colosseo, il Museo Nazionale Romano (SSCol), Rome, Italy
Co-author(s) - De Tommasi, Andrea, Soprintendenza Speciale per il Colosseo, il Museo Nazionale Romano (SSCol), Rome, Italy
Keywords: ARIADNE, CIDOC-CRM, Open Data
Presentation Preference - Oral

This paper follows on from a contribution presented within the session “Barriers and opportunities: Open Access and Open Data in Archaeology” at EAA 2014. In 2014, we discussed the theoretical implications of data sharing and interoperability within the SITAR project. On this occasion, we want to provide an update of the practical implementation of information-sharing path, regarding the choice of data licenses, the privacy protection and intellectual property rights, and in respect of the CIDOC-CRM mapping of SITAR database. The SITAR (Archaeological Geographic Information System of Rome) has been designed and implemented by the Archaeological Superintendency of Rome, with the aim of making the archaeological data, coming from the Office’s archives, freely accessible to the public. A new project, SITAR database is now made up of about 4,000 information source records, from different excavations or other archaeological studies or surveys, from which about 14,000 record “archaeological part” have been identified, each of which represents a descriptive unit distinguished on the basis of a chronological and functional criteria. Data are currently published online on SITAR Project’s WebGIS portal (http://webvis.archeologiaeuropea.org/webgis/login.php), where they can be freely consulted.

SITAR Project, partner of the Arieone project from 2013, is completing in the early months of 2016 the analysis of data licensing, starting from the analysis of the Italian regulatory framework and the comparison with the best practices developed by other project partners.

The study has been carried out in collaboration with the Central Institute for the Union Catalogue of Italian Libraries and Bibliographic Information (ICCU) and the University of Padua, and in particular it intends to return to the reflection on the methods for achieving interoperability between databases, on Open Data release within Arieone and the managing and licensing of original archive documents, i.e. grey literature, which have been digitized.

TH3-03 Abstract 08

Integrating data for archaeology

Author: - Garnolis, Dimitris, Athena Research Center, Maroussi, Greece (Presenting author)
Co-author(s) - Finn, Johan, Swedish National Data Service, Gothenburg, Sweden
Co-author(s) - Olsson, Olof, Swedish National Data Service, Gothenburg, Sweden
Co-author(s) - Alfonsi, Eleni, Athena Research Center, Maroussi, Greece
Co-author(s) - Felicetti, Achille, University of Florence, Florence, Italy
Co-author(s) - Nicolucci, Franco, University of Florence, Florence, Italy
Co-author(s) - Gey, Sebastian, German Archaeological Institute, Berlin, Germany
Keywords: Data enrichment, Data integration, Infrastructure
Presentation Preference - Oral

In the past years, infrastructure projects in the Archaeology domain have focused on data aggregation in order to bring to the end users the vast amount of information gathered from various organizations and stakeholders. The typical processes found in a
data aggregation infrastructure include: ingestion, normalization, transformation and validation processes that mainly focus on the homogenization and clearing of heterogeneous data. A portal is usually employed to present this information to the end users and is met with limited success due to the vast information contained. In order to increase the quality of services that are provided to end users, the European funded project Ariadne (http://www.ariadne-infrastructure.eu/) aims at integrating this data by modelling the underlying domain and providing the technical framework for automatic integration of heterogeneous resources.

The heart of the infrastructure lies in the underlying domain model: Ariadne Catalog Data Model (ACDM), a DCAT derived model which models a large number of entities such as Agents, Language resources, datasets, collections, reports, services, databases, etc. With the help of a of a micro-service oriented architecture and a set of powerful enrichment micro-services all aggregated data are transformed into XML and RDF, annotated over subject, space and time with the help of AAT, Geonames and Perio.do thesauri (thus establishing a common reference) and interlinked with each other based on their structural or logical relationships. The data integration services can mine for links among resources, link them together and against language resources, related vocabularies. Complex records can be split into their individual components, represented, enriched and stored separately while maintaining their identity using semantic linking. Each integrated resource is assigned a URI and published to:

- a) Virtuoso RDF Store in RDF which provides a SPARQL interface
- b) to Elastic Search in JSON which provides a powerful indexing mechanism that can help present and associate resources accurately in real-time.

This approach can provide developers and creative industries with the means to create innovative applications and mine information from the RDF store.

End users ranging from simple visitors to domain researchers can access this data through the infrastructure’s portal which is capable of hiding the complexity of this plethora of data, filter the results using a plethora of filters and present connected resources in a way that can help guide the user instead of confusing him/her.

The technical framework has been developed using various programming languages such as Java, PHP, Javascript, it is distributed spanning multiple virtual machines and brings together different established technologies and components. Both the technical infrastructure and the portal will be presented and demonstrated.

TH3-03 Abstract 09
Linked Open Data Approaches within the ARIADNE Project

Author - Dr. Wright, Holly, University of York, York, United Kingdom (Presenting author)

Keywords: ARIADNE, Linked Data, Open Data

Presentation Preference - Oral

ARIADNE is a four-year EU FP7 Infrastructures funded project, made up of 24 partners across 16 European countries, which hold archaeological data in at least 13 languages. These are the accumulated outcome of the research of individuals, teams and institutions, but form a vast and fragmented corpus, and their potential has been constrained by difficult access and non-homogenous perspectives. ARIADNE aims to bring together and integrate existing archaeological research data infrastructures, so researchers can use these distributed datasets in combination, and in new ways. This paper will give an overview of the progress of the ARIADNE project, focussing on efforts to create a shared infrastructure into which metadata is gathered, and a portal to allow cross-search of this metadata. To this end mapping work has been carried out to facilitate searching across space, time and subjects, using Linked Open Data (LOD). This work represents LOD best practice by incorporating existing international initiatives such as the Getty Art & Architecture Thesaurus, and contributing to emerging best practice initiatives like PeriodO. As ARIADNE is in its final year, conclusions can begin to be drawn about the challenges faced along the way, and possible directions for the future.

TH3-03 Abstract 10
ArchaeologistsEngage. Thinking Big - We Can Change Archaeology

Author - Tibbetts, Belinda, Exeter, United Kingdom (Presenting author)

Co-author(s) - Schenck, Tine, ArchaeologistsEngage, Oslo, Norway

Keywords: Engagement, Public, Social

Presentation Preference - Poster

ArchaeologistsEngage encourages engagement between archaeologists and the public. We offer a platform for public engagement and dialogue through social media and a range of events. In January we launched Challenge 2016, an exciting call to archaeologists to undertake one new form of public engagement to improve the direct dissemination of our research to members of the public.
The theoretical and methodological perspectives in archaeology

I propose to look at this site through Lefebvrean Spaces, namely at the multiple spaces of representation extant at the limes of Steppe Nomads. Besides being a fortress and the wall built to separate the above-mentioned worlds for defense purposes, this Byzantine Empire, the Islamic Caliphate, and Medieval North represented by the indigenous people of the Caucasus and the integrate those fields through archaeological common ground. The basis for this archaeological model is the site of Darband. "The Production of Space" by Henry Lefebvre (1991) outlines three main categories of space: perceived (physical) space, conceived (mythical, conceptualized, encoded) space, and lived space (the space of political negotiation between all categories, including archaeological "spaces of representation"). In my paper, I will argue that this theoretical framework can be useful in order to reconcile different archaeologies at the common ground where physical space and knowledge are shared as a part of everyday life.

Theoretical and methodological perspectives in archaeology

Ottoman Mediterranean and its archaeology between two worlds

The Ottoman legacy has left a significant imprint on the social and cultural relations in the Mediterranean. The chronological frontiers of Ottoman legacy show a shared knowledge in the Levant, but this legacy and its chronological contexts protect a local and differentiated knowledge. The Ottoman symbiosis and cohabitation created a symbiosis between its central and peripheral clusters. The archaeological data and its distribution in the Ottoman Mediterranean indicate Ottoman policy and its colonization effects on the social and economic structures. This paper aims to discuss Ottoman knowledge and its archaeological clusters to identify Ottoman Mediterranean and some problematic and debatable validity in the current modern and nationalist archaeologies.

Ottoman Mediterranean and its archaeology between two worlds

Early Middle Ages as social conflict: local communities in post-Roman Iberia and the Mediterranean

In the last two decades the debates over Early Middle Ages in Western Europe have been revitalized due to two interrelated processes. On the one hand, the incorporation to the scientific research of a huge amount of new data coming from Commercial Archaeology and the resulting damage to heritage within a capitalist management in pre-crisis times. On the other hand, it has been revitalized because of the introduction of concepts such as "identity," "religious community" or "ethnicity" within archaeological and historical interpretation of the period. The renewal of identity and ethnic interpretations, almost lost after World War II, have introduced new important and interesting debates, but also recovered others, even though the discipline, in general terms, is still dominated by a kind of naïve empiricism which pays little attention to the social and political implications of the textual data. However, as philosophers like Slavoj Žižek claims, this "ethnic revival" is not causal but closely related to the crisis of the late capitalism and used as a shield against postmodernism traumas. Early Middle Age archaeology, as a scientific field (following Bourdieu’s characterization) has not been isolated from this process and in some cases, has not only misinterpreted the archaeological record, but also has been the basis for racist politics in Western Europe. One of the consequences of this is the blurring of Early Middle Ages as a period of high social conflict among different social strata, beyond ethnic parameters. In this paper, we will try, in the first place, to make a deconstruction of some current discussions over Early Middle Ages and, in the second place, to make a social and anthropological interpretation of Early Middle Ages in terms of social conflict and of economic and symbolic adaptation of local communities, overall peasant societies, to the failure of a Roman project of World-Empire. For that purpose, some concepts from Marxist Critical History Archaeology (E. M. Price, M. Oren, M. James, T. Mommsen) will be used to interpret some key elements of post-imperial archaeology, using the central part of the Iberian Peninsula as a case study within the Mediterranean context. This territory has been recently analysed in a PhD research and is inserted in a Research Project on social inequalities in Early Middle Ages. Thus, domestic architecture, settlement patterns or funerary remains will be analysed within this theoretical frame, trying to contextualise but also to extrapolate conclusions and ideas for other case studies.

Early Middle Ages as social conflict: local communities in post-Roman Iberia and the Mediterranean

Beyond hierarchy: Common property rights & migration as a factor in rapid change in material culture

Keywords: Beyond hierarchy: Common property rights & migration as a factor in rapid change in material culture

Presentation Preference: Oral
Sudden and almost complete changes in material cultural are, in archaeological contexts, frequently ascribed to migration. An inauspicious is the almost complete replacement of Romano-British artifacts by those from north-west Europe in many parts of England in the first few decades of the early fifth century AD.

The paper begins by offering a brief critique of current models for explaining such rapid change in which migration is given a leading role: military cohesion among migrant groups; their apparent resistance to assimilation; replacement of existing leaders by high status immigrants; and ethnogenesis, the deliberate framing of political ideologies aimed at rationalizing territorial control. It notes that all elements of such models take a ‘top down’ view, in which access to power is predicated on status and wealth within hierarchical political structures, and where cultural change is explained in terms of leadership by an elite.

The paper moves to an alternative, experimental, ‘bottom up’ approach to investigating rapid changes in material culture. It begins with the premise that all aspects of a stable, sustainable, agricultural economy depend on property rights over land. Access to and exercise of property rights enable an individual to make a living, offer the opportunity to generate a surplus or acquire goods, and create opportunities for personal interaction with elites through tribute, gift-giving or taxation. An analysis focused on the practical management of agricultural property rights offers the possibility of a ‘bottom up’ perspective on cultural change that anchors abstractions about social relations into the everyday realities of making a living.

The paper then explores the impact of migration on the daily lives of peasant cultivators through their common property rights in territorial resources. It notes the structural link between property rights and governance, the role of the latter in the regulation, maintenance, protection and enforcement of property rights, and the generalized predictability of frameworks for governing shared resources - in particular their characterization as ‘horizontal’, predicated on equity among all right-holders and exemplified through normative expectations of participation and consensus. It goes on to examine Ravenstein’s (1885) classic conclusions about migrants and the migration process through the lens of common property rights and their characteristic governance structures. It concludes that, however great sudden changes in material culture might be, if there is archaeological evidence for the contemporary continued exploitation of collective resources then it is highly likely that immigrants and their descendants were assimilated into receiving communities and that they were unlikely to have been a driving force in that cultural change.

The argument does not discount the possibility of cultural change as a result of variations in access to resources, wealth and status whether or not as a result of migration. Nor does it challenge the existence of political and social hierarchies. It argues, instead, that the complementary contribution of collective traditions should not be neglected in explaining transformative cultural change. The paper concludes by suggesting the need for more complex, more dynamic, perhaps even epidemiological, models to explain change in the human past.

**TH3-05 Abstract 08**

**Does Chronology Matter? The Early Medieval Venice Narrates through Water, Wood and Labor**

**Author:** Calatroni, Diego, Stanford University, Stanford, United States of America (Presenting author)

**Keywords:** Anthropological Theory, Ecological Degradation, Historicism

**Presentation Preference:** Oral

How much do the historical events rewritten through archaeology speak for themselves as memories, and how much do the archaeologists construct them into cohesive narratives? This paper aims to consider the demanding activities of sequencing events and building effective chronologies in order to transform archaeological records into meaningful historical events.

Using early medieval Venice and its origins as a test case, I would investigate the political and cultural role of pre-manufactured chronologies built around few problematic late antique and early medieval written sources in the interpretation and narration of the archaeological records. I will also attempt a comparison between the different approaches to the materiality of the Venetian past including both Italian academics, conditioned by a strong historicist tradition since Croce’s works, and the international scholars’ community.

The paper, integrating ecological degradation and anthropological theory of materiality, aim to reassess the process formation of new settlements in the Venetian lagoons at the end of the Roman period. From Late Antiquity to the Early Middle ages, specific ethnic and social groups developed a new perception of the geography of Europe and of the Mediterranean region. The unique relationship with the lagoon environment is bringing novel perspectives to the interpretation of archaeological dataset. The human-ecological relationships that underpinned the rise of Venice emphasize the social aspect of the materiality of the past, and simultaneously it seems to have a significant legacy in the present.

**TH3-05 Abstract 01**

**Nature: Cultures Heritage, sustainability and feminist posthumanism**

**Author:** Associate Prof. Christina, Fredengren, Stockholm, Sweden (Presenting author)

**Keywords:** Environmental Humanities, Heritage, Posthumanism

**Presentation Preference:** Oral

This paper makes use of feminist posthumanism to outline how a range of heritage policies, practices and strategies, partly through their base in social constructivism have a clear anthropocentric focus. Not only do they risk downplaying materiality, but also often in the context of a political economy of change that anchors abstractions about social relations into the everyday realities of making a living.

The argument does not discount the possibility of cultural change as a result of variations in access to resources, wealth and status whether or not as a result of migration. Nor does it challenge the existence of political and social hierarchies. It argues, instead, that the complementary contribution of collective traditions should not be neglected in explaining transformative cultural change. The paper concludes by suggesting the need for more complex, more dynamic, perhaps even epidemiological, models to explain change in the human past.

**TH3-05 Abstract 02**

**Time, Colonialism and the Intricacy of Relational Practice**

**Author:** Professor Corneli, Per, University of Gothenburg, Västra Frölunda, Sweden (Presenting author)

**Keywords:** Americas, Colonialism, Relationism

**Presentation Preference:** Oral

In the context of destructive and fierce colonialism, questions of interaction and relationism are crucial but also intricate and require subtle means of analysis. In the advent of European Colonialism in the Americas, the encounter is largely one of human exploitive and conflictual interaction, but also a question of humans encountering, relating to new bacteria, new animals, new vegetation. Opening for a fresh approach to these questions require a set of theoretical and methodological tools, which includes thoughts from feminist writers like Braudt. But there is also a need to critically reflect on certain aspects of relationist approaches, like those developed by Haraway or Barad. The general frame must allow for an intricacy of time, for varied times and processual developments operating in different fields and in different spheres. Revisiting certain ideas from Marx, perhaps partly surprisingly, can prove productive and stimulate new approaches to questions of historical process, class and exploitation.
TH3-05 Abstract 03

Where is the Feminism in Archaeology?

Author: Torge, Joana, University of Southampton, Poole, United Kingdom (Presenting author)

Keywords: Feminism, Gender, Survey

This poster examines the extent to which feminist theory has been integrated into research and teaching within archaeology. Based on a study of publications and the modules taught by archaeologists who have previously published on gender and feminism in archaeology, the state of the discipline in relation to feminist theory and the complexity and problematic features of the integration of feminism into mainstream archaeology are revealed. The results show that publications which are of interest to feminist scholars are found in many academic journals, yet a notable lack of archaeological publications explicitly assert a feminist perspective. Most publications have a tendency to take either a more neutral approach found in ‘apolitical’ gender archaeology or a post-processual interest in experience, embodiment and phenomenology. Can we then assume that feminist archaeology has successfully managed to integrate into mainstream archaeological thought? Results of a survey of the profession, in particular of academics with teaching posts indicate that archaeological modules which focus on feminism in both undergraduate and postgraduate settings have now fallen by the wayside. By investigating publications of a specifically feminist or gender archaeology together with modules taught at universities across the Western academic archaeology tradition, the results of this research illustrate a post-modern trend to scrap categories and accordingly the marginalisation of those subjects which require categorisation for acknowledgement.

TH3-05 Abstract 04

Politics and archaeology in an uncaring universe, or feminism without historical binaries

Author: Professor Robb, John, University of Cambridge, Cambridge, United Kingdom (Presenting author)

Keywords: evolution, gender, politics

Presentation Preference - Oral

This paper parses the paradoxes which result from the collision of three facts: (a) Archaeological and historical accounts of the past are often taken as foundational narratives and laden with political meaning; following on from this, archaeologists have a responsibility to make sure that our work is used in productive rather than destructive political ways. (b) We also have a responsibility to say true things about the past. (c) People in the past were often deeply “political incorrect”, with attitudes and practices different from today’s and sometimes no doubt entirely appalling by modern standards. The prehistory of gender relations is often a complex and varied example. Archaeologists have responded to this paradox in varying ways, none satisfactory. One is by not engaging with the question of whether the past acts as a political mirror for the present. A second is by adopting a “see no evil” approach where we contemplate only positive aspects of the past. A third is to fit the past within the three traditional narratives (historical lack of change means natural inevitability, progress towards utopia, and progress towards dystopia). All of these rely upon an underlining, often unspoken rigid and distorting historical binary distinction between “us” and “them”, the modern and the pre-modern. As a counter-example, I explore a revisionist history of gender in which not only the “content” of gender but its existence and definitional form is seen to evolve continuously throughout human history. A feminist approach in this case is not about championing the interests of one sector, but about exploring the possibility for difference of all kinds, including historical. The result is a narrative which both accepts the past on its own terms and which we learn what history really implies about our present and our future.

TH3-05 Abstract 05

Women and archaeology in Portugal during the 60ies of the 20th century: ’exceptio firmat regulam’?

Author: Doctor Martins, Ana Cristine, Faculdade de Ciências Sociais e Humanas da Universidade NOVA de Lisboa, Lisboa, Portugal (Presenting author)

Keywords: Portugal, Theory, Women

Presentation Preference - Oral

In 1958, Lisbon hosted the first National Archaeological Congress. Being itself a novelty in the Portuguese archaeological panorama, this Congress has integrated other innovations, likewise a growing number of women in archaeology. Situation confirmed in the following decade, when the number of women dedicated to archaeology has been more evident. Toward that several political factors that characterized the important ’60s, influenced largely by changes observed in culture and cross-border mentality, as witnessed young graduates Portuguese archaeologists academically in other European countries.

Using methodologies of history of science and archaeology, and of gender studies, we will seek to comparatively analyze the status of women in archaeology practiced in Portugal in the 60ies. We will list, for that, names, research projects and knowledge production places. A method that will allow us to understand if the participation of women in archaeology in the country in those years, corresponded to the emergence of new research topics and ways to observe the material realities identified in the field and (apparently) absent from the archaeological record, as female ones. We intend, therefore, to realize to what extent women archaeologists contributed to the development and archaeology statement in Portugal, perceiving translated knowledge networks, or not, in sharing and perpetuation of theories and methods. Only then can we recognize the existence of individual scientific independence, especially in women, or, on the contrary, the (consciously or unconsciously) reproduction of already established theoretical models.

TH3-05 Abstract 06

Bones, Stones, and Names - determining and naming prehistoric men and women

Author: Dr. Fries, Jana Esther, Lower Saxony State Service for Cultural Heritage, Oldenburg, Germany (Presenting author)

Keywords: Binary Perception, Physical Anthropology, Venus

Presentation Preference - Oral

The paper discusses by which methods and means a certain sex is attributed to the bodies of prehistoric individuals or depictions and the effects of an ‘archaic’ assumption.

Bog bodies, skeletal remains and cremated bones have been determined as physically female or male by physicians, archaeologists and physical anthropologists. Statuettes have been named ‘Venus’ (often) or ‘Adonis’ (rarely) by archaeologists and historians and even rather abstract depictions of prehistoric humans have been interpreted as biological men and women. These attributions have an immediate effect on the further description and interpretation of the archaeological record.

I will discuss how and why archaeologists (among others) tend to see a (biological) man or a woman in every representation of a human being and even in their physical remains. Besides that the paper examines the long history of naming prehistoric individuals or depictions after antique goddesses or heroes. It deals with the physical and psychological characteristics that are attributed by this naming and the resulting effects on our image of prehistoric humans.

TH3-05 Abstract 07

The end of archaeology as we know it

Author: Dr. Vogel, Helga, Free University Berlin, Berlin, Germany (Presenting author)

Keywords: Ancient Near Eastern Studies, Archaeology of the gap, Function of theory

Presentation Preference - Oral

One of my favourite thinking-things are the findings unearthed by Leonard and Kathleen Woeckley and their workmen in the Royal Cemetery at Ur in what is today South Iraq. The archaeological record of the cemetery (around 2500 BC) is well known beyond the narrow limits of ancient Near Eastern studies partly because of the exceptional grave goods, which still provide one important fundament of our knowledge of ‘Sumerian culture’, partly because of the mass burials the excavators came across in some special graves. To my knowledge there is probably no theoretical approach, popular in archaeology the last 20 years or so, that was not used to ‘explain’ these mass burials, often hardly noticing the actual archaeological record. Now, my approach to make some sense of the findings of the Royal Cemetery was always very material based taking into account not only the ‘special graves’ but the whole Early Dynastic cemetery (roughly 6800 graves). The result is this: scarcely anything fits together and everything seems contradictory. The situation may be summed up in one statement (actually a Detroit based music collective’s motto): UIR, this is Underground Resistance, unexploitable. What is the function of theory in such a situation? More than gloss over lack of knowledge? Does it make any sense, for example, to interpret the positions of dead bodies in a 4500 year old ancient grave with Foucault’s concept of ‘docile bodies’? Is it really satisfactory to reduce human behaviour to performances of power/ submission? If we want an archaeology that actually respect ancient people, their lives and attitudes, should we not accept the resistance of the dead of Ur against our access/ exploitation? Whom do we serve by producing fantastic ancient worlds (supported by sophisticated postmodernist frameworks) standing on test of clay (literally in the case of ancient Near eastern studies)? I strongly advocate decentralising perspectives in archaeology. This is an ‘archaeology of the gap’ of blank spaces’ occupied by women and all other ‘subgroups’ usually not represented in the records of ancient Near Eastern archaeology (at least this is the usual attitude that one might also question). But how to theorize the proposed approach and who will fund archaeological projects that only produce open ends and tons of questions?

Helga Vogel, Free University Berlin Email: vogelha@zedat.fu-berlin.de.
Theoretical and methodological perspectives in archaeology

TH3-05 Abstract 08
Contributions of social anthropology to the knowledge of the status of the adorned bodied in archaeology
Author - Dr. Belard, Chloé, University of Southampton, La Roche sur Yon, France (Presenting author)
Keywords: adorned body, gender, archaeology, social anthropology
Presentation Preference - Oral

This paper proposes to present the first elements of a research project taking an interest in the visual effect of adornments, the social status of the body and gender ideology. The main issue is to determine to what extent the social and symbolic status of the body can be understood in death archaeology by means of ethnographic record. Firstly, through different ethnographic data, it is possible to observe how adornments are used to emphasise the different parts of the body according to their aptitudes and their symbolic meanings.

Secondly, the social categorisation and gender ideology related to adornments can be specified in view of social anthropology and in taking into account the notion of intersectionality. Three questions are fundamental: who are the wearers of adornments, why do they wear them and for whom? Furthermore, which aspects of adornments are used by several human groups as a medium to create social categorisation and which other aspects can be individualised? Finally, how bodies and movements of men and women can be controlled by means of adornments and to which aspects of gender ideology of each society this can be linked? Therefore, this research project aims to investigate to what extent social anthropology can allow us to better understand the bodily and symbolic use of buried adornments.

TH3-05 Abstract 09
Was there always a man and a woman?
On flexibility of sexuality in historical Islamic Iran
Author - Prof. Paspil Yazdi, Leila, Neyshabour, Iran (Presenting author)
Keywords: flexibility, Safavid Iran, Teimurid Iran, sexuality, bisexuality, homosexuality
Presentation Preference - Oral

Being propagated repetitively, the general image of contemporary Middle Eastern Muslim women is comprised of feminine bodies wrapped in black cloths called Chador (veils), the ones who cry more than speak, feel more than deduct and are always fighting/to be controlled by a very patriarchal society. Such an image has been seriously produced based on a very recent dichotomy and their symbolic meanings.

How much these images can be generalized to the past? During the last decade, the propagated image of Islamic sexuality has been very much challenged by historians. Referring the miniatures, sculptures and wall paintings, the performativity of gender during medieval ages can be very differently described from the recent propagated one. Chronologically, by the occurrence of Islam to historical Iran the change of the solid Zoroastrian dichotomous concept of men/women begun while afterwards the invasion of the region by central Asian Turks made bisexuality normative. Very famous pieces of literature such as Ghahdoosnameh [from 10-17 centuries A.D] introduce the only real love, the love between two men or two women. Noteworthy, it seems that modern governments are responsible to change the bisexuality as normal sex orientation to heterosexuality in order to control the bodies and also to revive the pre-Islamic value.

Analyzing pre-modern Islamic Shii'a, it is obviously detectable that there were always ways to put these vast ranges of sexual activities out of punishment frameworks. Archaeologically speaking, such a distinctive gender performativity has been materialized in the remained material culture related to the body such as wall paintings, pottery motifs and miniatures. In the first glance, the flexibility of sexuality would be observed within the manner applying by the painters who have visualized the bodies, there are very few distinctions between the bodies of men and women freely acting, practicing sex and everyday life while there were several words addressing several types of sexuality in the literature.

In this article, the authors try to investigate material culture dated to Teimurid and Safavid era [15-17 centuries A.D] through them they will be able to establish the very different historical framework of gender performativity and the flexibility of sexuality in Teimurid and Safavid Iran. The author try to project “sexual flexibility” as a cultural “situation”. It seems that flexibility goes beyond the contradictory homosexuality/heterosexuality.

TH3-05 Abstract 10
How moral travel produces difference - telling Nuu-chah-nulth whalebone clubs
Author - Dr. Marshall, Yvonne, University of Southampton, Southampton, United Kingdom (Presenting author)
Keywords: becoming, difference, moral geography
Presentation Preference - Oral

Wilson Duff (1975: 12) opens his book images stone b.c.: “Images seem to speak to the eye, but they are really addressed to the mind. They are ways of thinking, in the guise of ways of seeing.” Duff went on to suggest that the choice of stone as a medium for seeing-thinking was a move designed to place thinking outside of time - and thereby into a world of being (cf Marshall 2000 World Archaeology). In a recent article in the Canadian Journal of Archaeology (2019), Natasha Lyons and I argued in a similar vein for an understanding of objects as spatial ‘tellings’ materialised in non-linear, non-narrative and therefore a-temporal forms. Our common position with Duff is that objects/images are arguments concerning possibilities for being and becoming, not representations of beings.

Using whalebone clubs as my forum, I show in this paper how the Nuu-chah-nulth people of Vancouver Island, British Columbia, create object ‘tellings’ (ways of thinking) which set out a moral or ontological geography. Moral travel through this geography constitutes a process of becoming which produces difference (cf Marshall 2012 Feminist Theory). Simple moral travel produces everyday growth and change. But when more fundamental transformation is sought, through engagement with great power or wealth, moral travel is demanding and dangerous. The transformative possibilities of moral travel are calibrated in effort and risk.

TH3-05 Abstract 11
Material feminisms and the question of anthropomorphism in northwest Argentina
Author - Alberto, Benjamin, Framingham, United States of America (Presenting author)
Keywords: Anthropomorphism, Feminism, Materiality
Presentation Preference - Oral

Elizabeth Grosz has argued that new ontologies are essential for new grounds of feminist politics. Anthropomorphism in ceramic forms, often encountered in archaeology, always risks reduction to only a metaphoric expression in which the substance of the thing - its materiality, its ground - is left unquestioned. An absolute divide between fleshly body and ceramic body underlies and results from such reductionism. Addressing the ontological status of sex, gender, and the materiality of bodies, as Grosz has for many years, provides new ways to conceive of different bodies and their relationships.

I bring into focus the potential for new ontologies of bodies informed by feminist and queer approaches to materiality through a study of a collection of anthropo- and zoomorphic ceramics from the first millennium AD northwest Argentina. As, if Grosz suggests, difference is enacted equally through or across ‘natural’ and ‘cultural’ processes, the ceramics can be understood as materialities/bodies that share processes in common with other bodies (flesh, stone, etc.) regardless of the stuff out of which they are made. Anthropomorphism then becomes less a question of resemblance and more one of marking and enacting difference.

TH3-05 Abstract 12
Foreign women – from merchandise to merchant. The change in interpretations
Author - Dr. Koch, Julia Katharina, Lektorin für Archäologie, Preetz, Germany (Presenting author)
Keywords: gender archaeology, embodiment, social construction
Presentation Preference - Oral

Grave inventories which deviate from the norm of particular cemeteries are very popular in interpretations about prehistoric social structures. Special cases are people buried with imported grave goods and therefore discussed as indicators for different types of cultural contact and transfer. The focus of the paper is on the change in interpretations of female burials with foreign artefacts in Central European Bronze and Iron Age. In the 1960s the first perceptions of such prehistoric women in the “Högelgräber” - Bronze Age or in Late Iron Age burials near the oppidum Manching buried with foreign artefacts are combined with images of passive female roles. Influenced by a changed image of social female roles in Europe the interpretations permit actually similar Early Iron Age women an active role in trade networks around the Alps. But independent of interpretations the archaeological data are always the same - female burial with a mixture of local and non-local jewellery. So, how can we know how active or passive such women could have been as social actors in prehistoric times? The paper discusses the change of interpretation for the background of the increasing influence of gender theories in Archaeology and asks about the possibility of approximation to prehistoric realities beyond modern ideals and utopian (feminist) wishes. A further aspect of this topic is the influence of the new scientific methods like isotope analysis on actual mobility models.
Interpreting the late Iron Age record in Gaul

Author: F. Flury, Béatrice, Bruxelles, Belgium (Presenting author)

Presentation Preference: Oral

Late iron age studies, by the very nature of the main written source, “Caesar De Bello Gallico”, our modern western view of war, and periods of unrest and culture change, as well as the trend towards the interpretation of records through male directives of research strategies, mostly lead to geopolitical and economical models of culture change, and by a self-feeding process, overlook the clues enabling archaeologists to identify in the records, and therefore in future record, the missing links leading to alternative interpretations.

Indicative are the titles of the majority of classical archaeological monographs, “Le pas des legions”, “Roman frontiers” (or non-defined genders given the neutrality of linguistic terms “ the god of the Celts”, “Les Celtes”, “Celtic art”.

One could argue that in the process of synthesizing the new discoveries, in the long term historical interpretation, one might still easily miss the presence of females in archaeological contexts, and therefore their role in society, with implications in the long term historical interpretative framework and therefore in the building of contemporary ideology.

Indeed, interpretation of the status and role of females in society of a given period would rely on texts, inscriptions, figurative representations, burial types, as no indices appeared in northern Gaul UVK contexts, and their tangibility in other areas, on tenuous indications in earlier contexts. There, the arid nature of the archaeological witness, in a traditional interpretative schema leads to conclude that lack of evidence is proof of absence, however this is no proof of non-existence, and criteria could be inferred from wider context in order to find missing links in further research.

For the purpose of sociological interpretation, bolder authors refer to classical historical records, as well as later testimonies, so that sociological discourse oscillates between myth and reality: mentions in later Celtic societies of great Britain, or poetical works, and occurrence of alternative roles, exemplified in the short episode of the revolt of Boultica and her daughters, their subsequent destiny (and maintenance in the status of the dominated).

I wish to underline here that I am not writing in the perspective of “feminist archaeology”, but of the overall stream of French new archaeology.

Newer archaeological discoveries of MLT AND LLT in Gaul may enable us to build up means of identifying clues to define missing links so as to rediscover sociological context and interpret the body of record in periods of acute culture changes in a different light.

In this paper, some new archaeological data from Gaul enable the distinction of criteria to re-examine older records, and develop by way of contextual, spatial, functional, stylistic, regional and chronological comparison, as I have already devised in previous work, approaches or indices to identify the presence/absence of women in the body of records.

Tied to a wider historical framework, and related to other links, this could allow further interpretative writing on causes for culture change, but separated from pure data analysis. Copyright 14 February 2016

Th3-05 Abstract 15

“Chercher la femme”.

Interpreting the late Iron Age record in Gaul

Author: Flury, Béatrice, Bruxelles, Belgium (Presenting author)

Presentation Preference: Oral

Late iron age studies, by the very nature of the main written source, “Caesar De Bello Gallico”, our modern western view of war, and periods of unrest and culture change, as well as the trend towards the interpretation of records through male directives of research strategies, mostly lead to geopolitical and economical models of culture change, and by a self-feeding process, overlook the clues enabling archaeologists to identify in the records, and therefore in future record, the missing links leading to alternative interpretations.

Indicative are the titles of the majority of classical archaeological monographs, “Le pas des legions”, “Roman frontiers” (or non-defined genders given the neutrality of linguistic terms “ the god of the Celts”, “Les Celtes”, “Celtic art”.

One could argue that in the process of synthesizing the new discoveries, in the long term historical interpretation, one might still easily miss the presence of females in archaeological contexts, and therefore their role in society, with implications in the long term historical interpretative framework and therefore in the building of contemporary ideology.

Indeed, interpretation of the status and role of females in society of a given period would rely on texts, inscriptions, figurative representations, burial types, as no indices appeared in northern Gaul UVK contexts, and their tangibility in other areas, on tenuous indications in earlier contexts. There, the arid nature of the archaeological witness, in a traditional interpretative schema leads to conclude that lack of evidence is proof of absence, however this is no proof of non-existence, and criteria could be inferred from wider context in order to find missing links in further research.

For the purpose of sociological interpretation, bolder authors refer to classical historical records, as well as later testimonies, so that sociological discourse oscillates between myth and reality: mentions in later Celtic societies of great Britain, or poetical works, and occurrence of alternative roles, exemplified in the short episode of the revolt of Boultica and her daughters, their subsequent destiny (and maintenance in the status of the dominated).

I wish to underline here that I am not writing in the perspective of “feminist archaeology”, but of the overall stream of French new archaeology.

Newer archaeological discoveries of MLT AND LLT in Gaul may enable us to build up means of identifying clues to define missing links so as to rediscover sociological context and interpret the body of record in periods of acute culture changes in a different light.

In this paper, some new archaeological data from Gaul enable the distinction of criteria to re-examine older records, and develop by way of contextual, spatial, functional, stylistic, regional and chronological comparison, as I have already devised in previous work, approaches or indices to identify the presence/absence of women in the body of records.

Tied to a wider historical framework, and related to other links, this could allow further interpretative writing on causes for culture change, but separated from pure data analysis. Copyright 14 February 2016

Th3-05 Abstract 16

Queering Skeletal Sex Assessment at Worthy Park, Hampshire, England

Author: Downer, Abigail Górkiewicz, Trent University, Stouffville, Canada (Presenting author)

Co-author(s): Williams, Jocelyn, Trent University, Peterborough, Canada

Keywords: Mortuary Archaeology, Queer theory, Skeletal Sex assessment

Presentation Preference: Poster

One of the first things bioarchaeologists do after coming across human skeletal remains is to assess the basic biological characteristics of an individual: their age and sex. Sex assessment involves looking at morphological and metrical characteristics in the skeleton that allows researchers to place an individual in one of six available sex categories: male, female, possible male/female, ambiguous, or indeterminate. Often, these categories are collapsed into two categories (male and female) in two ways: 1) possible males/females are incorporated into the male and female categories, or are excluded; 2) skeletons sexed as ambiguous are either left unreported or are seen as errors of the acting researcher. These approaches may leave out variability in biological sex that is naturally observed in humans, and may impede researchers investigating non-binary gender and sex identities.

In order to test this approach, this research investigated the early Anglo-Saxon Worthy Park burial ground in Hampshire, England using queer, performance theory, and Marxism. Worthy Park was chosen because it represents a cultural complex that is thoroughly reported; the remains are excellently preserved, and the burial ground contains a large number of inhumation burials with a diversity of burial offerings. This research found that at Worthy Park, the most closely clustered individuals were males based on their burial offerings, with subadults following closely behind; possible males/females were not numerous enough to make a precise conclusion while females were the most diverse of all sex assessment categories in terms of burial assemblages.

Th3-05 Abstract 13

Implementing Intersectionality: Diversity of Viking-Age Shields

Author: PhD student O. Nåverlöld, Kerstin, Stockholm University, Sundbyberg, Sweden (Presenting author)

Keywords: Identity, Intersectionality, Viking Age

Presentation Preference: Oral

This paper presents parts of my current research, in which I study Viking-age shields using intersectionality as an analytical tool. All though discussed for years, intersectionality as an archaeological analytical method is still relatively unexplored. Hence I will outline some possible methodological implementations of intersectionality with regards to a specific research material, using shields and representations of shields as an example. I will also present some of the identity categories that are visible in the material and how they possibly interact.

My research explores shields in archaeological contexts along with two- or three-dimensional depictions of shields, how shields are described and in what contexts they occur in the Old Norse literature. By identifying four ‘shield categories’ I explore how different shields related to identity and social roles as well as practices during the Viking Age.

When analysing the shields with regards to identity and objects as identity markers, I aim to understand how the different shields reflect identities and practices that intersect: Using intersectionality as a multi-dimensional analytical tool for studying power and social hierarchy, by preprinting different aspects of identity (such as gender, religion, class, etc.) I propose it is possible to identify features that overlap the material/non-material shields. Taking intersectionality as a starting point creates the potential to highlight the seemingly diverse and complex aspects of shields in the Viking Age that previously have been overlooked.

REVEALING THE MAKING AND BREAKING OF COMMUNITY IN EUROPEAN PREHISTORY

Friday, 2 September 2016, 14:00-16:00
Faculty of Philosophy, Room 107
Author - Bonney, Emily, California State University Fullerton, Long Beach, United States of America (Presenting author)
Co-author(s) - Johnson, James, Vienna Institute of Archaeological Science, Vienna, Austria
Keywords: community, prehistory
Presentation Preference - Regular session

Archaeological imaginings of ‘community’ are central to both our theoretical foundations as well as our methodological frameworks. Whether explicit or implicit, community acts as a meshwork for how people, materials, discourses, and ideas are brought together to form meaningful enterprises, in addition to how archaeologists investigate communities. Recent additions to the increasingly rich body of literature on community focus on the relational ontologies of community, addressing the fluid and dynamic nature of human-based communities to be more inclusive of plants, and animals, geological formations. In Tim Ingold’s (2011) terms, we must undo the inversion that seeks to turn communities into immovable and immutable points and dots. Instead, we should focus on meshworks that highlight the life, growth, and movement. Such meshworks are immersed in the ebbs and flows of life. Building upon Ingold’s idea of meshworks, we include in this the eventual breakdown or disintegration of community as an interesting and important topic of exploration.

Despite the important and theoretically vibrant research being done on community, the epistemologies involved in the identification of community remain relatively uninterrogated and/or avoided. This may be because considerations of ontology and epistemology in archaeological research of community are treated as separate ‘knowable’ conditions and are thus studied individually. We suggest that community ontology and epistemology are inseparable and should be treated as such. To better understand how communities were made in the past, and how best to identify them, we further suggest that archaeologists explore the life history of community, rather than just their emergence or other specific temporal and spatial points of interest. We invite scholars of European prehistory (broadly considered) to explore these meshworks and to critically interrogate their epistemologies for identifying communities in prehistory.

REVEALING THE MAKING AND BREAKING OF COMMUNITY IN EUROPEAN PREHISTORY

A phenomenological turn in archaeological explanation: is it possible?

Author - Assoc. Professor Toonev, Tsanl, National Institute of Archaeology and Museum - Bulgarian Academy of Sciences, Sofia, Bulgaria (Presenting author)
Presentation Preference - Oral

Archaeology borrows ideas from semiotics which in its reductionist variant sees symbolic features as passive signs that only through the acts of mind acquire social value.

To improve archaeological explanation it should be studied the logic of how individuals and communities establish epistemic relations and how they create their own ontologies. I will provide examples of prehistoric symbolic behavior based on similarities not measured in distance and time but on how people perceive things.

The making, the breaking and the remaking of the Greek Neolithic Community

Author - Consulting Prof. Pyrgaki, Maria, Hellenic Open University, Athens, Greece (Presenting author)
Keywords: community, Meshwork, Neolithic
Presentation Preference - Oral

This paper explores the meshworks and examines their epistemologies for identifying the Greek Neolithic Community. Community and its constituent parts were continually being made, broken and remade over the year (Amil 2002; van Weel 2008). The community acts as a meshwork for how people, things, feelings and ideas are limited by some kind of association. The last ten years have seen journals and conference papers with references to networks, bundles (Keane 2003, 2009), Pauskait (2013), entanglements (Holdler 2011, 2012) and assemblages (following Deluze and Guattari 2007; DeLanda 2006). This paper discusses the Ingold’s idea of meshwork. Ingold (Ingold, In Lines 2017) takes inspiration from Deluze and Guattari’s idea of assemblages and he pushes the concept of a meshwork to describe the rhizomatic, living, co-creative entanglements of humans and other beings. Yet something, he stresses that knowing must be reconnected with being, epistemology with ontology, thought with life (Ingold 2011).
Entanglements of pottery acquisition strategies in the Mycenaean palace at Pylos

Author - Zeman, Pirot, Adam Mickiewicz University in Poznan; Institute of Prehistory, Poznan, Poland (Presenting author)

Keywords: Entanglements, Mycenaean culture, Pylos, Pottery production, pottery acquisition

Presentation Preference - Oral

Mycenaean economy has been a subject of numerous analysis, focusing mostly on various aspects of palatial redistribution, exchange and control system (Voutaki and Killian 2001, Pullen 2010). The idea of the “palace”, which was supposed to be dominant in Mycenaean social and economic landscape, still constitutes the foundations of our thinking about the processes taking place in the Late Bronze Age Aegean. But in the meantime, many scholars have pointed out a clear duality in Mycenaean economy. It consisted of the “palatial” section, visible thanks to the archives of Linear B tablets, as well as “non-palatial” section, noticeable only by the archaeological remains and sporadically appearing in the archives (Shelmerdine and Palaima 1986, Bennet 2001, Knappet 2001, Whitehead 2001, Gaiety 2007, Nakassis 2015).

Within the broad subject of Mycenaean economy I would like to scope only on the one particular subject of pottery acquisition strategies in the palace at Pylos, narrowing the analysis only to the last period of its existence. The duality of Mycenaean economic system mentioned above, can be clearly seen and presented within that subject. The period LH II B, dated roughly to the 13th century BC (Shelmerdine 2008: 4), is the climax of Mycenaean palatial civilisation, containing most of available archeological remains. The palace at Pylos, after 300 years of development was by that time a complex, bureaucratic, administrative and industrialized structure (Wright 1986). It’s organization and ways of controlling the society and economy were the subject of numerous papers and analyzes, approaching this extremely wide subject with different perspectives and propositions (Shelmerdine and Palaima 1986, Voutaki and Killian 2001, Gaiety and Parkinson 2007, Pullen 2010). I would like to propose a combined model based on earlier papers. The strategy of palatial pottery acquisition system will be presented as, an again two-dimensional system, with two main pillars. Firstly, the pottery industry has been affected with the designation of the “royal” potter, who probably together with his co-workers or competitors listed on tablets, had become high-rank and specialized producers, cooperating with the palace, supporting the waran in fulfilling his duties and enjoying special privileges. The second pillar of the pottery acquisition strategy was obtaining all the other needed vessels through a taxation of various local workshops, existing in the town of Pylos and the internal part of the Hither Province of the state. I would like to present this model using the idea of entanglements, created by Ian Hodler (2012). Outlining the wide web of dependencies, between things and humans involved in Pylian pottery industry, will help to better understand its complexity and position in the Mycenaean community of Messenia.

Creating Locality: Place and Community along a Fen River

Author - Dr. Kohring, Sheilà, University of Cambridge, Cambridge, United Kingdom (Presenting author)

Co-author(s) - Boulton, Kate, University of Cambridge, Cambridge, United Kingdom

Keywords: community, landscape, locality

Presentation Preference - Oral

How do you define ‘being a local’? Often this is an intangible concept wrapped up in a sense of community identity including an intimate knowledge of your social network and immediate environment. Embedded in this is a shared understanding of the time - place relationship, and how to generate a network and connection between related Working Groups and how to appeal to the wider members to join these groups. The recent conflicts witnessed by the world have created a range of new dilemmas for the management of cultural heritage sites, museums, cultural artifacts and so on. Working Parties are one of the core elements of the EAA to produce knowledge, strategies and propose decisions about specific issues. There are positive and negative changes happening in the world and this fast rhythm of dynamism necessitates updating in the fields of archaeological practices, interpretations, documentations and protection measures. The Working Parties and Committees have crucial role in contributing to that updating process. This form of organization enables members to express themselves, to share thoughts, and to create proposals. The outcomes of discussions within these groups are unequivocally important for the future of European archaeology. This presentation aims to remember the initial objectives of Working Parties and Committees within the EAA, what the current situation is and to discuss how to generate a network and connection between related Working Groups and how to appeal to the wider members to join these active smaller units.

Experiences from the Farming, Forestry and Rural Land Management Working Group

Author - Dr. Holyoak, Vincent, Historin England, London, United Kingdom (Presenting author)

Keywords: common agricultural policy, European Commission, rural

Presentation Preference - Oral

The EAA/EAC Working Group on Farming, Forestry and Rural Land Management has been active now for over 10 years. Its foundation and its subsequent work have been a recognition that - not only is the European Commission more active in rural policy...
TH3-07 Abstract 03
The working group „Archaeology and Gender in Europe (AGE)“: views on the past and to the future

Author - Dr. Gustmiedl-Schillmann, Doris, Freie Universität Berlin, Hamburg, Germany (Presenting author)

Presentation Preference - Oral

In 2009, the working group “Archaeology and Gender in Europe (AGE)“ was started. It has as its area of concern the discussion of Gender issues in European archaeology, where gender is considered both as a structural element to be studied in the past and as influencing research in the present. It addresses the study and the understanding of gender arrangements in the past and the study and understanding of how current gender systems affect archaeology as an academic and professional practice.

Today AGE is a very active working group with 58 members from Europe and beyond (U.S., Iran), which is organizing sessions to gender-related topics at the Annual Meetings of the EAA. To make these sessions more sustainable, they should also be published.

With this paper, I would like to give a short overview over the actions of AGE in its first 7 years. As mentioned in the round table abstract, at the Annual Meetings of the EAA is much room for the presentation and discussion of research, but mainly in an individual perspective. Working groups can organise sessions within their topics, but besides that there is not much room for them to present their work and communicate what they have done in the year between two conferences: The small report working groups are asked to give at the Annual Business Meeting are mostly either cancelled or shortened. Therefore, I would also like to present and discuss some ideas how the working groups can be made more visible within the EAA, which could bring them on the one hand more active members, on the other hand can promote the collaboration between the different working groups.

TH3-07 Abstract 04
From Incident to Structure. Possibilities for a network of professional Associations within EAA

Author - MA MSC Mark, Spanjer, SAXION, Amsterdam, Netherlands (Presenting author)

Keywords: Advocacy, Political Strategy, professional archaeologists associations

Presentation Preference - Oral

Archaeologists have power, real power. The power to inspire; the power to bind people; the power to influence; the power to address and make change. We are perceived as interesting. We, ourselves and our work have a pull on the general audience and fellow human beings. Our potential “selling power” makes the average politician and activist drool. In the past 50 years we have incidentally used our influence to protect Cultural Heritage to great effect. EAA can look back on a series of successes where it was able to effect developments to protect Archaeology in Europe. But even with this in mind, generally speaking we as individual archaeologists or even as a group feel that we are politically speaking of little relevance; or even powerless. As long as the CPAA exists the committee has discussed, in and outside our annual meetings at the EAA conference, the need to become more political active and more organized. Yes, as individuals we can achieve great results in influencing politics and decisions. But the general consensus over the years within CPAA is that we need a constant and structural stream of actions to influence laws, regulations and decision making in the field of Cultural Heritage at the seats of power in Europe. Individuals and national associations on their own will almost certainly not be able to operate with great effect on this stage. To achieve this structural influence, EAA seems an excellent possibility and “tool”. In the last year it seems that the organization is moving towards a more active political role.

What would be needed to enhance EAA with a successful political machine? What would EAA need to fulfil that role? How would CPAA and other committees and working parties need to evolve to make this possible? This presentation would like to explore the opportunities for a European Network of archaeological associations with EAA as an overall body.

TH3-07 Abstract 05
Working Party (WP): Integrating the Management of Archaeological Heritage and Tourism

Author - Williams, Anemari, Amersfoort, Netherlands (Presenting author)

Keywords: Politic, Professionalisation, Working Groups

Presentation Preference - Oral

The aim of any WP should be to avoid overlap in sessions and create synergies between sessions with related topics; to put a certain topic the agenda of the EAA; create a dialogue amongst the EAA members and with representatives from other relevant disciplines outside the Association if we don’t want our comments to remain unnoticed in an “archaeological vacuum”.

A WP could form a link to the outside world, a mouthpiece on certain topics that are important for archaeology but relevant to other disciplines as well. A WP can make connections and control the topic within the expanding organization of the EAA. It is clear that with the growing number of sessions and papers the scientific and local organizing committee don’t have a clear oversight. It would be interesting if the WP could form two-way bridges where information on specific topics can be brought outside our EAA bubble, and other ideas and thoughts can also reach us, always with the archaeological interest at heart.

Our WP explicitly invites participation and input from all stakeholders that are involved in archaeological tourism and strongly support a multi-disciplinary approach. In an ideal world the archaeologist plays a central when an archaeological site is developed for touristic activities. This is however not always the case and in order to achieve change we will invite other stakeholders that aren’t EAA members to join our WP and participate in our meetings and sessions and the EAA members of this WP will take part in other conferences and prominently become part of the decision making processes that concerns archaeological tourism.

TH3-07 Abstract 06
Public archaeology is a martial art

Author - Dr. Richardson, Lorna-Jane, University of Umeå, Umeå, Sweden (Presenting author)

Keywords: politics, public archaeology, UK

Presentation Preference - Oral

Public archaeology in the UK deals with politics, power and inequalities, and aims to explore the impact of archaeology in present day social and political landscapes. Can this work in practice during a period of unprecedented cuts to government budgets covering heritage issues? This paper will explore how our work affects political decisions and whether archaeology be used as an instrument of policy and politics. Can political activism be part of our professional work, and is this ethical?

TH3-07 Abstract 07
EAA and Politics: role and potential of the non-permanent Working Parties and Committees

Author - Dr. Hueglin, Sophie, Newcastle University, Basel, Switzerland (Presenting author)

Keywords: Politics, Professionalisation, Working Groups

Presentation Preference - Oral

Apart from the scientific exchange EAA’s Annual Conference always has been also an important opportunity to discuss and engage in political topics. For groups who want to meet regularly and work on long term issues the EAA offers the possibility to form a Working Party or Committee. Currently the EAA has more than ten active Working Groups (http://eaa.org/working_groups.html), who meet in Round Tables during the Annual Meeting and give a short report on their activities at the Annual Members Business Meeting. Some of them even report on their Round Tables in TEA.

Working Groups are very different regarding their topics, but also in the way they work. With the EAA having increased considerably in members and becoming more professional the Working Groups should too. Here some of the most active members are to be found, but at the same time the potential of these unofficial bodies is far from fully exploited. We should discuss on very practical terms how Working Parties could contribute more to the expertise needed in the EAA Board and how they could meet effectively at the Annual Meeting, but moreover also work continuously during the rest of the year.
The material record naturally lends itself to long-term perspectives. In few areas is this as apparent as the study of technology, which has historically been closely intertwined with the disciplines of archaeology and anthropology. But has our focus on the long-term caused us to unwittingly shape a unilinear, technologically deterministic picture of the past? And is there something to be learnt from the parts of the story which have been pruned from this evolutionist model?

The papers presented in this session will explore examples of how our pattern-seeking approaches have excluded interesting aspects of the story of the relationship between humanity and technology, and the methods by which we can restate these. We argue in favour of complexity (but not as a rule), of the little details which can enrich or subvert archaeological grand narratives, while acknowledging that the latter are also an integral part of our discipline.

This session is intended to stimulate discussion of our current approaches to the archaeology of technology, and to consider ways in which they can be developed in order to inform broader theoretical and methodological developments.

TH3-08 Abstract 01

Technology and the Arrow of Time

Author: Dr. Duckworth, Chloé, University of Leicester, Leicester, United Kingdom (Presenting author)
Co-author(s): - Goyat, Anouk, University of Alicante, Alicante, Spain

Keywords: archaeology, technology

Presentation Preference - Oral

We argue that evolutionary assumptions are still prevalent in many areas of archaeological research, regardless of whether or not they are made explicit. While there is undoubtedly a place for such models, they can also have negative effects on our understanding of the past, driving us to frame change in a developmental sequence and omitting those parts of the picture which do not accord with this "single story". This is particularly true, we suggest, of the archaeology of technology. A key problem is that we have no clear archaeological definition of "technology". In modern English, the term generally applies to the cutting edge of a given period; that is, to novel practices or products only. Longer-lived technologies, particularly those involved with animal-rearing and food production, are rarely considered in the same breath as pycnotechnologies, despite their often global impact. Without doing away with narrative approaches altogether, we can nonetheless benefit from a more complex and thorough understanding of the archaeology of technology, which acknowledges the diversity of past practices and leads us to a closer understanding of where and how the material and the social worlds meet.

TH3-08 Abstract 02

Embracing variability as a mode of analysis

Author: Dr. Kohring, Sheila, University of Cambridge, Cambridge, United Kingdom (Presenting author)

Keywords: chains of practice, improvisation, pottery

Presentation Preference - Oral

Archaeology excels at locating patterns in the distribution of material culture and interpreting the behavioural practices associated with these artifacts. However, in order to do this, we are often required to homogenise data towards "norms" that fit macro-scale narratives about prehistoric lifeways. Often the variability underlying the complexity of social networks is ignored when, in fact, it could provide insight into the dynamics of how change at the macro-scale occurs. This paper explores how analysis of technical variability can be beneficial in assessing how knowledge is networked within communities and how it articulates with wider social and technological traditions. In particular, it uses Late Neolithic, Copper Age and Early Bronze Age pottery technology to assess how the analysis of variability (rather than the lack of variability) opens up questions on how social change occurs and becomes sedimented within local communities.
TH3-08 Abstract 05

Untold Stories About Ancient Survey: Balbus and his "Expositio et Ratio Omnium Formarum"

Author: Möritz, Alexandru, Institute of Archaeology, Bucharest, Romania (Presenting author)

Keywords: Balbus and Calenus, gnomon and dioptra, military survey applications

Presentation Preference: Oral

The paper starts from the premises that, most often, the ancient written sources were given less attention from the perspective of technical information they might provide. The details concerning the dating, geographic location and the correlation with already known historic events was considered essential and, unfortunately, most often sufficient. In addition, specialists capable to read in the original language the ancient sources might not have always been familiarized with the principles of ancient technology. Due to these causes, many of the stories concerning the beginnings of technology remained untold. We might have proof that a certain principle or method were applied, but we do not know HOW. Our presentation proposes a re-reading/re-analysis of the work Expositio et ratio omnium formarum, dating most probably from the first decade of the 2nd century AD, and preserved in fragmentary copies from the 6th and 9th centuries. Taking the shape of a letter written by a certain Balbus and addressed to a certain Calenus, the work contains numerous data of topographic nature, including the mentioning of certain military survey applications. These latter ones present a particular interest. For example, the determination of the widths of a river that had to be crossed or the height of a fortification that had to be conquered “without venturing within bowshot of the enemy” (M.J.T. Lewis) led to the development of ingenious methods. Although the volume is often cited, the accent on the politico-military conjecture prevailed, to the detriment of the technical information it provided, which was neglected. Our presentation will analyze exactly these neglected aspects. We will approach Balbus’ text at three interrelated levels. Firstly, we will try synthesis all the mathematical knowledge that Balbus possessed at the time. Then, strictly based on these, we will try to reconstruct the methods and, implicitly, the instruments that might have allowed the performance of the three military survey applications that Balbus mentioned in the text. The reconstruction of the methods and instruments will be integrated in the historical context of the original text, by evoking a contemporary personality, that of Heron of Alexandria, which brought numerous contributions to the technical field, including that of topographic measurements, with his paper Dioptra. Finally, we will try to discover more about the persons behind the analyzed text (Balbus and Calenus), who, most probably, “were people outside the upper classes and the governing group which traditionally provided most of the evidence that comes from literature” (Brian Campbell 1996).

TH3-08 Abstract 06

Tin presence in Geto-Dacian silver coins as revealed by XRF and micro-PXe – a possible explanation

Author: Dr. Constantinescu, Bogdan, National Institute for Nuclear Physics and Engineering, Magurele-Ilfov, Romania (Presenting author)

Keywords: geto-dacian coins, silver, tin

Presentation Preference: Oral

Geto-Dacian silver coinage - "Celtic" type starting with Philip II tetradrachms imitations - is active from end of 5th to beginning of 1st Centuries B.C. A spectacular aspect is the presence of tin in these coins starting with 1st Century B.C. It is logic to suppose that tin was deliberately and gradually introduced. The average fineness and the average weight of the issues corroborate the supposition. There is a reduction of the fineness with the time that is specific to almost every Geto-Dacian coin issue. There is a reduction of the fineness with the time that is specific to almost every Geto-Dacian coin issue. Tin concentration in coin increased with the time - at the beginning of 1st Century B.C. it was more or less proportionally to copper concentration. This could suggest that bronze was used instead of copper in alloying silver. A very high correlation is not expected that tin was deliberately and gradually introduced. The average fineness and the average weight of the issues corroborate the supposition. These composition sets are typically interpreted through the lens of ‘grand narratives’: the provenance hypothesis, a broad sequence of alloys, statistically lumping analyses into groups, or simplistic routes of exchange. These schemes are increasingly at odds with current archaeological concerns such as the fine-scale performance of identity, value, and the agency of individual people and objects.

TH3-08 Abstract 07

“Yes! We’re all individuals!” “I’m not”: Clusters and the singular in the chemistry of copper-alloys

Author: Dr. Peter, Bray, University of Oxford, Ruslip, United Kingdom (Presenting author)

Keywords: Chemical analysis, copper-alloys, Object life histories

Presentation Preference: Oral

The chemical analysis of prehistoric metal is one of the longest ongoing scientific experiments in the world. Beginning with the pioneers of organised chemistry and archaeology, around 100,000 artefacts from the European Bronze Age have now been investigated. These composition sets are typically interpreted through the lens of ‘grand narratives’: the provenance hypothesis, a broad sequence of alloys, statistically lumping analyses into groups, or simplistic routes of exchange. These schemes are increasingly at odds with current archaeological concerns such as the fine-scale performance of identity, value, and the agency of individual people and objects.

The grand narratives are beginning to become strained from a chemical perspective as well. Recent research at the University of Oxford has emphasised the subtle variations in chemical composition caused by a unit of metal’s unique life story. Quantities of metal can pass through a number of forms, merge with others, be reworked, used, and decorated over time. Many of these processes will leave chemical and isotopic marks that can be interpreted by comparison with contemporary artefacts. In short we are aiming to develop a system of relative chemical interpretation for copper-alloys. This paper will give a series of case studies where a fresh look at old data can reveal individual technological and social stories, within the broad sweep of European Early Bronze Age metal use. These include individual workshop choices, rare chemical signatures that demonstrate the production of small axes from recycled daggers in England, and strange local patterns that were caused by melting and recasting centuries old metal in the south of Ireland.

TH3-08 Abstract 08

A more efficient means for going backward?

Animal husbandry as technology

Author: Dr. Fothergill, Ty, University of Leicester, Leicester, United Kingdom (Presenting author)

Keywords: Animal husbandry, Technology, Theory

Presentation Preference: Oral

Theoretical examinations of relationships between human and non-human animals in the past are few and far between. There is a clear scholarly focus on concepts such as "exploitation" of species, "disposal" of remains, and a generally unilinear approach to domestication. Past animal husbandry is broadly viewed as a component of agriculture, and conceptualized as temporally progressive, ever approaching an ideal economically-efficient means of production. When a trend in quantitative data fails to follow this model (as an example: a decrease in the size of cattle in Britain after the 5th century AD) it is relatively investigated and cultural factors may be implicated (e.g. Roman withdrawal from Britain). Whilst such factors may be partly responsible, only certain lines of archaeoecological evidence (sex ratios, mortality profiles, metrics) are employed to draw conclusions about activities and practices undertaken by a range of practitioners across a large and varied social landscape. Is it more likely that cattle became smaller after the Romans left Britain because the Britons lacked the knowledge and skills to husband them in the most productive way, or that indigenous cattle breeders simply lacked the resources and connections to a network which had been available to them during the Roman occupation? Could there be other factors at work? Such questions cannot be addressed in a comprehensive and nuanced manner by comparing a few strands of quantitative data, and a more flexible theoretical approach is warranted. Technology has been part of the toolkit of archaeological thought for centuries, and does not merely equate to tool use. Manufacturing practices which leave a clear archaeological signature are recognised as technologies. Animal husbandry is not different in that it is a continuous process, a work of creation and amendment over time, which is subject to alterations in knowledge, skills, and practice. Including the idea of animal husbandry as a technology would allow for the incorporation of multiple strands of evidence at different scales; a recognition of an array of activities as part of practical processes; inclusion of social and cultural factors such as gender, status, and identity; animals to be considered as potentially agentic; and the tantalising prospect of examining the dissemination of animal husbandry knowledge through systems of human networks.
TH3-08 Abstract 09
Digging democracy

Author - Swedberg, Stig, Kulturlandskapet, Fjällbacka, Sweden (Presenting author)
Co-author(s) - Olistund, Anika, Kulturlandskapet, Fjällbacka, Sweden
Keywords: Cooking pits, Environmental archaeology, Sample strategies
Presentation Preference - Oral

Archaeology has been used as part of the History about the national state. Still today this story is being retold, many times uncritically. At the same time we as archaeologist must admit that we also often retell the big linear story. A mound is given higher priority than smaller more insignificant graves, a settlement area with longhouses more than a site with cooking pits but no postholes. By systematically choosing not to excavate peripheral sites, small sites, and temporarily used sites we create a history of central places and big men. This is an undemocratic way of conducting archaeology.

We propose a democratic archaeology, regarding methods, sites and people. In our scientific research programme we develop a methodology for archaelogical sites so that they can be a part of our history. This includes, for example, carefully choosing the excavation methodology, and to supplement the collection of finds with scientific analysis in order to actively search for the stories of the people that didn’t have the power to erect stones or mounds.

Before the excavation of the site Tanum 1821 a strategy for sampling the site and structures, especially cooking pits, was formulated. A sampling of the surface was performed in relation to the structures. From excavated structures the section was sampled by a continuous grid and consisted of ten to twenty samples from each structure. These samples were used for geochemical analyses, mainly phosphate, magnetic susceptibility, loss of ignition and lipid acids. These samples were supplemented by samples for macrofossils and radiocarbon dating. The ratio between large and small fire-cracked stones were calculated.

By combining these analytical methods we can conclude that cooking pits are complex structures. The cooking pits on the site could be subdivided into three categories, of which one were used for processing grain. By combining these results with a landscape analysis, including other settlement sites, place names and natural preconditions, we could interpretate the site as an activity area used for the processing of grain.

The site can be interpreted as a peripheral site (now and then) but important for the society. Peripheral sites are also sites beyond control. In such a place can, for example, subversive thoughts and discussions be performed. This is sites were monuments and mounds won’t be erced, but instead represents other parts of the society.

We want to tell other stories. To be able to do that we need to excavate more peripheral sites and use more diverse methods. More people of the past must be given a chance to be heard. Diversity and variety is an important part of a democratic archaeology. If all voices shall be heard we must also acknowledge them, in prehistory as well as today.

TH3-08 Abstract 10
Technological variability of pottery in long-term perspective: a case of the Neolithic settlement

Author - Kretina, Petr. Institute of Archaeology CAS Prague, Prague, Czech Republic (Presenting author)
Co-author(s) - Ther, Richard, Department of Archaeology, University of Hradec Kralove, Hradec Kralove, Czech Republic
Co-author(s) - Neumennova, Klara, Institute of Archaeology CAS Prague, Prague, Czech Republic
Keywords: modal mineralogical analysis, Neolithic, pottery technology
Presentation Preference - Poster

This poster comprises results of a technological analysis of pottery from the large Neolithic settlement site in Bylany, located in the Kuhna Hora district in the Czech Republic. This project is based on a complex methodology with the aim of identifying the degree of variability of the technological characteristics and of interpreting the relationship between the technology and social environment of the settlement. The technological variability is being examined in relation to the chronological diversity and the spatial patterns of the site.

Macroscopic analysis establishes a grid of categories into which the observed phenomena are sorted. By using this approach there will always be some specific groups of pottery. In many cases, however, we do not know the real nature of these groups. Are there different groups of pottery that reflect the distinctive technological traditions of specific chronological phases or are there only continual variability together with one or two broad concepts regarding paste recipes? These are basic dichotomies that we cannot resolve without having the possibility to reliably quantify the differences.

The question is, what are our possibilities in regard to mapping the technological variability on a quantitative basis. The human senses represent very powerful analysers and their “feelings” can capture complex or subtle differences between the visual qualities of observed objects. For validating these feelings we need accurate quantitative data. Standard thin-section petrography can only partially solve this problem. Semi-quantifications are either time-consuming or subjective - depending on the observer’s experience.

A possible solution to this problem lies in a new advance in scanning electron microscopy that enables automatic modal mineralogical analysis that constitutes an accurate estimation of the distribution and the volume percentage of a mineral within a thin section.

TH3-09 Abstract 01
Building big. Incentives for cooperative action of hunter-gatherers at early Neolithic Göbekli Tepe

Author - M. A. Dietrich, Oliver, Deutsches Archäologisches Institut, Berlin, Germany (Presenting author)
Co-author(s) - Dietrich, Laura, German Archaeological Institute, Berlin, Germany (Presenting author)
Co-author(s) - Dietrich, Laura, Deutsches Archäologisches Institut, Berlin, Germany (Presenting author)
Keywords: Göbekli Tepe, Neolithic, Social Cohesion
Presentation Preference - Oral

During the 10th and 9th millennia BC, at Göbekli Tepe in southeastern Anatolia monumental circular enclosures made up of up to 5.5m high pillars decorated richly, mainly with animal motifs, were built by hunter-gatherer communities. One of the important questions regarding this site concerns the way in which small-scale groups joined their forces for constructing a place that clearly is strongly connected to their worldview. The distribution of elements of Göbekli’s iconography evidences a catchment area of about 200km around the site as the homeland of these groups. 20 years of excavation have revealed some clues: A close look at the massive amount of filling in Göbekli’s enclosures reveals that we are not dealing with sterile sediments. The material used to intentionally backfill the buildings at the end of their use-lifes consists of limestone rubble from the quarries nearby, flint artefacts and immense amounts of animal bones smashed to get to the marrow, clearly the remains of meals. With traces of settlement absent, for Göbekli Tepe this readily leads to the idea of large, ritualized feasts as a mode to gather workforces and ensure cooperation. The present contribution will explore the likeliness and possible consequences of this scenario.
Late Neolithic settlement of Stîr, Syria. The settlement was extensively excavated by the German Archaeological Institute and represents one of the few explored sites of this period in the Northern Levant. It has a rich stratigraphic sequence which covers nearly a thousand years. So-called individual single-room houses consisted of ‘special’ multiple-room buildings, singular grinding equipment with whole sets for ‘collective’ food processing, and isolated vessels with large storage rooms or buildings. The chronological sequence of the architecture and the contexts and evolution of grinding stones suggest a transition from individual to communal consumption and a possible coexistence of social behaviors related to food consumption. Furthermore, the very early production and use of pottery accoutrements these processes.
Building and Burying Together to Stay Together

Author: Prof. Miller Bonney, Emily, California State University Fullerton, Long Beach, United States of America (Presenting author)

Keywords: collective, Crete, tomb

Presentation Preference: Oral

This paper argues that the construction of collective tombs at the beginning of the Bronze Age on Crete constitutes an example of building and burying to effect social cohesion. At the end of the Neolithic the early population of Crete dispersed across the island, yet evidence for durable settlements dateable to this period, with the exception of the major sites of Knossos and Phaistos, remains scarce. Rather the social cohesion of these clusters of people was promoted through the construction of monumental collective tombs. With diameters of at least five meters the tombs were built of massive boulders the collection and transport of which to the site of the tomb required collaboration and social organization. The first tombs, which would have looked more like mounds than the cylindrical structures often portrayed in reconstructions, evoked the caves in which the Neolithic population lived and buried their dead and some of which remained in use during the Early Bronze Age. Having relocated to areas which lacked caves - and particularly to the south central part of the island - the settlers recalled their places of origin as a means of maintaining social unity. Although some have argued the tombs were built for the elite, burial goods were relatively modest - two to three pieces of pottery and perhaps a personal item - and the overall impression is that the mortuary practices were intended to bind the community together. There is no evidence in these early tombs for any individual receiving special attention. Instead it appears that every member of the group received the same treatment at the time of internment - deposition on the ground accompanied by a few objects. Bodies piled up over time, the desiccated remains swept to the side or long bones and skulls selected while the rest were removed. Some 400-500 years after the tombs were constructed the population finally constructed more substantial settlements that nevertheless remained visually proximate to the cemeteries which continued to serve the role of enhancing social cohesion. This role persisted throughout the Early Bronze Age as the emergence of a more robust built environment evoked the addition of anterooms to pre-existing tombs and the construction of more architecturally defined new tombs. Only the emergence of a supposedly palatial culture at the transition into the Middle Bronze Age supplanted these tombs as an important mechanism for social cohesion.

Looking for a spa? A social cohesion at Santovka – case study

Author: Mrg., PhD Bača, Martin, Department of Archaeology, Faculty of Arts, Comenius University, Bratislava, Bratislava, Slovakia (Presenting author)

Co-author(s): Bytina, Jozef, Department of Archaeology, Faculty of Arts, Comenius University, Bratislava, Bratislava, Slovakia

Keywords: religion, Slovakia, springs

Presentation Preference: Oral

Santovka (formerly known as Maďarovce) is an Early Bronze Age - tell type settlement at southwest Slovakia. It is surrounded by thermal springs which are famous for their salubrious qualities. An ongoing excavation project (current 8 excavation seasons) uncovered a medium-sized fortified site, with exceptionally high number of prestigious artifacts of exotic origin and clear evidence of extensive metalworking activities. Ceramic production and consumption is pretty much heterogeneous, with predominant elements of so called matorace, encrusted ware and otomani culture ceramic traditions. The character of uncovered finds as well as geographical position of the site suggests, that Santovka was a place, where identities were able to merge, transform as well as maintain their distinctive character. These processes were obviously dependent of proper social cohesion. We therefore welcome the topic of this paper, because we believe, that Santovka offers a nice example of a site, where theoretical models related to subject of social cohesion could be studied and applied. We suggested, that local thermal springs were a natural place of healing (solidarity) as well as religious (social integration) qualities and therefore of a supra-regional importance. If we accept the healing as a background for social cohesion on subconscious level, then other shared ritualistic activities are not so different. Moreover, poll-production, hunting and grain storage could play a similar role. In this paper we will present the idea in context. Our methodology for studying social cohesion will be based on theoretical models influenced by studies of R. K. Merton and his followers. We will use these models for postulating hypothesis based on artifacts and observed archaeological events and environmental conditions.

Collective harvesting at Százhalombat-Földvár, Central Hungary: a material cultural perspective

Author: Hatbrocker, Eva, Leiden University, Delft, Netherlands (Presenting author)

Keywords: Bronze Age Hungary, harvesting, sickle blades, chieftain, power-centre, collective activity, social relations

Presentation Preference: Oral

Investigating the sickle blades of Százhalombat-Földvár yields information on social relations as they show harvesting to be a communal activity, carried out in the power-centre of the Bronze Age chieftain of the Benta valley. Százhalombat-Földvár, Central Hungary is a Bronze Age tell settlement along the Benta River at the delta of Benta river. Bronze Age in Hungary is the period between 2800-2700 BC and 800 BC. From this period, Százhalombat represent 2000-1400 BC. This archaeological site has important role in the research of Bronze Age in Hungary – and abroad. The excavation of the Bronze Age fortified settlement is carried out within the framework of an international programme that was set up in order to examine the differences, similarities and connections between three different regions of Bronze Age Europe. Százhalombat-Földvár, due to its size and geographical position, can be considered the head of the Bronze Age chieftain in the Benta valley, according to the model proposed by Earle and Kristiansen (2010). However, detailed research of the site itself is challenging this view. Comparisons of the material culture with other site-types show little indications of a difference in social hierarchy within each site. Hence, instead of political differences, they might be economical.

Sickle blades are common finds at the site of Százhalombat-Földvár, where they are the main chipped stone tool type during the late major occupation of the settlement (1700–1400 BC). However, sickle blades are rarely found at other Bronze Age site from the valley (Priskin 2014). This information suggests harvest was a centralised communal activity controlled by Százhalombat-Földvár. Thereby, harvesting (and sickles) could have been organised among social relations, and could help to keep alive these associations.

Presentation Preference: Oral

The studies on Bronze Age Italy have underlined the existence of differences in the apparent social homogeneity of communities. The terramara society has been singled out as an example of social cohesion and homogeneity, thanks to its regular settlement pattern and repetitiveness of house sizes, but also to its “economic” funerary representation and to the widespread infrastructure investment in water channels and fields, as well as in material culture. On the contrary, Southern Italian communities have been described as more hierarchical and socially divided communities, exposed to the Mediterranean wind of inequality coming from the Aegean and the East.

Anyway, the patterns of social disintegration in reaction to the Late Bronze Age crisis show that the collapse of the terramara system was more radical and extreme than the limited rearrangement suffered by the Southern Italian societies.

It can be suggested that solidarity, identity and cohesion are indeed patterns linked to dynamic structures of power, strongly relying on a non-contradictory expression of power, which likely has its strength in a fustilistic structure of power.

Anyway, it is also interesting to deconstruct this view of (ancient) societies, in order to understand how far our research traditions have fossilized our understanding of the past.

Take an image, it’ll last longer: Mycenaean multimediality, prestige, and competitive conformity

Author: Thaler, Ulrich, German Archaeological Institute, Athens, Greece (Presenting author)

Co-author(s): Dr. Renzoni, Andrea, CRMN - ISMA, Rome, Italy

Keywords: Bronze Age Italy, social cohesion, social disintegration

Presentation Preference: Oral

The inherently, literally built-in sequestrative nature of Mycenaean palaces as the seats of political authority and the role of palatially sponsored feasts, held amongst others at the palace itself, a means of creating a shared identity and thus fostering social cohesion have been key topics of Mycenaean archaeology for the past two decades. The proposed paper seeks to further highlight the link between creating a common identity and promoting cohesion in the sense of conformity. Beyond ‘making Mycenaean’, as it has been put, how could the palace then make those Mycenaeans fall in line, i.e. bind them to itself and its agenda? Establishing a prestige discourse in which the palace was both the yardstick to gauge one’s standing and the provider of the means to enhance it is suggested as a possible key strategy, ideally leading, from the palace’s perspective, to what might be termed a ‘competitive conformity’ of the ruled. Following a discussion of the nature of prestige, potential visual elements of every object organized by and/or associated with the palace are sought as possible correlates, i.e. physical and iconographic evidence, of such a palace-fostered discourse. Specific attention is paid to such potential mementos which transpose iconographic themes closely associated with the socially exclusive architectural setting of the palace itself, e.g. themes in the canos of palatial wall-paintings, into different media and media of different degrees of exclusiveness. Possible case studies include drinking vessels, chariot and hunting iconography as well as depictions of antithetical felines and griffins.
**TH3-09 Abstract 13**

**Ritual feasting as indication of social cohesion? A late Bronze Age case study from Romania**

**Author:** Prof. Dr. Metzner-Nebelsick, Carola, LMU Munich, Munich, Germany (Presenting author)

**Co-author(s):** Prof. Dr. Nebelsick, Louis, Karolym Stefan Wyszynski University, Warsaw, Poland

**Keywords:** ritual, feasting, Bronze Age, cohesion, competition

**Presentation Preference:** Oral

The talk will focus on ritual feasting in the late Bronze Age site of Lapus in Northwest Romania. As a result of an international excavation and research project (Chair for Pre- and Protohistory, LMU Munich, Germany; Maramures County Museum in Bârlad, RO; Archaeological Institute, Karolym Stefan Wyszynski University Warsaw, PL) a monumental, multi-period cult building was uncovered. In each phase a large hall with a central hearth was deliberately destroyed by fire after a period of use and subsequently covered with a clay mantel, on top of which the next hall was erected. Outside those buildings large quantities of pottery vessels of various functions – ranging from storage vessels to delicate cups - have been found. We interpret them as the remains of feasting events of a larger group of people. In accordance with the common interpretation of feasting like creating group identity and cohesion within society we also see oppositional aspects represented in Lapus. As a result of excavations in the past and recent surveys within the project several contemporary or supposed contemporary barriers with traces of comparable structures were detected. Thus ritual feasting in Lapus may also have functioned as means of competition among different families and an indicator of social distinction and a display of wealth and power.

The paper will address aspects of ritual behaviour on a theoretical as well as evidence-based level.

**TH3-09 Abstract 14**

**Do swords make warriors? Identity & cohesion among armed individuals in the European Bronze Age**

**Author:** Notroff, Jens, German Archaeological Institute, Berlin, Germany (Presenting author)

**Keywords:** Bronze Age, swords, warriorhood

**Presentation Preference:** Oral

With the rise of the Bronze Age in Europe it seems that the sword as new and innovative weapon suddenly became assigned an importance beyond its mere role as armament. A specialized group referred to as elite warriors/ in research tradition seemed to have been drawn a certain status from their peculiar role within a social system developing complex group identities and heavily drawing on cohesive communities. In the course of this paper the warrior’s sword will be discussed as tangible (yet not exclusive) manifestation of such a group identity – apparently uniting (and dividing) different levels of (functional) role and (social) status of Bronze Age warriorhood with a closer look at the weapon’s changing expression in funerary ritual and deposition tradition of the Nordic Bronze Age. In the end the emblematical role of the sword symbol (respectively its substituents) in the constitution of group cohesion among individuals armed with and represented by a sword in Bronze Age Europe will be further explored.

**TH3-09 Abstract 15**

**Social cohesion as concept of habitus through the lens of archaeological record**

**Author:** Pape, Eleonore, German Archaeological Institute, Frankfurt am Main, Germany

**Co-author(s):** Uhl, Regina, Eurasia Department of the German Archaeological Institute, Berlin, Germany (Presenting author)

**Keywords:** 3rd Millennium, habitus, social cohesion

**Presentation Preference:** Poster

Social cohesion can be expressed, created and maintained through a variety of ritualized (and/or) performative events which can respectively involve different group constellations that constitute society. Following Bourdieu’s concept of fields and habitus, we choose to focus on the entanglement and juxtaposition of different group identities at different levels, expressed through distinctive sets of material culture and features. Our experimental approach shall be applied to various case studies of the 3rd millennium BC in Europe from a cross-border macro-level to a multitude of local micro-scale units.

---

**TH3-10 Abstract 01**

**Linear Pottery houses and their social context**

**Author:** Dr. Zych, Renata, Błogowa Tyutyńka, Poland (Presenting author)

**Keywords:** houses, Linear Pottery, society

**Presentation Preference:** Oral

The population of Linear Pottery culture constructed stone houses in a rectangular fashion. They were not only in large settlements, but small settlements as well, consisting of one house and few related utility features. The construction of the houses was noticeably uniform.

The architecture of the houses depends on technical ability, but also on the cultural traditions of a given social group. The house is suited to people from that particular group, and therefore must materialize the group’s common thought images that form the basis of its identity. Outlined here is the problem of the house as a phenomenon of forming society. Subjects of study included Linear Pottery houses in the territory of Poland.

**TH3-10 Abstract 02**

**Ancestral Homes: Household Biographies in Late Iron Age Scotland**

**Author:** Dr. Buster, Lindsey, University of Bradford, Halifax, United Kingdom (Presenting author)

**Keywords:** Biographies, Iron Age Scotland, Roundhouses

**Presentation Preference:** Oral

This paper presents the results of biographical and materiality approaches to the study of a group of well-preserved Late Iron Age houses at Bromilow in south-west Scotland. The roundhouses display a variety of different forms and fabrics, and indicate the idiosyncratic nature of buildings which were far more than a passive backdrop to everyday life. Certainly of the roundhouses, particularly those constructed in stone, demonstrate frequent and unusual developmental sequences and complex life histories, which were punctuated by special deposits. These modifications took place in a generation, or across two or three generations, and appear to have been concerned with the renegotiation of household identity with relation to previous generations and ancestors. Furthermore, the re-inventing of certain special deposits by others laid down several centuries later suggests the presence of...
strong oral histories and practices designed to prolong the memory of successive generations of inhabitants of these buildings. As such, the houses themselves (their fabric and their spatial organisation) appear to have been central to the construction, maintenance and reconfiguration of household identity in later prehistoric Europe, as glimpsed through various ethnographic examples in the more recent past.

---

**TH3-10 Abstract 03**

**Household Archaeology in a small scale house in an early byzantine settlement**

**Author:** M.A. Steinborn, Miriam, Römisch Germanisches Zentralmuseum Mainz, Mainz, Germany (Presenting author)

**Keywords:** Byzantium, Excavation, Household

**Presentation Preference:** Oral

The early Byzantine settlement of Caćin Grad in southern Serbia can be identified with the imperial city Ludoviana Prima known from De Aedifici of Procopius which existed for merely 90 years. Without any marks of earlier or later occupation, the excavations provide undisturbed insight into everyday life in the 6th century. Excavations in Caćin Grad take place since 100 years. The early campaigns concentrated on representative buildings like churches, while the emphasis nowadays is on the living quarters. Considering the concept and methodology of Household Archaeology, one single room house was excavated in 2014 and 2015 in high resolution with integration of archaeobotany and soil science. This finds indicate a habitational function. The interpretation of the building bases on the results of interdisciplinary research. The simple configuration of the house and the multiplicity of potential types of use in a single room structure challenge the examination. It raises the question whether it was a complete household or not. This is the crucial point where field work and the theories of Household Archaeology come together. Working with an entirely constructed house and a few objects connected with specific activities restrict the possibilities which houses with many rooms and outdoor-areas may provide. Therefore the preliminary results of the excavation will be discussed from the perspective of Household Archaeology.

It is necessary to examine the activities in- and outside the building to understand the function the household fulfilled in the settlement. Taking their perspective on the settlement raises the question of their mentality and their everyday life. The household can be seen as the place where social roles are negotiated and thus as a social landscape which reflects the mentality of the dwellers. The analysis of installations and furnishing of the vast room helps to reconstruct activities carried out in daily routine and how the domestic space may be used. The observation which things were left behind or even don’t appear in the archaeological record allows statements about the end of occupation. Life in Caćin Grad took place in a time of far reaching cultural change. Written sources provide little insights in the situation of common life. In combination with the archaeological record they allow to delineate the possibilities of household-organisation for a specific historical situation.

The talk will examine if it is generally possible to work with the household concept if there are unspecific structures or if it is rather necessary to apply it to gain more information. With regard to cultural formation processes this also raises the issue of the possibility to detect pauperism archaeologically. For this purpose it will present the archaeological remains of a specific small house and compare it with the normal course of life in early Byzantium known from historic traditions.

---

**TH3-10 Abstract 04**

**Pottery as personal belonging in a Clarisses convent in Vilnius**

**Author:** PhD student Urbonaitė-Ubig, Miglė, Klaipėda University, Klaipėda, Lithuania (Presenting author)

**Keywords:** historic archaeology, household, pottery

**Presentation Preference:** Oral

Pottery is the most common artefact in excavations of historic sites. Due to vast number of fragments pottery is often identified as mass artefact. Nevertheless, some early modern period pottery in Europe can be associated with personal needs and usage. Pottery with scratched marks such as initials, religious abbreviations, letters or numbers or unidentified scratches are found from South Holland, England and Germany. These marks are assessed as a personal sign of the owner. Most of these marked pottery fragments are uncovered from monasteries and convents. This fact leads to an interpretation that nuns and monks possessed their own ceramic dishes while in most cases private property was forbidden.

In a convent of Clarisses in Vilnius Old Town (Maironio street 11) 10 fragments of marked ceramic dishes from the end of 17th to beginning of 18th century were uncovered during the excavations in 1994 and 2007. These dishes had only marks of letters which were identified as initials of the nuns. Historic data of this convent allowed to identify few names and some initials were associated with two or more nuns.

It is known that no personal property was allowed in this convent as well as leaving the territory was also forbidden. This convent can be assessed as a private household with its own specific rules and domestic life. While no personal possession was allowed the presence of marked pottery is intriguing. These fragments can be interpreted as personal belongings. Dishes could be used for personal hygiene rituals or as a prevention of infectious diseases. There is also a possibility that some nuns had their specific diet requirements and some of the dishes could have been used for serving them food.

**TH3-10 Abstract 05**

**House and Household – an archaeological approach**

**Author:** PhD Tagesson, Göran, Swedish National Museums, Linköping, Sweden (Presenting author)

**Keywords:** early modern period, household, houses

**Presentation Preference:** Oral

The household is commonly identified as a fundamental element of social organization in past times. In archaeology, the household has often been regarded as an essential level of research, in order to bridge the gap between grand theories of cultural change and the practical archaeology on the ground. Theoretical discussions as well as analyses based on empirical observations now tend to take place in dynamic intersections where the household is understood intermingle. This makes it sometimes even as something much different from a specific social structure. New approaches tend to combine social organization and agency with spatial and material dimensions. The household as a unit for organizing property, production and consumption is confronted with the household as ideology, discourse and manifestation. The relationship between the physical house and the household as a social unit is no longer evident and has to be discussed.

In my paper I will discuss the possibilities to combine a vast bulk of archaeologically documented urban buildings from the 17th and 18th centuries in Kalmar, Linköping and Linköping with detailed accounts of the households, the owners and the inhabitants. The relations between the households will be analyzed in comparison with the building structures within a theoretical framework of actors and agency. The main focus is how to develop the analyses and understanding of households as function and structure in past times, and the relationship between houses and households, as for example through deeper cooperation between history and archaeology.
ARCHIVES AND ARCHAEOLOGY – SOURCES FROM THE PAST, TOOLS FOR THE FUTURE

Saturday, 3 September 2016, 09:00-18:30
Faculty of History, Room 331

Author - Gustavsson, Anna, Gothenburg University, Gothenburg, Sweden (Presenting author)
Co-author(s) - Mihajlović, Vladimír, Institute for Balkan Studies of the Serbian Academy of Sciences and Arts, Belgrade, Serbia
Co-author(s) - de Tomasi, Francesca, Istituto Italiano per gli Studi Storici, Naples, Italy

Keywords: archives, collections, history of archaeology

Presentation Preference - Regular session

In this paper we are exploring theoretical and methodological approaches to archive-based studies as well as the conceptualization and use(s) of archives. The importance of archives for archaeological research and field practice is undisputed in present-day archaeology. Nevertheless archival sources are often neglected and/or underused. Archives are essential for historians of archaeology, but at the same time they are also invaluable for the everyday practice of archaeologists. The process of archiving is one of the most important features of archaeology and it has had a great influence on the professionalization of the discipline. However, various archival aspects are often overlooked. For example, it has been common practice to separate documents and artifact collections when archiving when they should in fact be included in the archives together as equally important archival data. This greatly impacts anyone who studies the past of a particular site, biography of an archaeologist or the history of archaeology in general. In addition, the archive can work as a resource connecting the past, present and future of our discipline. Archives can also provide a starting point for research projects.

The starting point for this session is the broad definition of an archive: archival records including documents, finds and museum collections. We welcome papers from scholars working with historic as well as contemporary archival sources and we also encourage broad-based humanistic views and interdisciplinary perspectives on archives. By exploring the archive as a concept and by combining various types of archival materials, we can redefine the archive as a resource and gain a new perspective on archive-based research studies.

Archaeological archives – A deconstruction

In this paper, I propose a critical examination of the archaeological archive. Using my personal experience as an archaeologist working in the archives at the Museum of Cultural History in Oslo as a point of departure and a case study, I intend to explore the concept of the archaeological archive from two different angles:

1. In archaeological research, archaeological contexts are always being interpreted with a conscious and reflective view on past research paradigms and history of science. Archaeological practice however, is very rarely subject to the same meta-archaeological scrutiny. Nevertheless, archaeological archives are historical artefacts with complex conditions of production, which, in the same way that archaeological artefacts can be read and interpreted as remnants from prehistory, can be read and interpreted, both as a historical source for the context and provenience of archaeological artefacts, as well as remnants of the theoretical and societal circumstances and conditions that have, in different ways, influenced the archaeological processes.

2. What has and has not been documented and kept in the archival archives is a product of changing paradigms and selective memory, whether conscious or unconscious. Even so, because of the destruction and displacement caused by an archaeological excavation, the original documentation is the closest we will ever get to the original situation, and archaeological archives, in general, will offer a description of how and why it came into being. From the point of view of research, an archaeological archive will also be the least biased source of information, as everything re-interpretation from previous research adds a new layer of preconceptions.

Histories of the Museo Nazionale Romano: arrangement and management from the beginning to the 1930s

Author - Pietrolettì, Irene, University of Rome Tor Vergata, Roma, Italy (Presenting author)
Keywords: Museo Nazionale Romano, Terme di Diocleziano, museology

Presentation Preference - Oral

Through research in various Italian archives, it is possible to reconstruct the history of the first national museums of Rome in the nineteenth and twentieth centuries. Some collections of documents (like those of the Archivio Centrale dello Stato) allow us to understand the institutional events that the museum experienced in the course of its life. The archival material enables us to draw a profile of the scholars who directed the museum in different periods. Lastly, the photographic archives permit us to reconstruct an idea of the arrangement of the museum exhibits over the years.

The National Roman Museum was founded in 1889 when, in the climate of nationalistic pride that followed the unification of Italy, the new government decided to bring Rome to the level of other European capitals, providing it with a large state archaeological museum which could compete with the famous collections of the Vatican and Capitoline museums and with foreign public museums. In addition to this intention, there was also a practical problem: finding a shelter for the thousands of finds that the digs put in place for the redevelopment of Roma Capitale progressively brought to light. The choice of where to build the museum fell on the Terme di Diocleziano, an archaeological environment of exceptional importance in the heart of the city, that however revealed all its limits quickly. The legal status of the Baths, which was partly in the hands of private owners, and the areas unsuitable for exhibition of the works created enormous difficulties in the life of the Museum. The directors who took turns dealing with its management attempted large restoration projects to transform the archaeological ruins in the exhibition, but the technical difficulties and the lack of money prevented the realization of various projects. In this difficult situation, ordinances and arrangements of materials representative of the cultural climate of the different eras were proposed: from the environmental museology to the rhetoric and grandiose exhibitions set during the years of Fascism. The archival material sheds light on the facts and character of a season that is emblematic for the creation of legislation for the protection of antiquities in Italy.

Furthermore, part of the research is dedicated to the heritage of the museum. I have digitally studied the inventories of the Museo Nazionale Romano, preserved in the scientific archive in Palazzo Massimo. As a result of this work, I have created a database that collects information about the provenance and excavation context of some 35,000 artifacts. Diagrams that analyze these data enable us to study the chronological evolution of the museum’s heritage and the reconstruction of the history of archaeological excavations in Rome during the late nineteenth and early twentieth century. This part of the research represents another possible use of the archival data to enrich a reconstruction of the museum’s history.
In this paper I want to develop a very simple linear line of thought about the significance of the archives and archaeological documentation. In one of his papers James Detz proposed that archaeological documentation, field reports and similar works should be treated as archaeography seeing that they stand in a similar relation to archaeology as ethnography does to ethnology.

One could pursue this idea further and claim that archaeography, description of the artifacts, and not the artifact itself is the source of archaeological research. During fieldworks artifacts are collected, measured, described and interpreted, and only the result of this process and not the excavated object could be called an archaeological source. Site and artifact documentation published in various reports and papers is then applied to other papers and the process is repeated indefinitely. Adopting this notion should switch scientific attention to the archives as they hold not only the aforementioned sources, but also artifacts-objects, and thus they provide the only context for reconstructing excavation process and reference point for the discourse. The nature of archaeological site allows full contact with the artifacts in its context, but at a price of being confined to the excavated area, so that the view upon explored culture or community is restricted only to the actual size of the site. Any additional information is obtained via archaeological archives, which makes properly maintained archives one of the most important factors for conducting studies. In my paper I will explore this inductive nature of the research by presenting the possibilities enabled by the introduction of joined archives for Greek painted pottery. Focusing on their main features like standardization of documentation, accessibility and others I will discuss benefits and drawbacks of archive-based research.
Albeit Cyrenaica, being one of the prominent regions of the Greco-Roman civilization, attracted the attention of scholars from the medieval period onwards, its political isolation after the Arab and later, Ottoman conquest, gave reason to the visible delay of archaeological activity and writing her scientific biography. Most Romanian and Hungarian archaeologists for almost a century. However, the systematic excavations conducted at the site of Turda-Luncș at the beginning of the 20th century and the excavations at the site of Turda-Luncș in 1922–1923, as well as the preventive ones in 1916, have revealed the necessity of re-evaluating her archaeological activity and writing her scientific biography.

This paper is a case study about the experience of working with archival sources in the process of writing Zsófia Torma’s scientific biography, within a complex research that has been undertaken during the past three years, in seven Central and Eastern European institutions. These institutions are as follows: The National Széchenyi Library (Budapest, Hungary), The Hungarian Academy of Sciences (Budapest, Hungary), The Hungarian National Museum (Budapest, Hungary), The National Archives of Hunedoara County (Devă, Romania), The National History Museum of Transylvania (Cluj-Napoca, Romania), The Brukenthal National Historical Museum (Sibiu; Orașenii, Romania), and The Széchenyi National Library (Sibiu: Orașenii, Romania). These institutions are the richest in archival materials concerning Zsófia Torma’s personal and scientific life. The first part of this paper aims to trace the differences and similarities between the archival materials from Romania and Hungary, by taking into consideration various aspects ranging from the content and relevance of the documents to their accessibility, way of preservation and the role of institutions.

In addition to this, the second part of the paper focuses on the methodology employed in this research, as well as its main results and conclusions. Finally, the paper emphasizes the importance of archival materials in establishing Zsófia Torma’s place in the history of Hungarian, Romanian and European archaeology.

### TH3-11 Abstract 11

**Digging in the repository: finding the First World War in the University of Glasgow archives**

**Author:** Dr. Novotny, Jennifer, University of Glasgow, Glasgow, United Kingdom (Presenting author)

**Keywords:** archives, First World War, supermodern

**Presentation Preference: Oral**

Archaeologists and archivists share a material focus; our disciplines deal with the tangible past, the physical manifestation of history through objects, documents, and sites. Furthermore, we are drawn to our work by the tantalising promise of the thrill of discovery, bringing to light knowledge that has been forgotten or neglected in intervening centuries. Thus, the collaboration of archaeologists and archivists for Glasgow University’s Great War centenary commemoration project seems a natural fit.

This paper reflects upon the experience of being an archaeologist and historian working in an archive, specifically examining the intersections of these two distinct but related practices while undertaking research into the First World War. Firstly, it highlights the role of archives in archaeological research. Through case studies of specific institutions and collections, we will illustrate how these repositories are used as a starting point for research into the First World War. We will also explore the differences and similarities between the archival materials from Romania and Hungary, by taking into consideration various aspects ranging from the content and relevance of the documents to their accessibility, way of preservation and the role of institutions. Finally, we will emphasize the importance of archival materials in understanding Zsófia Torma’s place in the history of Hungarian, Romanian and European archaeology.
to start the research in archives. Sometimes an archival source – a document like an accident report or an announcement in the newspaper – leads to a systematic search for a possible place of wreckage. As archaeologists, we must learn to read both the material culture and archival sources, which possibly relates to each other. In this paper, two cases from Finnish waters will be presented, which have both archaeological findings and written sources associated with them.

The first case is that of a remarkable medieval maritime accident with quite a lot of written documents telling its story. The possible site of the accident is in the brackish waters of the Gulf of Finland. How might we reconstruct the scattered pieces of a wreck in the area, and how might we reconstruc the accident from the late 15th century?

The other case is related to two shipwrecks of 18th-century merchant ships. Would it be possible to combine written documents, like bill of lading and escape records, to find a shipwreck? Is it possible to identify a shipwreck, and what methods should be used in the archaeological research process?

**TH3-11 Abstract 13**
The relationship between archive documents and archaeological material of a naval conflict

**Author**: Mäkinen, Johanna, University of Helsinki, Sipo, Finland (Presenting author)

**Keywords**: naval conflict, wreck sites, written documents

**Presentation Preference**: Oral

This research questions the role of archive documents in conflict archaeology. The second naval battle of Svenskaund took place on 9 July 1790 on the south coast of Finland, outside the modern city of Kotka. The battle was part of the Russo-Swedish War (1788-1790), and it is the largest naval battle ever fought in Northern Europe. The focus of this research is the apparent contradiction between archival documents about the battle, and existing archaeological material. The general view, based on written sources, is that a large number of the vessels of Russia’s rowing fleet shipwrecked near Lehmäsaari Island, on the east side of the naval battle area, after being disadvantaged, partly due to weather conditions. However, only eight wreck sites have been located so far in the vicinity of Lehmäsaari Island. The small number of the wrecks has been explained by site formation – especially non-cultural – processes, but no comprehensive research has been published about this subject. The aim of this paper is to study this imbalanced relationship between archival documents and underwater archaeological material. The body of material interrogated consists of the archive – both primary and secondary sources – as well as archaeological material.

**TH3-11 Abstract 14**
Analysing Archived Material to Unravel Wheelhouse Chronologies in the Western Isles, Scotland

**Author**: Dr. Kua, Anthony, University of Glasgow, East Kilbride, United Kingdom (Presenting author)

**Co-author(s)**: Brown, Lisa, Historic Environment Scotland, Edinburgh, United Kingdom

**Keywords**: Oral Analysis, Bayesian Chronological Modelling, Scottish Iron Age

**Presentation Preference**: Oral

The site of Bruthach a Tuath on the Isle of Benbecula was investigated as part of a rescue excavation which was undertaken in 1956 and 1957 in advance of the building of a Rocket Range in the Uists; the results of which were never published. In the 60 years since, the finds material and paper archive has found its way into the collections of a number of different institutions, including the National Museums Scotland, Kelsingrove Museum, Historic Environment Scotland, and the National Archives. Collation and analysis of this fragmented record has brought to light previously unrealised information about the excavated features, showing the presence of at least two wheelhouses and numerous related features. Details for the excavated deposits were lacking, although the location of the artefacts and the date they were found were recorded on the finds boxes; consequently, a finds matrix formed the basis for interpreting the stratigraphy on site. A radiocarbon dating program was undertaken to identify the timing and sequence of activity related to the wheelhouses. Twenty-six radiocarbon measurements were taken from single-entities of wood charcoal, animal bone, human bone, and pottery residue. A Bayesian approach that considered stratigraphic contexts and feature formation processes was used to estimate the site chronology and sequence. Results demonstrate that activity occurred primarily in the 2nd–1st centuries BC. The chronological analyses have also helped identify ancient curation and provide evidence addressing if Iron Age activity may have been more extensive than the two decades. Further, this demonstrates the potential that artefacts in older archives have for producing new chronologies and for redefining archaeological interpretations. Similar approaches could be taken to help maximise the potential of old archives that may be incomplete or not recorded according to modern standards.

**TH3-11 Abstract 15**
The Aerofototeca Nazionale of Rome: a photographic archive for the study of Italian heritage

**Author**: Foa, Lisa, Roma, Italy (Presenting author)

**Keywords**: archival archaeology, Adamesteanu

**Presentation Preference**: Oral

Today, with the use of commercial drones, aerial pictures of archaeological sites and landscapes can be easily obtained and, thanks to more or less user-friendly software, easily processed – as it was recently discussed at the 2nd International Aerial Archaeology Conference that took place in Rome in February 2018 – and present-day records can be compared with “pre-economic boom” images to better understand what has changed in our landscapes and single sites.

Since its creation, the Aerofototeca Nazionale, based in Rome, has acquired several different collections of aerial photographs. Today it houses aerial photographic materials that date from the very end of the 19th century (e.g., the images taken by G. Boni during his excavations in the Roman Forum) to recent years. The core of the collections are the thousands of images taken by the Allied air forces while surveying war zones during WWII; despite their often precarious preservation state, these images depict several areas of the Italian Peninsula that look totally different today, due to the growth of urban areas and the development of infrastructures.

The Aerofototeca, founded in 1958, is a historical photographic archive of the ICCD – Istituto Centrale del Catalogo e Documentazione – part of the Italian Ministry of Culture (MBACT).

The archaeological Divò Adamesteanu was the first director of the Aerofototeca. He organized the first body of archival materials and designed the archive as an instrument for the collection, preservation, cataloguing and study of aerial photographic records. The Aerofototeca is an essential source for archaeological research and the safeguarding of our heritage.

The author of this paper, during an 18-month internship at the Aerofototeca, followed by field research, worked on the rearrangement of a group of more than 4,000 slides, the so-called “fondo Adamesteanu”. A focus on a selection of those slides was published on the periodical Archeologia Aerea VI, 2012. The aim of this paper is to show a few examples of the potential of this archive as a fundamental source for understanding the development of our fast-changing landscapes and as a tool for the safeguarding of Italian archaeological sites.

In particular, starting from the pioneering 1908 aerophotographic survey of a stretch of the Tiber River, some areas along the river will be analyzed on the basis of the materials available at the Aerofototeca, retracing phases of ancient and recent history of the landscapes.

**TH3-11 Abstract 16**
Endangered Archaeology in the Archives: utilizing historical aerial photography to assess heritage

**Author**: Banks, Rebecca, University of Oxford, Oxford, United Kingdom (Presenting author)

**Keywords**: aerial photography, databases, heritage under threat

**Presentation Preference**: Oral

The Endangered Archaeology of the Middle East and North Africa (EAMENA) project aims to locate, document and monitor archaeological sites and any damage to those sites in an online platform for the Middle East and North Africa region utilizing remote sensing and networks of professionals. The threat to archaeological sites due to political and social upheaval in the MENA region has drawn much attention and is being effectively monitored remotely by a number of projects, but the more gradual threats to sites from development and agriculture over the last century are less well documented. Historical aerial imagery collected from the first half of the 20th century is a fantastic resource that has captured landscapes and sites before modern development, population increase and conflict drastically changed the region and accelerated heritage loss. The collections however are scattered between institutions and many are poorly documented. The paper will present how EAMENA with the Aerial Photographic Archive for Archaeology in the Middle East (APAME) has begun working with these collections to not only utilise a fantastic resource for the documentation of heritage, but to digitise and facilitate knowledge sharing of what these collections hold.

**TH3-11 Abstract 17**
Another kind of archive: on the preservation of publications and born-digital material

**Author**: O’Riordan, Emma Jane, Society of Antiquaries of Scotland, Edinburgh, United Kingdom (Presenting author)

**Keywords**: archaeology, digital, publications

**Presentation Preference**: Oral

The Endangered Archaeology of the Middle East and North Africa (EAMENA) project aims to locate, document and monitor archaeological sites and any damage to those sites in an online platform for the Middle East and North Africa region utilizing remote sensing and networks of professionals. The threat to archaeological sites due to political and social upheaval in the MENA region has drawn much attention and is being effectively monitored remotely by a number of projects, but the more gradual threats to sites from development and agriculture over the last century are less well documented. Historical aerial imagery collected from the first half of the 20th century is a fantastic resource that has captured landscapes and sites before modern development, population increase and conflict drastically changed the region and accelerated heritage loss. The collections however are scattered between institutions and many are poorly documented. The paper will present how EAMENA with the Aerial Photographic Archive for Archaeology in the Middle East (APAME) has begun working with these collections to not only utilise a fantastic resource for the documentation of heritage, but to digitise and facilitate knowledge sharing of what these collections hold.
The Society of Antiquaries of Scotland has been publishing since 1792 and has produced the journal Proceedings of the Society of Antiquaries of Scotland (PSAS) annually since 1851. These volumes provide a record of research excavations, rescue excavations, archaeological surveys, studies of objects, overviews of historical records, publication reviews and more. Physical copies of the Proceedings are sent every year to Fellows of the Society as well as to libraries and institutions across the world. In 2001, the Society began scanning our PSAS archive and since 2003, PDFs of papers more than a year old have been available to view freely online via the Archaeology Data Service (http://archaeologydataservice.ac.uk/archives/view/psas/index.html); since 2011, users have downloaded PSAS articles more than 386,000 times. We also host the full text of our out-of-print monographs and Scottish Archæological Internet Reports (SAIR) with the ADS. The sheer amount of archaeological knowledge that our publications contain makes it an indispensable resource for anyone studying the history of antiquarianism and archaeology in Scotland, as well as a treasure trove of detailed information on archaeological sites and artefacts. As these publications cover hundreds of years of research, thousands of different objects and sites and hundreds of authors, their shared common link is often the Society itself. How can the Society best use its own heritage and archives to inform future work? One of the research projects of the Society is the Scottish Archaeological Research Framework (ScARF). This free-to-use online resource (www.scottishheritagehub.com) summarises what the acknowledged experts in their fields – not only archaeologists but also those in related disciplines such as geosciences, environmental sciences, history and museums – thought about Scottish archaeological knowledge at the time of the first reports in 2012. The work is divided by time period and each period ‘panel’ made a series of recommendations for future research. Now, in 2016, the panels are beginning work on the next version of these reports. This will mean that the 2012 reports become, in effect, an archive themselves. One of the challenges moving forward will be to ensure that as the first set of questions posed are answered, that the archaeological information that led to them are not forgotten but archived so that in the future, contemporary trends and lines of thinking can be studied. It is planned that the new reports will contain links to more of the raw data and archives used in their creation and it is possible that many of these data and archives will be available online. However, the ability to view these will only be a useful addition if they are openly accessible. The Society has a privileged position from which to think about the long-term survival of our archaeological heritage as it has been around since 1780 and, as long as there is a public interest in Scottish archaeology and history, will remain for the decades and centuries to come. How can we ensure that our rich history and archives will remain visible and relevant for as long as they are needed?
HOW TO MAKE A FIELD SCHOOL WORK:
MANAGING ISSUES, DANGERS, OPPORTUNITIES

Friday, 2 September 2016, 09:00-16:00
Faculty of Philology, Room 114

Author: Balco, William, University of North Georgia, Dahlonega,
North Georgia, United States of America (Presenting author)
Co-author(s):
- Carvalho, Vieira, Universidade do Algarve, Faro, Portugal

Keywords: Archaeology, Field school, skills

Presentation Preference: Oral

Archaeological field schools are the primary means to expose students to their first excavation and to train future generations of professional archaeologists. During these programs, students are engaged in experiential learning, critical thinking, and cultural experiences. Likewise, the development of an archaeological field school often engages university administrators and faculty in a similar manner, introducing them to the nuances of scientific archaeological fieldwork. This paper discusses the challenges faced and administrators and faculty must face together when developing an international archaeological field school. Such programs break the mold of a traditional study abroad program by involving complex logistics, risk management strategies, site locations, course schedules, and learning outcomes. University of North Georgia’s Sicilian Archaeological Field School serves as a case study for the development and implementation of a new international program requiring close cooperation between universities, civic, and regional partners. This program blends instruction with research to provide students with a holistic education in archaeology and archaeology education.

TH3-12 Abstract 03
How to improve the offered preparation and avoid the risk of “fake” field school

Author: Vecchiet, Costanza, Durham University, Trieste, Italy (Presenting author)

Co-author(s):
- Chiarini, Riccardo, University of North Georgia, Dahlonega, Georgia, United States of America
- Vecchiet, Costanza, Durham University, Trieste, Italy

Keywords: Archaeology, Field school, skills

Presentation Preference: Oral

Field school seems to be a compulsory “step” every future archaeologist is required to attend to form and train his/her skills, useful for any future career. However, over the past decades - especially the last two - a steadily increasing lack in number of sponsors and fundings opened the access to excavation areas to volunteers and non-technician, in love with this job, holding partial or no skills at all, but available to help and enjoy the digging experience in change, sometimes, only of accommodation and meals. Surely, to some extent, the contribution volunteers gave to archaeology has been wide and important in order to carry on some excavation valued little. But is it safe, both for security and carefulness of the work, replace in the hand of not paid and not formed specialist the work that should be led by professional archaeologists?

Universities are the first bodies allowing to test our abilities, training our skills and checking our work during the whole excavation session. Otherwise, especially in certain countries were the practices of field school on “real” excavations are not available to help and enjoy the digging experience in change, sometimes, only of accommodation and meals. This paper is aiming to analyze both the academical and the private sector, trying to outline fixed point and guiding lines the two of them should use when offering an amazing, but truly worthy, field school experience.

Running Your Dissertation as a Field School: Pros and cons for both instructor and students

Author - Potorak, Darren, SUNY Buffalo, Tonawanda, United States of America (Presenting author)
Keywords: Archaeologists, Field School, Teaching

Presentation Preference - Oral

TH3-12 Abstract 07
Silchester Insula IX Town Life Project: A good example of management, training and public engagement

Author - Edwards, Bedin, UCL, London, United Kingdom (Presenting author)
Keywords: Field-School, Silchester, Students

Presentation Preference - Oral

Archaeological Field Schools have been for many years now seen as the suitable environment in which archaeology students can be trained to become professional archaeologists. In the last decade Field Schools have become very popular and are no longer exclusively run by Universities but are increasingly run by private institutions.

This paper is based on the author’s experience at University of Reading Field School Silchester Insula IX: Town Life Project (2011-2014) and it is to present through the analysis of detailed data, interviews with former participants, personal experiences the field school organisation and learning process which transformed (some) students into Silchester Insula IX supervisors and professional archaeologists. It will describe the author’s participation – first – as overseas student and then the path he had to follow in order to become one of the trench-supervisors – responsible for a group of 15-25 students and volunteers. What is the role of a supervisor and what are the tasks of this key figure: especially regarding teaching/learning and health&safety, site management, site supervision and archaeological reports are some of the points that will be discussed. The second purpose of this paper is to present: firstly, what are the issues (i.e. health&safety, students’ satisfaction, visitors on site), dangers (i.e. funding, conservation, post-excavation projects) and threats (i.e. high fees), that this Field school dealt with during the winter period, a second school has been set up, focusing on Material Culture Studies. Usually, the participants learn about Roman material culture through a series of introductory lectures on a specific class of material (glass, pottery, small finds, faunal remains, environmental samples etc etc). Then, they spend a week working hands on the finds recovered during the excavations. They learn how to deal with material culture, in terms of reconstructing the economy and society behind it, how to draw archaeological finds and how to reach a chronology for the context first, and the settlement then.

This paper will describe the construction of the training school at the Alberese Archaeological Project, emphasizing the reasons (as well as the benefits) of paying tution fees and how the schools work in the direction of satisfying the participant’s expectations. Data will be provided to quantify and measure the results of the schools in terms of future employment for the participants. Finally, this paper draws its conclusions upon the importance of the training schools, not only in terms of improving the participants’ knowledge and skills, but especially in terms of the learning environment and career network development they contribute to the combination of university and non-university institutions, leading and organizing the schools and their related activities, represents a plus in the experience of the participants. Moreover, a point will be made on the opportunity offered also to young specialists and scholars to develop their own teaching experience, helping them to enhance their future careers in academic or in professional archaeological units.

TH3-12 Abstract 06
Training the future generations of archaeologists at Alberese: A plus in the experience of the participants

Author - Dr. Sebastiani, Alessandro, University of Sheffield, Sheffield, United Kingdom (Presenting author)
Keywords: Archaeology, Field Schools, Training

Presentation Preference - Oral

This paper aims to describe the nature of the field and lab schools directed under the umbrella of the Alberese Archaeological Project in south Tuscany (Italy). Moreover it intends to show how the schools were built up to train the next generation of archaeologists and fulfill their expectations, in terms of enhancing their future academic or commercial archaeology careers.

The Alberese Archaeological Project provides two different types of training schools. Both of them are run by the Department of Archaeology at the University of Algarve, in collaboration with John Cabot University, the University of Queensland, Michigan State University, the British School at Rome and a local company of commercial archaeology.

The archaeological fieldwork school attracts students and early career scholars from all over Europe and North America. They join a learning environment through the excavation of a Roman maritime site, set along the Tyrrhenian coast. The format

TH3-12 Abstract 08
To what extent can management skills help archaeological sites in their self-sustainability?

Author - Vecchiet, Costanza, Durham University, Trieste, Italy (Presenting author)
Keywords: Archaeology, Future, Management

Presentation Preference - Oral

Sadly, we are living in an era in which archaeological and general cultural heritage are often downgraded with spare financial helping and bad evaluation of their potential, both economical and educational. Over the last two decades, new types of possible funding (e.g. crowdfunding and donation from private bodies) have offset the vacuum of state financial assistance – at least in Italy - allowing some important project to be realized even after all.

Nevertheless, it is undeniable this cannot be considered a long term solution, and new perspectives for the maintenance of archaeological sites and cultural areas need to be founded out and seriously taken into account.
One of this could be and, in the daily scenario, must honestly be an attempt to self-sustaining by the excavations and of the cultural projects themselves. It is in this renewal air and management reorganization that new Master and specialized courses were born. They are born because of the sector specialists having realized how important it is for the survival of archeology and free management find a way to make culture more accessible, not a slave to political austerity. Several can be the ideas an archaeological site could develop in order to achieve its “freedom”: paid guided tours, small gadget for visitors, open days/weekends for families during which could be asked a small contribution for excavation maintenance. Everything it is up to the archæologists and their skills in understanding what people really want, and what people are really keen and available in paying for.

Certainly, also enriching the staff with one or two specialized managers could be a good idea, but why not merging archeological and managing knowledge all in the hands of one who really run the excavation and its activities?

These, obviously, are just some suggestion. Thus, analyzing and comparing experiences tested already, the present paper will try to give an overview about the current status of archeology and its future opportunities and possibilities if well managed.

TH3-12 Abstract 09
Site management and business plans, conservation and public engagement issues and opportunities

Author - Eduardo, Bedin, UCL, London, United Kingdom (Presenting author)
Keywords: Financial Self-sufficiency, Site Management, Sustainability
Presentation Preference - Oral

Archaeological projects have been for many years now considered enterprises run mainly by public funding. Additionally, in many countries it is a commonly accepted notion that supporting heritage will automatically mean money loss and the need for extra funding is a constant “curse” for many site managers. In particular cases insufficient funding precludes the management of the site from running even basic maintenance work, consequently causing bad publicity, as less areas become accessible for visiting, and reducing the opportunities to improve the site facilities.

The primary purpose of this paper is to explore through case-studies what are the key aspects of a successful management plan and business plan and what are the major financial, political issues encountered during the development of projects and how to handle these issues. It will also highlight the importance of involving different stakeholders as means to increase the chances of the success of site management, its conservation and valorisation.

The second purpose is to explore limitations in achieving financial self-sufficiency while managing an archaeological site and demonstrating the need to change the approach to Italian Heritage in order to “rescue” it from the risk of abandonment due to lack of funds. If a site can reduce the reliance of public funds it will protect the site from possible conservation and valorisation issues due to lack of funds.

The last goal of this paper is to explore what actions can be taken to reach a much wider public, including those that would not naturally come to visit the site, and understand the possible threats of the rise of visitor numbers, while investigating the possible benefits in terms of job creation within the site and in the buffer zone.

The final question which will be tried to answer is: are all sites potentially sustainable or is it necessary to consider the closure of some to preserve them until more funds become available?

TH3-12 Abstract 10
Drama - Merdzhumekia:
German archaeological field-school in Bulgaria

Author - Valchev, Todor, Regional Historical museum - Yambol, Yambol, Bulgaria (Presenting author)
Keywords: archaeological field-school, Drama - Merdzhumekia, German methodology
Presentation Preference - Poster

The prehistoric settlement mound Merdzhumekia was situated near the village of Drama in the Tundzha municipality, Yambol district. It has been completely excavated during the Bulgarian-German project from 1983 to 2011. The joint project was undertaken by Sofia University “Sv. Kliment Ohridski” in Bulgaria and Saarland University in Germany. The international project was led by prof. Alexander For, prof. Jan Lichardus, prof. Francesca Bartelmes and Illya Iliev.

The aim of this poster is to present the methodology used by German scholars during the archaeological excavations in the village of Drama. The system permitted students to participate in all aspects of the project: archaeological excavations, graphic documentation and processing of ceramic materials and finds. During the international project, more than 300 students and University assistants participated from Bulgaria, Germany, Czech Republic, Slovakia, Hungary and Luxembourg. Some of them are now leading archeologists and University professors in Bulgaria, Germany and England.
CREATIVE ARCHAEOLOGIES II
CONTINUING THEORY AND PRACTICE IN A NEW BRANCH WITHIN THE FIELD OF ARCHAEOLOGY

Saturday, 3 September 2016, 09:00-13:00
Faculty of Philology, Room 114

Author - Synne Astrid, Anita, University of Gothenburg, Gothenburg, Sweden (Presenting author)
Co-author(s) - Danis, Annie, University of California, Berkeley, United States of America

Keywords: art, creative archeology, heritage, interpretation
Presentation Preference - Workshop

The approach of this presentation is to focus on how creative archeology can provide information about the contemporary life in a small town, and give another picture. The project started in 2009 when an asylum-seeker came to the author’s university seeking refuge. The asylum-seeker was from a country where the population is struggling to survive due to economic and political issues. The author decided to turn the asylum-seeker’s story into a creative archeology project, using film, video, and performance to explore the depths of the asylum-seeker’s experience.

In this presentation, the author will discuss the process of creating a creative archeology project and how it can provide new insights into the struggles of asylum-seekers. The presentation will also highlight the importance of creative archeology in providing a more nuanced understanding of the contemporary world.

TH3-13 Abstract 02
The Archaeology of Pinboards – the future and the past in ads and posters

Author - Ph.D. Grahn Danielson, Benjamin, Picea kulturarv, Fors, Sweden (Presenting author)

Keywords: Community, Future Archaeology, Pinboards
Presentation Preference - Oral

In this presentation, the author will discuss the use of pinboards as a creative tool in archaeology. The presentation will explore the history of pinboards as a tool for organizing and presenting information, and how they have been used in modern archaeology. The author will also discuss the potential of pinboards as a tool for engaging the public in archaeology.

TH3-13 Abstract 03
Archaeological carpentry, Doing theory with your hands

Author - Dr. Mikeluz, Dmitriy, Institute of Archaeology of Cultural heritage, Ljubljana, Slovenia (Presenting author)

Keywords: art, carpentry, theory
Presentation Preference - Oral

In this presentation, the author will discuss the use of carpentry in archaeology as a means of exploring the relationship between the past and the present. The author will use examples from the work of Russian archaeologists to illustrate how carpentry can be used as a tool for understanding the past.

In addition, the author will discuss the use of carpentry in modern Moscow, where it is used as a creative practice in archaeology. The author will explore the potential of carpentry as a tool for engaging the public in archaeology.

TH3-13 Abstract 04
Creative archaeology of modern Moscow

Author - Doctor Bellows, Leonid, Institute of Archaeology of RAS, Moscow, Russian Federation (Presenting author)

Keywords: archaeological monuments, creative archaeology, modern Moscow
Presentation Preference - Oral

In this presentation, the author will discuss the use of creative archaeology in modern Moscow. The author will explore the potential of creative archaeology as a tool for engaging the public in archaeology, and will discuss the potential of modern Moscow as a laboratory for creative archaeology.

TH3-13 Abstract 05
Archaeological Field Schools in the UK: What, Where and How?

Author - Roberta, Arabella, National Museum of the Royal Navy, Cranleigh, United Kingdom (Presenting author)

Keywords: current status in UK, development, field school
Presentation Preference - Oral

In this presentation, the author will discuss the use of archaeological field schools in the UK. The author will explore the potential of field schools as a tool for engaging the public in archaeology, and will discuss the potential of modern Moscow as a laboratory for creative archaeology.
Archaeological field schools are viewed as the first port of call for students aspiring to become archaeologists. On top of this, they are often major research outlets for universities and archaeological organizations, and often come to represent the sector on television and in publications. Their position and importance in the sector is well developed and, until now, viewed as well understood.

When starting research on field schools in the UK, confused responses were given to simple questions on definition, curriculum, length, cost, demographic and standards. I subsequently set out to start to answer some of these questions over three stages. The first developed the context, looking at how training in practical archaeology had developed over the last 50 years in relation to the economy, government legislation and the archaeological sector in general. The second addressed the issue of definition; comparing the different terms used for practical training – ‘field school’, ‘course’, ‘dig’, ‘fieldwork’, ‘excavation’ etc. - and seeing where the term ‘field school’ belonged and, importantly, who belonged within it. The balance discussions from sections 1 and 2, the final section focussed on real data. Drawing from the first database of archaeological field schools in the UK and from a qualitative survey of individuals who attended field schools recently, they offered an insight into the current situation of field schools in the UK today. The response demonstrated a broad confusion over the definition and expectations of field schools, fuelled by a lack regularity on the length, demographic, cost and curriculum on offer.

What this research shows is that field school is a fundamental area of the archaeological sector which, in the UK and contrary to its academic counterpart, has failed to develop in a way which caters to the demands and regulations required by its participants. In light of the economic difficulties field schools are facing, they are being forced to compromise and develop. It is therefore a perfect opportunity, albeit well overdue, to develop field school as strategic assets for the sector and wider cultural heritage, as well as a fairer environment for those taking part. The data produced and topics discussed in this paper hope to mark the start of this process.

TH3-13 Abstract 06
Visual aesthetic of archaeological practice: a creative approach
Author - Mermel-Martinez, José-Antonio, Arqueología de Guardias Association, Benajara (Murcia), Spain (Presenting author)
Keywords: archaeological practice, Archaeological theory, creative archaeology
Presentation Preference - Oral

The image projected by the archaeologists in the archaeological practice on the sites has set the social valuation of Archaeology in terms of relevance and usefulness. However, the procedures followed in the archaeological research have blocked, in many cases, the consideration of Archaeology as an active practice to integrate, on purpose, the archaeological works into the citizen’s interests. Taken into account the destruction of social, cultural conventions which are posed by some special visual styles as Street Art and Photo/Video journalism, it is analyzed the creation of archaeological Ethnography to identify visual patterns which belong to the archaeological practice, which transform it into an aesthetical of movements, to allow the reflection about the concept of “universal”. This go beyond the Theory and has been applied on practice during a field school of Archaeology done at an official High School of the Spanish State, in Murcia, in which was made relevant the presentation of new ways to understand common values of Archaeology as the experience, materiality and temporality through playing with the visual perceptions of both artistic and archaeological practices, with the creation of Art and the take of consciousness. This, finally, propose us two interesting conceptions to the Archaeology: the inclusion of creative ways to see the meanings of archaeological practice, and the utilization of Archaeology in an activeistic sense to fight the injustice derived from the integration processes at the moment of shifting from one social context to another.

TH3-13 Abstract 07
Kulmin - digital dissemination of cultural heritage
Author - Prestvold, Kristin, Sør-Trøndelag County Authority, Trondheim, Norway (Presenting author)
Keywords: digital dissemination, Kulmin
Presentation Preference - Oral

How do we inspire curiosity and interest in heritage and cultural history when the personal guide is absent? How can we create wonder and sense of place and time in the encounter between people and cultural heritage without a good storyteller?

Sør-Trøndelag County Authority has developed a product and a strategy for digital dissemination of cultural heritage via mobile phones and tablets named Kulmin. Focus is on the good story, the good storyline. Focus is men, women and children’s encounter with the cultural heritage. The monuments and sites are made vivid and dramatic through text, audio and video on smartphones and tablets in stories based on archaeological, cultural and historical facts. The stories are characterized by myths, legends, events and people, conveyed through dramatization, humor and other narrative devices.

The dissemination has included input from the hearing and visually impaired, and the contents should be understandable and engaging independent of the user’s ability or disability. The aim of Kulmin is to make cultural heritage accessible to all. Kulmin takes the step from protection of our cultural heritage to facilitate, make available and visualize the historical monuments and sites. Kulmin as a product is not technologically advanced. The innovative aspect of Kulmin is in how heritage is being conveyed. Technology is only the tool, the content is the king with an aim to capture the interest and create curiosity. Dramatizing the past through ‘the good story’ makes the cultural heritage more accessible and exciting.

TH3-13 Abstract 08
Let Archaeology be Archaeology and Art be Art - and let them tell a story side by side
Author - Bangbade Dissing, Nina, Municipality of Skanderborg, Skanderborg, Denmark
Co-author(s) - Pusup, Marianne, Visit Skanderborg, Ry, Denmark
Co-author(s) - Hest-Hansen, Lene, Museum Skanderborg, Skanderborg, Denmark (Presenting author)
Keywords: Art, Collaboration, Cultural Tourism
Presentation Preference - Oral

We strongly believe that the archaeological discipline benefits from interdisciplinary approaches. We believe in co creation and equality between art and archaeology but still think that the different disciplines theoretical framework should be respected.

We have made a concept called eScape. Our approach is not theoretical but based on practical projects made on site. The concept eScape is all about combining art, archaeology, past and present - creating and telling art on sites with strong archaeological evidence in combination with the scientific archaeological excavations.

The location and the landscape is the raison d’être of the project - and locals as well as tourists are given the opportunity to experience landscape storytelling combined with world history interpreted by modern art.

eScape brings out art and cultural heritage “on location”, away from the walls of the museum, creating a phenomenological space where nature, art and cultural heritage meet and communicate with one another, giving visitors unique and unexpected experiences.

Collaboration between specialist in Tourism, Art and Archaeology and combining the three parts on equal terms is crucial, as well as participation from locals and children. Turning people who stare into people who care – and people who dare and share.

TH3-13 Abstract 09
Layers of living in layers of time
Author - PhD Synnestvedt, Anita, University of Gothenburg, Gothenburg, Sweden (Presenting author)
Keywords: art and archaeology, heritage, theory and practice
Presentation Preference - Oral

In 2013 the largest urban archaeological excavation ever undertaken in West Sweden started in the area of Gamlestaden in Gothenburg. The town of “Nya Lödöse”, which lay here between 1473 and 1624, is being excavated. The area is set to undergo major transformations. New construction activities with buildings, a new hub for public transport, walkways and bike lanes will transform the urban landscape. The archaeological dig is done behind fences. You can have a glimpse of what’s going on, peeking through little openings, but it’s hard to understand - what is happening? You can go for a guided tour, but do you see the connection between now and then? Do the archaeologists care about what’s happening outside the fence while they are digging? What is present, what is past? How can we explore the environment when space is money? In a workshop arranged in May 2015 archaeologists, musicians, artists and students investigated the environment in Gamlestaden with the aim discovering stories and contexts in the many layers of time. This investigation resulted in a video: Layers of living in layers of time. The purpose and the outcome of the video will be discussed in the presentation.
TH3-14 Abstract 01
Farms, hamlets, villages and towns. Settlement variability in Early Modern Scandinavia
Author - Dr. Rosén, Christina, Arkeologerna SHMM, Töllsjö, Sweden (Presenting author)
Keywords: Early Modern, Scandinavia, Settlement
Presentation Preference - Oral
Words like farm, hamlet, village or town are often used to describe different kinds of settlements but they are not simple and straightforward. Archival sources, maps and archaeological records show no clear link between spatial form, socio-economic status and political status. The same general form may correspond to different socio-economic situations. In this paper I will discuss settlements by taking variability as the starting point rather than pre-conceived concepts and models. Maps, tax registers and archaeological records from several parts of Scandinavia will be discussed with a focus on Western Sweden.

TH3-14 Abstract 02
Areas reserved for rich and populated by poor or a melange of many factors?
Author - Dr. Sappinen, Liisa, University of Turku, Turku, Finland (Presenting author)
Keywords: socio-topography, layout, Turku, early modern, urban settlement
Presentation Preference - Oral
Research, even if focused on the same topic, is relevant and has many variables, which may change in the course of time affecting approaches, methods and results in remarkable ways. In urban contexts in Finland, archaeological practice has long been restricted by the existence of studies based on historical information, which however is not abundant or diverse. The supremacy of historical studies has especially affected the research of the early modern and modern periods in those towns with earlier history where the focus of archaeological research has been in medieval periods. During the last two decades, archaeological excavations have increased the amount of source material, which offers an interesting supplement for historical studies and cartographical information.

In this paper, the relation between research, settlement and the socio-economy of the city is discussed with an example of Turku, which is the oldest town of the present-day Finland and was one of the most important towns of the medieval and early modern period in Finland. The first presentation of the layout of the city are from the 1630s and the extent of the establishment and settlement of the town. It took more than 100 years before a map was made in the 1750s with the list of the plot owners including information about their professions and site values.

Tracing the earlier settlement history and socio-economic topography of the town is like trying to compose comprehension about the picture by piecing an old puzzle with only a few pieces that have been spared. The information from the 1700th period and beyond is valuable as such, but how much this information has labeled the conceptions and interpretations about the socio-topography of "Turku in earlier periods and on what grounds. The city is a living organism that updates itself through different processes that follow different rhythms and the possible impacts these had on the lives of the town residents. Some processes are slow and ongoing, while others are more rapid, such as seasonal changes. The data from about two hundred archaeological field reports together with a theoretical orientation helps to unfold a more diverse picture of the Saudi early modern town.

TH3-14 Abstract 03
Norrköping and Kalmar: A spatio-temporal analysis of two early modern Swedish towns
Author - Agnesten, Sofia Andrine, Gothenburg university, Gothenburg, Sweden (Presenting author)
Keywords: Early modern time, Settlement variabilities, Spatio temporality
Presentation Preference - Oral
During the early modern time, one of the most extensive phases of city transformation in Europe occurred in Sweden. This spatio-temporal analysis explores settlement variabilities and social dimensions in the two Swedish towns Norrköping and Kalmar during the time period. These were, from a Swedish Early Modern perspective, rather large towns with both having major ports on the east coast of the Baltic Sea. However, from a utilitarian and functional perspective they differed in many aspects and because of these differences they help illustrate some of the urban settlement variabilities of this dynamic period. The space analysis is performed on several levels, where the spatial dimensions are examined in the towns as a whole, but also more focused, e.g. at block level and even more thorough at plot level. The temporal part of this analysis focuses on exploring various time related processes that follow different rhythms and the possible impacts these had on the lives of the town residents. Some processes are slow and ongoing, while others are more rapid, such as seasonal changes. The data from about two hundred archaeological field reports together with a theoretical orientation helps to unfold a more diverse picture of the Swedish early modern town.

TH3-14 Abstract 04
Same name, same background, same function? Similarities and differences of the Scandinavian Husebyverk
Author - Dr. Lemm, Thorsten, Stiftung Schleswig-Holsteinische Landesmuseen Schloß Gottorf, Schleswig, Germany (Presenting author)
Keywords: cultural-historical background, royal administration, royal farm
Presentation Preference - Oral
Since the early 20th century the more than 130 hamlets or farms in Scandinavia and the Orkeys known by the name Huseby, Huseby, Huseby, Huseby, Huseby etc. have been a relevant topic in historical, archaeologi-cal and onomastical research, closely linked to the discussion of kingship and political administration. Especial the highly frequent use of the place-name Huseby, their uneven distribution over Scandinavia, and the use of husaby as an apppellative in some early written sources led to the understanding of a great majority of the Husebyverk as places with local background. As such the Husebyverk have in many cases been a substantial argument in theses on the administrative and economic structure of royal power in the Viking Age and the early Medieval Period and in theories about the early state formations. However, recently conducted detailed analyses of their cultural-historical backgrounds give reason for a much more deliberated view on the Husebyverk. There are certain similarities and differences that can be observed between these sites and there must be reasons for that. Were different historical and/ or chronological backgrounds responsible for the diversity of the Husebyverk? And how does this affect the widely accepted interpretation of these sites? These questions will be addressed by the paper and hopefully discussed during the session.
Did socio-economic developments change the landscape of Ireland?

Author - Tighe, John, Trinity College Dublin, The University of Dublin, Castledermot, Co. Meath, Ireland (Presenting author)

Keywords: Agriculture, Early Medieval Ireland, Economic Development

Presentation Preference - Oral

The two greatest influences to the socio-economic landscape of Ireland in the early medieval period were the coming of Christianity and then the raiding and subsequent settling of the Vikings in the coastal emporia, such as Dublin and Waterford. But how did these events shape the socio-economic changes at this point? I hope to show that these events were in themselves, the catalysts, rather than the instigators of change.

In the aftermath of the Late Iron Age lull, which ended c.AD300, there was an increase in crop production, the growth is seen in stark contrast to the previous five hundred years or so, which it seems was a time of stagnant growth. The increase of crop cultivation, as well as the introduction of new technologies, such as the water-mill and the coulter plough, increased production, allowing specialisation and creating a surplus, furthering a division of labour and exchange networks.

When talking about the early medieval period in Ireland, one instantly thinks of the ubiquitous ringforts, of which it is now estimated, there was as many as c.70,000. Despite Stout’s estimation that they went out of use after c.AD900, there is no other type of secular settlement found in all areas of the country to populate the landscape. It is possible that although ringforts did not change in morphology after this period, many being re-occupied in the later medieval period, its possible their location echoed a change in their function, away from being a cattle pen to being one used to control and exploit the agricultural producers. While some have attributed the inception of souterrains as refugees from Viking raids, I would view them as drier stonehouses for grain than outdoor environments, and this may be an indication of areas of concentrated agricultural exploitation.

The manner in which the dead are treated is indicative of how people saw themselves in the landscape. The transfer of bodies from family-orientated graves, including ferai, which were often used as boundary markers, towards community cemeteries, may indicate a changing nature of belonging, as the narrowing of the kin-group meant that less people would have been eligible for positions of power. Furthermore, many of these community cemeteries became the attention of gatherings, which once would have taken place at elder trees or next to burial mounds, showing how the church became a central player in these assemblies.

The ecclesiastical settlements which were founded from the mid-fifth century on provided Ireland with its first permanent catalysts to socio-economic change and its patronage by the elites, which helped to increase their wealth and prestige, subsequently leading to the centralisation of power at a provincial level in Ireland.

A multi-proxy approach on identifying stabling patterns in prehistoric times

Author - Ebner, David, Free University, Berlin, Germany (Presenting author)

Keywords: animal husbandry, spatial analysis, stabling

Presentation Preference - Oral

The identification of stables in prehistoric settlements often depends on exceptional preservation conditions or geochemical analysis of sediments. But it is possible to determine patterns of architeconic features, particular objects and landscape use leading in the same direction? This presentation is dedicated to a multi-proxy approach to establish a method enabling the identification of different strategies of animal husbandry and stabling. The initial attempt is based on excavation examples with extraordinary preservation conditions especially from the northern sea or lake sites with proof of existing or non-existing stabling features. But also settlements with inferior preservation can hold evidence of stabling that can be proven by various scientific methods. Finally, it will be tested whether it is possible to evolve these results on different settlement concepts and periods.

**Islands on lakes – life and rituals of Slavs in Pomerania during the pagan-christianity transition**

**Author:** Prof. Chudziak, Wojciech, Nicolaus Copernicus University, Toruń, Poland

**Co-author(s):** Dr. Kazimierczak, Ryszard, Nicolaus Copernicus University, Toruń, Poland

**Keywords:** Pomerania, Islands, Religion, Slavs

**Presentation Preference:** Oral

The baptism of Mieszko I, the founder of Polish state, in 966, had been a key event for the Slavs living in the Odra and Vistula basin, an important caesura between a pagan style of life and the new Christian one. For a long time, among medievalists and archaeologists, the knowledge on this topic has been based on researched proto urban centers such as Szczytno, Wolin, Kołobrzeg and Gdańsk. So far, little attention has been paid to the centers located on the islands of Pomerania Lakeland. However, since 2004, in the Institute of Archaeology at Nicolaus Copernicus University in Toruń, a research on the significance of these islands in the socio-economic and religious life of Slavs in the times of ideological and political transformation at the end of the 1st and the beginning of the 2nd millennium A.D. has been undertaken. Currently, the research is being conducted in several such places. The Island of Żółte, located on the lake Zaratko, belongs to the better examined ones. In the following paper, the authors will present the selected questions concerning the interpretations of this place according to the religious, social and economic contexts. The results of the interdisciplinary archaeological and bio-archaeological research will be the basis of their considerations.

**TH3-14 Abstract 11**

**Spatio-Demographic Structure and Social Organization: A Linear Trajectory or Overlapping Trends?**

**Author:** Zubow, Ezra, SUNY at Buffalo, Buffalo Ny, United States of America (Presenting author)

**Co-author(s):** Dr. Dushchenko, Aleksandr, Institute of Archaeology of the NAS of Ukraine, Kyiv, Ukraine

**Keywords:** demographic development, settlement, social complexity

**Presentation Preference:** Oral

Oversimplified understanding of the general systems theory with its concepts of balance, positive and negative feedback strongly related population growth and increase in social complexity and economy to each other. Meanwhile, recent studies showed disproportions between demographic trends and socio-economic transformations worldwide. Concerning the simulations based upon the Cucuteni-Tripolye settlements and their systems, this paper presents the deep non-linear patterns of demographic development that in many cases may be wrongly taken for specific types of socio-political organization.

**TH3-14 Abstract 12**

**Settlement and Process in Colonial Encounters**

**Author:** Professor Cornell, Per, University of Gothenburg, Västra Frölunda, Sweden (Presenting author)

**Keywords:** Colonialism, Settlement, Socioeconomic

**Presentation Preference:** Oral

Discussing two cases from the Americas, the question of settlements and the socio-economic will be addressed in relation to a colonial context, the European conquest of the continent. One case addresses developments in what is today Quintana Roo, Mexico, and the other a case from the Cachapui river system in today’s Northern Argentina. Questions of relationship and encounters will be addressed, but in particular the relation between settlement organization and the socio-economic. The potentials of the concept of mode of production, in a new revised version, will be tested.

**TH3-14 Abstract 13**

**Society in flux: Evidence from the middle/late Northern Württembergian Urnfield Culture**

**Author:** Girotto, Chiara, University of Durham, Durham, United Kingdom (Presenting author)

**Keywords:** Northern Württemberg, stratification, Urnfield Culture

**Presentation Preference:** Poster

Up to date the society of the Untermain-Swabian-group of the middle/late Urnfield Culture has never been analysed by a combined approach of the spatial and temporal distribution of settlement, hoards, burial patterns (n=701 sites including isolated objects) and grave goods. This case study of Northern Württemberg introduces a new idea about of structure and organisation of society at Ha A2/B1. Furthermore it briefly presents a previously unpublished cemetery of the transitional Ha A2/B1 period at Erlenbach “Käppelesäcker” (district Heilbronn, Germany). Settlement patterns suggest a society whose patterns followed natural resources while sitting in close proximity to the most important rivers of the region, the Neckar and Tauber. Although hithop settlements exists no correlation with settlement accumulation or clusters could be detected. Therefore it is hypothesised that the patterns of settlement were governed by exploitation of natural resources of the lowland and access to larger rivers. The importance of rivers is stressed by the pattern of hoards as they mainly appear in the Neckar region. Burials follow the settlement pattern and imply the preference of rivers and suitable soils for agriculture.

Trade had to be an important factor of the North-Württembergian societies as they never developed distinct types of metal artefacts. No export objects are known but agricultural products and salt are both possible ideas. The ability to trade suggests over production and possibly the existence of a vertical social structure.

As cremation was the prevailing burial practice vertical organisation and its impact on individuals can only be interfered by the analysis of grave goods. Early and early middle urnfield culture graves usually do not exhibit dissimilar “wealth” through grave goods. But at the cemetery of Erlenbach “Käppelesäcker” the grave of a child (7–10 years) yielded a small golden wire ring, a rare imported broken bronze bracelet, other metal objects and pottery. This finding might suggest a heritable form of social status but no other rich graves were detected in the necropolis. It is hypothesised that some individuals could accumulate more imported objects than others and some form of vertical organisation existed.

Overall the study concluded that the data of the transitional Ha A2/B1 period suggests a society in flux. First obvious differences in grave attire start to exist but the settlement pattern does not suggest any interregional forms of rulership. Instead social organisation on a smaller scale, governed by economic success could have been the starting point, leading to the later presumably hierarchical societies of the Iron Age.
THE ATLANTIC ARC AND ITS NEIGHBOURS
IN THE FIRST MILLENNIUM AD: FRAMING NEW PERSPECTIVES

Friday, 2 September 2016, 14:00-16:00
Faculty of Philology, Room A7

Co-author(s) - O Riagáin, Russell, Ruprecht-Karls Universität, Heidelberg, Germany
Keywords: Atlantic, Landscape, Networks
Presentation Preference - Regular session

Taking Europe's Atlantic seaboard as an area of study is by no means adopting a novel perspective, even if the majority of the scholarship on its constituent parts has been of a narrow spatial perspective, usually focussing on either a single region, or on immediately adjacent regions. Where a broader spatial remit has been adopted, it has usually been within a conterminous paradigm, with designations such as 'Atlantic Fringe' bearing the imprint of a mixture of Classical bias and more modern social evolutionism. Conversely, the temptation of adopting a neo-Romantic exceptionalist approach to the wider region, emphasising its uniqueness and unity of shared traits must also be avoided. Therefore, this session will adopt a via media. Papers are sought examining regional similarities and differences, responses to environmental and the movement of people, ideas and things within and around the ar e. Furthermore, papers are also sought addressing the ways in which different areas of the arc interacted with their inland neighbours, both with social-mega-configurations such as the Roman and Frankish Empires and on a more micro-political level, either affecting or not affecting cultural change and identity shift.

Multidisciplinary papers treating this issues are particularly encouraged, as are papers adopting a comparative perspective, utilising case studies from across the Atlantic Arc. The focus will primarily be on the first millennium AD, but papers may also be accepted from beyond this chronological timeframe, so as to provide further insight by setting the main temporal remit in its broader geographical context. Similarly, papers dealing with areas adjacent or otherwise connected to the session's spatial remit might also be accepted to set the Atlantic Arc in its wider geographical context.

TH3-15 Abstract 01
The materiality of early Christianity: stone and the sea in western Scotland
Author - Dr. Macklonado, Adrigh, University of Glasgow, Glasgow, United Kingdom (Presenting author)
Keywords: Christianity, materiality, religion
Presentation Preference - Oral

Narratives of conversion to Christianity in Britain and Ireland prioritise the actions of human agents and the agency of their bodily remains. However, unlike much of western Christendom, the insular Atlantic provinces are characterised by a relative disinterest in translating and venerating the relics of the saintly dead before the 7th century. It is worth asking how saints and sacred places were created in this context, and how these ideas a materialist approach raises new questions of personhood and ontology which might be applicable across the Atlantic arc. One distinctive way in which the sacred dead and holy places were materialised is by carving names and crosses in stone. An embodied perspective of these carved stones, from sourcing and carving to emplacement and experience in the landscape, reveals embedded beliefs on the efficacy of specific kinds of stone. The movement of stones by sea is one way in which these attitudes can be spotted; water-worn boulders are frequently used, and substances such as quartz and ochre also have liquid-like aesthetic qualities. Finally, landscape location and the situation of carved stones with relation to the sea can be seen as a linking characteristic of several early Christian sites in the area. All this raises questions about the technological and ontological position of stone as mnemonic of sacred places and the sacred dead, and how the broader notion of 'Christianity' was actually created and expressed locally.

TH3-15 Abstract 02
Comparing early Christian stone monuments in north-western Europe: movement and identity
Author - Busset, Anouk, University of Glasgow, Glasgow, United Kingdom (Presenting author)
Keywords: carved stones, Christianity, movement
Presentation Preference - Oral

Stone monuments have been used by people for many centuries; as a medium for expressing messages and ideals, and as a means of transforming the landscape. During the early medieval period, this tradition developed, and indeed flourished, principally at the north-western edges of Europe. With Christianisation, carved stones were especially prominent in the process, by embodying and expressing Christianity as part of identities chosen by elites, and to convey a message of power in the landscape. Both secular and religious elites from north-western Europe commissioned and erected stone monuments in the landscape for a variety of reasons; for example, as a memorial practice, or to convey a message of power over both the people and the landscapes they experienced, inhabited, traversed, and assembled in throughout their lives. The widespread nature of the erection of stone monuments thus lends itself particularly well to a comparative study. By situating these monuments within a macro-scale approach and placing them in a wider context, the individuality of stone monuments is both revealed and further understood. This paper will thus present early Christian carved stones and rune stones from Ireland, Scotland and Scandinavia using a three-level comparative approach developed in my recently completed PhD thesis, which consists in looking at and comparing the monuments, the landscapes they are erected in, and ultimately their role within the Christianisation process. The theme of movement in the landscape, and how it is created by the presence of early Christian carved stones, will be used as a common thread.

TH3-15 Abstract 03
Self Affirmation: Building new identities through contact and exchange in early medieval Northumbria
Author - Dr. Wilson, Jacqueline, University of Bristol, Bristol, United Kingdom (Presenting author)
Keywords: borderlands, early medieval Northumbria, funerary sites
Presentation Preference - Oral

Archaeological approaches to Frontier and Borderland can include a variety of dimensions for consideration, from the physical or invisibility of boundaries, to their rearrangement over time and the ways in which they serve to create contexts of foreignness and enclosure. This paper focuses on interaction in the early medieval borderland zone of Northeast England and Northwest Scotland, with reference to their British neighbours, and across the Atlantic Arc and North-eastern part of Scandinavia. This paper explores how populations used the landscape to create and maintain their identity and territories during a time of significant upheaval in which northern Britain witnessed the withdrawal of the Roman Empire, widespread conversion to Christianity, and the emergence of centralised kingdoms. This is achieved through identifying the succession of conscious and unconscious choices involved in the construction of identity from local thinking to larger scale socio-political aspirations inferred through changes in the composition and setting of funerary sites. Evidence from early medieval burial sites suggests that the Tyne and Forth region was a zone of contact for multiple groups in the 5th-8th centuries. Comparative analysis highlights the contrast between this area and the Atlantic and Northern Arc, demonstrating the existence of intellectual territories and varied local responses from these groups.

TH3-15 Abstract 04
The recreation of identities in the late Iron Age and Roman period in Ireland (AD1-500)
Author - Dr. Wilson, Jacqueline, University of Bristol, Bristol, United Kingdom (Presenting author)
Keywords: Ireland, Romans
Presentation Preference - Oral

In the past various interpretations have been used to explain the evidence of Roman material in Ireland, the likely impact of external cultural influences and the probable adoption and take-up of a shared value system in parts of Ireland in the late Iron Age (AD1-500). The most recently published research used multiple lines of investigation and multidisciplinary methods to explore the Roman material evidence and its distribution across Ireland in this way. Adopting a new approach here - especially one that encourages via media - frees the author from the prior constraints that limited wider theoretical discourse. In developing an alternative perspective, we can now move forward from the outdated dichotomies that placed Roman and native (or in this case Irish locales) into a state of perpetual opposition. This paper will use local and regional spatial similarities between settlements and society in both Roman Britain and Roman Ireland, and demonstrate where these overlap and are connected over time. Prior investigations by the author using AMS dates and strontium and oxygen isotope analysis on burials previously classified as intrusive in this period have demonstrated that some of these burials date to the Late Iron Age/Roman period and that for some their origin and early childhood was spent in Roman Britain. The focus of this discussion will be on how identities were being recreated in Ireland through the use of Roman-type objects for bodily adornment and how this would have impacted on the sense of self for the individual but also wider community relations. It will also explore how and why people appear to have adopted or emulated Roman ritual practices at key sites around Ireland. In presenting a comparative analysis with other societies engaging with the Roman administration but outside formal control and territory, temporal and geographical indicators will be explored to

Encourages a via media - frees the author from the prior constraints that limited wider theoretical discourse. In developing an alternative perspective, we can now move forward from the outdated dichotomies that placed Roman and native (or in this case Irish locales) into a state of perpetual opposition. This paper will use local and regional spatial similarities between settlements and society in both Roman Britain and Roman Ireland, and demonstrate where these overlap and are connected over time. Prior investigations by the author using AMS dates and strontium and oxygen isotope analysis on burials previously classified as intrusive in this period have demonstrated that some of these burials date to the Late Iron Age/Roman period and that for some their origin and early childhood was spent in Roman Britain. The focus of this discussion will be on how identities were being recreated in Ireland through the use of Roman-type objects for bodily adornment and how this would have impacted on the sense of self for the individual but also wider community relations. It will also explore how and why people appear to have adopted or emulated Roman ritual practices at key sites around Ireland. In presenting a comparative analysis with other societies engaging with the Roman administration but outside formal control and territory, temporal and geographical indicators will be explored to
demonstrate transition over time. It will highlight how at key historic centres in Ireland early Roman influences became embedded into a syncretic Romano-Irish ritual practice, which in time paved the way for the adoption of Christianity in Ireland.

**TH3-15 Abstract 05**

**Europe of the Regions? Sailing between Scylla and Charybdis on Europe’s Atlantic Arc**

**Author**: Ó Riain, Russell, University of Cambridge, Heidelberg, Germany (Presenting author)

**Keywords**: Early medieval Europe, Multiscalar perspectives, Theoretical archaeology

**Presentation Preference**: Oral

This paper will explore the epistemological and ontological validity of taking the various territories along Europe’s Atlantic seaboard as an area of study in the first millennium AD. It draws on some of the insights gained thus from an on-going wider collaborative research project on the Atlantic Arc in the first millennium AD with Patrick Gleeson, University of Newcastle, and Álvaro Carvajal Castro, University College Dublin. In keeping with the overall theme of the session, an attempt will be made to steer a course between various extremes usually portrayed as a series of binary oppositions, as evinced in the various particularist/generalist, -emic/-etic, structure/agency, micro-/macro- and exceptionalist/universalist debates across the social sciences, archaeology included. Different poles have attracted varying numbers of adherents in recent decades, as archaeology – and indeed the social sciences in general – lurched from one paradigm to the next. It is argued here that there is no single way of thinking about historical problematics our current (purportedly) epistemologically-anarchic academic milieu. None of these oppositions are as stark as might often be implied, rather they occupy the extreme ends of various spectra, more related to issues such as the spatial, temporal and/or evidential parameters of a scholar’s area of study, or to individual bias. The death of the grand narrative was proclaimed more than three decades ago, however, very little has been offered up as an alternative for scholars interested in change over time and/or on broad geographical scales.

Using the Atlantic Arc as a broader test-case, and more specifically my own multidisciplinary research on settlement in Ireland, Scotland, England and Norway within this wider area, a via media is proposed here. This ‘middle road’, adopted from post-structuralism, might be best termed might the ‘aggregate narrative’, a mediating, empirically-grounded collaborative approach, which brings together the work of several scholars working on smaller spatiotemporal scales or utilising different categories of evidence. This helps mitigate not only against the issues inherent in macro-level generalist approaches, but also those associated with over-adherence to the sorts of micro-level, particularist and exceptionalist approaches associated with the national archaeologies of various regions of Europe. It also helps mitigate against issues such as the relationship between nationalism/regionaism and archaeology on the one hand, and on the other, the epistemological dissonance brought about by the use of different systems of classification.

**TOWARDS DIGITAL INFRASTRUCTURES FOR OPEN, PARTICIPATORY, PUBLIC ARCHAEOLOGY**

**Thursday, 1 September 2016, 14:00-16:00**

**Faculty of History, Room 329**

**Author**: Dallas, Costis, University of Toronto, Canada (Presenting author)

**Co-author(s)**: Degreve, Ann, Brussels Capital Region - Heritage Direction, Brussels, Belgium

**Co-author(s)**: Fernie, Kate, 2Cultures Associates Ltd., United Kingdom

**Keywords**: CARARE, digital archeology, Europeana

**Presentation Preference**: Round table

The Amersfoort Agenda of the European Archaeological Council, developed during its 15th annual symposium, identifies the need for concerted action to meet the objectives of the Council of Europe’s Framework Convention on the Value of Cultural Heritage for Society (Faro Convention) to secure the rights of people to access, participate, and benefit from cultural heritage and cultural life, and contribute towards its enrichment. This round table, taking stock of the insights from digital infrastructures such as Europeana and its CARARE network of archaeological and architectural heritage archives across Europe, will explore and debate how aggregated digital archaeological resources and the infrastructures supporting them can best serve the needs of a truly participatory and open social archaeology, enhancing and unlocking their value to foster citizenship, innovation, economic growth, employment and social cohesion. Understanding the potential value of digital archaeological infrastructures for diverse stakeholders including young people and children, the needs and opportunities they may offer for archaeological land management, education, tourism, research and the creative industries, as well as the promises and challenges of integrating social media, open curation, crowdsourcing, and semantic enrichment to enhance social access and participation to archaeological sites and data, will be among the topics to be discussed.
In scientific literature the term “Baltic region” is often used in either of two meanings: as the geographical region around the Baltic Sea, and as a cultural region of the Balts.

This conference theme on the Archaeology of the Baltic Region seeks interconnections of both meanings of the term “Baltic”. The remains of material culture and toponymical forms demonstrate that the influence of the Baltic cultures covered the territories from contemporary Moscow to the Oder river, and from contemporary Latvia to the Ukraine and overlaps with geographical region around the Baltic Sea. Cultural and technological interactions between these two regions were important factors in the formation of Northern, Eastern and Central Europe throughout the period of the 2nd millennium BC to the 16th century AD. However, various roles played by different cultures in the development of the region remain problematic, and were heavily influenced by the nationalistic narratives of the 20th century.

Fundamental questions about the formation of the both “Baltic regions”, the interconnections between Baltic, Slavic, Finno-Ugric, Germanic cultures and the rest of Europe; the impact on formation of medieval Lithuanian, Russian, Polish, German, and Swedish states will be discussed in this Theme.

This Theme is dedicated to Maria Gimbutas (1921-1994), the world-renowned Lithuanian scholar who contributed immensely to the studies of the Balts as a part of the wider Indo-European phenomenon of the “Old Europe”.

Hillforts resp. strongholds are most famous and recognizable monuments of ancient societies in the northern part of Europe. From the region east and south of the Baltic Sea altogether about 1.700 hillforts and strongholds are currently known, dating from the Early Metal Age/Bronze Age to Medieval times. Numerous investigations within several decades of archaeological research have provided various information about the occupation layers, functions and chronology of the hillforts/strongholds. Nevertheless, new information can be gained under the application of interdisciplinary methods. Such approaches provide new results regarding the settlement history and function of the sites, but also the reconstruction resp. transformation of the surrounding cultural landscape.

The purpose of the session will be to present a comprehensive overview of the current state of research of hillforts/strongholds in the region east and south of the Baltic Sea. Therefore we invite researchers to submit papers which will present archaeological, historical and interdisciplinary investigations of hillforts/strongholds. The session’s preferably spatial focus is on the Eastern Baltic area, but we also welcome papers dealing with fortifications outside of this region to enable a necessary comparison of approaches, methods and results of the archaeology of hillforts/strongholds.

TH4-02 Abstract 01
The continuity of hillforts in long-term perspective: a case study from south-eastern Estonia

Author - Dr. Valk, Heiki, University of Tartu, Tartu, Estonia (Presenting author)
Keywords: chronology, hillforts, long-term perspective
Presentation Preference - Oral

Hillforts have often been regarded just in the context of some definite time period – as power centres and important centres of the settlement pattern. However, not much attention has been paid to the network of hillforts as a phenomenon from a long-term perspective. The paper sheds light upon the question on the basis of a case study concerning the hillforts of south-eastern Estonia: where problem-based small-scale excavations with the aim to establish the chronology of sites were carried out on 31 hillforts, i.e. on almost all the sites, in 2015-2016.

Until the late 20th century it seemed quite clear that hillforts emerged in south-eastern Estonia only since the beginning of the Viking Age. Archaeological excavations, both radiocarbon dates and finds, have, however, fully disproved the suggested model. It appears that hillforts emerged in the pre-Roman Iron Age already and were used in different time periods. However, the network of sites has greatly changed in the course of time. Many of the sites, especially those of the Early Iron Age, were of short-time use, sometimes also re-used. Only in a few cases the site was used over a long time period. The case of south-eastern Estonia enables one to suggest that dates and chronology of hillforts, based on only external features, and not proved by results of archaeological excavations, may be most misleading.

TH4-02 Abstract 02
The evolution of hillforts in Lithuania according the C14 data

Author - Ass. prof. Zabiela, Gintautas, Klaipėda university, Klaipėda, Lithuania (Presenting author)
Keywords: C14 data, hillforts
Presentation Preference - Oral

About 200 hillforts (from about 900 known) were investigated in Lithuania until 2015. According to the data, got in time of these excavations, was made the general evolution of hillforts. The main stages of development of fortifications were designed in basis of typological dating of archaeological artefacts. Until the last decade of this century the C14 data in Lithuania were seldom
and majority in old LSC method. Now we possess new series of these data, made in AMS mode. They allow us to correct some aspects in development of hillforts in Lithuania. Between them are the time of origin of hillforts and this development in Roman and Migration periods. C14 data permit to precise some aspects in this development, but not change the general schema.

The new C14 data, given from hillforts in neighbouring countries also estimate for creating the modern model of development of hillforts in South-East Baltic region.

TH4-02 Abstract 03
The application of geophysical investigations in Baltic hillforts
Author: Dr. Messe, Sebastian, German Archaeological Institute, Berlin, Germany (Presenting author)
Co-author(s): Dr. Holzhauer, Alexander, Institute of Baltic Region History and Archaeology, Kleipeda, Lithuania
Keywords: Baltic Hillforts, Geophysics, Noninvasive methods
Presentation Preference - Oral

Since 2010 several archaeological sites have been geomagnetically surveyed in Lithuania. In the framework of this cooperation also several hillforts (Taurapilis, Opstainiai/Vilkyškiai, Jakai) have been investigated. In almost all sites features and structures could be detected that enables some initial statements on the structure and dimensions of the archaeological monuments. For some sites the surveys also provided very precise and hillfort to unknown information about the settlement context like in Taurapilis and Opstainiai/Vilkyškiai (fortification ditches) or Jakai (Submantine stone wall fortification). These new results clearly show the potential of noninvasive, especially geomagnetic methods for archaeological purposes, not just for archaeological research, but also for cultural heritage management. The geomagnetic data can be used differently as basis for specific archaeological investigations – which have for example already been conducted in Taurapilis – and for the development of future concepts and strategies for the protection and preservation of these sites. The paper focus on the most exciting results of these surveys which will be presented and discussed during the talk.

TH4-02 Abstract 04
Signals of subsistence economy as revealed by pollen data: a case study from Lithuanian hillforts
Author: Dr. Stancikaitė, Miglė, Nature Research Centre, Vilnius, Lithuania (Presenting author)
Keywords: hillforts, Lithuania, pollen data
Presentation Preference - Oral

During the recent decades archaeobotanical survey became and important part of the archaeological investigations conducted on different chronological and spatial scale all over the Europe. Territory of Lithuania was not exception and pollen, plant macrofossil, diatom or phytolith analysis was carried out in the environs of the hillforts. In mostly cases, these investigations was a part of complex interdisciplinary approach that provided scientists with complex information dealing with paleoenvironmental, economical, chronological, cultural and etc context of the investigated monument and surroundings during the 1-2 millennia AD. Herewith a new data revealing the peculiarities of the vegetation patter, introduction and expansion of the cultural plants and strategies for the protection and preservation of these sites. The paper focus on the most exciting results of these surveys which will be presented and discussed during the talk.

TH4-02 Abstract 05
The environment of the Sambia hillforts according to the pollen studies
Author: - Ershova, Ekaterina, Moscow State University, Moscow, Russian Federation (Presenting author)
Co-author(s): - Krokhin, Nikolay, Institute of Archaeology RAS, Moscow, Russian Federation
Keywords: environmental archaeology, land use, pollen analysis
Presentation Preference - Oral

A large number of paleogeographic reconstructions based on pollen data were made for the coast of the Baltic Sea by European and Russian scientists. However, such reconstructions for Sambia Peninsula are still lacking. Archaeological studies of the Sambian expedition (AK RAS (2005, 2010-2013) in the area of the village of Kulikovo (Kringitten) have identified a number of natural and man-made objects that are suitable for palynological studies. These are cultural layers, pits and moats fillings, archeological soils, buried under the deluvial sediments, as well as small peatlands. All of these objects have been dated using archaeological or radiocarbon methods. Pollen analysis of the sediments allowed us to reconstruct in the general the vegetation changes of the North of the Sambian Peninsula over the past 2,000 years. It is shown that prior to the intensive agricultural development coniferous-deciduous forests with spruce, pine, oak, linden, hornbeam, elm were widespread, along with black alder forests in the lowlands. The mass extermation of upland forests was associated with Roman time (about 1800 BP). In the following, Prussian, period (about 1300 BP), pollen data indicates a continuation of deforestation - decrease or complex disappearance of the black alder, which is a result, apparently, of the amelioration of lowland swamps for pastures and fields. Pollen data indicates the absolute predominance of open agricultural landscapes also during the subsequent periods, until the 20th century. Some features of the land use of different epochs, such as the cultivation of various crops, have been revealed. Also, pollen studies allowed us to identify some local episodes of vegetation changes associated with the history of individual archaeological sites. In addition to the late Holocene sediments associated with human activities, well-preserved organic sediments with radiocarbon dates 8500-10000 BP were found in the floodplain of the creek near the hillfort. Pollen analysis allows us to reconstruct the local environmental conditions at the boundary of the Peatlocone and Holocene: the gradual transformation of a shallow freshwater reservoir in the march and than in the fen, while pine forests dominate the surrounding landscapes.
as Radio-Carbon-analysis are available only for a few monuments in Poland, Lithuania and Latvia, but they are absolutely absent for the Kaliningrad Region.

In the context of a bigger project on settlement archaeology, conducted by the Centre for Baltic and Scandinavian Archaeology in Schleswig and the Museum of Prehistory and Early History in Berlin and financed by the Academy of Sciences and Literature Mainz, the author developed a new strategy for the dating of hillforts. Using a motor driven drilling equipment for sampling datable material, especially charcoal for Radio-Carbon-analysis, the ramaps of several hillforts in Lithuania and Russia have recently been investigated.

The paper gives an overview on the methodology and presents first results of the recent investigations.

TH4-02 Abstract 08
Reconsidering early hillforts in the East Baltic: conflicts and metallurgy

Author - Podelius, Vytenis, National Museum of Lithuania, Vilnius, Lithuania (Presenting author)

Keywords: behavioral archaeology, early hillforts, spatial analysis

Presentation Preference - Oral

Recent research of archaeological finds and new discoveries in the Lithuanian museums encourage reconsidering the cultural phenomenon of emergence of hillforts in the Late Bronze Age. The basic assumption of this paper is that the emergence of hillforts is a behavioral expression of prehistoric conflicts. A contemporaneous process of appearance of locally executed metallurgy in the East Baltic region concentrates in hillforts as well. Thus making the two practices comparable.

With application of behavioral archaeology theory, the research of the formation processes of Narkūnai “Didysis” hillfort is presented as a case study with spatial analysis of household and technical ceramics, bone arrowheads and spearheads, and metal finds. Results suggest abandonment of the northern building with the concentrated sherd’s nests and bone finds. The analysis of aforementioned groups of finds is compared to recent research and spatial analyses by Latvian and Estonian archaeologists of archaeological context of Aas, Raida, and Kruvinčiai hillforts. In addition, distribution of early hillforts and early metallurgical activities in the East Baltic region and its chronological character are analyzed.

Typologically most of the earliest finds from the hillforts are attributed to PN-VI, with exception to the bone pins with nail-shaped head and Majdów type bronze pin that indicate a possible end of PII. Casting moulds for socketed axes from Narvė, Gauja, Łobez, and Venta river valleys as well as moulds for spearheads from Asva, Brikuti and Kruvinčiai hillforts are one of the earliest evidences, dated to PN-VI, of locally executed metallurgy in East Baltic region. The histograpical/ceramic classical route of Daugava river seems to attract most of the early metalworkers. Casting moulds for Mālar-type socketed axes are an indication of the early metallurgical activities in the hillforts. The latter casting moulds, like the rest of the technical ceramics types, are scarce, with similar amounts in Narkūnai and Kruvinčiai and one newly found in the National Museum of Lithuania from Garmi hillfort. However, the Mālar-type bronze axes are not specific to the East Baltic region, on the contrast the axes are mostly found in Scandinavia or in Upper Vistula region of the inseparable Azinutai-type axes. Furthermore, spatial analysis of Narkūnai hillfort technical ceramics indicate that the Mālar-type bronze axes had been cast on two different occasions, therefore making some ground for the itinerant metalworkers’ hypothesis. The aim of the paper is to reconsider the emergence and character of early hillforts in the East Baltic region, correlating the spatial analysis of bone, ceramic and metal artefacts, and the emergence of locally executed metallurgy as a reliable process.

TH4-02 Abstract 09
Late Bronze Age hillforts in Pomerania: an overlooked problem

Author - Niedźwińska, Kamil, University of Gdańsk, Gdańsk, Poland (Presenting author)

Keywords: hillforts, Late Bronze Age, Pomerania

Presentation Preference - Oral

Although hillforts identified with Lusatian culture, from the end of the Bronze Age and beginning of the Iron Age appear in vast area covering Western Pomerania, Western Pomerania in particular, Lusatian Hillfort in Pomerania, beside Lower Oder region. This area is surprising, especially taking into account relatively numerous appearances of hillforts in Great Poland that is a region directly neighbouring with Pomerania from the south. On the other hand, investigations conducted in the 1960s to verify Pomeranian hillforts described as originating from Early Medieval and Medieval Period resulted in detecting at least at a dozen sites with materials from the late Bronze Age.

The aim of this paper is to introduce the problem of alleged presence of Lusatian culture hillforts in the central part of Polish Pomerania. It is highly probable that this kind of settlements played an important role in interregional contacts between Eastern and Western parts of Pomerania, together with Great Poland. In wider perspective their role in the course and working of the Amber route at the end of the Bronze Age should also be taken into account and investigated. It seems that new tools available for archaeologists like GIS software and LIDAR data may bring a new opening and new perspectives in researching this case study.

TH4-02 Abstract 10
Moving forward in the understanding of medieval ring-forts in Central Poland. Rozprza case study

Author - Dr. Sikora, Jerzy, Institute of Archaeology University of Lodz, Lodz, Poland (Presenting author)

Co-author(s) - Dr. Krütz, Peter, Department of Geomorphology and Palaeogeography, Faculty of Geographical Science, Lodz, Poland

Co-author(s) - MA Wróblewski, Piotr, Independent researcher, Warsaw, Poland

Keywords: archaeological prospection, Early Middle Ages, ring-forts

Presentation Preference - Oral

Medieval ring-forts in Central Poland were a subject of archaeological interest since the 1930’s. Twelwe features included in our projects were previously either partially excavated. These studies despite gathering new data regarding stratigraphy, chronology and material culture usually failed in bringing forth definite understanding of the ring-forts functioning in the landscape. Since the plaza’s ring-forts along with the rapid advance of non-invasive methods new possibilities were opened up for the study of ring-forts and their landscape contexts. In 2013-2015 three projects based on combinations of non-invasive and geoarchaeological methods were undertaken. Multiple methods such as magnetic gradiometry, earth resistance, aerial prospection, photophase prospection with a amplified field method, analysis of archival aerial data, airborna laser scanning, intensive analytical field walking, RTX GPS and Total Station surveys and geomorphological surveys along with geological mapping were carried out in order to provide possibly comprehensive and complementary data sets without archaeological excavations. All results were integrated in a digital environment based on open source GIS software. The project methodology allowed the collection of vast and significant new datasets such as previously unrecorded information about the spatial structure of fortification features: additional rampart lines in Chełm, the course of not preserved ramparts in Wrók and Pikiel, a developed moot system in Rozprza, a previously unknown second, smaller ring-fort in Stare Blozow. Traces of open settlements were also detected in the close vicinity of the strongholds. In each case the applied methodology helped to specify environmental determinants of settlement’s situation. The studies in Rozprza (ca. 60 km south from Lodz) were a prime example of new data categories that non-invasive approaches bring forth. The excavation was excavated in 1960s but revaluation of previous knowledge is now necessary. Remains of the Rozprza ring-fort defensive system are poorly preserved but still visible in the field as earthworks. Currently, the site occupies an area covered with meadows and fallow fields situated between the contemporary main channel of Łucjanka and Rajskaja River in the central part of valley floor, but on the Piastian and aluvial terraces remnant. Non-destructive surveys of the ring-fort surrounding were carried out in 2013-2015. In 2015 the small-scale excavation phase began, combined with complex paleoenvironmental research. It helped to detect the presence of a developed system of moats and ramparts which appeared to be a palimpsest composed mainly of elements of a late medieval motte and bailey residences, which replaced an older, early medieval settlement, the mound system and the earthworks and timber ramparts as well as moats with a depth of up to 1.4 m with organic fill of gyttja and peat and partially inorganic deposits with rich remains of woods as well as other organic materials. The results correspond to various geophysical anomalies and crop marks documented during aerial reconnaissance.

Acknowledgements. This research project was financed by three one-year grants from The Ministry of Culture and National Heritage No. 01851/13/FPK/NID (2013), 4962/14/FPK/NID (2014), 4962/14/FPK/NID (2015) and by a grant from the National Science Centre on the decision No. “DEC-2013/11/B/HS3/03785” (2014-2017).

TH4-02 Abstract 11
Is Hollenstedt the Carolingian Holdunsteti from 804 AD? New contributions to an old controversy

Author - Dr. Schneeweiss, Jens, Institute for the History of Material Culture RAS, Saint Petersburg, Russian Federation (Presenting author)

Co-author(s) - Dr. Brandt, Jochen, Archäologisches Museum Hamburg/Helmsmuseum, Hamburg, Germany

Co-author(s) - Dr. Sikora, Jerzy, Institute of Archaeology University of Lodz, Lodz, Poland

Co-author(s) - Dr. Schneeweiss, Jens, Institute for the History of Material Culture RAS, Saint Petersburg, Russian Federation

Co-author(s) - Dr. Brandt, Jochen, Archäologisches Museum Hamburg/Helmsmuseum, Hamburg, Germany

Co-author(s) - Dr. Brandt, Jochen, Archäologisches Museum Hamburg/Helmsmuseum, Hamburg, Germany

Co-author(s) - Dr. Sikora, Jerzy, Institute of Archaeology University of Lodz, Lodz, Poland

Keywords: Carolingian Border, ceramics, dendrochronology

Presentation Preference - Oral

The stronghold „Alte Burg“ near the village of Hollenstedt is an Early Medieval fortification, which was long-interpreted as the place where Charlemagne met representatives of the Danish king Godofrid in AD 804. It was partly destroyed and then excavated in the late 1960s and 1970s. Since that time there is no consensus about the dating and the related interpretation of the site, which is ranging between the early 9th and 10th c. AD. This question is of major importance not only for the historical interpretation of the site but especially for the understanding of the ceramic finds. The excavations at Hollenstedt revealed a unique complex of pottery showing both Saxonian and Slavonic influences. The solution to the dating problem can establish Hollenstedt as a reference site for those “hybrid” ceramics. In autumn 2014 recent research including excavation and geophysical prospection provided new data that are presented in the paper. They prove the erection of the fortification not earlier than in the late 9th c. AD. Moreover, the data require a re-interpretation of the whole situation, described with the passage „... in loco, qui dicitur Holdunsteti“ in the Royal Frankish Annals in 804 AD.
Spatial analysis of the system of fortifications of the Iron Age hillforts Dyakovo culture

Author: Chaukin, Sergey, Institute of Archaeology Russian Academy of Sciences, Moscow, Russian Federation (Presenting author)

Keywords: hillforts, iron age, spatial analysis

The study deals with the sites of the early Iron Age in the area between the Oka and Volga (East European Plain). This area was inhabited by tribes of the so-called Dyakovo culture. The remains of the fortifications of these settlements are the ramparts and ditches located on the residential area and the perimeter of the scarp - construction settlements on the slopes. Number of lines of fortifications on each settlement varies. Usually it is 1-3 shaft and ditch. With the help of GIS analysis to determine the spatial patterns of the fortifications on the location of the ancient city. This study is to determine the functionality of the ramparts and moats, define local cultural centers. The research considered the organization of space in the settlements Dyakovo culture from the 8th century BC to the 7th century AD. The beginning of D'yakovo culture hill-forts dated to the end of sub-boreal climatic period which is characterized by climate cooling, compared with the previous, and the change of deciduous forests with fir. This period continuous to 500's BC and covers the first phase of life in the hill-fort. Next climatic period Subatlantic characterized by even more cooling and moistening climate. It is falls on top of the second and third stages of life on the hill-forts. All settlements were divided into three layers corresponding chronological periodization. Stage 1 - 8th century BC - 6th century BC; stage 2 - 5th century BC - 2nd century BC; stage 3 – 1st century - 7th century AD.
Keywords: Bronze Age Cairns, Gotland, Ritual Practice

There are over a thousand cairns on Gotland that has been discussed as burial sites belonging to the Bronze Age and around 200 of these have monumental dimensions, ranging from 20 to 50 meter in diameter and 2.5-7 meter high. Only a few of these structures have been partly excavated and only one have so far been totally excavated with archaeological scientifically methods. These cairns have so far only been discussed as burial sites but due to our recent archaeological excavations in relation to three of the largest cairn environments on Gotland (Uggarring, Örga and Hägrö) and re-examination of the material excavated at Kaupanger new knowledge about these places have been generated. Our investigations show that these monuments go beyond the function as only burial sites. This paper present a new approach to analyse and discuss the ritual practices indicated by our recent excavation at these sites that allow us to understand them both as burial and ritual sites in a changing physical and spiritual environment during several thousand years.

TH4-04 Abstract 03
Patterns or randomness? Contextualising Estonian Bronze Age bronze stray finds on the landscape

Author - Paavel, Kristina, University of Tartu, Tartu, Estonia (Presenting author)
Presentation Preference - Oral

From Estonia, most large Bronze Age (1800–500 BC) metal items such as axes and spearheads have been found from non-settlement, non-burial context as single stray finds. In contrast, bronze finds from settlements and burial sites are small and of personal nature - tweezers, razors or clothing-related items such as buttons. The connection of stray bronze finds with coeval settlement sites has been assumed on a few occasions. A couple of items have been associated with possible deposition in water bodies. The possibility of these stray finds being deliberate depositions on the landscape, as identified in large parts of Europe, including the Baltics, has until now been systematically unexplored. This phenomenon has been interpreted from different perspectives: sacrifice, conspicuous consumption, mundane safe-keeping, memory practice and the removal of valuables or objects with powerful life-histories from circulation. Seeking patterns in Estonian material required characterising the original deposition environments of individual find locations. To do so, I combined archive materials, topography, shore displacement data and information on soil properties. The results point to observable patterns in artefact distribution, with a preference for water bodies, wetlands and slopes. This implies not random losses, but wilful deposition activity.

TH4-04 Abstract 04
Digital re-construction of a Bronze Age stone wall enclosure and the landscape at Lina Mire, Gotland

Author - Associate Prof. Wallin, Paul, Uppsala Universitet, Uppsala, Sweden (Presenting author)
Co-author(s) - Martinsson-Wallin, Helene, Uppsala Universitet, Uppsala, Sweden
Co-author(s) - Wahlin, Joakim, Dalarnas Museum, Falun, Sweden
Co-author(s) - Sandelin, Anders, Sandelin Animation, Stockholm, Sweden

Keywords: Bronze Age, Re-construction, Wall enclosure

Presentation Preference - Oral

The aim of the project was to digitally re-constrcut the stone wall enclosure at Gothemshammar and to understand its location in the surrounding landscape. Excavations into the feature uncovered its internal construction details, as well as, datable materials from domestic animals and charcoal. Fifteen AMS dates gave a clear and somewhat unexpected age of the structure to the mid Bronze Age ca. 1000–700 BC. The northern end of the wall is to be found at the end of a steep cliff, and since the southern end of the wall ended in an open slightly slanting terrain it suggested that it might have ended at the sea level when built to demarcate a point in the landscape. We therefore reconstructed the water level using LiDAR data indicating that the former sea level at mid Bronze Age could be set at about 10 m above the current sea level in this area. To place the wall enclosure in its Bronze Age context we also plotted other features tied to the same time, such as stone ship settings, cairns, other wall enclosures, and known hoards into the re-constructed landscape. It then became quite evident that points, small islands, and the coastal locations was of great importance for the location of these monuments and that Lina mire must have been an important ‘port’ for Bronze age communications, internal as well as external, and Gothemshammar was strategically located at the entrance of this water system.

TH4-04 Abstract 05
Between Social Dynamics and Cultural Constancy, Case Study of the Trzciniec Culture

Author - PhD student, Agne, Zilinskaite, Vilnius University, Vilnius, Lithuania (Presenting author)
Keywords: Bronze Age, pottery, Trzciniec Culture

Presentation Preference - Oral

The appearance of the Trzciniec Culture (Trzciniec Cultural Cycle) in Lithuania and its role in the formation process of Bronze Age cultures is still a controversial question at the present stage of research. The investigation of this culture started only a few decades ago even though Trzciniec culture artefacts have been found in Lithuania for a long time. The archaeological material of this culture is known from almost 20 sites in current Lithuanian territory. Individual pots, clusters of potsherds and talisman artifacts are usually found on these long-term lived sites. The ornamental motifs on the pottery in all the groups of Trzciniec Culture are the most important criterion for identification. However, the conspicuous influence of neighboring simultaneous cultures can be seen in this pottery. Its background was no doubt Globular Amphora and Corded Ware Cultures with influences of the Narva and Nemunas Cultures in Lithuania.

There are more individual sites which scattered over the northern area far from the main Trzciniec Culture territory (Lithuania, Latvia, Kalingrad district). One may reasonably ask how these finds should be evaluated as ‘islands’ of Trzciniec culture (1), as a reason to include Lithuania in the Trzciniec culture’s range (2) or as the result of the influence or penetration of cultures linked to this culture (3). Therefore, the Trzciniec culture in Lithuania’s territory could be treated as one of the most influential phenomena of the Middle Bronze Age. This paper analyses various aspects of the concept and chronology of the culture and presents a history of the research in the culture’s territory. Priority is given to archaeological pottery, the main indicator for cultural identification. In addition, this paper analyses the Bronze Age cultural situation in the Eastern Baltic region and raises the question of whether the Trzciniec culture existed in Lithuania and in what form.

TH4-04 Abstract 06
Coastal and northern Lithuania in the Late Bronze Age – communication networks and interactions

Author - Assoc. prof. Merkevičius, Algimantas, Vilnius University, Vilnius, Lithuania (Presenting author)
Keywords: Bronze Age, cultural contacts, materiality

Presentation Preference - Oral

The Late Bronze Age, from around 1200 BC, was a time of significant cultural changes in Lithuania and in the whole Eastern Baltic Region, especially in the coastal zone and around Daugava River. A new culture elements, such as some type of graves, pre-Celtic fields, cup-marked stones, stone enclosures, metal artefacts (Mair type axes, miniature daggers and others) shows contacts and interactions in the Baltic sea Region. Some of new culture elements are the result of external influences from coastal zones of the western and southern Baltics. Distribution of new type of sites and artefacts suggests communication networks in the Baltic sea Region. One of the trade route was established at the beginning of the first millennium BC and functioned between central Sweden, Gotland, east Baltic Region (Daugava route) and northeast Russia in the first half of the first millennium BC.

The aim of the paper is to discuss communication networks and nature and scale of interactions in the Baltic Sea Region in the Late Bronze Age.

---

TH4-04 Abstract 07
Materialised and non-materialised contacts in Bronze-Age Eastern Baltic

Author - Professor Lang, Valler, University of Tartu, Tartu, Estonia (Presenting author)
Keywords: Bronze Age, Finno-Baltic contacts, long-distance contacts

Presentation Preference - Oral

Archaeology as an academic discipline studying material culture can easily follow contacts between people from different regions if some evidence has been left behind – usually something material which can be studied by scientific means. There are numerous examples of bronze artefacts found, for instance, in what is today Estonia that demonstrate long-distance contacts with the mid-Volga region, the Caucasus, Scandinavia, etc. We know about these contacts because of some materialised witnesses. There is no doubt that each item of foreign origin must be carefully studied in order to avoid the trap of a novice detective – everything that seems evident at first sight need not be true. The presentation will discuss several artefacts with the purpose of analysing the probable nature of contacts that yielded those items.
It seems rather plausible that the fortifications, iron (battle)axes, and shepherd’s crook pins reflect different aspects of the same process, which most likely involved troubled times and even some military impact. It is likely that some groups of invaders of Indo-European or Baltic-Slavic origin may have infiltrated into the Finnic population during this process.

TH4-04 Abstract 10
Crown Torque from Jamlitz
Author: Vorotinskaya, Larissa, The State Hermitage Museum, St.Petersburg, Russian Federation (Presenting author)
Keywords: Germany, Kronenhalerzinge, spectral analysis
Presentation Preference - Poster

The State Hermitage keeps the crown torque from Jamlitz, U.Kre. Besekow, north-eastern Germany. It had been found by accident while plowing a field, then bought in 1925, and subsequently kept by the Berlin Museum (Staatliche Musee zu Berlin Nr II 10965).

Today, the torque is one of the so-called Kronenhalerzinge, mainly found in Denmark and Northern Germany. The few findings of such crown torques are known to have been made in Poland, Romania and Ukraine. An accumulation of at least seven items was discovered in the area of Lesiuk and Grabyia villages in Podolesy, Chernigov Region. Nearly in all cases, the findings were made in swampy areas and were apparently of votive nature. Apparently, these items belong to the German Jastorf Culture that existed in Northern Germany and Denmark. In Eastern Europe, such findings are probably due to the relocation of the Germans to the east.

The Jamilt crown torque is type IV according to Jochens Brandt’s classification and probably dates back to Step C1 according to M. Shchukin (i.e. the last quarter of the 3rd century BC – first half of the 2nd century BC). According to Bjorn Rauchfuss, the torque belongs to shape 2: Crown torques with an oval, almost quadrangular cross-section.

Parts of the Jamilt crown and the pivot pin were cast from wax models. The hole for the pin was made in the wax model and subsequently refined on castings. The casting was followed by further finishing. Obviously, this torque was originally defective, since the lock does not close, and parts of the lock are poorly fit to each other. The torque opens up and cannot be used for its designated purpose. This is characteristic of the Jamilt torque. Similar items from Podolesy close perfectly, and the lock keeps the parts of the ring together.

The Department for Scientific and Technical Examination at the State Hermitage carried out spectral analysis of the Jamilt crown torque’s metal using a Bruker ArtAX™ X-ray fluorescence spectrometer. The torque is made of tin bronze with a considerable admixture of lead.

This data is consistent with that of the analysis of the crown torques from Zalesyé (Ternopol Region, Ukraine), Lochstedt (Pavlovka, Kalinin Region) and Mecklenburg, with the ratio between the main elements used in the metal alloy (copper; tin and lead) varying to a rather large degree.

TH4-04 Abstract 11
The Early Roman Iron Age site at Ellinmiittu, Rauma Finland
Author: PhD Uotila, Kari, Muuritutkimus, Kaarina, Finland (Presenting author)
Keywords: digital documentation, early Roman, iron finds
Presentation Preference - Poster

During the years 201-2015 of field studies both ground-penetrating radar and aerial photographing with a drone were tested. Documenting of the caimns was mostly done with laser scanning technique. This is the largest 3D-documented Early Roman Iron Age site in Finland.

The site was 3.5 hectares and it was surveyed in several phases. New caimns were found from the forested terrain during each phase of the last phase of the excavation the whole hill was opened with a digger, which revealed about 250 caimns. Based on this data the total amount of caimns can be estimated to have been about 300 and about 200 of these have been male buried. From between the stone mounds a concentration of over 2500 morto-pottery shards was found. This has been interpreted as a part of a burial or a settlement site. In this area also pieces of burned bone were excavated. From them bones of fish, seal and one bone from either a sheep or a goat were identified. Macroscale analysis revealed seeds of barley and wheat.

The most surprising finds were two iron bracelets, two pieces from iron knives and two small pieces of iron. These were all found from a caimn located at the highest outcrop of rock in the area. The caimn was covered with red sandstone slabs. There was also another caimn which was covered with sandstone slabs in the area but it revealed no finds. The iron bracelets are a very rare find from an Early Roman Iron Age site in Finland and they suggest connections to the Baltic region.
Tarand graves spread in Estonia and around the Baltic Sea during Early Iron Age (500 BC – AD 450). This grave type was the most preferred one during a long time in the area of nowadays Estonia. The overall type of grave changed only slightly during these centuries, but the exact construction and contents of the grave varied regionally as well as temporally. Nevertheless, aside the differences, there are numerous similarities that allow the researchers to group the graves and see their evolution through time centuries, but the exact construction and contents of the grave varied regionally as well as temporally. Nevertheless, aside the differences, there are numerous similarities that allow the researchers to group the graves and see their evolution through time.

Tarand graves were not chosen randomly. The selection of grave sites was influenced by both internal and external factors of the Early Iron Age society. The graves were located in areas that were significant for the local community, such as near important settlement sites or along significant routes.

The poster will concentrate on a handful of case studies of Pre-Roman Age tarand graves and intends to map the influences and trends that have lead the mourners to build these monuments, bury their dead either cremated or inhumed, and to choose and place the items suitable for the grave.
In Holy on Lolland, a chieftain's grave from the Early Roman Iron Age was found in 1920. The grave is one of the richest dating back to this period from Northern Europe. In 1999, pottery and black soil were observed in the area NW of this rich grave, and mini excavations in the following years revealed a settlement from the same period as the richest graves in the area. In the period from 2010 to 2015, larger excavations have been carried out in the settlement and activity area. These investigations have been carried out in collaboration with the Museum Lolland-Falster, Center for Baltic and Scandinavian Archaeology (ZBSA), and the National Museum.

The settlement and activity area cover an area about 100x150 meters (328x492 feet), and about a third of this area has been excavated up until now. On larger parts of the Holy settlement, culture layer is preserved in a thickness of up to 0.6 meters (1.9 feet). It contains large amount of pottery and preserved animal bones besides the remains of clay floors. The preliminary studies show that the building at Hoby represents a larger community/village. The long houses are located in EW rows. To the North, the settlement is bordered by an activity area with a large water-filled pit surrounded by numerous smaller pits, deposited bone mounds and ashes. The activity area and the house constructions are contemporaneous. In this paper, the settlement will be presented, and the current state of our research concerning settlement structure, economy, and cultural perspectives will be presented. Finally, the results are compared to some of the contemporary settlements from current Danish territory.

TH4-05 Abstract 03
Rosenholmejv a central site in Middle Jutland
Author - Olsen, Martin, Winther, Museum Midtjylland, Herning, Denmark (Presenting author)
Keywords: Central settlement, Lübsowgraves
Presentation Preference - Oral

Central settlement and hinterland—life and death in the 1 Century AD. A complex of rich graves, farms and villages. In the central part of Jutland.

Museum Midtjylland has excavated a number of sites that all relate to an extraordinary rich site, Rosenholmejv. This central site is a settlement that covers most of the period from 500 BC through 200 AD, but with a "highlight" in period B1a. At this time a grave yard is constructed which includes a number of extraordinary rich graves with gravegoods and constructions that place them in the upper class.

It links them to other regional groups in Denmark, Europe and to the political turbulence we see in those years. At the same time, this group of people expresses their status in the construction of a "famstead" that is in every respect extraordinary, with features that both illustrate their social, regional and international status.

Additionally, we do have a number of sites in the “hinterland”, some are excavated and others known through geophysical surveys. This group includes both settlements as well as graveyards. Hereby we get an insight into an organization that is highly synchronized.

TH4-05 Abstract 04
Studying the Iron Age Settlements in Lithuania: Current Issues and Future Directions
Author - Dr. Vengalis, Rokas, Lithuanian History Institute, Vilnius, Lithuania (Presenting author)
Keywords: prehistoric settlements, settlement pattern, survey
Presentation Preference - Oral

The research of the iron Age in Lithuania (which is dated to the 1st millennium A.D. according to the periodization of this region) was focused only on the ethno-history for a long time and that was the reason why the attention of archaeologists was directed to the studies of the burial sites. Because of such trend we could say very little about communities of that period, except for their ethnicity. There was some knowledge about the social structure, trade directions and ideology as well, but practically there was no information about the subsistence, the economy, settlement patterns and other themes. In recent decades this trend begins to change little by little – researchers begin to take interest in topics which were not analyzed before and at the same time the attention is drawn to the fact that the material which we collected up to now does not allow to analyze the newly emerging issues.

This report presents the research problems concerning Iron Age settlements in Lithuania and provides the examples of how these studies, though still sparse, significantly change the understanding of the these communities.

There is quite a challenge encountered in attempting to analyze the intra-site structure of settlements. For example, for intra-site analysis is faced with problems, such as chronology, pottery typology and its correlation with chronology, identification of buildings, etc. This report presents a sample from the Lübsow settlement which shows that we can obtain valuable data applying new methods by researches. In the material of research from previous decades. The application of spatial analysis shows quite different settlement structure than was thought previously – the settlement was not solid but consisted of segregated farmlands, which changed their location over the course of time. Such data allows to draw some conclusions about the social structure of communities, subsistence, economy etc. and raise further questions for future research. Considering settlement pattern analysis, the main problem is associated with the representativeness of archaeological sites. Until now, no one ever conducted purposeful surveys looking for the settlement sites in Lithuania and only several of such sites were registered. Settlement pattern was basically reconstructed by buried sites, therefore the impression of a very sparse settlement of that period became dominant. The recent survey, which focused on the search for settlement sites in Kernave region, indicated that in fact the situation was quite different. That recent survey showed that the settlement pattern was at least somewhat denser. This now provides for the research of the Iron Age in Lithuania, even though they are still in the initial stage, contribute very significantly to the overall formation of the image of this period, which until now was based essentially only on data from burial sites. In order to achieve tangible results, the whole range of information not limited to certain type of sites must be used.

TH4-05 Abstract 05
An attempt to define ratio of barrow cemetery and settlement site in term of community size
Author - Dr. Strumiatienė, Andra, Lithuanian History Institute, Vilnius, Lithuania (Presenting author)
Keywords: barrow cemetery, rural communities, settlement site
Presentation Preference - Oral

The material culture of the Iron Age represented by the artefacts coming from burial monuments is relatively well known for the archaeologists; however, information on the local communities which left this legacy is rather scarce. One of the main characteristics describing any human community is its size. Usually, the size of the community is identified on the basis of the data derived from the burial monuments. However, there are other methods of establishing the size of the community on the micro-level, as well: for instance, they include area estimates or dwelling-based estimates. In ideal cases, data derived from different sites forming archaeological complexes should be correlated for the demographical analysis.

The region of eastern Lithuania is an area with very frequent occurrence of barrow cemeteries of different size, ranging from one to tens and hundreds of mounds, which suggests (apart from being impacted by destruction) the communities of different size. On the contrary, the number of known settlement sites is rather low. The settlement research is still very fragmented and limited to small-scale excavation producing small and biased samples. At best, only the location of a settlement site can be identified - its approximate location. If going into the national database, it is clear that the majority of the information is chronologically. That site space remains was established for most cases. As a result the ratio of barrow cemeteries and settlement sites has recently been rarely investigated not only in terms of community size, but even how to mutually interpret the overall pattern of evidence.

This presentation attempts to contribute to the issue of estimating the size of rural communities not so much addressing the absolute index, but rather seeking to prompt the comparative studies of data from different types of archaeological sites. To illustrate the approach, the archaeological complexes consisting of a barrow cemetery and a settlement site were distinguished in the Lithuanian Iron Age Barrow Culture and one relatively well preserved and excavated complex was chosen for the further case study. Analytical tasks were as follows: 1) to define the possible extent of the settlement site by combining tradition archaeological methods with geo-archaeological research data and micro-topography; 2) to assess the resultant area against the density coefficient, deriving this coefficient: a) from the data of excavated barrow cemetery, b) from the data of excavated settlement site in term of community size.
The presentation will aim at the analysis of spatial distribution and spatial relation of the hillforts and barrow cemeteries in East Lithuania. The Register of Cultural Properties data with some author's additions, different GIS map layers, LiDAR data, etc. will be used for this. The task of the inquiry will be to search for the regularities in the location of the hillforts and burial sites in respect to each other (e.g. visual contact), their setting on the terrain, water bodies connecting or separating them, etc. It will be attempted to identify agents relating hillforts and barrow cemeteries in the landscape or, vice versa, separating them. Special regard will be paid to those agents which can be considered as attesting to the perceptions of the afterlife and the relations of the worlds of the living and the dead (e.g. being visually connected or "hidden" from each other, separated by water or not, etc.). Such approach is expected to set a background for deeper insights into ideology and cults practiced by the societies which left the above-mentioned sites.

TH4-05 Abstract 07

Searching for links between artefacts from areas of prehistoric dwelling sites and burial grounds

Author – Dr. Banyte Rovell (Rowell), Rasa, Lithuanian Institute of History, Vilnius, Lithuania (Presenting author)

Keywords: burial grounds, dwelling sites, Roman Period

Presentation Preference - Oral

This paper surveys categories of finds that were found in Roman Iron Age dwelling sites and in burial grounds in Lithuania. Grave-goods belong to the sphere of sacrum where property donated for the dead might reflect a distorted picture of reality. Grave-goods are the result of creative activity performed in “real life”. Therefore finds from dwelling sites have great importance for connecting artefacts from burial grounds back to sphere of profanum.

We can seek answers to where the production of tools and ornaments took place. Another interesting question is whether the regional shapes/types of artefacts, usually placed on maps according a database of burial sites are distributed in a similar way in the settlement pattern of the same territory. Such a comparison raises the question of whether regional ornament styles were created under the influence of the regional taste of several artisans of a particular region and that process reflects the existence of a regional identity. Or perhaps these regional features had a more practical origin – the distribution of particular types in particular regions was outcome of network of trade and range of influence of production centres on the market.

West Lithuania was an area where Roman coins were placed in graves during the Late Roman period (end of phase C1a – phase C1b). This tradition testifies to the importance of the Lithuanian coastland for the maintenance of far-flung contacts with the Roman provinces. It is interesting that Roman coins have been found in the cultural layers of hillforts and settlements in Žemaitija and Central, Southern and Eastern Lithuania while the tradition of placing Roman coins in burials is almost absent. The latter finds testify to the circulation of Roman coins in all regions of Lithuania and such finds in dwelling sites leads us to consider their function in everyday life. Roman Iron Age finds in dwelling sites in Eastern Lithuania have especial importance because the database of burial sites from this period is still small. They reflect the fact that Eastern Lithuania, despite its location in the Baltic hinterland, was a region where various cultural influences from neighbouring areas and the European Barbaricum made an impression upon local traditions.

Summarising, it is possible to state that a comparison of finds from dwelling sites and burial grounds may provide new insights into the prehistory of the Balts during the Roman period. Therefore it is important to integrate the databases originating from the spheres of sacrum and profanum.

TH4-05 Abstract 08

A changing community in north-east Estonia from 400 BC to 900 AD

Author - PhD student Olli, Maarja, University of Tartu, Tartu, Estonia (Presenting author)

Presentation Preference - Oral

Aakre Kivivare complex is an interesting archaeological site in north-east Estonia which was settled continuously over 1000 years during the Iron Age. There is a monumental stone grave, at least two settlement sites, a hill-fort with two stages and a possible flat cremation cemetery very near each other from different time periods.

It is possible to study the change of burial customs, cultural and trade contacts as well as pieces of everyday life of the prehistoric community from the Pre-Roman Iron Age until the end of the Viking Age based on the Aakre Kivivare complex. Because most of the sites have been excavated, it can be assumed that the place was the centre of a bigger region during 1000 years. Therefore assumptions of a larger society of the time periods can also be made.

The chronology, characteristics of the monuments as well as items excavated from the sites will be discussed. Based on that, assumptions of the changing identity, religion and cultural and trade contacts of the community will be made.
TH4-06
CULTURAL ENCOUNTERS: PERSPECTIVES ON MOBILITY AND CULTURAL IDENTITIES IN THE BALTIC SEA REGION 4000-2300 BC

Saturday, 3 September 2016, 09:00-13:00
Faculty of Philology, Room K, Donelaitis

Author - Andersson, Anna-Carin, Gothenburg, Sweden (Presenting author)
Co-author(s) - Mazet, Laurent, Saginlandet Lejre, Lejre, Denmark
Co-author(s) - Maciej, Alja, Department of Historical studies, University of Gothenburg, Gothenburg, Sweden

Presentation Preference - Regular session

The mentioned time period in the North-European prehistory is very dynamic, and is acknowledged by three more significant subsistence economies. These economies are generally defined as to relate to different cultural groups and varying social customs: the farming Funnel Beakers, the seal hunting and fishing people of the Pitted Ware Culture, and the cattle herders of the Battle Axe Culture. Local and regional variations of these cultural groups and subsistence economies are present in all countries around the Baltic Sea region during this time period. Issues about the social relations and contacts between these different cultural expressions have for a long time been vividly discussed within archaeology. However, developed archaeogenetic methods and new results from by example strontium isotope and ancient DNA-analyses, have revealed that the mobility among people around the Baltic Sea in prehistory appears to have been more intense than previously thought. What impact does developed archaeological methods and results generate on the traditional interpretations of cultural encounters? How could these results be related to the archaeological material? The issue is important from the perspective that the archaeological knowledge we produce, by necessity also must be open for scientific revision. This session, therefore, aims to explore and discuss developed perspectives that could challenge the traditional interpretations of cultural encounters and borders among cultural groups in the Baltic Sea region during 4000-2300 BC. The presentations in the session may enrich archaeology on a theoretical and methodological level, but will also have the possibility to influence the wider cultural discussions concerning the contemporary constructions of cultural identities in Europe. The outcome of this session may also provide stronger arguments for a necessary understanding of the conditions of the contemporary and multicultural Europe.

TH4-06 Abstract 01
Ski Archaeology or tracking genesis & evolution of mobility technology across Prehistoric Eurasia

Author - MA Mazet, Laurent, Saginlandet Lejre, Lejre, Denmark (Presenting author)

Keywords: Experimental Archaeology, Prehistoric Transport Means, Ski-Mobility-Wood Technology

Presentation Preference - Oral

May Ski Archaeology contribute to clarify the emergence of transport technology, and to map Post-Glacial migrations across Eurasia?
The evidence of mobility in Post-Glacial northern Europe and Asia is well established. More than 200 ski, pole, sled, canoe findings and rock carving motives, strew the Eurasian continent from Northern England to Eastern Siberia. Recently, archaeogenetics begin to throw new light on Upper Paleolithic, Mesolithic & Early Neolithic migration waves and ways within Eurasia and across the Bering Sound. All things considered, the dispersion of akin artifacts does not only questions the mobility of flint, antler and bones tools, but also the early development of durable (but perishable) woodwork transport means, for hunters-gatherers or early nomadic herders and their survival equipment, through new landscapes to adapt.

Trails & skis, dugout canoes & grooved runners, skis & boxes, early backpacks & later coracles, rafts & early wheeled cars... many are examples of technological kinship, finding alter egos in vehicles or dwelling shapes, recorded by subarctic ethnographies across three continents: fur-shot skis, snow shoes & bark canoes, sledges & toboggans, transportable tents & seasonal hulls. In use over the very long term, they all descend from the same shaping of a piece of wood, thinner or lighter, bent and adapted to transitional displacement by human (or animal) propulsion. Beyond the revision of ancient ski' typology, this research aims to reconsider the emergence and track the developments of Post-Glacial mobility technology, linking material & cognitive resources, functionality & former geography. Experimental reconstructions, emphasizing “archaic” woodworking processes - chains operations - , and comparison to archaeological evidence and craft traditions, may contribute to sketch a “techno-genetic” family tree for these Prehistoric vehicles, through chronology and geography.

TH4-06 Abstract 02
The affect of Landscape Scale Forcing Factors on the Earliest Neolithization in the Baltic Basin

Author - Troskosky, Christopher, University at Buffalo, Cheektowaga, United States of America (Presenting author)

Keywords: Climate Change, Cultural Interaction, Neolithization

Presentation Preference - Oral

Understanding the underlying mechanisms for the “Agriculturalization” of Mesolithic Hunter Gatherer cultural groups has long been one of the great problems to be solved in Northern European Neolithic studies. This problem is especially difficult to deconstruct in the Baltic Region where traditional explanations of migration, diffusion, leasing and demographic pressures break down in the face of exceptionally slow temporal development of the Neolithization Paradigm Shift in culture across relatively small geographical distances.

In this paper a modification is made to Marek Zvelebil’s Homo habitus model, were used to verify the hypothesis that for the case of the formation of the Funnelbeaker (TRB) on the Kajavian Plain the substitution phase of agricultural adoption is short relative to the phases of agricultural availability and agricultural consolidation because it was triggered by landscape level forcing events of various intensities and durations.

Furthermore it is posited that the contemporary dissolution of the Lengyel complex in the region resulted from greater affect due to culturally specific vulnerabilities with respect to these forcing factors than their hunter-gatherer contemporaries. This can be seen in the distribution of intercultural agency markers in the material culture and settlement systems of the local TRB fusion group composed of a mix of the remnants of the Lengyel complex and neolithized hunter gatherers.

TH4-06 Abstract 03
Neolithic Cultural Encounters in the Territory of the South Lithuania (4200-2000 BC)

Author - Marcinknieciūtė, Eglė, Vilnius University, Vilnius, Lithuania (Presenting author)

Keywords: cultural encounters, Neolithic hunter-gatherers, South Lithuania

Presentation Preference - Oral

Till the end of 20th century southeastern part of the Baltic region was interpreted as periphery of the neolithisation centers in Central and Western Europe. Neolithisation also Indo-Europeanization process was explained by Late Neolithic colonization of Corded Ware Culture (Battle Axe Culture) warriors, who assimilated autochthonous hunter-gatherers.

Archaeological and multidisciplinary research over the last 15 years denied the approach of dynamic evolution, revealed intensive mobility and interaction among various societies of hunter-gatherers and farmers. In the territory of the South Lithuania cultural encounters appear to have been the most intensive. Favorable geographical conditions and raw find found in a surface of the area caused an emergence of numerous smaller settlements of hunters-gatherers. Archaeological material of Dubičiai, Nemunėlis, Navia and maybe Comb-Ware cultures also pottery of Funnel Beakers, Globular Amphora, Corded Ware cultures was found in this territory. The most of the sites were settled in a sandy soil which is unfavorable for preservation of organic materials, also flint artifacts of different chronological complexes are mixed in this kind of environment. Nevertheless, by applying paleo-geographical environment reconstruction, spatial-statistical analyses and correlating data of radiocarbon analysis, research of landscape micro-topographical, floral and faunal features as well as ethno-archaeological and experimental archaeological patterns, it is possible to extract and date different complexes, define activities of subsistence economy and behavior of the societies.

TH4-06 Abstract 04
Pottery traditions and cultural processes in the Gulf of Finland region in the 3 mil. BC

Author - Postgraduate Khokhina, Margarita, Saint-Petersburg State University, Saint-Petersburg, Russian Federation (Presenting author)

Keywords: Gulf of Finland region, late Neolithic - Early Metal Period, Pottery

Presentation Preference - Oral

The eastern part of the Gulf of Finland region is rather important for the study of cultural and historical processes of the end of IV - III millennium BC. This territory from the ancient time was located in a contact zone among the areas of different archaeological cultures and pottery traditions. During the mentioned period, which in Russia is usually called the Early Metal Period (EMP), bearers of Comb and Corded Ware pottery traditions coexisted here. The area was peripheral for the both of them. Current study is devoted to the reconstruction of cultural and historical processes, reflected in ceramic material. Among the sources of the study there were fragments of more than 200 vessels from 36 archaeological sites from the eastern part of the Gulf of Finland region.
Comb Ware pottery tradition is deeply rooted in the local Neolithic. As a result of coexistence with groups of population from some closed regions new components appear within this tradition. Among them the temper of sediments concerned with this walls of the vessels and shallow ornamentation, typical for Karelia and southeastern Finland. Another component is organic temper (leather with shield) and mostly comb ornamentation which is most probably characteristic for the upper Volga region. Intensification of contacts during the EMF resulted in a variety of Comb Ware tradition - and the relative ease and speed of the spread of these it’s an evidence of probable relativity of their bearers.

In the III millennium BC Corded Ware tradition appears in the eastern part of the Gulf of Finland region. It also seems not to be homogenous. There are some “typical” vessels, which have a wide range of analogies in Eastern Baltic and even in so-called “A-horizon”. At the same time there are some “hybridous” vessels, that have some features of Comb Ware: imprints of comb stamp and pits, decorated and cut inside rim. This is probably the case when Corded Ware tradition was influenced by the local one - and this can be seen in exterior imitation on the vessels.

When it is worth to mention that different variants of Comb Ware tradition are very closed to each other in one of most conservative aspect of the pottery tradition - in modelling of the vessels. They are almost all formed by coiling technique. At the same time, vessels made in Corded Ware tradition are modelled from small separate patches of clay. The difference of the two points of view on the same objects proves the fact that Corded Ware was just slightly influenced by the Comb one - so we can conclude that groups of people, bearers of these traditions, did not have such closed contacts as those of Comb Ware.

Three Anthropomorphic Clay Figurines from Vantaa Jokiniemi, S. Finland
Author: MA Fast, Jan, University of Helsinki, Espoo, Finland (Presenting author)
Keywords: Bateic Sea region, Comb Ceramic Culture, Settlement interaction
Presentation Preference - Oral

In July of 1990 an extremely detailed and realistic head torso of an anthropomorphic clay figurine was found during excavations conducted by Heureka the Finnish Science Centre at the large stone-age dwelling site in Jokiniemi, Vantaa, S. mainland Finland. The settlements of the Waldburg type and the origin of Primorskaya Culture

Author: Dr. Zaltman, Edvin, Archeology Institute of Russian Academy of sciences, Kaliningrad, Russian Federation (Presenting author)
Keywords: Corded Ware Culture, Primorskaya Culture, Settlement archeology
Presentation Preference - Poster

The questions, related to the genesis of Primorskaya Corded Ware Culture, still remain the most difficult and complicated. It is ultimately determined by the lack of research in some regions.

The archeological research, started in the 90s of the XX century, allowed us to define a particular group of settlements on the coast of the Vistula Bay (Pribrezhnoye, Ushakovoye 1-5) – the settlements of the Waldburg type. Their equipment greatly differs from the previously known Primorskaya Culture complexes.

Unlike many other Primorskaya Culture settlements, the remains of the deepened up to 8 m into the subsoil and up to 35 m at length constructions are preserved in Pribrezhnoye. The main part of the eighteen C-14 datings, obtained from charcoal, bones, and hazelnut shell found in the lower and the upper levels of construction, corresponds with the interval 3100-2900 BC.

These datings do not comply with the traditional concepts of Primorskaya Culture existence as it coincides with phase III of GAC. The ceramic complex accentuates the peculiarity of the monument even more. Different kinds of wide-mouthed pots with small bottoms and ear-like handles developed here instead of one of the most widespread pottery forms Wilstavistiltöpfchen, which can’t be found in this monument. The amphorae are remarkable for the oval shape of the neck. The amount of the beakers does not exceed the average 5-5%. The main cultural complex of the settlements Ushakovoye-3 and Ushakovoye-2, which are situated 8 km to the south of Pribrezhnoye, belongs to the post-classical phase. In accordance with the radiocarbon data, obtained from the charcoal of the upper and the middle parts of the cultural layer, the monuments existed in the interval 2400-2200/2100 BC (post-classical phase). As a whole, ceramic forms and the ornamentation had transformed into widespread forms from adjoining territories, though some ware types, inherited from the previous periods, preserved.

Wood and charcoal from the lower layer in Usakovo-3 showed the interval 2850-2700 BC. The majority of the pottery types repeat the ceramic forms from the lower level of the constructions in Pribrezhnoye. A complete identity can also be found in the technology. The ornamentation is represented by cord semi-ovales, triangles and waves. The prevailing type of the ornament is the combination of simple horizontal cord imprints and pits or dimples.

Thus, taking into account the striking peculiarity of the local cultural complex and the early C-14 datings, we can assume the existence of the protophase in the development of Primorskaya Culture, which theoretically refers to the period 3100-2900 BC. We can assume, that the original impulse came from GAC, though the main forms of wide-mouthed pots and boat-shaped vessels are most likely related to Corden Culture.

Peculiarities of the household constructions, ceramic complex, and material culture as a whole differ fundamentally from the antiquity of CWC. The cultural processes on the coast of the Vistula Bay apparently took their course differently than on the adjoining territories, at least on the initial stage. GAC and Bell-Beaker cultures could play the main role in those processes.

In recent years several programs have been developed and refined to reconstruct individual diets on the basis of stable isotope data, typically in terms of consumption of two or more isotopically distinct food groups. Instead of simply looking for statistically significant patterns in human stable isotope values, therefore, we may attempt to test whether food consumption patterns varied over time, geographically, between sexes or age groups, according to mortuary ritual, within an individual's lifetime, etc. Such attempts often meet with scepticism because they require the relevant food groups to be defined, and appropriate values applied to parameters that cannot be measured directly, such as fractionation between diet and human isotope values. The identification of human groups for comparison (e.g. defining appropriate regional or chronological samples) is also subjective. Rather than ignore these questions, we investigate how sensitive our interpretations are to factors such as the software and parameter values used, periodisation, sample size, and statistical testing criteria. We use new and previously published isotopic results from prehistoric burials at Lake Burgteik, Latvia, to show which of the informed choices we have to make have the greatest impact on the final narrative.

Mesolithic diversity in the Baltic region
Author - Dr. Eriksson, Gunila, Archaeological Research Laboratory, Stockholm University, Stockholm, Sweden (Presenting author)
Co-author(s) - Lidén, Kerstin, Archaeological Research Laboratory, Stockholm University, Stockholm, Sweden
Keywords: Mesolithic, Motala, stable isotopes
Presentation Preference - Oral

Taking the two Mesolithic sites in Motala – Kanaljorden and Strandvägen – as a starting point, stable isotope data from a wide range of Mesolithic sites both east and west of the Baltic Sea will be discussed. The large variability in carbon, nitrogen, sulphur and strontium isotope values reflects not only the diversity in available resources, but also differences in mobility patterns and cultural choices, as well as chronological change.

Keywords: animal bones, stable isotopes, Stone Age
Presentation Preference - Oral

A long-standing systematic archaeological research at the Lake Lubāns valley have revealed the region to be an area with a number of significant Stone Age settlements and burial grounds. So far, 27 Mesolithic and Neolithic sites have been detected, and in 18 of them archaeological excavations have been conducted.

The excavations, starting from mid-20th century up to nowadays have provided a rich and diverse animal bone material from settlements, as well as human burials. However, there have been no previous attempts to approach the material with stable isotope analysis method.

In this paper we present animal bone carbon and nitrogen stable isotope analysis results from different sites and introduce a discussion about the local isotope ecology of the Lake Lubāns valley.

How close is close? Faunal baselines in the Eastern Baltic region
Author - Torv, Mari, University of Tartu, Tartu, Estonia (Presenting author)
Keywords: faunal baseline, hunter-gatherers, Eastern Baltic, stable carbon and nitrogen isotopes
Presentation Preference - Oral

Stable isotope analysis of carbon (13C) and nitrogen (15N) of human and faunal bone collagen from archaeological contexts is an established method to address questions of past diets, and mobility patterns. In the context of the Estonian Stone Age, only human bone collagen has been systematically targeted for stable isotope analysis. However, to comprehend and analyse the isotope ratios of human bone collagen of any particular site in detail, it is important to know faunal isotopic composition to provide a relevant isotopic baseline. It is not a novel statement, but the question of “how close is close enough” still remains.

In the paper I will examine both the spatial and temporal requirements for a faunal baseline. The theoretical discussion will be complemented by examples from my own research on Estonian hunter-gatherers and published data from other hunter-gatherer sites in the Eastern Baltic.

The freshwater shell midden at Rynņukalns, at the outlet of Lake Burtmaņai in northern Latvia, is a regionally unique site type, which apparently reflects the intensive use of local freshwater resources in the late 4th millennium cal BC. Dietary stable isotopes in bone collagen from the crania of 3 individuals buried in the midden, and also from 4 individuals dated to this period at the nearby Zvīņki cemetery, suggest that adult diets were dominated by freshwater species to an extent not seen previously, and that forest and especially coastal resources were relatively insignificant, by comparison with the preceding periods. Incremental sampling of dentine can provide a record of diet at a much finer temporal resolution than bone, however, and we are therefore sampling the molars of one Rynņukalns individual to see whether it is possible to detect changes of diet and even of residence, at the quasi-annual scale permitted by this method. This approach may also allow the estimated date of death to be refined, as the radiocarbon age of collagen with a more terrestrial or marine isotopic signature will be less affected by dietary reservoir effects.

Incremental sampling of dentine is also employed to the study of the human molar from Riņņukalns individual to see whether it is possible to detect changes of diet and even of residence, at the quasi-annual scale permitted by this method. This approach may also allow the estimated date of death to be refined, as the radiocarbon age of collagen with a more terrestrial or marine isotopic signature will be less affected by dietary reservoir effects.

The last decade saw increasing progress in the analysis of human remains by archaeometric methods. Here we present results of systematic stable isotope (13C/15N) studies on Stone Age human remains from northern Central and Eastern Europe. The individuals cover the time period from the Preboreal to the Subboreal (c. 9500 to 2000 calBC).

By determining information on the diet of the sampled individuals and linking it to chronological information, the data set sheds light on changes in subsistence economy in the background of cultural developments and absolute chronology. The results of the isotope analyses show a considerable consumption of fresh water resources during the Mesolithic and (early) Neolithic. It is interesting to notice that a major shift towards farming economy in northern Central Europe is visible not before the 3rd millennium calBC.

Presentation Preference - Oral

This paper is a critical evaluation of zooarchaeological, microscopic, palynological and archaeological data and their earlier interpretation in Lithuania, which served as the basis for constructing the concept of pre-Neolithic or Subneolithic low intensity agriculture and/or animal husbandry in the Eastern Baltic region. In addition, the paper presents the first direct AMS dates on remains of domestic plants and bones of domestic animals found in the Lithuanian Subneolithic and Neolithic settlements. According to the latest research, the substantial part of, or even the whole of the earlier “evidence” was wrongly forged because of the mistakes in the identification of plant and animal species and imprecise dating. The mistakes in dating were largely due to the ignorance of water reservoir effect when dating bulk samples of lacustrine sediments, re-identification of the impacts of bioturbation and palimpsest on the formation of archaeological strata, and low attention paid to stratigraphic and spatial documentation during very extensive excavations carried out in the second half of the 20th century. So far, there is no reliable evidence that domestic plants and animals were adopted in Lithuania prior to the appearance of the Globular Amphora and Corded Ware cultures in 3200/2700 cal BC. However, that does not mean that new evidence cannot be obtained in the future, if direct AMS dating of plant and animal remains from Subneolithic contexts is to be continued, and if systematic macrobotanical analyses would eventually be made on samples from settlements in higher elevations, and not only from lakeside settlements and fishings sites.

TH4-07 Abstract 08
Zedmar Culture in the Light of 14C dates - Relating to Sub- and Neolithic Cultures in the SE Baltic
Author - Kozicka, Magdalena, Nicolaus Copernicus University in Toruń, Iława, Poland (Presenting author)
Keywords: Bayesian modeling, subneolithic, Zedmar culture
Presentation Preference - Oral

Zedmar Culture ([later: ZC]) is phenomenon which absorbse researchers from one hundred years. In spite of it still is it known not more than a few peat bog sites of mentioned archaeological unit in three areas separated with not very great distances in the Northeastern Poland and in the Kaliningrad Oblast. As of today it seems like the range of the ZC is impossible to determine credible. What is most riveting is to figure out its origins especially due to establish proveniences of pottery making. This is because it seems the ZC was one of those archaeological cultures which mixed ceramic traditions (probably not only them) from both – agricultural and hunter-gatherers-fishers worlds.

To this day there is no 14C radiocarbon dates estimated and published for sites of the ZC. What is more important main groups of it where taken as a series from stratigraphical record from two epomnic sites. This allows to use Bayesian modeling in creating absolute chronology of the ZC. It is worthwhile to mention that there are sets of 14C measurements taken from pottery sherds, which were carried out in different traditions, and they also may be combined in some statistical calculations.

Bayesian statistic have been used in analysing and interpreting radiocarbon data for a quite long time and is quickly developing part of archaeological research. Yet there is many obstacles in correct applying and understanding its results, mainly due to radiocarbon dating disadvantages. In case of the ZC peat bog site’s stratigraphy is also an difficulty. Although after analyzing all of accessible data it is possible to establish a chronology of ZC. Moreover it enable to correlate it with other subneolithic cultures from the Southeast Baltic region (like Narva, Nieman, Pitt-Comb Ware cultures). There are available radiocarbon measurements for all of them however in diversified amount specially depending on a region and ceramic style. It is necessary to consider also the archaelogical impact into the ZC particularly the Funnel Beaker Culture group which seem to be related with the ZC. In the future this problem will be used in the study. Noticeable set of its radiocarbon dates constitutes one of the best backgrunds for joining into discussion for pottery’s origin in the ZC.

TH4-07 Abstract 09
Human occupation of the SE Baltic region: first trends from the middle- upper paleolithic transition
Author - Dr. Dzudzhiha, Olga, Vytegra museum of Nature and History, Kaliningrad Oblast, Russian Federation (Presenting author)
Co-author(s) - Molodkov, Anatoly, Research Laboratory for Quaternary Geochronology, Institute of Geology, Tallinn, Estonia
Keywords: Luminescence Dating (IR-OSL), Middle-Upper Paleolithic, MIS 3
Presentation Preference - Poster

The territory of the south-eastern Baltic region might be described as lying on the margins of the classical Paleolithic world. No Middle and Upper Paleolithic sites have been found so far in this part of Europe, and on the basis of available data the initial habitation of the region has been related to the Bugуль warming or Greenland interstadial sub-stage GI-1a, which began in northern Europe at about 14.7 cal kBP. The recent discovery of traces of human occupation at the Rydano-5 archaeological site (north-eastern part of the Kaliningrad region RF) has made possible a significant revision of our understanding of the early colonization of this territory. The luminescence (IR-OSL) age of the deposits implies that human occupation of the south-eastern Baltic region occurred at least between 50 ka and 44 ka ago, during the first half of MIS 3.

The dates obtained for the culture-bearing horizon place the Ryadino site among the most ancient sites of the transitional period from Middle to Upper Paleolithic in Europe such as Kostenițe 12 (53–52 kka), Khytlyoe 1 (55–48 kka), Weltenburg II (43–45 kka), Galasskostelec (43–42 kka), Kent’s Cavern (44–41 kka), etc. At the same time, the Ryadino site is the most northern (56°01’N) of all those mentioned above. Further north the only sites with slightly younger artefacts are found along the western flank of the northern Urals Mountains: Mamontovaya Kurya (43–40 kka BP) and Zazur’e (39–37 kka BP).

The lithic assemblage of the Ryadino site comprises more than 2000 flints and includes various kinds of tools, but whereas the chronology of the site has been established with confidence, the cultural attribution of the flint assemblage has yet to be identified. In the concerned time period, three groups of assemblages have been assigned to the earliest modern peopling of
Loose human bones from cultural layers at Zamostje 2, central Russia (c.6500–4000 cal BC)

Author: Törö, Mari, University of Tartu, Tartu, Estonia (Presenting author)
Co-author(s): Meadows, John, Center of Baltic and Scandinavian Archaeology, Foundation of the Schleswig-Hol, Schleswig, Germany
Co-author(s): Lozovskaya, Olga, Peter the Great Museum of Anthropology and Ethnography (Kunstkamera), Russian Ac, St. Petersburg, Russian Federation
Co-author(s): Moiseyev, Vyacheslav, Peter the Great Museum of Anthropology and Ethnography (Kunstkamera), Russian Ac, St. Petersburg, Russian Federation

Keywords: loose human bones, radiocarbon dating, stable isotopes, Zamostje, central Russia

Presentation Preference: Poster

Only 18 fragmentary human remains have been identified at Zamostje 2 (c. 6500–4000 cal BC), despite being an exceptionally good condition for organic preservation, and the recovery of millions of animal bones from the five cultural layers. Aside from a woman’s humerus, the human remains are all fragments of the cranium, maxilla, mandible, or isolated teeth, including naturally shed deciduous teeth, representing at least 5 and perhaps as many as 18 individuals, ranging in age from 6 or 7 to mature adult. Two cranial fragments have been dated by radiocarbon to the Late Mesolithic (aceramic) period (p. 6500–5900 cal BC), although one of the dated fragments was found in the Early Neolithic (Upper Volga ceramic) layer. Radiocarbon dating also allowed the measurement of dietary stable isotopes, which suggest only limited consumption of aquatic resources, despite the abundant archeological and archeozoological evidence that fishing was a central element of the Mesolithic subsistence economy, both at Zamostje and at other sites of this period.

One cranial fragment bears clear cutmarks demonstrating deliberate post-mortem removal of soft tissues, possibly in order to use it as a bowl or cup. Isotopically this individual shows no sign of having consumed aquatic species. Without a Mesolithic cemetery at Zamostje, it is unclear whether the culturally modified loose human bone belonged to an atypical individual, or whether the excellent preservation of fish remains and fishing structures gives an exaggerated impression of the importance of aquatic resources at this site.
TH4-08 Abstract 03

The Strong Link in the Chain? Jönköping Castle - a Swedish border fortress with hidden defects

Author: Pettersson, Claes B., Jönköping County Museum, Jönköping, Sweden (Presenting author)

Keyword: Conflict, Fortification, Siege archaeology

Presentation Preference: Oral

In the beginning of the 17th century the vulnerable southern border of Sweden was defended by modern fortresses. While Kalmar and Elfsborg protected the coastline, Jönköping castle should secure the inland routes towards the central parts of the realm. The site was strategically well suited, being a major crossroad with access to waterways.

The castle was originally a Franciscan convent, taken over by the Crown after the Reformation and fortified with walls, dry moats and corner towers. Vastly enlarged and modernized in the first half of the 17th century, this artillery fortress and its outworks covered an area of 10 hectares. From contemporary plans and drawings it is obvious that these defenses were built according to the latest principles in the art of fortification.

However, recent excavations and extensive GPR-mapping of the ruins have given reasons to doubt the battle-worthiness of this major border fortress. While written sources speak of cracks in the masonry and crumbling walls, archaeological observations of insufficient foundations and poor craftsmanship points in the same direction. It is questionable if the castle could have resisted a serious siege. Within lies the paradox of Sweden as a military state – its great ambitions in conflict with limited resources.

TH4-08 Abstract 04

The bastions of Christian 4th

Author: MA Simonsen, Rikke, Copenhagen Museum, Copenhagen V, Denmark (Presenting author)

Keyword: Baltic region, Fortifications

Presentation Preference: Oral

Christian 4th is considered one of the most influential Danish kings. From 1596-1648 he ruled the kingdoms Denmark-Norway, which included the southern part of Sweden and the islands of Gotland and Saaremaa. This gave Christian 4th control of the waterways to the Baltic Sea and a huge profit on the Sound toll – an important factor for the king in fighting for the Baltic Sea dominance and engaging the country in several wars.

Christian 4th made great effort to modernize the fortifications of the realm introducing the bastioned fortification on a big scale. He built more than 30 fortresses and fortified towns within today’s Denmark, Norway, Sweden and Estonia.

This paper wants to look into what concerns influenced the king’s strategy of building fortifications which had a strong focus on the Baltic region. Was the king demonstrating a general plan for the safety of the realm or was he reacting to sudden and changing threats? Many plans were made for building new fortifications and renovating old ones. Why were the plans carried out in some places but changed or given up in others? Were finances, incompetence, enemy threats or international politics responsible for the fate of the fortifications?

TH4-08 Abstract 05

The Early Modern Fortifications of Halmstad

Author: Lena, Bjugnner, Regional Museum Halland, Halmstad, Sweden (Presenting author)

Keyword: early modern, fortifications

Presentation Preference: Oral

Halmstad, situated in the former eastern part of the Danish kingdom, was from the beginning of the early 14th century a simply fortified town built on royal ground. Had a strategic position by the mouth of the river Nissan and the important road that led to the Swedish town Jönköping. Halmstad was also situated in a province that was bounded by Sweden. Several times during the 15th and the beginning of 16th centuries the town was forced to open the gates for the Swedish army. Halmstad was reinforced in the middle of the 16th century and a new fortification was erected between 1588-1605 under the leadership of the Dutch master builder architect Hans van Steenwinkel and after his death in 1601 succeeded by Willem Cornelissen. The layout of the new fortification system made it possible for the Danish king Christian IV to rebuild the town with a renaissance plan after a devastating fire in 1619. The defensive works was reinforced during the following decades. Through the Peace Treaty in Brömsebro 1645 Halmstad and the province of Halland became Swedish. The fortifications were maintained during the end of 17th century but started slowly to dilapidate and was demolished in 1735 by the military.

The first part of the paper will be a short presentation of the early modern fortifications put in the contemporary political situation and exposed position in the two kingdoms (Denmark and Sweden). The second part will present a geomorphological examples from the Danish period. The investigations during the last years have proved that the defensive works had an immediate impact on the medieval townplan in certain areas. Old structures have also been integrated and given new functions. Even if the inhabitants have been better protected the fortifications created practical problems and forced people to change their habits.
Kuressaare was a small fortress – four bastions located at the corners of the medieval fortifications were sufficient for its defenses – but its command was essential to maintain the power on the island and carry out the ambitions of the Baltic Sea hegemony.

The general design of bastion fortifications, which was regular from the beginning and thus well consistent with the ideal of the period, persisted throughout all construction stages of the fortresses. But major and significant changes involved the bastions, particularly their most characteristic parts, their flanks.

Although the core of the defense principle of bastion fortifications – perfect flanking defense – did not change, the methods to achieve it were considerably improved during the 17th century. Archaeological investigation allows us to get a glimpse of what it meant constructionally, and analyze the fortification-theoretical arguments for these costly and labour-consuming undertakings.

The road between Muscovites fortress Ladoga and Swedish fortress Nothberg (former Oreshek) after 1617 was divided into two parts lying in two states. The border was the river Lava. There on a high bank of small river a hillfort appeared in about early 1620s. It had temporary garrison (in 17th century from 20 to 200 persons). In 1657 a significant battle between Swedes and Muscovites was there nearby to hillfort. After the Great Northern War it lost its significance.

The ruins of the hillfort situated near the village Gorodiachev were archaeologically studied. The rampart was built in two periods using some wooden constructions two times. The inside part of the hillfort was practically free of cultural layers. The inside part of the rampart was added with significant earth structures that did not allow the rampart to destroy the hillfort. The problem is in dating. The ceramic material belongs to 16-17th cc. and is connected with local ("Oreshek") tradition of ceramic production; meanwhile some spots of ceramic belong to the medieval period. The issue of dating the hillfort is still open.

Thearcheological investigation allows us to get a glimpse of what the bastions and the hillforts were looking like during the 17th century. The inside part of the hillfort was practically free of cultural layers. The inside part of the rampart was added with significant earth structures that did not allow the rampart to destroy the hillfort. The problem is in dating. The ceramic material belongs to 16-17th cc. and is connected with local ("Oreshek") tradition of ceramic production; meanwhile some spots of ceramic belong to the medieval period. The issue of dating the hillfort is still open.

In the projects of Prussian fortifications in Pomerania different solutions are visible: traditional (casemates for guns in the flanks of bastions in Rügenwałde); modern, French inspired, connected with the activity of Huguenot engineers such as Cayart or Montargues, and the solutions influenced by Scandinavian military architecture (powder magazines in Stettin, similar to those in Copenhagen).

The decision to build a fortress in the first place was a political resolution from the Swedish crown, since Finland was a part of Sweden from the Middle Ages until 1809. The decision was a reaction to a situation created by two ruinous wars in 1700-21 (The Great Northern War) and 1741-43 (The Russo-Swedish War) where Sweden lost easternmost regions along with old fortifications.

remains under the condition of the new main fortress, place d’Armes, was a difficult decision. It had to be in the middle of the Finnish coastline, offering a protected water area for the fleet. Helsinki (Helsinky) and Degerby (Lovisa) were competing with each other, and surprisingly waterways and water areas became one of the issues of discussion. Finally, the architect in front of Helsinki was chosen, and fortification was originally built on six bedrocks isles following a bastion system, which was freely applied according to natural forms of the landscape. With my forthcoming doctoral dissertation, I have been considering what is the footprint of this decision of the location of the fortress in the underwater landscape.

Finally, the architect in front of Helsinki was chosen, and fortification was originally built on six bedrocks isles following a bastion system, which was freely applied according to natural forms of the landscape. With my forthcoming doctoral dissertation, I have been considering what is the footprint of this decision of the location of the fortress in the underwater landscape.

The primary characteristics of siege archaeology are that the remains in question are often from a relatively short period of time and that the events are not frequently documented, and in that case particularly by the victors. In recent years battlefield archaeology has had, at least in Sweden, a major boom, but the archaeology of sieges and siegeworks has been in the shadows. In this paper, we present the siege of the royal castle of Älvsborg 1612 during the Kalmar War, and the archaeology of certain events during this siege.

The royal castle of Älvsborg was of great importance for royal power. It secured the corridor of land that provided the crucial westward passage for Sweden. The castle and its fortifications are strategically located on a cliff at the mouth of the river Göta. The castle is an important and widely known part of Swedish history and is best known for two exceptionally large tributes paid to Prussian-Swedish hostility during the Seven Years’ War. Its last act was the annexation of Swedish Pomerania with Stralsund in 1815.

The main stress in this paper will be on the presentation of the activity of the Prussian side of the conflict, mainly in the area of construction of new permanent fortifications from the last half of 17th century through the first half of the 18th century. This large period is divided into two smaller ones.

During the first, between 1648 and 1720, Prussian activity was focused on securing the Farther Pomerania. Its main city and most important fortress was Kolberg. The bastion fortifications of this city were already built by Swedish forces during the last stage of the Thirty Years’ War, but the Prussians thoroughly rebuilt it during the long modernization between 1656 and 1716. After Kolberg a fortress in Rügenwałde was not planned, but never built. The main achievement of the second period was the modernization of the fortresses at Stettin. It lasted only fifteen years (from 1725 to 1740), but was very intensive, more than half of the Prussian engineering corps was involved in this large construction site. Just as in the previous period, also after 1720, another fortress was considered (in Stargard), but it also was never built. After 1720 the Prussian engineers had to handle the problem of a large number of smaller and weaker fortified complexes in the Hither Pomerania, “inherited” from Sweden, such as cities with bastion fortifications (Wolin, Damm, Cammin in Pommern, Neu Warp, Demmin, Dammgarten and Angarn), or single strongpoints such as scions in Pomeründe, Ankämper Fehr, Beinèmeund and Divenau. Only some of them were modernized (Pomeründe and Ankämer Fehr Schanze) but all of them were preserved until the second half of the 18th century, and even took an active part in the Seven Years’ War.

In the projects of Prussian fortifications in Pomerania different solutions are visible: traditional (casemates for guns in the flanks of bastions in Rügenwałde); modern, French inspired, connected with the activity of Huguenot engineers such as Cayart or Montargues, and the solutions influenced by Scandinavian military architecture (powder magazines in Stettin, similar to those in Copenhagen).
in connection with the Nordic Seven Years War (1563-1570) and the Kalmär War (1611-1613). These wars were two major conflicts between Denmark and Sweden and a result of both countries’ constant rivalry for dominion in the northern region of the Baltic.

Between 2003 and 2006, Gothenburg City Museum conducted a series of excavations at the Älvsborg Castle. The excavations aimed at examining structures belonging to the castle’s early modern fortifications. Some features were revealed, such as a moat, the moat, and the covered way. In addition to these, an extensive assembly of artifacts that can be directly linked to the Danish siege of Älvsborg 1612 was recovered. The artifacts consisted of a range of ordnance, including lead bullets, cannonballs, parts of rifles, fragments of grenades. In connection with the besieging aspect of siege archaeology, the excavations also uncovered remains of a besiegers approach (spj), and mines, and one of the castle’s defenders’ countermines.

During this project it has been possible to link some of the archaeological remains to actual events described in the historical sources therefore strengthening the actual narrative.

TH4-08 Abstract 13

The Outdating of Medieval Fortifications – The Castle of Raseborg and the Town Wall of Vyborg

Author: PhD docent Haggren, Georg, University of Helsinki, Espoo, Finland (Presenting author)
Keywords: Castle, Town wall, Fortifications, Medieval
Presentation Preference: Oral

The castle of Raseborg (Finland) and the town of Vyborg (Russia) both locate on the northern coast of the Gulf of Finland. Raseborg was built in the 1370s by the Swedes and during the next 150 years the castle was gradually enlarged. The town of Vyborg situated close to the eastern border of the Swedish realm and it was continuously threatened by the Russians.

Prior to excavations carried out at Rådhuspladsen in 2011/2012, relatively little was known with certainty about Copenhagen’s former western boundary. What knowledge was available mainly stemmed from cartographic sources and historical references, as well as present day street layout (particularly Vester Voldgade). The first map however was only drawn in 1590, and the first historical references for this area date to the later 1530s, when Vesterport (the western gate) is mentioned for the first time. Part of the aim of this excavation was to confirm or reject existing ideas about the city’s border to the west; where it was placed, how it changed through time.

In addition to these, an extensive assembly of artifacts that can be directly linked to the Danish siege of Älvsborg 1612 was recovered. The artifacts consisted of a range of ordnance, including lead bullets, cannonballs, parts of rifles, fragments of grenades. In connection with the besieging aspect of siege archaeology, the excavations also uncovered remains of a besiegers approach (spj), and mines, and one of the castle’s defenders’ countermines.

During this project it has been possible to link some of the archaeological remains to actual events described in the historical sources therefore strengthening the actual narrative.

TH4-08 Abstract 14

The fortifications of Copenhagen:

The Western boundary as seen at Rådhuspladsen (Townhall square)

Author: Lyne, Ed, Museum of Copenhagen, Brønshøj, Denmark (Presenting author)
Keywords: Bastion, City Gate, Fortifications
Presentation Preference: Oral

Prior to excavations carried out at Rådhuspladsen in 2011/2012, relatively little was known with certainty about Copenhagen’s former western boundary. What knowledge was available mainly stemmed from cartographic sources and historical references, as well as present day street layout (particularly Vester Voldgade). The first map however was only drawn in 1590, and the first historical references for this area date to the later 1530s, when Vesterport (the western gate) is mentioned for the first time. Part of the aim of this excavation was to confirm or reject existing ideas about the city’s border to the west; where it was placed, how it was constructed and when, and how it changed through time.

The excavations at Rådhuspladsen carried out in advance of the Metro Cityring, offered an unprecedented opportunity to examine the remains of the fortifications along Copenhagen’s western boundary, and as will be discussed here, the evidence unearthed has been extensive and very illuminating regarding the ongoing changes made to this boundary through the centuries.

The historical evidence, previous archaeological observations and the new evidence as documented in 2011/2012 will all be outlined, in an attempt to achieve as complete an account of the story of this boundary as possible.
This paper addresses the question of wild mammals and its significance to life of societies living in Poland during the Middle Ages. Several publications about particular species have been published so far mostly in journal Archaeologia in 70’s and 80’s. There are also two archaeological and synthetic works about past Polish fauna by Piotr Wyrost (1985, 1994). However in present research authors revisit old records and opinions on this topic. Special attention will be also paid to fusion of archaeozoological, historical and ethnographical knowledge. It will be possible thanks to considering the time, space and category of archaeological contexts. Therefore the picture of medieval hunting, which was strictly related to the social status, will be possible to obtain. In this context it is important to emphasize special species such as red deer, elk, wild boar or brown bear. Crucial role played also aquatic mammals like beaver and otter, and its use as a fur-bearing animals. Apart from considerations on cultural aspects some osteometric observations will be performed. Measurements will be used for detecting the diachronic and synchronic trends in body size changes.

TH4-09 Abstract 03

The role of big game hunting among Iron Age boreal zone farmers

**Author:** PhD Student Kirkkinen, Tuula, University of Helsinki, Helsinki, Finland (Presenting author)

**Keywords:** animal hair identification, inhumation burials, wild animals

**Presentation Preference:** Oral

The role of big game hunting among Iron Age boreal zone farmers. Alices aces and Ranger tarandus in bioarchaeological assemblages at Iron Age and Early Medieval sites in South-East Fennoscandia.

This paper aims to discuss the role of big game hunting among the Iron Age farming populations in the southern half of Finland and West Karelia (Russia), South-East Fennoscandia. In Finland the importance of hunting and fur trade as supplementary economies have been considered an outgrowth of area's location at the northermmost limits of the cultivation zone in Europe. In recent studies hunting is hypothesized to have continued as the main subsistence strategy especially in Finnish inland areas long after the early phases of agriculture. In the northerm and eastern parts of Finland hunting retained its central role up to the Modern Age.

In this paper, the continuity of hunting and the long-lasting legacies of accompanied traditions are studied on the basis of Ranger tarandus feminosus and Alices aces skin and hair remains found in archaeological assemblages up to the 17th century. Although the results are based on a somewhat heterogeneous and fragmented body of source material, they underline the importance of hunting and wild animals in the Late Iron Age and Early Medieval world.

---

TH4-09 Abstract 04

In search of an animal skin: applying SEM for the soil of Pertulmannäki Corded Ware grave, Finland

**Author:** PhD Vajanto, Krista, Nanomicroscopy Center Aalto University, Espoo, Finland (Presenting author)

**Keywords:** animal hair identification, inhumation burials, wild animals

**Presentation Preference:** Oral

In the acidic soils of Finland, where organic materials from Stone Age are only rarely preserved, the Pertulmannäki Corded Ware grave is an important exception. Our unique findings confirm that an animal skin was present in the grave pit, possibly used to cover its floor. Similar practice has been noted from the organic remains of contemporary Yamnaya graves of south-east Europe. However, the Pertulmannäki grave is the first Corded Ware grave with preserved animal skin remains.

This paper addresses the need for more evidence of animal skin use in other Corded Ware graves.
TH4-09 Abstract 05
A critical appraisal of using relative bone weights of reindeer from archaeological sites

Author - Prof. Bartosiewicz, Łazło, Osteoarchaeological Research Laboratory, Stockholm University, Stockholm, Sweden (Presenting author)

Keywords: meat consumption, reindeer, relative bone weight

Presentation Preference - Oral

Quantification in archaeology requires a combination of various approaches. In addition to primary osteological data (Number of Identifiable Specimens and weight) derived measures have been calculated to compensate for bias caused by fragmentation and selective collection. Fragment weights have remained underestimated in developing such methods. The argument against their uncritical use is the changing specific weight of bone during diagenesis which precludes estimating absolute quantities of meat and even comparisons between bone deposits of different preservation.

Reichstein (1994) used the relative weights of elements in complete skeletons for cattle, sheep and pig as standards in analyzing the summarized fragment weights of elements in archaeological assemblages, presuming that the criterion of homogeneous preservation is met. Aside from NISP, weight often is the only information available in fragmented materials for estimating the representation of various body parts in food refuse. In this paper Reichstein's method is extended to reindeer, a meat source of key importance in Paleolithic Europe and throughout the history of the northern Baltic region and adjacent areas. Skeletal element weights of a mature male were chosen against whose percentual proportions weight distributions in archaeological assemblages can be compared. Bone measurements taken on the same standard individual can provide a basis for log size index (LSI) calculations, by which the few surviving bone measurements in the archaeological material can be compared to those of the reference specimen.

Given the methodological concerns involved ranging from taphonomic issues to intraspecific variability a SWOT analysis of the relative weight method was carried out to appraise its applicability to reindeer.

TH4-09 Abstract 06
Swine and ritual at the turn of fourth millennium BC on the Polish Plain

Author - MA Lisowski, Mikolaj, University of Sheffield, Sheffield, United Kingdom (Presenting author)

Co-author(s) - Stolle, Bettina, Stockholm University, Uppsala, Sweden (Presenting author)

Keywords: Neolithic, Poland, Zoarchaeology

Presentation Preference - Oral

The paper explores the role of pig in ritual communities associated with Globular Amphora Culture (GAC) at the turn of 4th millennium BC on the Polish Plain. Distinct ceremonial practices involving domestic animals are well-documented at sites linked to this culture, including commonly documented practice of so-called cattle burials. Pigs may also play an important role for GAC communities, and are also present in burial practice; however, the role of this species in other ritual activities, including feasting, is largely under-explored. Taking into account new evidence from Globular Amphora Culture at Widziszewo in Greater Poland region we aim to explore this issue. The deposit excavated in one of pits at this site consisted of a tight cluster of remains of six pig carcasses, disarticulated and consumed in distinctive and standardised manner during a short time event. The evidence from Widziszewo represents hitherto undocumented aspect of ritual activity of GAC communities, and has no direct analogies in the Polish Plain. Basing on the data, it is possible to trace the significance of pig as an animal consumed and/or deposited in ritual contexts of GAC. Particular emphasis is put on differential treatment of pig body parts, depositing heads in human burials (e.g. in Chochoła), and communal consumption of carcasses (as documented in Widziszewo). This issue will be a subject for further research to determine whether it was a widely applicable rule or a single instance.

TH4-09 Abstract 07
Cluttered faunal remains from a Roman Iron Age burial mound in Sweden: a taphonomic perspective

Author - Stolle, Bettina, Stockholm University, Uppsala, Sweden (Presenting author)

Presentation Preference - Oral

The area of Fullerö, north of Uppsala has been subject to numerous archaeological excavations. Artefacts and structures demonstrate a long continuity from Neolithic times and onwards. Finds datable to the Roman Iron Age (1st to 4th century AD) dominate the context. Investigations in 1934 concerned a burial mound in the southern part of the area (RAÄ 163:1). It contained a Roman Iron Age chamber tomb. Excavations yielded various precious finds, as well as human and animal remains. Artefacts and bones (mainly unburned) were unevenly spread out in the fill of the mound. Looting has been suggested as the main reason. The human remains represent a single individual, an adult male. The animal bones derive from both domestic and wild species. The burial mound at Fullerö is quite exceptional and unusually rich for its period. While the artefacts and human remains have been closely studied and interpreted, the faunal remains were only mentioned tangentially. Animals were common burial gifts in Swedish prehistory, deposited as complete individuals or food offerings. Unfortunately, looting as well as contemporaneous and later activities on the site have hampered a straightforward interpretation. An advanced approach, contextual taphonomy, was thus used to analyse the faunal content of the chamber tomb and to distinguish effects of later activities.

The identification and quantification of the remains will be accompanied by a comprehensive analysis of e.g. fragment size, weathering and fracturing. The matter is challenging and complex, but it is hoped that contextual taphonomy might offer a means to approach faunal remains in disturbed archaeological settings. This study will thus contribute to the discussion about the ritualization of animals during the Roman Iron Age and demonstrate the possibilities and limitations of archaeozoology today.
In the Lithuanian territory found 32 skeletal bones and manufactured artefacts of reindeers (Rangifer tarandus). Between them in 2014-2018 three Lynx type implements made out of reindeer antler were found within territory of Lithuania. One of the Lynx type implement is dating back to the 44000 to 42000 BC, the other two - 12 000 BC - to Late Allerød - Younger Dryas period. All other articles dating to Younger Dryas period. Trisegistic, stable isotope, radiocarbon dating, morphological examination on the implements carried out in Klaipeda University laboratories tell us that the one of them was made out of adult reindeer antler and was used as an axe. Wear marks indicate their use as a working tip. The other two were made of reindeer and was used as a hammers connection with leather and fur. Portable Confocal Scanning Light Microscope and Computer tomography scan of a reindeer antler artefacts illustrated of the anisotropic orientation of mineralized collagen fibers. These studies demonstrated the hierarchical structure of reindeer antlers. The trabecular bone is anisotropic, with aligned channels directed parallel to the long axis of the antler beam. Technological research has shown that stoutness articles, as Lynx type axes, were made of reindeer male antler and hammers - from female antler, because both sexes are members of the same species, and the properties of their antlers could, therefore, have emerged under similar pressures and constraints through evolution. This is confirmed by a reindeer antlers made of hardware functional purpose, which is to date the Northern European researchers were not analyzed until now.

The aim of this paper is to revisit a case study presented at the 21st Annual Meeting of the EAA in Glasgow in 2015 using results from all analyses conducted and offering an interpretation on their basis. During my presentation in Glasgow I argued that in regard to small and weathered finds it is often impossible to identify the raw material only by macroscopic evaluation but the use of low-invasive archaeometric techniques (conventional microscopy, SEM, microCT) can reveal structural micro-features and properties facilitating raw material identification. It was so in the case of eleven V-perforated bone buttons from a Bell Beaker female grave found at the Sandomierz-Zawichost Hill site in south-eastern Poland. Low power microscopic approach revealed qualitative features indicating that the osseous material used in the manufacture of these buttons might be animal dentine (ivory). If confirmed, it would link this eastern Bell Beaker artefact to the Iberian Peninsula, where the use of ivory for the manufacture of V-perforated buttons is well-known. In order to test this hypothesis, different analytic non-destructive and low-invasive techniques of imaging and morphometrics were employed: conventional microscopy (high and low power approach), scanning electron microscopy with energy-dispersive X-ray spectrometry (SEM-EDS) and micro-computed tomography (microCT). The results were cross-checked using Zooarchaeology by Mass Spectrometry (ZooMS) method, developed at the BiosCh laboratory of University of York, United Kingdom. Combined results showed that V-perforated buttons from the Sandomierz-Zawichost Hill site were made of cortical tissue with a fringe of cancellous tissue from a long or a flat bone (e.g. scapula) of genus Bos (domestic cattle or wild aurochs). It is consistent with what is known about Bell Beaker animal bone assemblages from Central and Eastern European context where cattle bones are the most numerous category of bone. Although the material is not exotic and as such it does not directly link the Polish Bell Beaker southern group with the Iberian Bell Beakers, it is interesting in terms of bone technology and its significance. In this case it can be argued that the choice of this particular material for the manufacture of V-perforated buttons is meaningful - the buttons are made from a bone (or bones) of familiar animal; this material was easily attainable and manifested mechanical properties known to the artisan. The raw material choice can be thus seen as a conservative act perpetuating familiarity and stability within the group to which the wearer belonged. This study shows that a comprehensive low-invasive analysis of small and weathered artefacts can facilitate raw material identification and, subsequently, highlight issues connected with the raw material selection and its significance in the past societies.

A long tradition in the research of prehistoric southern Scandinavia recognizes a full use of aquatic resources in the Late Mesolithic Ertebølle culture (5500-4000 BC): coastal sites are frequently found containing well-preserved fish bones, and isotope values from human collagen indicate a high dietary intake of marine resources. However, recent finds and new methodologies suggest that the view of a terrestrial focused diet in the Early Mesolithic period (9500-8800 BC) can be reinterpreted and the use of freshwater resources is found to be more important than previously known. Aquatic resources can therefore be seen as a major source of sustenance for foraging societies in Scandinavia much earlier than has been realized previously. In Norje Sunnansund, an Early Mesolithic site located in Blekinge, south-eastern Sweden, large amounts of fish bones were found that have been used to estimate the amount of fish being caught at the site, by analyzing different rates of taphonomic loss. The results from the excavated part of the settlement suggest that at least 60 tons of fish were caught. The large amount of caught fish and the evidence of the means of preparing and storing them form the earliest example of a large-scale fishing society, and the knowledge required to catch and prepare this volume of fish has further implications on a more structural societal level. A structured society is a prerequisite for the development of sedentism and enables large groups of people to gather together over an extended time period. Conservative dietary estimations from the recovered fish bone material suggest that enough fish were caught to sustain 100 adults, living solely on fish, for over 4 years.

Kurtuvėnai Manor – one of the first fifteenth century’s Manors established in Lithuania, which has been region’s economic and cultural center more than 450 years. In order to understand the livestock, breeding goals and practices at this manor at the time, this research combines an examination of relevant documentary of XV – XIX centuries (inventory books of Kurtuvėnai Manor and information from letters) evidence with a careful osteological analysis of 3027 bones and their fragments (XV – XIX centuries), gained in archaeological excavations. Although the size of animal farm varied during different periods nevertheless similar trends are observed. According to the observed data, it can be noticed that the smallest farm existed in the seventeenth century (this tendency was influenced by wars, famine and plague). Animal husbandry of Kurtuvėnai Manor was one of the strongest in Samogitia during the management period of the richest Samogitia’s noblemen’s (XVI century – Skadziskis, XVII century – Naparoka, XIX century – Pliateriai). This can
be explained by the economic power of the owners’ estate. During XV – XX centuries livestock was the main source of meat in comparison with wild animals or birds. This data indicates the importance of meat (pork, beef, poultry, fish) and production of milk. The shape, texture and the fragmentation level of the bones encountered in manor help to determine the animals’ slaughtering technologies. In XV – XX centuries wild meat firstly added variety to the noblemen’s table and also was a splendid entertainment. Mostly hunted animals were deer (Cervus elaphus), elk (Alces alces) and wild boars (Sus scrofa). Zoological studies, together with analysis of bones present in manors and data of inventory books confirm that here lived the rich noblemen who ate a high-quality of meat. This was affected by the material well-being of strong noblemen and their dependence on the nobility of the Samogitian affluent circle. For example, in 1563 Stanislawski Skałkiewicz sent 60 partridges for Prussian Duke Albrecht, three years later he sent 100 partridges. We also know that the householders of manors of the seventeenth century already took care of animal husbandry, reproduction and improvement of the species. It is believed that at the beginning of the seventeenth century the Dutch cattle came to the major manors in Northern Lithuania, mostly through Riga. Pedigree cattle and horses, which were fed and cared for by the manor were grown only on larger manors. But this innovation spread slowly. Recently, we have integrated our investigations of the excavated bones with technical and analytical development to gain an all-round perspective on social zooarchaeology. As the past researchers, we have to try to realize the full potential of zooarchaeological data and different methods of zooarchaeology.

Archaeozoology of Port Towns in Poland

Author - Prof. Makowiecki, Daniel, Nicolaus Copernicus University in Torun, Torun, Poland (Presenting author)
Co-author(s) - Wielejka, Martyna, Nicolaus Copernicus University in Torun, Torun, Poland

Keywords: Archaeozoology, Middle Ages, Towns

Presentation Preference - Oral

Between 9th and 10th century strong port centers had been established at the southern Baltic Sea. Some of them played a key role in the history of Pomerania and of Poland. We can list, among others, Gdansk, Kolobrzeg, Szczecin, and Wolin. Each of these centers was developing in a different cultural and environmental context. Archaeological research suggests that the role of ports as centers of economic, social, and political development was significant. For example, they were centers of exchange, and the food products from local and foreign resources contributed to their development. However, up to date results of analyses, published in numerous articles in Polish language, consider each of the centers separately. Therefore, the aim of this paper is to compare them according to the archeozoological data. The effect will be to indicate the differences and similarities in the role in the history of Pomerania and of Poland.

Birds and people on polish seaside in Middle Ages

Author - MA Wielgacka, Nicolaus Copernicus University in Torun, Torun, Poland, Poland (Presenting author)
Co-author(s) - Prof. Makowiecki, Daniel, Nicolaus Copernicus University in Torun, Poland

Keywords: birds, archaеozoology, Poland, Middle Ages, polity, hunting

Presentation Preference - Oral

Polish seaside is characterized by different environmental conditions than the rest of the country. Societies living there since early prehistoric times exploited its resources for food supply and for trade purposes. Beside fishes and mammals also birds have played an important role in farming and hunting economy. Although the studies on importance of this group of animals in Polish areas have been taken up rarely so far. This paper is focused on breeding and hunting for birds during the Middle Ages in Poland. Some aspects of birds history on polish Baltic coast were briefly presented mainly in papers about principal sites like Gdańsk and Kolobrzeg. On the base of published data and new research authors will compare obtained picture of birds economy with the rest of the country and observations for other parts of the Europe. Special attention is paid to a social status of domestic chicken and also to the hunting for birds with domestic dogs. The introduction of turkey is one of the most important aspect as well. The uniqueness of the coastal area can be observed considering the site in Lubin located on Wolin island. People living there have exploited local avifalunal species such as White-tailed Eagle and Cormorant.

Did rats abandon a sinking ship?

Discovery of animal products from the 14th c. shipwreck in Tallinn

Author - Dr. Lõugas, Lembi, University of Tallinn, Tallinn, Estonia (Presenting author)
Co-author(s) - Märtson, Liina, University of Tallinn, Tallinn, Estonia

Keywords: animal products, Medieval Time, shipwreck

Presentation Preference - Oral

The archaeological excavations of shipwreck that was found at a construction site in Kadriorg, Tallinn, Estonia in 2015, have resulted in a large amount of spectacular finds. The wreck originates from the 14th century and is a medieval cog-like merchant ship. Many everyday items made of metal, wood, birch bark, leather, textile, clay and stone, have been found both inside and around the ship. There are some burn marks visible on the wreck, which gives reason to assume that there was a fire that caused the shipwreck. Probably the lower part, which was not damaged so much sunk and became covered by sandy sediments quite fast. This caused good preservation conditions also for organic compounds of the materials, including different animal products.

The paper focuses on the animal remains found in situ in the wreck. This is a unique evidence supporting the information we get often only from the written sources like medieval inventory books or chronicles.
referring to a demographic bottleneck in 1970-1980’s. Subfossil samples (9,500-2,800 yBP) had higher haplotype diversity than historical samples of each extant species, suggesting that seal populations have been losing genetic variability throughout the Holocene, and not only as a result of recent population declines. An effective population size estimated from nucleotide diversity of subfossil samples was lowest for harbour seals and highest for ringed seals, which corresponds well with the inference based on the relative frequency of these species in archaeological sites at the Baltic coast. The effective population size of harp seals was comparable to ringed seals and higher than grey and harbour seals, suggesting that frequent occurrence of harp seals in archaeological record reflects their abundance rather than being a result of preferential hunting for harp seals. Reconstruction of the harp seal population dynamics suggests that their extinction was preceded by an abrupt rather than gradual decline. If the decline was due to an intensified hunting pressure, this would have likely affected all the seal species, and we found no evidence for this. Therefore, it is unlikely that the extinction of Baltic harp seals resulted solely from the hunting pressure.

TH4-09 Abstract 20

Worked bone and antler use-wear technology at Lielais Ludzas lake settlement complex

Author - Dancile, Guna, Čelis, Latvia (Presenting author)
Keywords: bone, antler, Lielais Ludzas lake, methods
Presentation Preference - Poster

Since 1950ties in Latvia is known a Stone Age settlement komplex around Lielais Ludzas Lake in Eastern part of Latvia. The coastline of the Lielais Ludzas lake has not been changed or reconstructed since 1954, when the water level was regulated and it lead to finding a lot of tools made of bone, antler and stone in different shapes and sizes. The discovered uncountable number of tools interested the locals so they started to gather them for private collections.

In the following years a number of archaeological excavations were organized in several settlements. The archaeological excavations in Kreiči, Budjanka, Jurizdika I and II, Kreiči burial-ground were led by Rauls Šnore, Francis Zagorskis, Lūcija Vankina, who confirmed that the territory around the lake was inhabited during the Middle Stone Age. But after few years of surveying archaeologist R. Šnore found more story find concentration sites all around the lake that could also have been a settlements - Baltia point, Baznīckunga island, Harpūnu island, Jurizdika (I, II), Kaļvi, Kubulova, Lumuža, Ludza town, Seļekova (I, II), Šķispuki, Užste un Vīti (Dūrī). Material use-wear was important all Stone Age but only used material depends of climate and accessible animal species. Environment combined with material use-wear technology was an important part of Stone Age people lifestyle so it is important to see correlation between worked bone and antler tools from excavated sites and stray find concentration places, also to clear out what kind of methods were used to make hunting and fishing tools in Stone Age settlement komplex all around Lielais Ludzas lake in Latvia.

Mostly all tools were polished by stones, sawed on top or at the bottom of tool, part of fishing gear is bored for fishing hook holes and barbs. Some of tools are made of big flakes of bones which are result of process of bone splitting. Some of the tools are decorated with carved decorations as well, but it is not a big part of all tools from Lielais Ludzas Lake. Tools mostly are made of the deer, elk, wild boar bones and antlers (identified by K. Paavere). Although not all tools were analysed, the dominance of the previously mentioned animals matches with the Latvian paleozoological material. It is obvious that elk was common, as more than 70 percent of all bone and antler tools used in the Early and Middle Mesolithic were made of elk. During the Late Mesolithic and Early Neolithic significantly grew the use of the wild boar (44.5%). Only in the Late Mesolithic people started to hunt also other species. A larger number of the marten, badger, fox, otter and other predator bones were found. Also the number of hunted roe deers and deers increased in the Early Neolithic, however not significantly.

Keywords: hunting, fishing, tools, Lielais Ludzas lake, tool use-wear, Mesolithic.

TH4-10 Abstract 01

Traces on Material Culture: Craftspeople and Contact Networks in the Nordic Bronze Age

Author - Dr. Nergaard, Heide, Moesgaard Museum, Ebeltoft, Denmark (Presenting author)
Co-author(s) - Armbuster, Barbara, Toulouse, France
Co-author(s) - Jouttiäiäniemi, Arne, Heimdal-archaeometry, Virum, Denmark
Co-author(s) - Saage, Ragnar, Tartu University, Tartu, Estonia
Co-author(s) - Tomsons, Arturis, Latvian National History Museum, Riga, Latvia
Keywords: Metal working, Technology, The Baltic Sea
Presentation Preference - Regular session

From the rock carvings depicting ships in the Scandinavian Bronze Age to the age of the Hanseatic League and its mighty cargo ships, the Baltic Sea has always played an important role as a travel zone, facilitating interregional contacts and dissemination of cultural and technological knowledge. The study of technological practices is indicative of the spread of innovation and the movement of craftsmen, and therefore not only shows the movement of goods but also the transfer of new ideas and the dissemination of people. Prehistoric and medieval production of metals in the Baltic Sea region demonstrates both shared practices and discrete traditions, making it central for our understanding of cultural relations and networks within this area.

This session aims to bring together archaeologists and archaeometallurgists exploring the traditions, continuity, and developments of metal crafts through external influences and innovation from the Bronze Age to the medieval period around the Baltic Sea. The focus will be on the history of technology and traditions of metal production, including aspects of metal working techniques, utilization of tools, and the layout and “chaine operatoire” of workshops. The interdisciplinary nature of the session will encourage discussions between cultural-historical approaches, experimental and archaeometric studies, to enrich our understanding of technological practices and to explore how metals, technologies and traditions were spread and shared within the region.

Keywords: Metal working, Technology, The Baltic Sea.

TH4-10 Abstract 02

Technology exchange and iron trade around the Baltic Sea

Author - Jouttiäiäniemi, Arne, Henrik, Virum, Denmark (Presenting author)
Keywords: metal trade, iron, smithing traditions
Presentation Preference - Oral
The traditions of iron smelting and smithing technologies in Denmark from the Iron Age to the Medieval period, is fairly well documented on the basis of metallographic analyses of more than 500 artefacts. Compared to similar analyses from other areas bordering the Baltic Sea, it can be seen, that in Pre Roman and Roman Iron Age, there are differences in technologies, that indicated that there was only a limited spread of traditions and knowledge.

In this period, the use of steel for cutting edges in tools and weapons developed in the areas south of the Baltic Sea whereas neither welded steel edges nor carbuncle forging was introduced in ten centuries of Denmark. One illustrative example is a number of single edge swords found in the votive deposit at Viomose on Funen. Most of the swords were made from combination of layers of iron and steel. On the basis of analyses of slag inclusions they were judged to have their most likely origin in the area of present da Poland. One sword on the other hand was made from low carbon iron, and the slag inclusions indicated that it was produced within present day Denmark. Apparently the form was copied with no knowledge of the technology.

A much more developed network seems to have been present in the Viking Age, where similar traditions for example forging knives seem to have existed in the whole area around the Baltic Sea. It shows that there has been contact between craftsmen throughout the area, and that technological traditions have been exchanged.

Iron, and especially higher quality metal as steel, was probably also traded within the area, and slag inclusion analysis shows that steel in Denmark was primarily acquired from abroad. Unfortunately, reference databases are not yet sufficiently developed, especially for the eastern areas, and it is therefore not possible to give a more precise description of the trade routes. Future cooperation on the exchange of analyses of slag from iron smelting, will be able to open new perspectives in the identification of the trade of metal in the past.

TH4-10 Abstract 03

Vendel period seaxes from Grobin

Author: Abolins, Artis, Riga, Latvia (Presenting author)

Keywords: Baltic Sea region, Metal Working, Vendel period

Presentation Preference - Oral

There has been little written about the Scandanavian seaxes found on the Eastern shore of the Baltic sea, and this paper is an attempt to present an overview of the finds from the Scandanavian colony in Seeburg (modern days Grobin) in Latvia. Since it is the only known colonist in the Vendel period outside their primary territory, it holds the special interest for researchers, but, so far, no special attention has been devoted to the seax finds. There are several fine examples in collection of the National History museum of Latvia, including one especially impressive longseax over 70 cm in length. After careful examination of the blade one can conclude that it was once a very fine example of bladearmst art of the period, consisting of mix of mono-stel and pattern welded elements. This seax and the technologies involved in the production of it and similar weapons will be the focus of the paper. Examining the other items connected with the burial that contained this seax, it is clear that it would once have belonged to a person of importance in his society, so it not only serves as a testimony of the skill of the maker, but also provides information on the people of this fascinating time period (burial is dated to the late Vendel period (most likely, 8th century).

TH4-10 Abstract 04

Bronze Age fine metal working in Nordic Europe - gold discs and vessels

Author: Dr. Hab. Armbruster, Barbara, Laboratoire d’archéologie TRACES - UMR 5608, Toulouse, France (Presenting author)

Keywords: Fine metal working, Nordic Bronze Age, sun discs and vessels

Presentation Preference - Oral

Gold work was an important means of cultural and social expression and exchange during the Bronze Age, a period particularly rich in golden prestige items. Along Baltic and Atlantic Europe, ideas and peoples moved exchanging information, goods and technological knowhow. This paper deals with the esthetic appearance and social function as well as symbolic meaning of a particular group of luxury items from Scandnavia and Northern Germany, such as ornamental “sun” discs and containers made in gold. It focuses on their fine metal working technology essential to create their specific shape and decoration. The presentation aims in scrutinising the development and independance of form, function and technology of gold work. One topic will be the goldsmiths’ workshop, its tool kit and materials used, as well as his social role in Bronze Age society. The presentation also intends to highlight the particular decoration techniques and tools applied to these sheet ornaments and luxury table ware.

---

TH4-10 Abstract 05

Some aspects of the local weapon production in Western Latvia from 9th to 13th Century

Author: - Dr. Tomsins, Artūrs, Latvian National History museum, Riga, Latvia (Presenting author)

Keywords: Early Medieval, Eastern Baltic, Weapon production

Presentation Preference - Oral

The question of local weapon production in the lands of the western Baltas during the end of prehistory and with the beginning or Medieval period and during the Baltic Crusades is closely connected with a problem of formation of the early statehood of the local peoples in the Eastern Baltic. Western Latvian weapons finds, especially more than hundred evidences of the double edged swords, pattern welded spearheads are significant source about warrior elites with similar identities across the whole region. These finds also reflect developed craftsmanship and several possible production centers of these weapons in Couronian lands, using both imported material sources, as well as using the skills of local craftsmen working with non-ferrous metals.

---

TH4-10 Abstract 06

New archaeometallurgical investigations on Bronze Age metal objects from the Eastern Baltic region

Author: Dubuc, Elke, Cuth-Engelhorn-ZentrumArchäometrie gGmbH, Mannheim, Germany (Presenting author)

Keywords: Archaeometallurgy, Bronze Age, Metal Objects

Presentation Preference - Oral

This archaeometallurgical study presents new research results regarding Bronze Age metal objects from the Eastern Baltic region. Since the last published analyses from Merkevičius in 1973 and Moltinger in 2010, this new study sheds more light on the metallurgical development in this remote and seldom investigated region when talking of Bronze Age metalurgy.

Since the Eastern Baltic region lacks own copper ore deposits and metal finds are rare, this project aims to answer various questions, e.g., which sorts of metal occur during the Bronze Age in the Eastern Baltic region? Were the Early Bronze Age objects imported or self-produced? From which deposit derive the used copper ores? What can be said about trade, import and/or self-production within that time span?

The investigated objects can be classified to different chronological periods ranging from the Early to the Late Bronze Age.

The metal finds derive from different find spots in Lithuania, Riaunigrand district (Russia) and Belarus. Most of them are single finds and one newly discovered hoard find from the Late Bronze Age, Kobbelbude.

We present the latest results of the performed analyses. Two analytical methods were applied on approx. 40 samples from metal objects (bronze axes, swords, spearheads). First, the chemical composition was determined by energy-dispersive X-Ray fluorescence analysis. Using those results, it was possible to classify different material groups and to make statements regarding the alloying behavior.

Second, stable lead-isotope ratios were analyzed for the first time in that region and the results were compared with lead isotope signatures from different copper ore deposits to identify possible regions of origin of the used copper. The geochemical fingerprints of the different deposits were taken into account as well.

---

TH4-10 Abstract 07

A multidisciplinary approach to the study of Polish silver denarii minted by the early Piasts

Author: Dr. Del Hoyo, Julio M., The National Museum in Krakow, Krakow, Poland (Presenting author)

Keywords: Non-destructive analysis, Polish denarii, X-ray fluorescence spectrometry

Presentation Preference - Oral

X-ray fluorescence (XRF) analyses have become a standard method in archaeological science due to their non-invasive and non-destructive nature. Chemical analyses of metal alloys may provide information about the manufacturing process, the provenance of raw materials, and the geographical distribution of ancient mints. A total of 110 silver denarii from the early Piasts (10-11 th centuries AD) belonging to the collections of the National Museum in Krakow and the National Museums Berlin have been studied using micro-X-ray fluorescence spectrometry and the data have been contrasted with archaeometrical results. The research has focused on evaluating the use of this technique as a screening tool for elemental surface characterization of the alloys. All denarii are made of Ag and Cu, with minor amounts of Pb, Fe, Au, Bi, and Zn. Quantitative analyses have revealed silver contents in the 86-97 % range for several of the surveyed coins. Regardless of the problems associated with the use of different

---
instruments and various experimental conditions, the results are in agreement with previous data obtained for similar coins from the same time period and geographical location. The advantages and limitations of the technique when examining numismatic collections are also explained. A known drawback of this method is silver surface enrichment, which is a common process observed in archaeological silver-copper alloys sometimes leading to incorrect interpretation of the data. Preliminary data from complementary techniques like neutron activation analysis (NAA) and proton-induced X-ray emission (PIXE) are very promising in studying some of these surface effects.

This study has the goal of providing elemental information, which will serve to enhance the current knowledge about geographical and chronological diversification of Polish numismatic collections.

TH4-10 Abstract 08
Smithies and forges in the Northeastern Baltic from the 11th to 16th century AD
Author - Saage, Ragnar, Tartu University, Tartu, Estonia (Presenting author)
Keywords: Baltic metal working, Historical metallurgy, smithy sites
Presentation Preference - Oral

Smithy sites are quite rare monuments to be archaeologically excavated. This study encompasses sites from Estonia (Paatsa, Haapsa -lu, Kuressaare and Käiku), Finland (Gubbacka and Tontimmäki) and Russia (Minino I and Gat) to get a better understanding of the smithies discovered so far and how has the forge construction changed. Also, ethnographic records of 19th century Estonian smithies are used to illustrate the variability of the different smithy set-ups and (when provided) the conflicting reasoning behind these choices.

In the Northeastern Baltic, the period under investigation can be divided into three stages. Firstly, the Iron Age smithies with pit forges in the 11th and 12th centuries. Secondly, the transitional period in the 13th – mid-14th century, when the urban smiths began to use new forge designs, while some rural smithies continued to operate in the Iron Age traditions. The 13th century marked a period of crusades in the Eastern Baltic, which was followed by the founding of new towns, which brought forth an influx of craftsmen from the already established towns from the West. Thirdly, the developed crafts guilds period from the mid-14th – 16th century, when the continued movement of apprentices had ensured the spread of urban smithy designs and techniques to the rural areas.

While Russian smithies do not necessarily follow the pattern of Finland and Estonia, they provide a valuable source of well-preserved workshops that are difficult to fill in our knowledge from that period.

TH4-10 Abstract 09
Tracing Multimetal Craftsmanship through Metallurgical debris – Open air workshops and multimetality
Author - Svensson, Andreas, Lund University, Lund, Sweden (Presenting author)
Keywords: Metallurgical debris, Multimetal craftsmanship, Multimetalty
Presentation Preference - Oral

Metallurgical debris is by far the most informative source material for studying the metal craftsmanship of the past. In comparison to the often well-kept and well-known finds in other areas of research, debris material are more or less confined to the original workshop sites and hence provide direct evidence as to production volume and quality, site organization, artisanal skill and operational sequences within the various crafts.

On many sites throughout the “Metal Age” evidence of both iron smithing and the use of non-ferrous metals can be found. Traditionally, a clear division between these types of crafts has been enforced in site interpretation, separating sites into ferrous versus non-ferrous workshop sites chronologically or spatially. However, the presence of, for instance, smithing slag cakes with droplets of Cu alloy within their matrix as well as casting debris of both metals and ceramic materials in forges and smithing hearths challenges this strict division.

The thesis project “From Crucible and onto Anvil” started in 2015 and focuses on sites housing remains of multimetal craftsmanship dated primarily from 500-1000 AD. Within the project a comprehensive survey of sites will be used to evaluate the presence of multimetal craftsmanship in the landscape based first and foremost on the metallurgical debris documented on or collected from them. Sites in selected target areas will be subject to intra-site analysis of their metallurgical remains focusing on workshop organisation, the array of metalworking techniques utilized and the chronological variances of multimetal craftsmanship.

A primary aim in the project is to elucidate the conceptual aspects of complex metalworking. The term multimetality is used to analytically frame all the societal and cosmological aspects of metal craftsmanship. Through this inclusive perspective both the metal craftsmanship and the metalworkers behind it are positioned within the overall socioeconomic framework. The metalworkers, their skills and competences as well as the products of their labour are viewed as dynamic actors in the landscape and on the arenas of political economy of the Late Iron Age. This paper aims to present a few examples of the surveyed multimetal sites, discuss workshop reconstruction through metallurgical debris and present preliminary interpretations of the sites internal organisation and placement within the cultural landscape. Many of the sites surveyed so far are interpreted as open air workshops with a relatively long continuity ranging several generations of metalworkers. How is this to be interpreted? Where the multimetal craftsmanship undertaken of temporary character? And if so, why did the metalworkers continue to use the same workshop site for generations?

The concept of multimetality and the possibilities to capture this elusive, yet crucial, element of metal craftsmanship through the study of metallurgical debris will also be discussed in the paper. The surveyed sites and the reconstruction of their internal workshop organisation will serve as examples of how multimetality was manifested on the sites and in the landscape.

TH4-10 Abstract 10
On some aspects of specialized production in Roman Iron Age. A case study of S-shaped clasps
Author - Patalan, Krzysztof, Zentrum für Baltische und Schwedische Archäologie, Schleswig, Germany (Presenting author)
Keywords: Goldsmith, Roman Iron Age, S-shaped clasps
Presentation Preference - Oral

The main topic of the paper are goldsmith products from the Roman Iron Age in the southern and western zone of the Baltic Sea region with emphasis put on the production of golden and silver S-shaped clasps which were used as a closure of the necklace.

Although one can speak about chainé operators in context of the individual specimens or in some cases products from limited geographical area such generalizations are not possible to the whole material. The use of certain techniques, order of their application or attempts to bypass them provide important information about local production and can be used to identify the producers or at least in attempt to limit the area of origin of the analyzed objects. In the presentation the production of S-shaped clasps will be outlined and compared in the different areas of their distribution. This would show the strength and direction of influences in the goldsmith production of the Roman Iron Age. On the other hand this deliberations – based on the assumption that S-claps may be perceived as both status and group affinity symbol – would allow to discuss those connections between the populations of the Baltic Sea region that were presumably based on heterogeneity.

TH4-10 Abstract 11
The path of knowledge - Transfer of knowledge of bronze casting in the Late Bronze Age Scandinavia
Author - PhD Cand. Nilsson, Andreas, Lunds Universitet, Lund, Sweden (Presenting author)
Keywords: Bronze Age, Bronze Craft, innovations
Presentation Preference - Oral

The Scandinavian bronze craftsmanship has been discussed countless times. But the discussion can continue thanks to new discoveries and new approaches within this subject. I intend in this talk to discuss technology dissemination and the availability of bronze casting technology in southern Scandinavia during the Late Bronze Age. Was the knowledge of bronze casting a closed knowledge or was the technology available to more people than specialists in bronze crafts? What paths have new innovations in form and function and the knowledge of changes in bronze casting technology taken? Can we see variations and ingenuity of bronze smiths at a local level? Was there space for everyday craftsmen or were all bronze craftsmen specialists? I will try to approach these issues to these questions by examining the various steps needed in the chain of actions of bronze casting and by discussing different parts of bronze casting technology such as appliance moulds, crucibles, technical ceramics and examine specific everyday objects made out of bronze such as socketed axes.

TH4-10 Abstract 12
Markers of ethnicity and female power? Some reflections on Scandinavian brooches in Viking Age Rus
Author - Neil, Michael, Uppsala University, Uppsala, Sweden (Presenting author)
Keywords: Baltic metal working, Artfact biography, Runikl dynast, Viking diaspora, Viking Age Rus
Presentation Preference - Oral

Prehistoric pictures are a special sort of source material. Pictures are not random products – they were created to convey messages. This statement applies especially to the oral culture of the Viking Age. However, Viking Age pictures rarely occur as independent monuments. More often, they appear as animal art on metal artefacts. The starting point for my reflections is a group of granodose brooches from Viking Age Russia.
To begin with, a recent 'object autopsy' on the famous Gnezdovo hoard revealed that two circular brooches should be regarded as locally made reconstructions of an elder brooch type, once imported from Scandinavia. In fact, no corresponding brooches from mainland Scandinavia display similar amounts of antighting. Why then was so much effort put into restoring the Gnezdovo brooches? One intriguing possibility is that these brooches represented heirlooms from an earlier generation of settlers. Presumably, over time some of these heirlooms transformed into important symbols of Scandinavian ethnicity. In this case the grandioso brooches from Yelets. Here we find an emblem, possibly linking the object to the princely House of Ryuk. Ryukid emblems were compositions of elements from various sources. We believe that different male princes created individualized emblems of their own. In the case of Yelets, the emblem combines Scandinavian and Oriental elements. Yet, being a female dress ornament, we might ask whether the Yelets emblem represents the might of the princely dynasty or the power of an individual female known from written sources. There is plenty of circumstantial evidence to conclude that Yelets brooch was made for a woman with close ties to the Ryukids, possibly during the second half of the 900s or the early 1000s. Ancient concepts of personhood were such that the actions of an upper class female fell back on her entire clan. Thus, we should perceive the mere act of commissioning that sumptuous brooch as a statement of might and power. Special consideration should also be given to the role of women in the building of alliances, as well as the function of female heirlooms within the social interplay. In fact, the Yelets brooch displays signs of wear and repair that might indicate that it had been passed down to later generations. As Viking Age craftspeople were able to travel considerable distances, there would have been no need for our female patron to seek out the gold smith. Having said that, we should neither exclude the possibility of a precious gift bestowed upon her, either by one individual or by several people.

TH4-10 Abstract 13

Technological aspects of the Swedish gold collars

Author: - Dr. hab. Armbruster, Barbara, Laboratoire d’archéologie TRACES - UMR 9068, Toulouse, France (Presenting author)
Co-author(s): Pesch, Alexandra, Zentrum für Baltische und Skandinavische Archäologie, Schleswig, Germany

Keywords: fine metal working, gold collar, Migration period

Presentation Preference: Oral

The Swedish gold collars from the Migration period are enigmatic masterpieces of Early Medieval fine metal working. Their refined imagery, complex form and decoration, and sophisticated manufacturing techniques were studied within the scope of an international research project coordinated by Pesch, Alexandra. This paper deals with the technological aspects of these masterpieces including the "chaine opératoire" of the production processes and the tools employed. It provides new insights on the collars' technology chosen by the goldsmiths to create the complete body, the figurative elements and the filigree and granulation work. Especially interesting are the technological features of the construction of the tubular sheet work and the making of the so called miniatures. The specialized and complex knowledge of the makers will be set in the context of fine metal working in the North during the Early Medieval period.

TH4-10 Abstract 14

Iron smelting process in the Žaro-Banduži archaeological complex (Lithuania)

Author: - Masilionienė, Ieva, Klaipėda University Institute of Baltic Region History and Archaeology, Klaipėda, Lithuania (Presenting author)
Co-author(s): - Seliškienė, Aurė, State research institute Center for Physical Sciences and Technology, Vilnius, Lithuania

Keywords: chemical analysis, Iron Age, iron smelting

Presentation Preference: Oral

The Žaro-Banduži archaeological complex is situated near the Baltic Sea in the southern part of Klaipėda city (western Lithuania) and includes Žardė (Kunciai) hillfort, Žardė-I-II settlements, Banduži-I-II settlements, Banduži (Žardo) settlement, and Banduži Cemetery. Few seasons were investigated the Banduži (Žardo) and Banduži settlements and discovering archaeological structures: hearths, fireplaces, ore extraction pits, ore burning fireplaces, charcoal production pits, iron smelting furnaces and wells. The purpose of some of the pits and structures has so far not been determined. The chronology of the Banduži (Žardo) and Banduži settlements is very broad; economic activities connected to iron smelting and other not defined domestic activities were conducted in this territory from 1st millennium BC - early 2nd millennium AD. Chemical analyses (XRF, SEM-WDX) of iron metallurgy artifacts and detailed analysis of archaeological material provide the opportunity to reconstruct process of iron smelting and to evaluate the development of archaeological complex in prehistory.
Prevalence of pathological lesions in the Iron Age water burial site Levānuža, Western Finland

Author - Salo, Kati, University of Helsinki, Helsinki, Finland (Presenting author)

Co-author(s) - Jakob, Tina, University of Durham, Durham, United Kingdom

Presentation Preference - Oral

The prevalence of periapical lesions in the lower molars, however, were slightly higher in Levānuža than in later periods. This may be explained by advanced dental wear or trauma. The alveolar-CEJ distance was also lower although teeth in general had more wear. This speaks for diet change (increase in carbohydrates and softer foods) in the later Iron Age, medieval and early post-medieval periods in Finland. For dental caries, however, even the existence of the pathogens causing dental decay in the whole material can be questioned, since lesions are so few and some of them are not typical caries lesions and could be taphonomic or developmental defects of the dental enamel.

The skeletons were incomplete, and the diagnosis was based on bilateral, extensive new bone formation on the perinasal area, as well as bilateral, extensive new bone formation on the long bones of arms and legs. According to the historical data, the city of Riga was the largest port in the Baltic region. It also helps to understand how VS was introduced into the territory of Latvia: the only individuals with possible VS in the archaeological populations of Latvia have so far been found in Riga and Ventspils, which were relatively large port cities in the Baltic Sea trade route during the post-medieval period.

---

Evidence for venereal syphilis in post-medieval Riga, Latvia

Author - Petersone-Gordina, Elina, Durham University, Department of Archaeology, Durham, United Kingdom (Presenting author)

Co-author(s) - Gerhardt, Guntr, Institute of Latvian History, University of Latvia, Riga, Latvia

Keywords: congenital syphilis, infectious disease

Presentation Preference - Oral

This research aims to evaluate the prevalence of venereal syphilis (VS) in two post-medieval cemetery populations from Riga, Latvia. Both skeletal populations were excavated prior to building and reconstruction work. Two hundred and seventy-four individuals from the Riga Dome Church cemetery (RDCC), and 198 individuals from the St Peter’s Church cemetery (SPCC), dating from the 16th – 17th centuries AD were included in the analysis.

To estimate age at death of the adult individuals, degenerative changes of the pelvis were evaluated, while sex was based on the morphology of the pelvis and skull using standard methodology. Age of non-adults was estimated according to dental development and eruption, using long bone length if dental analysis was not possible. All individuals were then observed for pathological changes possibly associated with VS, including destructive lesions on the outer surface of the skull and in the long bones, as well as bilateral, extensive new bone formation on the long bones of arms and legs. According to the morphological analysis, there were 108 males, 80 females and 86 non-adults in the RDCC population, and 74 males, 45 females and 77 non-adults in the SPCC population. Six individuals from the RDCC and two from the SPCC with lesions possibly associated with VS were selected for further analysis.

Pathological changes on the outer surface of the skull and on the long bones of legs characteristic of VS were observed in four female and one male individual from the RDCC. In addition, changes possibly related to late congenital syphilis were observed in a female and in a non-adult individual from this cemetery. All these individuals had been buried in a small area adjacent to the Northern wall of the Riga Dome Church, and it has therefore been hypothesised that it belonged to a hospital.

There were only two individuals with possible VS from the SPCC, a female and a male, both aged between 20 and 30 years at death. The skeletons were incomplete, and the diagnosis was based on bilateral, extensive new bone formation on the arms and legs, along with cortical thickening of the long bones. St Peter’s Church of Riga was associated with wealthy traders, but the cemetery outside the church mostly accommodated the ordinary, poor residents of Riga who belonged to St Peter’s parish. The cause of death of the person found during the excavation, mainly dress fittings, confirmed the presence of this lower status population group in the excavated area.

This evidence for VS from these two post-medieval populations complements historical data about the spread of the disease in Riga during the 16th – 17th centuries AD, along with the development of sea trade and the growth of Riga as a significant port city in the Baltic region. It also helps to understand how VS was introduced into the territory of Latvia: the only individuals with possible VS in the archaeological populations of Latvia have so far been found in Riga and Ventspils, which were relatively large port cities in the Baltic Sea trade route during the post-medieval period.

TH4-11 Abstract 04

Cribra orbitalia and trace elements in subadults from a 17th–18th century cemetery in Latvia

Author - Dr. Shotts, Sabrina, Smithsonian Institution, Washington, DC, United States of America (Presenting author)

Co-author(s) - Zairina, Guntr, Institute of the History of Latvia, Riga, Latvia

Co-author(s) - Tichinin, Alina, Department of Anthropology, California State University, Chico, California, United States of America

Co-author(s) - Rudovčič, Viva, Department of Analytical Chemistry, University of Latvia, Riga, Latvia

Co-author(s) - Vlkon, Arturs, Department of Analytical Chemistry, University of Latvia, Riga, Latvia

Co-author(s) - Engūzere, Astrī, Latvian National Museum of History, Riga, Latvia

Co-author(s) - Mužnieks, Virtsids, Latvian National Museum of History, Riga, Latvia

Co-author(s) - Barteliņš, Eric, Department of Anthropology, California State University, Chico, California, United States of America

Co-author(s) - Wärmländer, Sebastian, Division of Biophysics, Stockholm University, Stockholm, Sweden

Keywords: Bioarchaeology, Paleopathology, Trace elements

Presentation Preference - Oral

Cribra orbitalia (CO), or porotic hyperostosis of the orbital roof, is one of the most common pathological conditions found in archaeological skeletal remains of subadult humans. Reaching frequencies higher than 50% in many prehistoric samples, CO has been generally connected to a variety of factors including infectious disease and malnutrition. In this study, we tested the relationship between CO and trace element concentrations in 28 subadult skeletons from a 17th to 18th century cemetery in the historic town of Jākabpils, Latvia. Bioarchaeological evidence indicated high mortality for children in this cemetery: half of the burials were children under the age of 14, while a third were under the age of four. Life expectancy at birth was estimated to have been only 21.6 years. Seven of the 28 subadults (29%) showed evidence of CO, but only those in age groups of 1.5–5 and 5–11 years old. Trace element concentrations measured by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) showed no relationship between presence or absence of CO and levels of manganese, zinc, strontium, barium, copper, cadmium, or lead (p>0.05, one-tailed t-test, unequal variances). However, a significant relationship (p<0.05) was found between the presence of CO and decreased levels of iron. Further, the relationship between CO and lead and copper decreased significantly (p = 0.06). These results support the hypothesis that CO is related to iron deficiency, and suggests that deficiencies in other trace elements (e.g., copper) may be involved as well.

TH4-11 Abstract 05

Finns in the light of ancient mitochondrial DNA

Author - M.Sc. Majander, Kartu, University of Tübingen, Tübingen, Germany (Presenting author)

Co-author(s) - Översti, Sanni, University of Helsinki, Helsinki, Finland

Co-author(s) - Wessman, Anna, University of Helsinki, Helsinki, Finland

Co-author(s) - Salo, Kati, University of Helsinki, Helsinki, Finland

Co-author(s) - Onkamo, Päivi, University of Helsinki, Helsinki, Finland

Co-author(s) - Översti, Sanni, University of Helsinki, Helsinki, Finland

Co-author(s) - Wessman, Anna, University of Helsinki, Helsinki, Finland

Co-author(s) - Schuenemann, Verena, University of Tübingen, Tübingen, Germany

Co-author(s) - Krause, Johannes, Max Planck Institute for the Science of Human History, Jena, Germany

Keywords: Ancient DNA, Finnish population history, mitochondrial DNA

Presentation Preference - Oral

The historical migrations and relations of mankind are currently under an intense investigation through novel means in archaeological sciences. Studies illuminating the specifics of our past use wide range of interdisciplinary methods, such as isotopic analysis and ancient DNA (aDNA) has proved a powerful tool in analysing, genetics and statistics. Ancient DNA (aDNA) has revealed how genetic differences change in populations, with an unprecedented precision. Mitochondrial DNA (mtDNA) allows the maternal lineages to be followed back in time. Comparing the distributions and divergence of mitochondrial haplogroups helps revealing past migrations and shifts in the genetic structure.
Two boat-graves, Salme I and Salme II, were found and excavated in 2008-2011 in Saaremaa, Estonia. They are unique in the European context regarding the remarkable number of human burials inside the boats. Osteological and archaeological examinations have given indications of sex, age, diet, and mobility status. However, with recent developments, modern DNA technology can enable a comprehensive genetic analysis. Today we can get information about ancestry, origin, gender and/or lactose intolerance, family relationships and sex. It is also possible to predict physical appearance with regards to hair, eye and skin color, length, weight dyf wax, body odor and BMI.

The introduction of next generation sequencing (NGS) has opened up a whole new field allowing numerous analyses that would not otherwise have been possible. We will use NGS technology and massive parallel sequencing for a detailed genetic analysis of the Salme materials along with current archaeological methods to generate a database with DNA profiles and information about individuals from the boat graves. Ancient skeletal remains present a number of challenging features where the amount and integrity of recovered DNA are limiting factors. We will use NGS technology to overcome many of the challenges in a directed and genetic analysis. The assay provides the potential to analyze ancient DNA profiles of Viking age remains to ancient and contemporary European populations for information about ancestry and the migrations in ancient times. Our data may also provide information about phenotypic traits of these seafarers from early Viking ages.

**Keywords:** Finland, Late Iron Age, stable isotopes

**Presentation Preference:** Oral

The Luulastri cemetery in Eura is the most extensively researched Late Iron Age / Early Medieval cemetery in Finland, with over 1300 human burials. The cemetery was excavated from the 20th century AD and unfortunately preserved only in part. Our project called Life Histories in Teeth was launched in 2015 with the aim to develop isotope sampling methods and to produce new multidisciplinary information on the cemetery and the buried individuals. The best preserved human and animal dental and bone remains from 89 graves were selected and were sampled for this study. The human samples will undergo stable isotope analysis (813C, 815N, 818O, 843S) and a smaller sample set is further selected for compound specific isotope analysis, and later on, aDNA studies and new AMS-datings will be performed in a related project. In addition to this, µCT scanning, age at death modeling and paleopathological analysis will allow us to have a better understanding of the Luulastri people and their diets, origins and life histories in the Late Iron Age Finland. Revised typologies and comparisons of the acquired data to contemporaneous populations around the Baltic Sea will also contribute to a comprehensive understanding on the contacts between different areas during this time. Archaeanthropological analysis based on the excavation documents and preserved find material will shed light to the burial customs, which include double and multiple burials, and even some deviant cases.

Two boat-graves, Salme I and Salme II, were found and excavated in 2008-2011 in Saaremaa, Estonia. They are unique in the European context regarding the remarkable number of human burials inside the boats. Osteological and archaeological examinations have given indications of sex, age, and mobility status. However, with recent developments, modern DNA technology can enable a comprehensive genetic analysis. Today we can get information about ancestry, origin, gender and/or lactose intolerance, family relationships and sex. It is also possible to predict physical appearance with regards to hair, eye and skin color, length, wet/dry wax, body odor and BMI.

The introduction of next generation sequencing (NGS) has opened up a whole new field allowing numerous analyses that would not otherwise have been possible. We will use NGS technology and massive parallel sequencing for a detailed genetic analysis of the Salme materials along with current archaeological methods to generate a database with DNA profiles and information about individuals from the boat graves. Ancient skeletal remains present a number of challenging features where the amount and integrity of recovered DNA are limiting factors. We will use NGS technology to overcome many of the challenges in a directed and genetic analysis. The assay provides the potential to analyze ancient DNA profiles of Viking age remains to ancient and contemporary European populations for information about ancestry and the migrations in ancient times. Our data may also provide information about phenotypic traits of these seafarers from early Viking ages.

Recent studies of ancient genomes have revealed two large-scale prehistoric population movements into Europe after the initial settlement by modern humans: A first expansion from the Near East that brought agricultural practices, also known as the Neolithic revolution; and a second migration from the East that was seen in a genetic component related to the Yamnaya pastoralists of the Pontic-Caspian steppe, which appears in Central Europe in people of the Late Neolithic Corded Ware and has been present in Europeans since then in a decreasing North-East to South-West gradient. This migration has been proposed to be the source of the majority of today’s Indo-European languages within Europe.

In this paper we aim to show how these processes affected the Eastern Baltic region where the archeological record shows a drastically different picture than Central and Southern Europe. While agricultural subsistence strategies were commonplace in the Corded Ware culture. From the collections, Renko (13th to 19th century), Porvoo (16th to 18th century) and Hamina (18th century) 3-13 individuals are included in the aDNA study, respectively, as well as 20-35 Iron Age samples from Western Finland. All of the remains have undergone paleopathological and archaeological analyses.

We proved the presence and satisfactory preservation of ancient mtDNA in Finnish bone material over the timespan of 1,500 years. Several complete mitochondrial genomes for each of the archeological collections studied were retrieved. The mitochondrial evidence is used, through continuity tests, to compare the ancient DNA phylogeographic structure of Finns with that of the modern Finns. In addition, by including modern nearby populations into analysis, it is possible to examine the past relations and possible patterns of migrations in historical Finland. Previously published aDNA data from other locations is used to estimate the order and timing of population changes in Finland over time.

In the future we hope to include more ancient samples from Northeastern Europe and other parts of Finland, dating to the Iron Age, to further complete the historical timeline. Genome-wide nuclear DNA analysis is also planned for the samples well preserved.

As a modern population, Finns are well known for an abundant record of genetic research. There are, however, no ancient DNA studies focusing on Finnish population history before now.

In this paper we aim to show how these processes affected the Eastern Baltic region where the archeological record shows a drastically different picture than Central and Southern Europe. While agricultural subsistence strategies were commonplace in the Corded Ware culture.

From the collections, Renko (13th to 19th century), Porvoo (16th to 18th century) and Hamina (18th century) 3-13 individuals are included in the aDNA study, respectively, as well as 20-35 Iron Age samples from Western Finland. Investigating the human remains from the Tallinn gallows hill is part of an ongoing study of Estonian execution sites. The study involves field work and excavations of uninvestigated gallows hills, as well as analyzing material from previously excavated sites in Estonia. Comparisons will be made with data from neighbouring countries, and the ultimate goal is to provide a clearer picture of the history of executions in Estonia.

During an excavation in Vilnius in 2001, a mass grave was uncovered containing over 3000 individuals, later identified as Napoleon's soldiers from his unsuccessful 1812 campaign against the Russian Empire. In 2007, the burial ground of the former Royal Naval Hospital was excavated in Plymouth, UK. The graves that were excavated contained more than 150 British sailors dating from broadly the same period as the Vilnius mass grave. These two excavations therefore provide an excellent opportunity to compare broadly contemporaneous groups of servicemen that are very similar and at the same time very different.

The current project focuses particularly on spinal pathology and the respective effects that different kinds of manual labour might have had on individuals from the two groups studied. Whilst both groups are likely to have had rigorous demands placed on them by their respective occupations, the current study considers the extent to which varying kinds of habitual activities will have produced different patterns of alteration and pathological responses in this crucial part of the skeleton.

**Keywords:** ancient DNA, Estonia, Neolithic

**Presentation Preference:** Poster

The Neolithic Revolution, describing the transition from a hunter-gatherer subsistence to farming, is one of the most important processes in human history and has been found to be largely a result of demographic diffusion. The arrival of the first farmers in Europe led to an influx of genetic diversity not seen before as well as admixture of local hunter-gatherers and farming people. Changes in the human genetic make-up caused by the Neolithic Revolution were analyzed and described in previous studies including ancient samples from many parts of Europe; however, the genetic makeup of ancient humans from the Eastern Baltic region is still poorly studied.

Here we reconstructed the complete mitochondrial DNA of 20 individuals from different archaeological sites of Estonia covering the time span from the Late Mesolithic to the Late Neolithic. By determining the haplogroups of the individuals, we show that the typical European hunter-gatherer maternal lineages are represented exclusively in all individuals from all sites until the Middle Neolithic. From the Late Neolithic on, we see the inclusion of haplogroups that are linked to the Corded Ware culture. The geographic origins of these individuals have so far not been investigated. In this study, geographic affinities of 24 human skulls recovered from the Kronan wreck were investigated through the analysis of metric and non-metric cranial data. Although the results indicate that many of the individuals aboard the ship were Scandinavian, a number of individuals exhibit cranial and dental characteristics inconsistent with European ancestry. These findings provide new information about the demographics of the Swedish military community during the seventeenth century. In addition, the study demonstrates the limitations of current craniometric databases for distinguishing different populations around the Baltic Sea, a situation that will hopefully improve as reference data for these populations becomes available in the future.

Co-author(s): - Dr. Wadyl, Sławomir, University of Warsaw, Warszawa, Poland (Presenting author)

The potter’s wheel is one of the principal technological innovations of the Late Iron Age (10th – 13th century). Through Baltic ware pottery, its use rapidly spreads across the Baltic Sea region. This paper focuses on the variability of pottery-forming techniques in Latvia territory during the adoption of the slowly rotating potter’s wheel and Baltic ware pottery. As indicated by archaeological material, both Eastern and Western Latvia are part of the Baltic Sea trade network. It is the path along which potters spread their goods and skills. However, when conducting a more detailed analysis of Baltic ware, the use of potters’ wheel is subject to distinct local variations. In the East, there appears to be a sudden switch from the previous potter’s wheel tradition to the new Baltic ware. There is little to no interlaying period of varying hybrid-forms. It seems that the technology and the skills for using it were acquired almost at the same time. In the West the potters’ wheel is taken up only partly, preserving previous pottery production methods and using them alongside the new methods. The hand-made manufacturing tradition was forgotten, in fact, hand-made pottery was still produced until the fourteenth century. This paper aims to show a different pattern of relation of the local people to the changing world around them through the acquisition of Baltic ware and the potter’s wheel. The differences of taking up the new technological innovation could not have originated just from differing placement within the trade network. Both regions have equal access to the new technology. However while some take it up rapidly others seem more hesitant. The braking and remaining of thousands of years old pottery production traditions was influenced by longstanding socio-economic paradigms. Further discussion of pottery variation might reveal some important playing factors within these paradigms.

The cemetery of Linkuhnen at the Nemunas River is best known for the large number of swords and other weapons from the Viking Age. Only little attention has been paid to the various finds from the Roman Iron Age and Migration Period in Linkuhnen. The analysis and re-evaluating of the archaeological objects and archival material from excavations between 1928 and 1939 allow for a new perspective on this important site. The reconstruction of the excavation results provides a comprehensive understanding of the chronological situation at Linkuhnen for the first time and show a continuous usage of the cemetery from the Roman Iron Age and the Migration Period to the Viking Age (2-11, century AD) with almost 500 burials and over 5000 grave goods. The finds from the Migration Period are indicators for long-distance trade and communication between Prussians, Scalians, Curonians and the mutual relations between colonists and Curonians. The study uses both written and archaeological sources.

TH4-12 Abstract 06
Products Made with Inlay and Plating Techniques in the Ancient Prussia in the XI - XIV Centuries

Author: - Dr. Jahn, Christoph, Museum für Vor- und Frühgeschichte Berlin, Berlin, Germany (Presenting author)
Co-author(s): - Khokhlov, Alexandr, IA RAS, Tver, Russian Federation (Presenting author)
Keywords: Ancient Prussia in the XI - XIV centuries, the techniques of inlay and plating
Presentation Preference – Oral

Different products made using the techniques of inlay and plating iron with base and precious metal were known in Prussian applied art since the end of Viking era. This technology wasn’t applied in material culture of early middle-ages Prussians. It is unknown where was the source for such sophisticated jewelry technologies often applied Prussian masters at one a thing from the start the XI century. These technologies might be the result of multilateral contacts with Scandinavians and eastern territories and perhaps the territories beyond the Volga. These technologies had two chronological stages in Prussia. The first stage: the XI - XII centuries. Products of this stage have intricate geometrical shapes that indicate some connection with early Scandinavian samples. Time of their appearance in Prussia is similar with such décor spreading in neighbor territories of the Kurshi and the Finns. The inlay was used as for arms (sword pommales from Izrakipina, Swityj (Zimniki), plugs of spearheads from Vetrov (Ekrantin), Konorivo (Doliki), Konorivo (Budzuk), Muromskoje (Laptau), Fedorovo (Maltaten), Prusysnoje (Kuaster), parts of harness from Kurievsk (Klein Heide) and Volnoe (Schulstein). Such decor has parallels in more early decorative elements of the Baltic Sea region. The second stage: the XII - the beginning of XIV centuries. It is specified by appearance of numerous products (iron parts...
of sword knots and belts, spurs for riding and buckles of spurs, arms like the sword from the Balga castle surroundings and sword hilt from Marienwerder) decorated with geometrical and zoomorphic ornament like image of horned animals ("goats of Perkūnas god"). Made in unusual for Prussia style with using wire and foil from different metals. Some researchers had suppositions about their eastern origin connected with the movement of the Mongols in Eastern Europe in the XIII century. Such supposition has its reason considering geography of findings (Moravia, Poland, Kaliningrad region (East Prussia), Belgorod region). New findings of this stage goods (belt plates, spurs) are represented in materials from burial ground in Fedorovo, Belgorod. Such artifacts are also known in Belorusussia and Lithuania that can be explained by the migration of the population West-Baltic region caused by crusader expansion. Numerous decor elements connected with Christianity (different images crosses) appeared in this period. This stage is characterized by the reduction of products plated with silver that was in active usage at the first stage. Mass use of these technologies passed away among Prussian jewelers. In this period such goods served as status indicating jewelry of Prussian nobles. This jewelry tradition passed away completely perhaps under the influence of European fashion after absolute conquest of Prussian tribes by the Teutonic Order.

TH4-12 Abstract 06

Western Balts after the Vikings and just before the Crusades.

Finalisation of the post-doc project

Author - Dr. Shiroukhov, Roman, Vilnius University, Vilnius, Lithuania (Presenting author)

Keywords: Archival data, Chronology, Western balts

Presentation Preference - Oral

During the several last years of preparation of PhD thesis about Prussians and Curonians contacts in the 10/11th-13th centuries and the Post-doc project, dedicated to the Western Balts social, economical and cultural development in the described period, the unique archaeological archives and artefacts database of the 37th scientific institutions from the 8th countries has been collected. Following the tradition of the transregional research of the Western Balts, established by Carl Engel and other East Prussian archaeologists and working in all the major archaeological collections of the Baltic sea region, connected to the Western Balts culture of the late 10th-13th centuries, with a particular consideration on former "Prussia Sammlung", the picture of development of the whole South-East Baltic region on the basis of archaeological data was elaborated. Considering this, catalogues, maps and analytics for the each general artefact type, burial custom and social (cemeteries based) structure were prepared and partially published. The very first draft of the book reviewed by 2 senior researchers was sent to the Research Council of Lithuania in March 2015. The basis of the draft represents the dissertation, significantly supplemented with data collected during the implementation of a post-doc project in 2013-2015, as well as some new ideas and theories about the development of the South-East region of the Baltic Sea in the 10-13th centuries. The final stage of the preparation of the post-doc project book will be presented at the session.

TH4-12 Abstract 07

A Heraclius solidus - an Avar find from Sambia

Author - Dr. Zapolska, Anna, Institute of Archaeology, Warszawa, Poland (Presenting author)

Keywords: Avars, Heraclius, solidus

Presentation Preference - Oral

In 80’ of 20th century a unique find was made in Sambian Peninsula. During excavations a Heraclius solidus was discovered – the only so far Byzantine coin from this region. Gold coins of Heraclius were minted in big numbers and served as source of tribute payment for Avars. The time of paying these tributes to Khaghanat was very short – it lasted only few years – as long as Avars threatened to the Empire’s borders. Even though there are numerous finds of these coins in Lower and Middle Danube, in Carpathian Basin and further to the north up to Middle and Lower Rhine. One such coin was found on Polish lands. The one from Sambia is the farthest find and isolated at the same time. The artifacts, which can be linked with Avar influence found within West Balts Culture Circle are rare. Among them there are mostly belt fittings, elements of harness and sporadically parts of jewelry. The coin then arises suspicions and questions on its origin, time, ways and circumstances of the inflow.

In my paper I will present new ideas on this matter – contrary to common opinion, that Byzantine coins were brought to the north from the Carpathian Basin through Slaves, there were the rests of Germanic tribes, who should be linked with this mystery and unique find and it’s appearance at the Baltic shore.
TH5

SCIENCE AND MULTIDISCIPLINARITY IN ARCHAEOLOGY

Advancement in the use and application of scientific techniques and methodologies in archaeology have significantly altered and contributed to our knowledge of the past. Many of the greatest examples of the research reconstructions of the past have been achieved through the integrated application of multidisciplinary methodologies. This theme seeks contributions that examine how the combination of interdisciplinary research methodologies have affected and influenced development in all areas of archaeology. Debates on both the advantages and the limitations of scientific techniques are invited, together with case study examples that illustrate the improvement of quality and reliability in particular analytical methods.

Closely related to long-standing scientific methodologies in archaeology, bioarchaeology is increasingly presenting a new focus on application of a variety of biological research platforms to our understanding of the past. Employing new technologies, new methodologies and new knowledge from biomedicine, chemistry, physics and biomolecular research, these complement our understanding of the past by adding a “biological dimension” to archaeology. In this theme, we call for contributions and discussion on various aspects of human and animal agency and interaction (morphological variability, growth and development, senescence, diseases, diets) as well as human and animal population studies (paleodemography, genetics).

TH5-01  INVESTIGATING GEOCHEMICAL AND PETROGRAPHIC METHODS FOR FLINT IDENTIFICATION IN ARCHAEOLOGY

Friday, 2 September 2016, 09:00-13:00
Faculty of History, Room 217
Author: Sobkowiak-Tabaka, Iwona, Institute of Archaeology and Ethnology
Polish Academy of Sciences, Poznan, Poland (Presenting author)
Co-author(s): - Werra, Dagmara H., Autonomous Unit for Prehistoric Flint Mining in Warsaw, Institute of Archaeology, Warszawa, Poland
- Mangado, Xavier, University of Barcelona, Barcelona, Spain
- Hughes, Richard E., Geochemical Research Laboratory, Portola Valley, United States of America
Presentation Preference - Workshop

During the Stone and Early Bronze Age, flint and chert were the most widely used raw materials for making various types of tools and weapons. Along with dyes (used in burial rituals) and shells, lithic raw materials are among the most important items available to archaeologists to document long distance distribution, exchange networks, and mobility in Stone Age. Given this, precise identification of the outcrops of siliceous rocks-based on their mineral and chemical composition-is of crucial importance in determining the geologic/geographic areas from which artifacts originated. Because flint is notoriously difficult to source using macroscopic means, instrumental methods of analysis, e.g., energy-dispersive x-ray fluorescence (EDXRF), laser ablation-inductively coupled plasma-mass spectrometry (LA-ICP-MS) trace element analysis, scanning electron microscope (SEM), electron probe micro analysis (EPMA) and micropaleontological analysis all have been explored to help attribute artefacts to their source of origin and to distinguish among and between individual varieties of siliceous rocks.

This session will be devoted to geochemical and petrographic investigations of flints, including their potentials and limitations. We welcome a wide range of presentations dealing with research on different kinds of siliceous rocks, in any period of time and space, and hope the session will provide new directions for future research into the important problems of flint provenance studies.

TH5-01  Abstract 01
Archaeopetrological Study of the Lithic Industry from “Hort de la Boquera” site (Tarragona, Spain)

Author: PhD student Rey-Solé, Mar, University of Barcelona, Barcelona, Spain (Presenting author)
Co-author(s): - Garcia-Angelies, Parr, University of Barcelona, Barcelona, Spain
- Mangado, Xavier, University of Barcelona, Barcelona, Spain
Keywords: Archaeopetrology, Flint, Raw materials
Presentation Preference - Oral

The Epipaleolithic site of “Hort de la Boquera”, dated from 12,250±60 BP to 11,850±45 BP and 11,775±45 BP, is located in the north-eastern part of Iberia. The complete stone tool assemblage includes up to 24,000 flint artefacts. This presentation is the first approach to the analysis of the raw materials through an archaeopetrological study. First of all, results were obtained by use of mineralogical techniques: macroscopic and microscopic (petrographic) analysis, Scanning Electronic Microscopy (SEM), Micro-Raman and X-Ray Diffraction (XRD); thus combining mineralogical, petrological and micropaleontological methods. Additionally, a geochemical technique was applied: LA-ICP-MS. One of the aims of this presentation is to show the results that were obtained in this study and to demonstrate the advantages and disadvantages of each technique used. Finally we will show the initial results of the project’s geological surveys conducted in the area, which has allowed for the study of several primary outcrops of siliceous raw materials. The analysis of these sources of raw material and their comparison with the stone tools recovered in Hort de la Boquera rockshelter have led to an initial approach to the potential sources of supply of the Epipaleolithic groups that occupied this rockshelter. Together, these results make this study the most comprehensive analysis of the raw materials to have been carried out in the area, and will therefore be a breakthrough in our knowledge of the economy of the prehistoric communities, and thereby helping in the understanding of the reasons for certain human behaviours.
TH5-01 Abstract 02
Applying ED-XRF, LA-ICP-MS and PIXE analyses to characterize Pyrenean cherts. Potentials and limits

Author - PostDoc Sánchez de la Torre, Marta, Université Bordeaux Montagne, Pessac Cedex, France (Presenting author)
Co-author(s) - La Bordonnec, François-Xavier, Université Bordeaux Montagne, Pessac Cedex, France
Co-author(s) - Dubernet, Stéphan, Université Bordeaux Montagne, Pessac Cedex, France

Keywords: chert characterization, geochemistry, lithic raw materials procurement
Presentation Preference - Oral

An intense fastwork focusing on the definition and characterization of chert sources outcropping in the Pyrenees (SW Europe) was recently done. This work was linked to a PhD research concentrated in determining Magdalenian human mobility in the Pyrenees through the analysis of chert tools. This study contemplated a textural, petrographic and micropaleontological characterization of chert using macroscopic and microscopic methods. However, results showed that these techniques had some limitations regarding the existent similarity between several formations. Thus, recovering the previous data obtained after the textural, petrographic and micropaleontological characterization of several Pyrenean chert formations, we applied some geo-chemical methods. The aim was to observe the potential these methods could have to characterize chert and, by this way, solving archaeological questions. We would like to present in this communication the potentials and limitations of the application of energy-dispersive X-ray fluorescence (ED-XRF), laser ablation-inductively coupled plasma-mass spectrometry (LA-ICP-MS) and particle-induced X-ray emission (PIXE) to chert characterization.

TH5-01 Abstract 03
Sourcing prehistoric chert artefacts from Malta using new non-destructive techniques

Author - Chatzipanagiotou, Petros, University of Cambridge, Cambridge, United Kingdom (Presenting author)

Keywords: Chert, Malta, Sourcing

Presentation Preference - Oral

The purpose of this paper is to present petrological/geochemical techniques (e.g. LA-ICP-MS), which can contribute to the investigation into the origin of chert assemblages found in prehistoric sites in Maltese islands. This research is part of a greater project (FRAGSUS) investigating the extent to which these islands were laboratories of human activity and, in particular, their degree of connectivity with neighbouring areas. The project focuses on the Stone Temples on Malta (between 4th and 3rd millennia BC) and identifies the circumstances under which these unique monuments were built. Although these stone artefacts have been studied in the past, the research on their sources has been inconclusive. The advantages of these techniques are their great accuracy, the speed with which results are obtained and, most importantly, they are non-destructive. They are considered perfect for identifying the mineralogical and geochemical context of rock samples. These specific characteristics, combined together, can be great indicators of the origin of these chert assemblages. Finally, the main principles, functions, equipment and limitations of these techniques will be demonstrated. Secondly, preliminary results from both chert assemblages and chert outcrops from Maltese islands will be presented. Moreover, this paper will also show how the results should be processed in order to obtain the necessary and useful information in sourcing chert assemblages. Finally, a comparison will be made between these techniques and those used in similar research in western Greece.

TH5-01 Abstract 04
Renewed petrographical and geochemical studies of flint from secondary deposits: Belgian case study

Author - Dr. Moreau, Luc, McDonald Institute for Archaeological Research, University of Cambridge, Cambridge, United Kingdom (Presenting author)
Co-author(s) - Dr. Feunteun, Paul, Bal-Paléolithe, Villard-de-Lans, France
Co-author(s) - Dr. Brandl, Michael, Institute for Oriental & European Archaeology, Austrian Academy of Sciences, Vienna, Austria
Co-author(s) - Prof. Filmore, Peter, Institute of Statistics and Mathematical Methods in Economics, Vienna University, Vienna, Austria

Keywords: flint, flint artefacts, Neanderthals, secondary deposits, Belgium

Presentation Preference - Oral

The western region of the English Channel is an archaeologically rich area encompassing the French coastline and the plateaux of the Channel Islands located on the shallow Continental Shelf. Although modern sea level has obscured much of the prehistoric landscape for cooler periods during the Ice Age the region would have resembled a terrestrial plain with a diverse biotope ranging from boreal forest to tundra conditions, home to both Neanderthals and the large fauna that they hunted. This study is focused within the Middle Palaeolithic of the area; a time period represented well in the western Channel for example at large sites such as La Cotte de St. Brelade, Jersey. It aims to shed light on the now largely submerged Neanderthal resource base by reconstructing procurement of their preferred raw material, flint (here referring to siliceous rock of Cretaceous age). On the Continental Shelf we know that primary bedrock flint was likely only available from several small chalk outcrops to the north of Jersey, whilst secondary flint sources were present in rocky beaches and carried by nearby palaeo-rivers. These flint pebbles, removed from their original context, are very variable with thick, pitted, cortex and visible inclusions, deriving from multiple parent sites.

This research focuses on artefacts within the La Cotte de St Brelade assemblage that have likely been procured from a primary bedrock origin. At this stage these artefacts are identified macroscopically by the presence of thin chalky cortex and the fine-grained homogenous nature of the flint matrix. This project investigates the geochemical signature of these flint objects with
the hope to further clarify this theory and provide empirical data to macroscopic generalisation. It therefore employs an artefact
centric model first testing multiple assemblages from the site using portable X-ray fluorescence. This process will likely begin to
test the extent to which change can be supported by further targeted minimally destructive testing, such as LA ICP-MS to
achieve a more finite, qualitative perspective for geochemical trends within the sequence. Overall there are some clear
and obvious issues with sourcing flint in general (e.g. internal variation, high silica percentage) and particularly within this context
where we have no access to the suspected primary deposit, however the potential to realise information about this sustained
and varied Neanderthal occupation and sheer quantity of flint artefacts available to study outweighs preliminary negatives and
the future of this project will be to further adapt a methodology aimed to shed light on Neanderthal behaviour through their flint
acquisition strategies.

TH5-01 Abstract 07
Erratic Flint from Poland. Preliminary results of petrographic and geochemical analyses

Author - Dr. Sobociński-Tabaka, Iwona, Centre for Prehistoric and Medieval Studies in Poznań, Institute of Archaeology, Poznań, Poland (Presenting author)
Co-author(s) - Wiera, D.H., Autonomous Unit for Prehistoric Flint Mining in Warsaw, Institute of Archaeology, Warsaw, Poland
Co-author(s) - Hughes, R.E., Geochemocheamic Research Laboratory, Portola Valley, United States of America
Co-author(s) - Siuda, R., Faculty of Geology Address University of Warsaw, Warsaw, Poland
Keywords: erratic flint, geochemical analysis, petrologic analysis
Presentation Preference - Oral

Archaeological sites in Poland, and elsewhere in Western Europe, document that flint and chert have a long history of use. The most
commonly knapped raw materials throughout the Stone Age and Early Bronze Age, flints from a number of different sources
were used for making tools and weapons, fire-lighting tools, etc. When studying prehistoric flint, one of the more interesting
issues to be examined is the connection between deposits exploited at the time and the tools recorded at archaeological sites.
By following the spread and distribution of particular raw materials we can study the spreading of prehistoric communities, their
mobility and mutual contacts, as well as the size and quality of exchange networks.

At the same time, those features which caused siliceous rocks to be highly prized by ancient communities also mean that it is
easier to detect a deposit to be the raw material source for artefacts found at an archaeological site. That is why researchers try to describe
the diagnostic features of siliceous rocks using various petrographic and geochemical methods. The area of the Vistula basin is rich in
siliceous rocks and it contains deposits of several varieties of flint. A 'chocolate', grey white-spotted and striped (banded) variety, Volhynian flint on its eastern borders and erratic flint, occurring mostly in secondary
deposits, were all widely used in prehistoric times. Almost all of them have been examined by using both macroscopic
and petrographic-geochemical methods to define their diagnostic features.

Erratic flint has never been a subject of a separate macroscopic study. This perhaps stems from the fact that among
several varieties of flint used by prehistoric inhabitants the region of present-day Poland, erratic flint is the most challenging
raw material because of its high variability in colour, presence of fossil microorganisms and heterogeneous composition.
Lithic analysis, however, seems to be incomplete. In general, two main types of Cretaceous flint have been distinguished: the so-called
variant A - bluish-grey nodules, and variant B – Pomeranian flint in the form of pebbles (the so-called swallow eggs), yellowish-
brown or pink in colour.

The aim of the paper is to present the preliminary results of petrographic and geochemical analyses of erratic flint found
towards present-day Poland. Three different methods have been applied: electron probe micro analysis (EPMA), scanning electron
microscope (SEM) and energy-dispersive X-ray detection (EDXRF) spectrometry. The results of the EPMA and SEM analyses of erratic flint have revealed a largely homogeneous mineral composition, which suggests that mineral composition
will be of limited utility in distinguishing erratic flint. However, EDXRF analysis of a small sample of erratic flint has identified differences
calcium (Ca) and iron (Fe) content among samples of erratic and 'chocolate' flint but a much larger sample
number of erratic flint specimens needs to be analysed to determine the range of chemical composition they contain.

Acknowledgements: The investigations were funded by the National Science Centre in Poland (PRELUDIUM 2; UMO-
2011/03/N/HSS/01373).

TH5-01 Abstract 08
Lithic raw material from eastern part of Polish Carpathians. Results of preliminary research

Author - Prof. Pelisak, Andrezja, Institute of Archaeology University of Rzeszów, Rzeszów, Poland (Presenting author)
Co-author(s) - Dr. Trapka, Joanna, Institute of Archaeology University of Rzeszów, Rzeszów, Poland
Keywords: lithic raw material, macroscopic and petrographic characteristics
Presentation Preference - Oral

This presentation refers to the lithic raw material exploitations in the eastern part of Polish Carpathians. The surface surveys
and LIDAR analysis carried out in 2013-2016 on this area resulted in discovery of new resources of various lithic raw material
used in the prehistory: siliceous sandstones, quartzite, siliceous marls, menilite hornstones, flysch radiolarite, bincca-like flints,
large tabular hornstone. As suggested from artefacts found on the sites in Poland and Slovakia in various chronological contexts
these lithics were exploited both for local and much wider use. Identification of raw material itself as well as the outcrops of
different rocks is crucial issue in the study on relations between prehistoric communities.

The purpose of our work is to present the primary macroscopic and petrographic characteristics of various variants of
siliceous sandstones, quartzite, siliceous marls, hornstones, flysch radiolarite and flints from the Eastern Carpathians as well as their
natural sources. We point at distinctive features of macroscopically similar or almost identical raw materials that allow to
discern stone artefacts and suggest their source area.

TH5-01 Abstract 09
Flint studies for applications in archaeology – procedures and investigation sequence

Author - Dr. Zarina, Liga, University of Latvia, Riga, Latvia (Presenting author)
Co-author(s) - Segnis, Vaidas, University of Latvia, Riga, Latvia
Keywords: flint and chert, research procedures, stone tools
Presentation Preference - Oral

During the Paleolithic flint and chert besides other stone materials were widely used for making tools. Because of numerous
finds, flint becomes one of the most important information sources regarding prehistoric society for evaluation of ancient skills,
knowledge and innovations. Therefore needs for well-developed typology of tools and updated laboratory methods for raw
material identification and characterization can be recognized. Mentioned above leads to evaluation and future development of tools grouping and classification still visually based to be supplemented or replaced by tools morphometric analyses and numeric data analysis depending on research directions. In this respect specialized data coming from artifacts morphometric analysis can be used also for identification and characterization of used raw material, pointing, for example, to quality of the material for making tools, processing possibilities and traces of weathering. Current laboratory testing methods are well developed and available in most of the research centers and institutions, however, only few have developed a long-term classification, and the case studies with limited potential to be applied in traditional
archaeological studies.

Most of reasons are related to limitations to use destructive methods, needs for pretreatment, size of sample, specific qualifications etc., but still the main complications are coming from natural diversity of stone material and complications to obtain comparable analytical data.

In the study geological samples of flint and chert besides from sites in Northern Europe as well as archaeological samples collected
during Institute of Latvian History excavations in the Stocene Neolithic settlement and Lapini Mesolithic settlement were included.

The research procedure was developed for obtaining comparative analytical data. In the study macroscopic and microscopic
assessments in visible and ultraviolet light were carried out, and for chemical composition detection the X-ray fluorescence
spectrometry (XRF) method was used.

Our studies demonstrate needs for certain procedure and conditions to obtain analytical data which satisfy regional flint
tools studies regarding source material localization and tracing the transportation routes.

TH5-01 Abstract 10
Cultural contacts during the late Boreal and early Atlantic by the Baltic coast of Sweden

Author - Källquist, Matti, National Historical Museums, Sweden, Lund, Sweden (Presenting author)
Presentation Preference - Oral

What were the directions of the social and cultural routes of contact, during the late Boreal and early Atlantic in Southern
Scandinavia? This study is based on technological traditions in bone and lithic material, and strontium analyses from human
teeth. The main material comes from Norje Sumanans, a well preserved settlement covered by Littorina gyttja, excavated in
2011. The site lies by the outlet of a former lake, 2 km from the Baltic coast in Southeastern Sweden. It is among the first coastal
settlements from the Maglemosian time period excavated in Southern Scandinavia. The settlement has been inhabited repeatedly
during most of the year, and the finds are extensive, including both a varied lithic material and a bone material 14C-dated to ca.
7600–6800 cal. BC. The choice of lithic raw material – mainly Kristianstad flint, Senonian flint and quartzite – suggests connections
in both northbound and southbound directions. Some characteristics of the lithic blade technology and the bone technology also
suggest a connection with traditions from the east side of the Baltic, while bone ornaments and spindle whorls show some
similarities with the Maglemosian tradition. The results from strontium analyses of 12 lose human teeth strengthens the picture
of connections between people from different geographic areas.
The rise and development of brick production in Vilnius, the capital of the former Grand Duchy of Lithuania, was inspired as strategically important craft. The production of bricks has been changing and improving during more than seven centuries. Therefore brick is an important source providing the knowledge about the technical development, production potential and cultural influence during different periods. The evaluation of physical and chemical properties of bricks would enable us to judge about the technological standards of Vilnius bricks, deviations from them and their reasons. The promising investigation methods of the old bricks are related to applied methods of exact sciences. One of them is geochemical method. The geochemical data statistically grouped using Ward’s hierarchical clustering (Barcevičius, Taralkeivicius, 2015, Archaeologia Lituanica, v.16, p.45-62) enables to hypothesise that: a) in certain chronological periods the material for construction of buildings and production of bricks could be extracted from the same or adjacent clay deposits in different mineral composition; b) there existed brick production technologies specific for that period. So, it is possible to try to create peculiar “multivariate recalibration matrices” with as many as possible dated or characterised by other parameters samples. According to them it would be possible to determine at least approximate date of the newly found interesting brick of unknown chronology or to compare other features.

Geochemical investigations are understood as a complex of methods which includes: a) purposeful selection of brick fragment samples; b) multi-elemental method of determination of real total contents of elements; c) multivariate statistical analysis (cluster, factor analysis); d) analysis of the ratios of geochemical indices; e) graphical representation of data. Energy-dispersive X-ray fluorescence is usually used for investigation of chemical composition. Its advantage is that great number of chemical elements which can be determined including those related to clay minerals and their additives (Al, Ca, Fe, Mg, Na, K, Si, Ti) accompanied by specific trace elements (Ga, Co, Cr, Cu, Mn, Nb, Ni, Rb, Sr, S, P, Br, Zn, Pb, etc.).

Aiming to obtain more precise interpretation of brick origin and technological processes using geochemical methods it would be useful: a) to take more (10%) sub-samples from the same brick (avoiding the effect of random sample selection); b) to take samples from the inner part of the brick (reducing anthropogenic geochemical component); c) to use multivariate analysis method with obligatory determination of total content of main major chemical elements and their specific satellites; d) to compile geochemical database of as many as possible dated bricks (when a, b and c requirements are met); e) to select the set of chemical elements for multivariate analysis basing on various geochemical features (not only variability of composition); f) to verify and supplement the results of cluster analysis with the help of other multivariate statistical methods; g) to accumulate geochemical data on potential raw material (clay) deposits.

TH5-01 Abstract 12
Micromorphology of flint from Mesolithic–Early Neolithic site
Zamostje 2 via thin-section analysis

Author - Dr. Kulikova, Marianna, Herzen State University, St. Petersburg, Russian Federation (Presenting author)
Co-author(s) - Lazovskaya, Olga, Institute for the History of Material Culture, St. Petersburg, Russian Federation
Keywords: Mesolithic, Early Neolithic, petrography of flint, raw materials, Zamostje 2 site
Presentation Preference - Poster

Site Zamostje 2 is situated in the northern part of the Moscow district on the Duna River (Russia). The site has yielded cultural layers of the late Mesolithic and early Neolithic with pottery and dated to the time between the beginning of the 7th to the middle of the 6th millennium cal BC. The flint tools which were found inside the Mesolithic-Early Neolithic cultural horizons have many common features. Mainly the same flint sources were used for them. Micromorphology of flint samples including the composition and structure of flint was examined by means of thin-section analysis. Thin sections were investigated at low magnification between x10 and x100, as higher magnifications obscure individual features, which may not be helpful for structural interpretation. Using both plane- and cross-polarised light highlights the textural and structural characteristics of the sample. The microstructural, mineralogical and micropaleontological characteristics allow to divide several flint types and suggest their geological age. The most common is the stone tools for which was used the Carbon flint. There are several samples of Jurassic and Cretaceous ages Carbon flint was found in the site as pieces of rounded pebbles. The outcrops of flint sources in this region are covered by Quaternary deposits. The Quaternary deposits in this area are presented by the Upper-Volga outwash alluvial lowland with the depth of about 100 m. Lowland transits to Kolašo–Dmitrov marine-erosion ridge. We suppose that the main raw sources are the alluvial and moraine deposits of Quaternary age. It is possible also that some samples from flint of Cretaceous age were import items.
UNRAVELLING THE FORMATION PROCESSES OF THE ARCHAEOLOGICAL RECORD BY INTEGRATING ENVIRONMENTAL ARCHAEOLOGY AND TRADITIONAL FIELD EXCAVATION

Saturday, 3 September 2016, 09:00-18:30
Faculty of Philology, Room 92
Author - Rowena, Baroneja, University of Reading, Reading, United Kingdom (Presenting author)

Co-author(s) - Dr. Orton, David, University of York, York, United Kingdom
Co-author(s) - Dr. Reilly, Eileen, University College Dublin, Dublin, Ireland
Co-author(s) - Dr. Orton, David, University of York, York, United Kingdom
Keywords: Environmental archaeology, Site formation processes, Taphonomy
Presentation Preference - Regular session

In 1987 Michael Schiffer published the hugely influential ‘Formation Processes of the Archaeological Record’, which has continued to be consulted to interpret the biographies of archaeological materials, the formation of refuse and refuse assemblages, the spatial and diachronic development of archaeological sites, and to study sites in the context of their hinterlands. On the approach to the 30th anniversary of Schiffer’s publication, this session aims to examine the contribution that environmental archaeology, and its associated specialisms such as archaeobotany, geoarchaeology, palaeoentomology, palynology, and zooarchaeology, has made to advance our interpretations of formation processes on archaeological sites. We welcome submissions from all specialisms of environmental archaeology, as well as from archaeologists in other fields, particularly those who apply integrated approaches and/or experimentation to understand the taphonomy of data assemblages, the formation and reworking of stratigraphy, and the diagenetic processes that affect archaeological materials within their depositional context.

TH5-02 Abstract 01
A multi-disciplinary approach to formation and abandonment processes within later prehistoric houses

Author - Dr. Romaniewicz, Tanja, University of Edinburgh, Edinburgh, United Kingdom (Presenting author)
Co-author(s) - Dr. Hunter, Fraser, National Museums Scotland, Edinburgh, United Kingdom
Keywords: Abandonment processes, architectural analysis, Prehistoric building materials
Presentation Preference - Oral

From the Bronze Age to the late Iron Age people in Britain lived in roundhouses. They generally kept them clean which created wear, brush and cut patterns on the soft lowland soils. Later truncation left little remains behind apart from low heavily fragmented artefacts, the fills of negative features such as pits and postholes which can contain deliberate structured deposits, and the sediments trapped in the use-wear depressions. The material recovered from these hollows or the top fills of features is often ignored as representing redeposited material that can yield little securely stratified information. These deposits are either midden-rich, some showing a degree of lensing, or represent a bulk of homogenised but often artifically sterile infill. This paper is interested not only in the formation processes but the nature of their infills and the research potential of such redeposited “rubbish”. The multi-disciplinary approach based on recent excavations in Scotland uses micro-morphology, archaeological analysis of structure and building materials and experimental reconstructions from Britain and beyond. Results suggest that the accumulated infills in the work holes are unlikely to be contemporaneous with the final house occupation, but represent post-abandonment processes not linked to the particular structure, but to wider site activities. The homogenous bulk of material infill represents the remains of the houses’ superstructures and is studied at macro- and micro-levels to identify their organic building materials such as timber, turf and earth which are usually assumed to be “lost”. Interpretations with such redeposited material move away from trying to understand each structure on a site individually and towards studying these within a model that postulates a cyclical site use, in which individual features and materials change function and substance because they are interlinked in larger economic and cultural processes.

TH5-02 Abstract 02
Interpreting silos deposits in medieval Mediterranean France: archaeo-botanical approach

Author - Dr. Rios, Jerome, UMR7209, CNRS/MNHN, Paris, France (Presenting author)
Co-author(s) - Dr. Vaschalde, Christophe, UMR 5554 ISEM (CNRS)/ UMR7208 LAM3 (CNRS), Montpellier, France
Keywords: archaeobotany, medieval Mediterranean France, silos
Presentation Preference - Oral

For the last twenty years, large-scale public works have helped to improve medieval archaeological research in Mediterranean southern France. The multiplicity of rescue excavations has led to the discovery of several large enlisting areas, some of them formed by thousands of silos. The discovery of such structures systematically raises the archaeo-botanist the issue of the identification of the type of deposits excavated (in primary or secondary position), and, for primary deposits, the question of the type of products analyses.

The discovery of storage in primary position remained uncommon and was, so far, poorly documented by archaeobotany in this area. New archaeobotanical investigations on several sites in Languedoc-Rousillon allows us to present a review of the results on storage practices in this region, and a discussion on the methods by which archaeobotany can enlighten the existence of primary deposits in enlisting areas. In a second time, we will discuss the interest of studying deposits in secondary position to document several questions, such as the identification of other agricultural practices not related to the storage itself, or the reconstitution of past environment exploited.

TH5-02 Abstract 03
Exploring house (after)lives at Gobekli Tepe via archaeo-botanical and animal bone taphonomy

Author - Dr. Orton, David, University of York, York, United Kingdom
Co-author(s) - Rigasahn, Jana, Finders University of South Australia, Adelaide, Australia (Presenting author)
Keywords: Bone taphonomy, formation processes, microstratigraphy
Presentation Preference - Oral

This paper presents recent work on the Gobekli Tepe Mound (Turkey, ca. 9000-8500 BC), combining microstratigraphy and animal bone taphonomy to explore the use lives of buildings. Research on architectural stratigraphy and particularly on formation processes of infill deposits has demonstrated that buildings underwent several phases of use, abandonment and modification, and that at various stages of their lives they were used for different activities and purposes that included storage, refuse disposal and burial. While stratigraphy provides a relative sequence of events, animal bone taphonomy provides data on the nature and rate of deposit formation processes, allowing us to begin to approach the duration of each stage in the buildings’ lives. These observations can be linked with interpretations of social processes during a phase of Anatolian prehistory that saw societies transform to become more mobile, fluid, and competitive.

TH5-02 Abstract 04
When someone walked in these buildings (geoarchaeology of soils)

Author - Cammas, Cecilia, INRAP, Paris, France (Presenting author)
Co-author(s) - Groussset, Marie, INRAP, Montigny-le-Bretonneux, France
Co-author(s) - Marcy, T., INRAP, Croix-Molineux, France
Keywords: geoarchaeology, huts, Middle Ages
Presentation Preference - Oral

The Medieval period was documented for a long time by texts and iconography. These studies brought numerous testimonies which tended to present the living conditions of the noble persons and the clerics. For more than 30 years, in France, the archaeological research has totally changed this incomplete vision of the period. So, the development of the preventive archaeology, and more particularly on huge excavations called in french ‘Grands Travaux’ lighted numerous data and artefacts of the beginning of the medieval period.

The national institute Inrap which was in charge of many of these projects, operated numerous related disciplines of the archaeology such as geoarchaeology, archaeozoology, archaeobotany. It was in particular possible to make experiments, such as they were able to be put forward in particular on plan of the Channel relaying the river Saine and the North of Europe (code CSNE). The poster presented here shows the results which were obtained on the same excavation fields of the North of France within the framework of a micromorphological study of the Early Medieval stuff. We especially focused on huts called ‘surrain featured buildings’. It was set up that a particular strategy of sampling, which aims at taking into account the allowed time, as well as the average scientists and the available human being. All the archaeological units of this type having been searched and
taken, it was set up an index form of statement taking into account paleo-environmental comments and studies. It is to find easily samples with the aim of the study in laboratory. Every sample was coded and inventoried. A ceaseless round trip between field data (sediments and drawings / photos) and the data obtained by the micro-archaeological study, as well as the overall of the other disciplines allowed to document very finely structures which seemed in prior homogenous.

So, the studies led by the archaeologists during works of preventive archaeology allow to set up relevant scientific protocols. The BBs, structures in prior without notable interest, give a lot of information to understand the everyday life of the populations of the beginning of the Middle Ages in the North of France. Thanks to the interdisciplinary studies led everywhere, it is today possible to have a more just vision of the activities of populations we discover in archaeological field.

**TH5-02 Abstract 05**

**Cesspits and the P-P-P-P-problem:**

**The pitfill of the Pompeii premise and the palimpsest**

Author: Dr. Van Oosten, Roos, Leiden University, Amersfoort, Netherlands (Presenting author)

Keywords: cesspits, palimpsest, Pompeii premise

Presentation Preference - Oral

Given their high yield of artefacts and ecofacts, cesspits are afforded much time and effort in urban archaeology. While historical sources reveal that cesspits were emptied at regular intervals every few years, archaeologists still treat cesspits as closed contexts where artefacts lie fossilized and undisturbed by subsequent cultural or natural processes. This 'archaeological blind spot' results from the lack of attention given to cesspit cleaning activities in the application of traditional archaeological methods. For example, counting ceramics both in terms of the 'minimum number of vessels' and fragments to tackle formation processes is widely known since Schiffer's publications, but has not taken root in urban archaeology.

This presentation is a call for a reevaluation of the contextual analysis, meaning that stratigraphy must be the terminus framework that links the single specialist reports, which would otherwise end up as discrete paragraphs in the definitive archaeological report. In order to date artefacts and ecofacts correctly, the issue whether cesspits are (in terms of Bailey 2008) true palimpsests (with or without residual refuse), cumulative palimpsests or temporal palimpsests must be discussed.

---

**TH5-02 Abstract 06**

**Reinterpreting pits and post-holes:**

**Archaeobotany as a tool to access site formation processes**

Author: Dr. Tereso, João, CIBIO - Research Center in Biodiversity and Genetic Resources (Univ. of Porto), Porto, Portugal (Presenting author)

Co-author(s): Martin-Soajo, Maria, CIBIO - Research Center in Biodiversity and Genetic Resources (Univ. of Porto), Porto, Portugal

Co-author(s): Vaz, Filipé, CIBIO - Research Center in Biodiversity and Genetic Resources (Univ. of Porto), Porto, Portugal

Co-author(s): Gaspar, Rita, Natural History and Science Museum - University of Porto, Porto, Portugal

Keywords: Archaeobotany; Formation Processes; Pits

Presentation Preference - Oral

The interpretation of archaeological assemblages has traditionally been based on a classification of archaeological contexts in two categories: dispersed and concentrated. These categories have deeply influenced the interpretation of archaeological assemblages and archaeological contexts. Within this theoretical framework, concentrated plant remains are those found in association to well-defined contexts, structured or not. These are usually considered to represent short-term events in which human selection has played a determinant role, thus being mostly suitable for palaeoecological studies. The other category, dispersed remains were those recovered in sediments dispersed throughout the site. They are supposed to represent the accumulation of remains as the result of different daily activities along an undetermined period of time. As such, they should embody a longer diachronicity than the concentrated approach, thus being more suitable for palaeoecological approaches.

Nevertheless, this oversimplification of archaeological realities does not take into full consideration the formation processes of archaeological contexts, consequently being more prone to mislead their interpretations. We argue that archaeological studies would benefit from using a different theoretical approach, that integrates the taphonomic processes underlying the deposition of plant remains. On the basis of such approach stand the concepts of primary and secondary deposition and tertiary refuse which have been successfully used for interpreting archaeological contexts and archaeological assemblages (Schiffer 1987; LaMotta and Schiffer 1999; Fuller et al. 2014). To make this point, we will focus on prehistoric structures from two sites in the Sabor valley (northeast Portugal), Foz do Medel and Laranjeiras. In these sites, several feature interfaces were found, namely Mesolithic and Bronze Age post-holes and pits. Soil samples were recovered in these structures and charcoal analyses and carptological studies were carried out. The archaeological analyses ended up providing precious data regarding the formation processes of the fillings of some structures.
To solve this situation we created a strategy for the excavation. We measured the volume of large (bigger than 7 cm) and small (7 cm or less) fire-cracked stones. Sample from the soil surface were collected for chemical analysis. The section of excavated structures were sampled in three to five series from top to bottom. The purpose is to analyse the presence and amount of phosphates, magnetic susceptibility and the content of organic material. Also samples for macrofossiles and radiocarbon dating were collected.

The result of the analysis of the ratio of fire-cracked stones shows that this is a way to group the cooking pits. The macrofossile analysis concluded that one type of pit was used for processing meat. The lipid analysis also support this and the lipid acids from animals implies that another type may have been used for processing meat. The soil chemical analysis strengthens the grouping of the pits, but it supports an even finer grouping. Finally the soil chemical results from the surface show significant differences between the different types of structures regarding the activity areas around them. These areas were not detected in the field situation but are due to the analyses. The radiocarbon datings shows that the site were occupied temporarily.

The site was situated at a distance from the nearest known waterbodies. Our interpretation is that the site was an activity area and that it during at least three phases has been used for processing grain. It seems possible to compare this with historically known roasting activities. These were also performed separately from the settlements. It is an activity that is often associated with women, but the place was also known as a gathering point for others in the society.

By focusing more thoroughly on one type of structure we have been able to gain more understanding for it. We have also been able to discuss social organisation and democracy and thereby questions of interest for our society. The excavation is in itself an example of how to see democratically on different types of structures and sites.

Co-author(s) - Jaquet, Stefan, Integrative Prehistory and Archaeological Science, Basel, Switzerland
Co-author(s) - Rentzel, Philippe, Integrative Prehistory and Archaeological Science, Basel, Switzerland

Keywords: archaeobotany, micromorphology, Neolithic

Presentation Preference - Oral

At Zug-Riedmatt, excellently preserved waterlogged organic layers were conserved in a depth of 6m, below the deltas deposits of the river Lorze into Lake Zug. The layers have been accumulated during the Neolithic settlement activities between 3200 and 3100 cal BC. Even though only a small part of the site was excavated, an exceedingly dense recovery technique was used, ensuring that the site could be investigated in detail in the lab. Using a micromorphological methodological approach, 79 profile columns were documented, sampled and separated into layers in an intensive cooperation between archaeobotany, palynology, micromorphology, archaeozoology, geochemistry and field archaeology.

All disciplines involved simultaneously analysed the same samples and actively exchanged their results, experiences and ideas. The aim is to understand layer formation and degradation processes from different perspectives with a focus on taphonomic questions. Our talk provides an insight into the transdisciplinary discussion of three profile columns regarding archaeobotany, palynology and micromorphology. The three profile columns cover the whole occupation layer of up to 1.3 m of thickness, which contains various sediment types. The interplay between lake and deltaic deposits, which overlap with anthropogenic settlement activities, shall be presented. This micromorphological approach shows that complex, hard to solve questions emerge, which have to be discussed in detail between the involved disciplines.

TH5-02 Abstract 10
Formation processes related to foragers in tropical forests

Author - Dr. Friesen, David, University of Cambridge, Cambridge, United Kingdom (Presenting author)

Keywords: Foragers, Formation Processes, Tropical Forests

Presentation Preference - Oral

Although an important habitat for human societies, the study of archaeological site formation in tropical forests has been less studied compared to temperate and arid environments. Nonetheless, in addition to environmental factors, human behavior plays a significant role in the formation of the archaeological record. This paper focuses on the study of archaeological site formation processes related to forager ways of living in a tropical forest environment. It presents a geo-archaeological case study from South India where an integrated approach involved long-term ethnography, field excavation and geoarchaeological laboratory-based analyses.

The integrated approach enabled to associate social and cultural aspects of forager ways of living - such as mobility and immediacy - with patterns of use of space and material deposition. Field excavation and sediment sampling from recently abandoned sites of the same group, allowed the investigation of post-depositional processes at both the visible and invisible (micro- and sub-microscopic) scales of the archaeological record. The geoarchaeological analyses include taphonomy, magnetic susceptibility and phytolith analysis and soil micromorphology. The results of the geoarchaeological analyses exhibit the environmental post-depositional processes occurring in tropical forests, mainly characterized by acidic conditions and intensive biological activity. Overall, although forager ways of living and the environmental conditions in tropical forests challenge the formation of a well-preserved archaeological evidence, an integrated approach examining the different scales of the archaeological record can successfully reconstruct human behavior and the formation processes of archaeological sites.
Unravelling the formation process: re-excavating stratigraphy beneath the temples of Malta

Author: Prof. Malone, Caroline, Queen's University Belfast, Belfast, United Kingdom (Presenting author)
Co-author(s): Dr. Martin, Rowan, Queen's University Belfast, Belfast, United Kingdom

The great megalithic temples of Malta were first examined in a systematic manner in the early years of the 20th century by the archaeologist Thomas Ashby and Eric Peat from the UK joined Theobalds and Zaehner in Malta in the first properly recorded excavations, and their published records provide an important and useful reference to early archaeology. A century later, as part of the LUNCHES project, three temple sites have been re-excavated, in the quest for new samples for 14C dating and palaeoenvironmental data and in doing so have reinterpreted the work of these earlier scholars. This paper reviews how archaeological approaches to megalithic prehistoric sites have changed over a century by drawing some surprising conclusions about the quality and the questions of these pioneers. The current study is employing a range of interdisciplinary approaches to develop and enhance the archaeological record through coordinated methodologies to extract the maximum information from the remnants that remain.

Interdisciplinary research for unravelling the chronological sequence of archaeological sites of Ulów (Poland)

Author: Dr. Moskal-del Hoyos, Magdalena, W. Szafer Institute of Botany, Polish Academy of Sciences, Kraków, Poland (Presenting author)
Co-author(s): Dr. Niezabitowska-Włodarczyk, Barbara, Institute of Archaeology, Maria Curie-Skłodowska University, Pt. Marii Curii-Skłodowskiej 4, 20-031, Lublin, Poland

A group of archaeological sites located near the village of Ulów in Central Roztocze (Lublin voivodeship, south-eastern Poland) was discovered by people using metal detectors when searching for military items from World War II. The first archaeological survey of a group of archaeological sites of Ulów (Poland) was published in 2008 by the Museum of the History of the City of Lublin. However, no further research has been carried out since then. In this paper, we will explore the depositional, post-depositional and current land use processes that have resulted in the current configuration of the site.

Keywords: Antiquarian, Malta, Temples
Presentation Preference: Oral

The Middle to Recent Bronze age site of Ponticelli di Malalbergo was recently found in the lower alluvial plain of Bologna, 25 km NE of the city and 25 km south of Po river, 60 km westward the Italian Adriatic sea coastline. The study of a stratigraphic sequence contributes to knowledge of land formation from the Bronze Age to the present day.

The Po river alluvial basin allows a good preservation of archaeological sites due to fluvial sedimentation linked to postglacial sea level rise and tectonic subsidence. The resulting optimal sedimentary conditions guarantee the removal of most of the reworking and pollution conditions usually affecting the outcropping archaeological sites and related paleosols. In such a way archaeological and palaeoenvironmental studies can be successfully performed.

The related soil was laying at 6.65 m of depth (>3.5 m a.s.l) while the Roman age topsoil was recorded at 5.7 m (>3.3 m a.s.l) characterized by anthropogenic layers (Ap horizon). The site was resting on sandy loam soils possibly linked to a possible coeval riverbed or related structures. Clayey loams settled to the Roman age. The Roman topsoil was capped by a 2.75 m thick loamy clay layer hosting 8-10 cm thick peaty layers suggesting the size reduction of the former side and eastwards open, alluvial basin happened probably at the end of the High Middle Ages or the beginning of the Free Common age (XII-XIII century AD).

In the 18th century AD the proroging alluvial ridge of the Reno river new course deposited uppermost about 3 m of sandy loams.

This site stands for the first time that the cores of the alluvial plain was at some extent drained and suitable for human settlement both in Roman and Bronze ages. It is still possible to state if the sediments predating the Middle Bronze age were delivered by the Apennine alluvial network or Po river anabranching system.

From a phytoarchaeological viewpoint the paleo anthropogenic soil horizon dating to the Bronze Age recorded: 13g/kg CaCo3; 38.0 g/kg Organic Matter; 8-11 g/kg Ptot; 87 mg/kg Cu; 2 mg/kg Sn; 245 mg/kg Zn. As term of comparison the Roman age Ap horizon, instead, recorded: 50g/kg CaCo3; 25 g/kg Organic Matter. The Cu and Zn concentration was higher then the today accepted pollution thresholds suggesting a possible bronze fusion activity performed in the site core.

Recent discovery of a new Early Neolithic site in Santovka tries to fill in this gap. Site lies in south-western Slovakia on the northern outskirts of the Pannonian lowland, in the drainage basin of the creek Buž, which flows into Ipel. The constant monitoring of the site since 2002 and subsequent archaeological excavation with interdisciplinary approach has shed light into the transition of Mesolithic and Neolithic. The presence of thermal springs led during the Quaternary to the accumulation of travertine mounds. The Holocene formation of travertine dammed the creek Buž and led to the accumulation of calcareous clay during the Early Holocene. The analysis of plant microremains and mollusc shells dated to the first half of the 11th millennium BC shows that the site was covered with mosaic of forest and vegetation of open habitats.

The current study is employing a range of interdisciplinary approaches to develop and enhance the archaeological record through coordinated methodologies to extract the maximum information from the remnants that remain.
Exceptional discovery was made in the stratigraphically older layer of calcareous clay, where unusual pottery was located. Radiocarbon dates of the organic temper from pottery correspond with the end of 7th and beginning of 6th millennium BC. The pottery is of a standardized type. The composition of inorganic pottery matrix is not of local origin and points out that the sources of the raw material originated from the southern foothills of Štěrnické mountains. The pottery is tempered with grass stems and leaves. Changes of the organic matter in pottery matrix show a very low firing temperature.

The uniqueness of the site lies in the stratified sedimentary sequence containing the Early Neolithic artifacts in limnic environment, which preserved material that would be otherwise irretrievably lost.

THS-02 Abstract 17

Regional correlations of destruction layers using Earth’s magnetic field: The Levant case study

Author - Hassul, Erez, Hebrew University, Jerusalem, Israel
Co-author(s) - Agnon, A., Hebrew University, Jerusalem, Israel (Presenting author)
Co-author(s) - Nowaczyk, N., GFZ, Potsdam, Germany
Co-author(s) - Zuckerman, S., Hebrew University, Jerusalem, Israel
Co-author(s) - Finkelstein, I., Tel-Aviv University, Tel-Aviv, Israel
Co-author(s) - Maier, A., Bar-Ilan University, Ramat-Gan, Israel
Co-author(s) - Shahak-Gross, R., University of Haifa, Haifa, Israel
Keywords: Destruction layers, Paleomagnetism, Stratigraphic correlation

Presentation Preference - Oral

The temporal variations in Earth’s magnetic field have been recorded in fired artifacts and can provide independent tests for radiocarbon and typology. Cooking installations used continuously before particular calamities in different sites should show similar magnetization directions, if their constituent ferromagnetic minerals are appropriate for the method. The magnetization direction is measured with respect to the geographic north (declination) and the horizon (inclination). Correlation can be tested by inclination, declination, or both. We test correlations between ovens sampled in situ, within individual destruction layers at the mounds of Hazor, Megiddo, and Es-Safi covering Late Bronze and Iron Ages (13th-8th centuries BCE). During parts of that time, radiocarbon calibration severely limits temporal resolution of absolute dating. By contrast, the magnetic field in the Levant shows extreme fluctuations. The data supports the overall stratigraphic picture and demonstrate the potential of future studies to resolve some of the uncertainties and discrepancies between alternative chronological frameworks.

Applying silence and sound to environmental reconstruction: frameworks, applications, implications

Author - Prof. Lindstrøm, Torill Christine, University of Bergen, Bergen, Norway (Presenting author)
Co-author(s) - Zubrow, Ezra, Univ. at Buffalo, Buffalo, United States of America
Co-author(s) - Lindstrøm, Torill Christine, University of Bergen, Bergen, Norway
Keywords: archaeoacoustics, methodology, sounds, soundscapes

Presentation Preference - Oral

Culture and the Environment are noisy. The formation of sites within their environments is never quiet. However, the past is silent. It was not until the nineteenth century that one could hear sounds from the past. Admittedly, language notation began about five millennia ago and music notation about a millennium and a half. But, even that is recent for human existence. Notations depict sound, but are not the sounds themselves.

In 1877 Thomas Edison invented the phonograph, later to be developed into various sound recording technologies. Only then, did the sounds of the past become available to the present. We can listen to words spoken and music played long ago. – But can we hear the sounds of prehistory? No, but to some extent we can reconstruct them, and at least record and measure the present soundscapes of archaeological sites and their environments. Such recordings can give us relevant clues about earlier soundscapes as well as helping us understand how sounds were part of the prehistoric environment and the formation processes of site creation. Thus, we believe we can add further information about the location and cultural (sound-producing) activities of earlier times. When combined and integrated, these pieces of information from various sources can help us to build reasonable valid descriptions, interpretations, and even reconstructions, of past sounds and soundscapes.

Blake & Cross’s framework is a useful and comprehensive framework for integrating sounds, soundscapes and archaeoaoustic considerations into the archaeological multidisciplinary record. Finally, this paper extends their framework by emphasizing the importance of silence and sound for transient experiences that leave non-transparent remains.

THS-02 Abstract 19

Not separating wheat from chaff: considerations for differential recovery of charred plant remains

Author - O’Meara, Don, Newcastle, United Kingdom (Presenting author)
Keywords: Archaeobotany, Recovery, Taphonomy

Presentation Preference - Oral

This presentation aims to highlight some of the taphonomic issues which may affect the recovery of charred archaeobotanical material from archaeological deposits. The basis of this presentation is data from 10 archaeological sites in Northern England where the rates of recovery from the washover and the heavy residue have been compared. In this region finds of charred cereal remains may often be sparsely distributed in archaeological contexts, and will not meet the required number of elements recommended to conduct applications such as multivariate analysis. It is argued that due to differences in settlement patterns and geology the recovery of archaeobotanical remains in northern England is in many ways distinct to those in southern England. The presentation will discuss the differential recovery of chaff and grains that have been observed by the presenter, as well as the differential preservation and recovery of hazel nut shell. It highlights some of the methodological problems this creates when classifying sites as being ‘producer’ or ‘consumer’ sites, as well as broader debates such as the nature of wild and domestic plant consumption in prehistory. The presentation highlights the varied types of recovery from within a relatively small geographic area (England), and asks participants to consider how this might affect supraregional, or transcontinental interpretations. Concludes by bringing together the steps by which we can best be used for both site interpretation by trying to identify activity areas via the integration of archaeobotanical data with contextual information from excavation.

THS-02 Abstract 20

Deciphering formation processes of the urban Dark Earth: a geoarchaeological approach

Author - Dr. Nicosia, Cristiano, Université Libre de Bruxelles, Bruxelles, Belgium (Presenting author)
Co-author(s) - Devos, Yannick, Université Libre de Bruxelles, Bruxelles, Belgium
Co-author(s) - Vrydaghs, Luc, Université Libre de Bruxelles, Bruxelles, Belgium
Keywords: Dark Earth, Phytolith study, Soil Micromorphology

Presentation Preference - Oral

Urban dark earths are dark coloured, poorly stratified units, often formed over several centuries that have been uncovered in many European towns (Nicosia & Devos, 2014). Due to their lack of any recognizable internal stratigraphy, standard archaeological approaches typically fail to understand their complex histories.

The present contribution will demonstrate how geoarchaeological approaches, and especially micromorphology, can help to understand the complex formation processes, and to discriminate different human activities and natural processes involved in dark earth formation. In a second step, we will also discuss how soil micromorphology (the microscopic study of archaeological soil/sediments) can help to understand the taphonomical history of the botanical components, observed within the dark earth; we will hereby focus on the example of the phytoliths (Devos et al., 2013; Vrydaghs et al., in press).

Material culture and formation processes in archaeology

Author - Dr. Jose Luis, Solaun, University of the Basque Country (UPV/EHU), Vitoria-Gasteiz, Spain (Presenting author)
Co-author(s) - Asarrera, Aguzt, University of the Basque Country (UPV/EHU), Vitoria-Gasteiz, Spain

Presentation Preference - Poster

The importance of formation processes in archaeology is unquestionable. They condition the stratigraphic circumstances of sites and are determining factors for understanding the phenomena of occupation, abandonment and post-occupation of archaeological structures and sites. To know, for example, whether we are dealing with the level of use or destruction of a building is basic to be able to correctly reconstruct its biography, to determine its level of residuality or to establish its chronology.

We believe, however, that the study of the formation of the archaeological record has not been developed as it might have been, either theoretically or methodologically. In fact, the works of reference continue to be those written by M.B. Schiffer in the last third of the 20th Century. This investigator introduced the concepts of "systemic context" (dynamic stage during which elements shared the culture of their societies and different processes of aggregation and elimination were produced) and "archaeological context" (state in which these same elements have come to us over time, that is, the context of archaeology). Understanding the first will give us a better understanding of the second, in a process in which material culture plays a fundamental role as a link between both. It is precisely this aspect, the relationship between stratification and objects, that we want to discuss in this poster.

Starting from the experience accumulated by our group in field excavation, this study aims to characterise the main types of deposits that are recorded in an archaeological site, generating a reference framework that could be used as a hermeneutic and decoding tool of the archaeological record. For definition purposes, we will use 3 stages that are acknowledged in the lifecycle of any place (occupation, abandonment and post-abandonment), each of which comprises moreover different aggregation and reduction processes. Within the aggregation processes, we will pay special attention to pottery recovery in the archaeological context. In this respect, the manner in which artefacts are presented in the archaeological record constitutes one of the main instruments for identifying the depositional processes since these same processes contribute to the presence of pottery in a very different manner.

TH5-02 Abstract 23

The Archaeological Stratigraphic Sequences of the Vitava River Valley

Author - MA Kuchan, Milan, Labry o.p.s., Praha 9, Czech Republic (Presenting author)
Co-author(s) - Blazkova, Tereza, Labry o.p.s., Praha 9, Czech Republic

Keywords: Geoarchaeological archive, settlement episodes, Stratigraphic sequences

Presentation Preference - Poster

Archaeological terrains located on the left bank of the Vitava river in the Czech Republic are the unique "geoarchaeological archive". These sites are threatened with current building development. But archaeologists don’t always give them so much attention it deserved. Their importance lies especially in the chronological record, integrity of unique archaeological findings and opportunities to study their genesis. We are constantly monitoring the occurred raie layers on the left bank of the Vitava River in Prague (parts Sedlec, Dejvice and Bubeneč). We are talking about geomorphological temperate eastern slopes of the hills and foothills of the Upper Švýca height. Local stratigraphic sequence captures the settlement from the Paleolithic to the present. It often has the character of a coastal "Tell" and has generally polygonal origin. According to the current knowledge on the riverbank there is a stratified layer stratigraphy of the loess loams containing Upper Paleolithic finds and this layer is overlaid by Holocene layers composed mostly by the dark loams containing remnants of archaeological cultures from the Neolithic period to the present. Preserved stratigraphic layers have thickness from 0.5 to 1.9 meters and in parts of transverse depressions it may be as much more thicker. The aim of this paper is to show thelatest data sources to the object of interest and to assess the state of current research.

Nowadays it is possible to comment the genesis of stratigraphic sequences only on the basis of macroscopic observations made during the archaeological rescue researches. On sites shown we can see, that development of the layers is characterised by a multi-stage formation processes that may have a different time frames. On the example of the research in the street Pod Špalky in Prague-Podbabla (2011) can be seen each episode of this stratigraphic process. It’s clear that there are rotating episodes of rapid deposition of sorted sandy material with local expressions of pedogenesis probably in the interval between the various stages of settlement and cultural layers formed in “situs”, which are documented with up to 18 episodes of the residential settlements and waste overlayed by fine sediment. For a more detailed understanding of the development of the stratigraphic sequences in a timeframe is necessary to undergo the results of the excavations to a more thorough multidisciplinary research.

The River Lis Basin, located in central Portugal, is an ecotone between the coast and the inland mountains. The unique conditions for highly preservation of both organic and inorganic materials make it a key region to acquire high-resolution data from both geological and archaeological contexts, fundamental for understanding features of hominin behaviour, such as mobility, site use, adaptive strategies and resource exploitation, namely from the highly productive coastal environment.

Besides hundreds of open-air sites, this basin also has hundreds of caves and rockshelters, many of them with sediments reaching their roofs and with clear evidence of human occupation. In those areas tested it was possible to recognize well-preserved multi-occupational archaeological layers, several types of artefacts made in organic and inorganic materials and also human burials. In 2015, the EcoPlis research project was started with the goal of find and characterize, with the highest resolution possible, the complete sequence of the Middle and of the Upper Paleolithic occupations in the Western-most Europe. Among other things, the project aims to contribute significantly for the understanding of the period before the demise of Neanderthals and their replacement by Modern Humans. In our first year, we found over 50 new caves and rockshelters with sediments, found artefacts dated from the Acheulean to the Chalcolithic and start the excavation of two cave and a rockshelter. Our approach includes the 3D piece-planning of all visible finds without a cut-line, the complete flotation of the sediments from archaeological layers and samples for phytoliths and parasites. Among other things, we found multiple entrances with human remains in a shallot valley and in a same cliff that may correspond to two Early Prehistoric mortuary complexes, a dense shell layer in a Paleolithic site located over 25 km from the present seashore and, thanks to our protocol, we could recognize fine lenses of deposition of the natural and archaeological remains in a same archaeological layer that will allow us to create detailed diachronic and synchronic snapshots of the human occupation and ecodynamics of this region throughout its Prehistoric occupation.

Presentation Preference - Poster

The integration of pollen and non-pollen palynomorphs (NPP) analyses provides essential data to reconstruct palaeo-environmental conditions in both regional and local scales. The application of these analyses in archaeological deposits also offers the possibility to obtain evidence of socioeconomic practices, in terms of documenting crops, gathered plants, stalling of flocks, etc. In addition, the integration of both bioarchaeological proxies and the information from the archaeological excavation allows reconstructing the dynamics of formation of the archaeological record. In this work, a spatial analysis of pollen and NPP taxa has been carried out in order to obtain a better understanding about the formation of the several archaeological structures and sedimentary units of the site of La Draga (Sitges, Spain), a pile dwelling site located in the shore of Lake Banyoles.
Dietary Isotope and Paleopathology Reconstruction of the First Pastoralists from Cis-Baikal, Siberia

Author - Dr. Waters-Rist, Andrea, Leiden University, Leiden, Netherlands (Presenting author)

Co-author(s) - Losey, Robert, Department of Anthropology, University of Alberta, Edmonton, Canada

Co-author(s) - Khairniski, Artur, Irkutsk State Technical University, Irkutsk, Russian Federation

Co-author(s) - Nomokonova, Tatiana, The University of British Columbia, Vancouver, Canada

Keywords: Diet, Pastoralist, Siberia

Presentation Preference - Oral

Nomadic pastoralists first arrived in the western region of Lake Baikal, Siberia, known as the Cis-Baikal, around 3000 years ago. Compared to early and later periods, the lifeways of these pastoralists, who brought with them domesticated animals including horses, sheep, goats, and cattle, are poorly known. This research presents the first stable carbon and nitrogen isotope dietary reconstruction of Cis-Baikal pastoralists (n=55), with most sites and individuals (n=34) deriving from ~2950-2350 calBP, in the Bututkhel mortuary tradition. Stable isotopes of carbon and nitrogen, as well as every pastoralist skeleton is examined for paleopathological evidence of trauma, disease, and morphological alteration.

Isotopic results demonstrate that foragers utilized a mixed subsistence strategy, relying considerably on the Lake’s many fish species and possibly also on the Baikal freshwater seal. In particular, Cis-Baikal pastoralists have stable nitrogen ratios from 11.0 to 18.0‰, which is two to three trophic levels higher than the domesticated fauna (mean ~4.0 to 5.0‰), with slightly lower δ15N values in individuals from later periods. Pastoralists from the Bututkhel period have stable carbon values that are 2.0 to 4.0‰ negative than their domesticated livestock, which can be explained by consumption of freshwater vascular. In some later period pastoralists δ13C values become even more negative, which, in conjunction with lower δ15N values, suggests the C4 plant miliatk may have been consumed either by people or their livestock. Yet, fish remained an important part of the pastoralist diet up to modern times.

Many of the skeletons were very incomplete, limiting paleopathological investigation. Of the more complete skeletons, by far the most common pathological lesions are osteoarthritic of the spine and degenerative disc disease (n=9) and spondylosis of the fifth lumbar vertebra (n=3). One older male had a healed tibia-fibula fracture and two individuals had genu valgum. Despite these advances, other aspects as the dietary component of the pathological conditions, the role played by the mobility in the spread of the maladies, and whether diseases can alter the biogeochemical signals in the tissues deserve further in depth attention. This session aims to bring together archaeologists, physical anthropologist, paleopathologist, archaeozoologists and scholars related with these topics. The objective will be to explore the connections between diet, mobility and disease, analyzing human and animal remains. The non exclusively unresolved problems to discuss are: i) the impact (absence) of the introduction of new foodstuff in the health status of a population, ii) growth patterns and health outcomes, iii) changes in human and animal subsistence strategies and consequences on their lifestyles, iv) the exposure to toxins (e.g. trace metals) and how to tell these effectively from post-mortem contamination, and v) the relation between (infectious) diseases and mobility. We welcome papers on case studies in these or similar topics, as well as contributions that address methodological aspects such as intra-skeletal variability or new bone chemistry applications (e.g. FTR, Pyn-GCM, multi-isotopic studies, proteomic, etc.).
Investigations of stable isotope ratios from human remains in relation to geographical regions, sex, age, grave goods and chronology allow statements about the living and environmental conditions in ancient times. Stable isotopes do not decay over time and are therefore ideal tracers in biological systems. Swiss skeletal series are of great importance for research on European populations of the Late Iron Age (450 to 15 BC). Written sources are scarce and biological-archaeological analyses provide direct information about individuals. Human remains (N = 146) from burial sites of different regions at the Swiss Plateau and the Swiss Alps were analysed. Collagen was extracted and stable carbon, nitrogen and sulphur isotopes were analysed. Additionally, published data from Münsingen was included for comparisons. All data were analysed for sex, age, regional and chronological differences within and between the burial sites. Stable isotope data indicate an overall diet mainly based on animal protein and plants sources following the C3 photosynthetic pathway. Significant differences between the Swiss Plateau and the Swiss Alps were found with more positive δ13C and δ15N mean values observed for the Swiss Alps. Some individuals indicate a significant intake of C4-plants in the diet. Cultural and/or climatic changes as well as different geological conditions might have led to distinct patterns of crop cultivation and animal husbandry. No significant differences could be detected between males and females as shown for Münsingen. Regarding the age classes the δ15N values follow an isotopic trend indicating a breastfeeding signal for infants. The δ15N data suggest a more terrestrial based diet with minor consumption of freshwater fish. Differences in the δ4S data might reflect different local δ4S values with minor mobility in Late Iron Age populations.

The paper will present and discuss results of stable isotopes analysis of carbon and nitrogen for a diet as well as strontium and oxygen for a provenance from 6 investigation cemeteries with chamber graves. This form of elite burials was constructed and used in early medieval Poland mostly during the second half of the fifth century and the first half of the sixth century. During this time of shifting of social divisions, forming of elites, creating of a state and a religion shift from paganism to Christianity. Chamber graves were characterized by having an inner wooden construction in a form of a chamber and were often furnished with numerous and luxury grave goods. Such burials were places of eternal rest for men, women and children. For the study of the diet and the provenance were examined samples of bone collagen and tooth enamel from individuals buried in chamber graves as well as samples from ordinary human graves and animals remains as a background. The obtained results suggest that individuals buried in chamber graves formed a heterogeneous group of people. Some of them seem to be of local origin and some were newcomers from different regions. Their diet, with some exceptions, did not vary much from the deceased interred in ordinary graves. However, the diet consumed by men and women buried together in double graves differed significantly.

The late medieval period in Holland was characterised by substantial socioeconomic changes. While the region was largely undeveloped prior to AD 1200, after came large scale urbanisation and flourishing international trade, changes that would have impacted many aspects of life. This paper investigates the effect of these changes on diet by comparing skeletal collections from the central medieval village of Blokhuzen (AD 1000-1200) to the late medieval town of Alkmaar (AD 1448-1672) using a combination of dental disease and stable isotope data. The caries results clearly point to a dietary shift (213 individuals analysed). The urban population of Alkmaar has a significantly higher caries frequency, which begins at a younger age, than the individuals from Blokhuzen, suggesting increased consumption of cariogenic products, such as sugars and starches. Significant dietary differences are also demonstrated by the stable isotope data (sample of 50 individuals analysed). The population of Alkmaar showed significantly enriched δ15N ratios and had more variable δ13C ratios than the population from Blokhuzen. This may be due to increased consumption of freshwater or marine fish by the people of Alkmaar. Alternatively, the consumption of animals/animal products of a high trophic level such as chicken, eggs, and pigs could have contributed to enriched δ15N ratios.

The caries results demonstrate the potential of this inter-disciplinary approach to understanding medieval society. A combination of dental disease and stable isotope data provides a unique window into the past diet, which may inform modern dietary interventions.

The paper will present and discuss results of stable isotopes analysis of carbon and nitrogen for a diet as well as strontium and oxygen for a provenance from 6 investigation cemeteries with chamber graves. This form of elite burials was constructed and used in early medieval Poland mostly during the second half of the fifth century and the first half of the sixth century. During this time of shifting of social divisions, forming of elites, creating of a state and a religion shift from paganism to Christianity. Chamber graves were characterized by having an inner wooden construction in a form of a chamber and were often furnished with numerous and luxury grave goods. Such burials were places of eternal rest for men, women and children. For the study of the diet and the provenance were examined samples of bone collagen and tooth enamel from individuals buried in chamber graves as well as samples from ordinary human graves and animals remains as a background. The obtained results suggest that individuals buried in chamber graves formed a heterogeneous group of people. Some of them seem to be of local origin and some were newcomers from different regions. Their diet, with some exceptions, did not vary much from the deceased interred in ordinary graves. However, the diet consumed by men and women buried together in double graves differed significantly.
This strontium analysis method was applied on a large skeletal collection (MIN 260) discovered from the Inn Hamina cemetery. The site which was used during the 16th to 18th century AD and has been previously studied with stable isotope analysis for diet, which has revealed that the population has been heavily consumed in the area. In this study, strontium isotope ratios were analyzed from teeth of ten people. Moreover, local plant materials were collected for a baseline study on this remote area. Preliminary results suggest that strontium isotope analysis should be interpreted with caution when the population has a large input of aquatic food in their diet.

TH5-03 Abstract 09
Diet, morbidity and mortality of a north Finnish town 1600-1800 AD
Author - Professor Nunez, Milton, University of Oulu, Helsinki, Finland (Presenting author)
Co-author(s) - Lopez-Costas, Diália, Universidad de Santiago de Compostela, Santiago de Compostela, Spain
Co-author(s) - Varela, Tina, University of Oulu, Helsinki, Finland

Keywords: CT and SIA, Finnish Lapland 1600-1800, morbidity, mortality and diet
Presentation Preference - Oral
Kemi (c.65ºN 25ºE) has been a small but relatively important town in southern Finnish Lapland since the 16th century. The morbidity and mortality of its inhabitants has been studied on the basis of death records that contain the statistics of nearly 1000 individuals that died in Kemi between 1600 and 1850. These data include the individual’s name and profession, the death date, the date at death and, from 1750 on, the cause of death. In addition, the naturally mummified remains of some individuals buried under the churches of Kemi and Hawkspudas (c.75 km SE) from the early 17th to the mid-18th century were investigated by means of Computerized Tomography (CT) scanning and stable isotope analyses in order to obtain information about possible pathological features and the diet. Zooarchaeological and ethnohistorical data have been used together with isotopic results in the interpretation of the local diet. This paper presents and discusses the preliminary results of this research.

Dietary variability among earliest domesticated pigs in the NE Iberian Peninsula (5700-3500 cal BC): a stable isotope perspective
Domesticated pigs (Sus domesticus) played an important role in the early Neolithic economy of the western Mediterranean. Studies from the Iberian Peninsula reveal that their exploitation followed a systematic pattern oriented to the production of meat, for example with animals slaughtered between the age of 18 to 24 months. While this pattern appears relatively homogeneous over the region, in order to investigate how early Neolithic communities raised and managed domesticated pigs in the NE Iberian Peninsula, we selected a rich assemblage of wild and domestic pig bones from Neolithic sites, dated between 5700-3500 cal BC, for carbon and nitrogen stable isotope analysis. The results reveal remarkable diversity in the diet of domesticated pigs between sites, pointing to the existence of different management strategies. This study shows the correlation of the results by the type of habitat (rural, urban, pasture, arable, vineyard, etc.), the quality of the diet (animal, cereal, vegetables), and the location of the site. The results suggest that pigs were raised according to different needs and goals in different regions, highlighting the diversity of management strategies during the early Neolithic in the Iberian Peninsula.

TH5-03 Abstract 11
What can FTR tell us about archaeological bone collagen preservation?
Author - Prof. Martinez Cortizas, Antonio, University of Santiago de Compostela, Santiago de Compostela, Spain (Presenting author)
Co-author(s) - Lopez-Costas, Diália, Universidad de Santiago de Compostela, Santiago de Compostela, Spain
Co-author(s) - Rial Tudó, Marcela, University of Santiago de Compostela, Santiago de Compostela, Spain
Co-author(s) - Kaal, Joeri, Pyrolyscience, Santiago de Compostela, Spain
Keywords: bone collagen, FTR, FTIR
Presentation Preference - Oral
The collagen of human and animal bones is routinely extracted and analysed in Scientific Archaeology (e.g. paleoecological studies, 14C dating, etc.). Reliable information can only be obtained from analysis of collagen with a “good” level of integrity, a condition that has been determined by different approaches based on, for instance, elemental composition (C and N content), C:N ratios, collagen yield, amino acid profiling or amino acid racemization. In addition, spectroscopic techniques provide a sensitive, non-destructive method to investigate the molecular structure of extracted collagen; however, a deep knowledge of multivariate statistics is required to deal with the large amount of data generated.

We used FTR spectroscopy to characterize non-ultrathermal collagen extracted from 50 skeletons recovered in 8 necropolises from NW Spain, representing a wide chronological period (~3,500 years), multiple soil environments and different funerary deposits. The second derivative and the standard deviation spectra were used to identify the most relevant absorption bands. Principal components analysis (PCA) and multiple regression models were developed to synthetize the spectroscopic information and to estimate collagen quality parameters.

The four principal components extracted by PCA were interpreted as two main diageneric changes:
1) a primary process leading to the preferential loss of collagen-helices and a residual increase in carbohydrates, and ii) a secondary process related to the loss in g-sheets; and two minor components related to: i) variations in alkaline side chains and ii) absorptions of the OH of carbohydrates and amide A. Highly significant regression models were obtained for the quality indicators (collagen yield, C, N and C:N ratio using the principal components as predictors, but no relationships between the δ13C and δ15N and the components were found. Our data suggest that the decrease in C and N contents and the increase in C:N ratios are caused by the degradation of the protein and the relative preservation of carbohydrates.

It can be concluded that the extracted archaeological collagen does not seem to be contaminated with exogenous organic substances; i) for the studied samples there is a continuous change in C, N, and C:N ratios that is coupled to the structural integrity of the collagen; and ii) the observed diageneric changes in collagen composition/structure did not affect in a significant way the δ13C and δ15N values, thus supporting their use for paleodiet reconstruction.

TH5-03 Abstract 12
Leprosy of the past: The genetics behind pathogen-host interactions, as revealed by ancient-DNA
Author - Economou, Christos, Stockholm University, Stockholm, Sweden (Presenting author)
Co-author(s) - Krzewiński, M., Stockholm University, Stockholm, Sweden
Co-author(s) - Kjällström, A., Stockholm University, Stockholm, Sweden
Co-author(s) - Daalen, L., MRM, Stockholm, Sweden
Co-author(s) - Lidén, K., Stockholm University, Stockholm, Sweden
Keywords: genetics, immunity, leprosy
Presentation Preference - Oral
Leprosy is a well-studied disease of the past. Its significance in paleopathology has been secured due to many historical references, bone lesions that allow osteoarchaeologists to document its presence in the archaeological record, and various biomolecular studies that have traced the patient’s genetic marker. The causative agent (Mycobacterium leprae) has been proven to be an organism that does not exhibit much variability, neither in terms of time nor space. However, studies have shown that a distinct phylogeography seems to exist, allowing researchers to discuss several scenarios about how leprosy spread across the world. In contrast to the limited genetic variability of the pathogen, however, the clinical symptoms of the disease vary to such a degree that this has led to the notion that it is the host's immune system that plays the major role in the development of the pathogenicity of leprosy.

In this study, we investigate the frequency and even the presence of the allele thought to be protective agent against leprosy in populations of the past. For this reason we generated new aDNA data from two cemeteries from Medieval Sweden (where leprosy had been previously documented) and compared the results with published genomes from even earlier populations, reaching back to the Mesolithic. Our findings show that the “protective” allele was already fixed in Medieval Europe but seems
to be lacking in specimens from the Stone Age. Thus, we discuss whether there has been selection of this allele, as well as the possible routes that it followed in order to enter Europe and give rise to its prevalence today.

**Finding a common framework for skeletal science in Archaeology**

**Author:** Dr. López-Costas, Olalla, Universidade de Santiago de Compostela / Group Earth System Sciences, Dpt Geography, Santiago de Compostela / A Coruña, Spain (Presenting author)

**Co-author(s):** Bodolic, Sonja, Instituto Superior Técnico, Lisboa, Portugal / Bolyai University, Cluj-Napoca, Alba Iulia, Romania

**Keywords:** life conditions, population/environment perspective, skeletal science

**Presentation Preference - Oral**

Skeletal science can be defined as the application of scientific techniques to the analysis of archaeological skeletons. It includes well-known methods such as stable isotope analysis, ancient DNA and elemental composition; as well as other of more recent introduction as FTR, pyrolysisa-OS-M and proteomics. All these methods are under the umbrella of biochemical approaches, since they study the chemical, physical, geological, and biological properties of bones and teeth. Their most usual pursuit is to reconstruct different pre-mortem features (i.e. diet, mobility and health) of the individuals the skeletons belonged to. Thus, it is worth to remind that the properties we analyse in skeletons are in fact approximations (i.e. proxies) of the multiple processes governing bone and tooth formation and degradation.

My own research started in the field of Physical Anthropology with emphasis in osteological variation and paleopathology. In the last years, I have been more involved in the application of biogeochemical techniques, discovering their utility in unravelling pre-mortem characteristics and how complementary their data are with more classic macroscopic approaches. I also realized that less attention has been paid to the role of post-mortem processes (diagenesis) on the chemical transformations of bone and their effect on pre-mortem signals. Despite the recent advances in every specific field, and with few exceptions, most of the investigations have been highly disciplinary, seldom involving other close research areas. An example is the few connections between paleodiet reconstruction using stable isotopes and the study of ancient health, which has been discussed in the recent workshop “Paleoanthropology: What does it really matter? As Physical Anthropology teaches us, the focus should be put in the populations since they better reflect the overall life conditions, avoiding the bias single case studies may introduce. And the population perspective should be embedded within an integrated vision of the environment, whose changes challenge human populations at many levels (e.g. health, resources availability, migrations). The changes also pertain to specific human activities such as mining and metallurgy that may pose a threat (e.g. metal pollution) both to the societies and the environment.

Moving our focus from the straightforward interpretation of the data to the understanding of the processes involved will surely allow us to see the big picture that can explain aspects of human life in the past. In my opinion, a common, coherent framework based on the population/environment perspective should be implemented to be able to unveil the complex signals of our ancestors.

**Keywords:** isotopic analysis, paleodiet, paleopathology

**Presentation Preference - Poster**

The advances in geochemical and physical anthropological studies have provided new tools to reconstruct the lifestyle of archaeological populations, especially on those minorities not commonly mentioned in the texts. This is the case for nuns. Despite the relative availability of works dealing with religious communities food and everyday life, these are almost exclusively focused on male, i.e. monks. However, the habits of the cloistered nuns have remained invisible to chronicles as well as to bioarchaeological research. An osteological, palaeopathological and paleodietary (δ13C and δ15N in bone collagen study) was performed in an ancient and human skeletons recovered from the Cloister of the Infant Don Juan, in Belmonte (Cuenca, Central Spain). The human sample comprises 43 individuals who lived in the 16th (n=28) and 17th (n=15) centuries AD: 38 females, 1 male and 4 of indeterminate sex. The sample covers a wide range of ages, most of individuals were estimated from 25 to 39 years of age-at-death (n=19). Archaeological and historical records suggest that the studied area of the church yard was used to bury the Dominican nuns who process in the convent. In order to contextualize nuns’ diet, 13 faunal specimens were also analyzed including sheep (7), Gallus (3), pigs (2) and marine fish (1, catshark).

The faunal sample presents a great isotopic variability. This is particularly the case for δ15N of sheep. Although all these animals were adults between 18 and 24 months at death, they show a 3σ range (9.6-6.6‰). This may be reflecting the wide variation of ecosystems surrounding the site including some areas with saline geological materials (e.g. continental salt mines). No correlation has been found between the size of the sheep and their isotopic signal. Gallus also show a quite large variation on δ15N, while pig values are more homogenous. Terrestrial animals δ15N ranges from -18.7‰ to -21.0‰ including herbivores, which suggests a low intake of C4 plants in some of them. In contrast to humans, δ13C values are within a limited range (-17.6‰, -18.6‰), but δ15N shows a continuous shift between 9.7 and 12.7‰. The latter is an unexpected result considering that a religious community should consume basically the same kind and amount of food. There is no relationship between nun’s isotopic variation and their age at death, period of burial and main paleopathological features (including one possible case of brucellosis, another two chronic infections and two cases of osteoporosis). A reliable explanation for the results could be the austerity and fasting habits that were common in Dominican nun communities, particularly between the 16th and 18th centuries. It is known that severe famine can produce enrichment in δ15N due to autolysis of proteins. The paleopathological study also supports the assumption of a very austere life, e.g. muscle/skeletal stress markers and osteoarthritis have a high presence in the sample. This intriguing hypothesis demands more research to unveil the most intimate life of the female inhabitants of the cloisters in their way to find God.
Since 2012, excavations at the site of Montiel (Spain) had led to the discovery of two cemeteries, representing two socially and culturally distinct periods or communities: one Muslim (10th - 13th century AD) and one Christian (13th - 15th century AD). The geochemical composition of these osteological remains (10 Muslim individuals and 21 Christians) was investigated to see how different religious beliefs, culture and social status might have influenced the diet of these populations which were buried in a similar environment and with similar techniques to compare the results obtained with historical sources.

The nature and location of dietary components determine their specific geochemical composition which passes on through the food chain and is archived in consumers' bones. The Muslim and Christian skeletal remains can therefore be used as witnesses of individual's dietary habits and preferences, at least for the last 50 years before their death, as a result of the time frame of bone (bioapatite) registries. The mineral part of the bone (bioapatite) registers the time span of dietary constitutents (lipids, carbohydrates and proteins), while the composition of bone's organic component (collagen) reflects the geochemistry of ingested protein. The geochemical analysis of both bone bioapatite and collagen can therefore provide a detailed picture of the subsistence strategies adopted by the late medieval populations buried at Montiel.

These dietary strategies will be discussed regarding the type of plant resources, inferred from bone carbon isotopic ratios (δ13C), the origin of water supply, deduced from bone oxygen isotopic ratios (δ18O), as well as individual's trophic level position, addressed using bone nitrogen isotopic ratios (δ15N). While these isotopic tools have been routinely employed in past dietary studies and measured using an IRMS, bone Br/Ca and Ba/Ca ratios were also analysed to provide additional information on the trophic level, marine food consumption, as well as potential mobility. Bone Br, Ca and Ba contents were measured using a cutting-edge technique (LA-ICP-MS) that enables us to create spatial high resolution maps of bone trace element concentrations and target preferential bone histological features which might be preserved from post-mortem alteration.

This study also investigates the geochemical composition of contemporary faunal remains (ca. 10 individuals from each period studied) from neighboring settlements, with a view to establish an environmental geochemical baseline for each analytical proxy applied, and to enable the discussion of the Muslim and the Christian economy in Montiel.

In a Silesian area of Poland, in the region of Lower Silesia, the burial site of the Strzyzow Culture in Rogalin contained 15 graves with the skeletal remains of 18 individuals. In 3 of 15 graves skeletal remains of more than one individual were found (one adult and one child in each of 3 double graves). Interdisciplinary archaeological and genetic investigations allowed to approximate sex and biological age (skeletal and dental age) of individuals. There were skeletal remains of 9 adults and 9 of children. Among the adults there were 4 males and 5 females. Genetic investigation allowed to establish sex of the children - 2 males and 5 females. The sex of two individuals (children) is unknown.

DNA investigations continue. Interdisciplinary investigations of excavated skeletal remains were carried out to corroborate the knowledge gained from archaeological, anthropological, radiological, odontological and genetic investigations. The research was based on visual inspection, stechnoeptic investigation, classic radiology. The research was supported by computer tomography imaging (CT) to obtain digital images and 3D reconstructions as well as 2D radiographs, which is the essential for skeletal and dental age estimation, to determine the biological status of skeletons, to diagnose any bone pathologies and abnormalities. Two skulls from graves 10 and 15, were subjected to identification tests, i.e. face approximation process using 3D computer software.

Two skulls from graves 10 and 15, were subjected to identification tests, i.e. face approximation process using 3D computer software.
Initially the genetic profiles obtained from the remains of the graves 10A, “The Warrior” and 10B - bone fragment derived from a child pointing a parent-child relationship. However the genetic profiles obtained were incomplete so it was very difficult to define the relationship type. In later stages of the project it has again carried out a genetic analysis of the remains of the graves 10A and 10B, with another bone fragment (10A grave). The results of this new analysis provided a more complete genetic profile and confirmed the earlier presumption of parent-child relationship. In the analysis of mitochondrial DNA (mtDNA), the same haplotype mtDNA were observed among individuals of the graves 4B and 8, and the graves 3 and 5, which may define their kinship in the maternal line. Estimates haplotypes of mtDNA in these relationships are H1b and H1a respectively. In addition, mtDNA haplotypes have been obtained in the analysis of the graves 2, 6B and 12. Preliminary results indicate that individuals belonging to haplogroups H1a and H1b respectively. Recent genetic studies of the remains of the burials 13 and 15 have been inconclusive about the sex of the individuals analysed. While mtDNA haplotypes obtained indicate that they belonged to haplogroup J1T.

The presented studies have proven that interdisciplinary analysis from a wide range of archaeology-related and anthropological-medical fields can assist studies and broaden the knowledge of archaeologists and anthropologists to enhance the understanding of the Strzyszow Culture.
TH5-04 Abstract 02
First evidence of mobility levels from British Bronze Age cremations
Author - Dr. Apelby, University of Leicester, Leicester, United Kingdom (Presenting author)
Co-author(s) - Evans, Jane, British Geological Survey, Nottingham, United Kingdom
Co-author(s) - Evans, Chris, Cambridge Archaeological Unit, Cambridge, United Kingdom
Keywords: Cremation, Mobility, Strontium
Presentation Preference - Oral

The question of Bronze Age mobility has been central to many discussions of the period. In Britain, such discussion has been largely focused on the notion of cremation as a mortuary rite from the end of the Early Bronze Age, which has meant that human remains could not be subject to isotopic analysis. Whilst there is good isotopic evidence for different mobility patterns in the Beaker period, in later periods we can trace only the movement of artefacts and not the movement of people. Since the publication of a new method for carrying out strontium analysis of cremated remains within the last two years (Hewitt et al 2014; Sneeck et al 2015), a whole new area of analysis has therefore opened up. This paper presents the results of the first analysis of mobility in cremated human remains from the British Bronze Age. The remains come from the barrow cemetery of Over in the Cambridgeshire fenslands, which is one of very few cemeteries where the barrow mounds survive and have been excavated using modern techniques. This analysis therefore offers a unique opportunity to understand how mortuary practices, and changes in mortuary practices over time, are related to the mobility of the people buried within a barrow cemetery.

TH5-04 Abstract 03
„Cremated Dating”? Case studies for the dating of Bronze Age cremation burials from Hungary
Author - PhD Dari, J., Déri Mugeum, Debrecen, Hungary (Presenting author)
Co-author(s) - PhD Kis, V., Institute of Archaeological Research Centre for the Humanities of HAS, Budapest, Hungary
Co-author(s) - PhD Kulcsár, G., Institute of Archaeology Research Centre for the Humanities of HAS, Budapest, Hungary
Co-author(s) - Major, I., Herdshtanti Laboratory of Environmental Studies, Institute for Nuclear Research, Debrecen, Hungary
Co-author(s) - Patay, R., Ferenczy Museum, Székesfehérvár, Hungary
Co-author(s) - PhD Szabó, G., Wosinsky Múum Museum, Székesfehérvár, Hungary
Co-author(s) - PhD Vizi, G., Institute for Archaeological Sciences, Évőifesz Lorged University, Budapest, Hungary
Keywords: AMS dating, Cremated remains, Early & Middle Bronze Age in Hungary
Presentation Preference - Oral

Cremation of dead bodies was a very common practice in the Carpathian Basin during the early, middle and late phases of the Bronze Age. The scientific value of cremated remains were undervalued due to the small amount of calcinated bones and the microfragmentation of human bodies that provide only limited bioarchaeological information. Beside the restricted information archaeologists have to face with methodological problems. One of these problem is that sometimes it is not easy to collect the tiny cremated bone pieces within a cremation burial. Another, “burning question” is the dating of the cremated bone remains.

Contrary to the nearly 70 year old development of the traditional 14C dating, the methodology applicable to cremated bone is now in a phase of maturation. The aim of our presentation is to provide case studies of several Early and Middle Bronze Age (2600/2500–1600/1500 BC) cremation burials from eastern, central and western Hungary. It is important because sometimes there is a poor fit between the relative chronological scheme and the still building radiocarbon chronology of the region, mainly because of the dominant burial practice of cremation. The presented, selected assemblages are special because they contain not just calcinated bones, but unburnt animal bones as gravegoods. The dating of these assemblages, and the analysis of burnt and unburnt animal bone collagen and its ratio was preformed. From this new data we can find new insights about the mobility and interaction of the people buried in these burials.

TH5-04 Abstract 04
The Role of MDCT in the Stratigraphic Study of Ancient Cinerary
Author - Innocenti, Dario, Moncalvole, Italy (Presenting author)
Keywords: Cinerary, Stratigraphy, Ums
Presentation Preference - Oral

Cinerary urns are a real challenge in the study of ancient populations. Content and container are indeed the result of a series of social customs and funerary gestures that begin after the death of the subject with the cremation rite and ends with the deposition of the ashes in the definitive burial place. The difficulties related to the study of the funerary rite of cremations are essentially connected with the quantity and quality of information that can be obtained. The stratigraphic analysis of the urn content potentially documents the depositional process from its filling to its deposition in the definitive grave, including any changes related to the interaction with the surrounding environment, tampering, and so on.

Manual laboratory micro-excavation permits an ordinate empty of the urn through an arbitrary division of its content in horizontal sections, from top to bottom, joined to an accurate graphic and photographic documentation. One of the limits of this method is the difficulty to fully understand the spatial relationships between the layers and materials contained in the urn and their alterations.

Multidetector CT (MDCT) permits a careful, non-destructive volumetric study of the whole content of the urn, keeping unchanged the spatial relationships between the layers. The differences of X-ray density of the layers and of the material contained in them permit to easily individuate the interfaces between them. Briefly, MDCT offers many advantages in respect to micro-excavation from stratigraphic point of view, suggesting its utilization before any non-repeatable operation made on the urn.

Our experience after MDCT scan on 40 cineraria from Neolithic to Roman age will be presented.

TH5-04 Abstract 05
A Case of Contested Cremains Analyzed Through Metric and Chemical Comparison
Author - Dr. Sebastian, Wälmänder, Stockholm University, Stockholm, Sweden (Presenting author)
Co-author(s) - Barlinke, Eric, California State University Chico, Chico, United States of America
Co-author(s) - Shults, Sabrina, National Museum of Natural History, Washington, D.C., United States of America
Co-author(s) - McMillan, Coleen, California State University Chico, Chico, United States of America
Co-author(s) - Van Deest, Tracy, University of Florida, Gainesville, FL, United States of America
Keywords: burned bone, cremains, forensic anthropology
Presentation Preference - Oral

Since the 1980s, cremation has become the fastest growing area of the U.S. funeral industry. At the same time, the number of legal battles against funeral homes and cremation facilities has increased. Forensic anthropologists are often asked to determine whether the contents of an urn are actually cremated bone, and to address questions regarding the identity of the remains. This study uses both metric and chemical analyses for resolving a case of contested cremains. A cremains weight of 2021.8 g was predicted based on the decedent’s reported stature and weight. However, the urn contents weighed 4137.5 g. The urn contents also contained material inconsistent with cremains (e.g., moist sediment, stones, ferrous metal). Analysis using XRD and SEM demonstrated that the urn contained thermally altered bone as well as inorganic material consistent with glass fiber cement. Although the controversy continues, cremains cases such as this one can be resolved using a forensic multidisciplinary approach.

TH5-04 Abstract 06
Cremated bones from Early Iron Age tarand graves in Estonia
Author - MSc, MA Kivirüüt, Anu, University of Tartu, Tartu, Estonia (Presenting author)
Co-author(s) - MSc, MA Kivirüüt, Anu, University of Tartu, Tartu, Estonia (Presenting author)
Keywords: cremation, Early Iron Age, methodology
Presentation Preference - Oral

This presentation will focus on the methodology and results of Estonian Early Iron Age (900 BC – AD 450) grave type called tarand grave. The work has been conducted on four different grave sites and the intention is to find out whether there were retrieval systems behind placing the dead into the grave and explain the findings in the context of the Iron Age burial practices.

The contents of the tarand graves are severely commingled – artefacts and bones are scattered in between the stone constructions. Also, the bones in these graves are very fragmented and can either be cremated or inhumed, even though cremation was the predominant rite. Visual osteological analysis of the found material has been beneficial, but has also given rise to further questions. In order to understand more about the burial customs and gain more information from the material, I have used a combination of methods: among them radiocarbon dating, d13N analysis, statistical and location analyses, 3D photograms, radiographs.

I will give an overview of the used methods and how they have benefitted my research. I will also focus on the results and present possible interpretations of the findings thus far.

TH5Science and multidisciplinarity in archaeology
A compilation of 14C dates over the last 50 years shows that less than 6% of all the bone dates were performed on purified bioapatite. The effective separation of the phase to be dated and the secondary calcite seems to be a challenge for researchers due to their identical chemical formula. Nevertheless physical and chemical changes which occur during the cremation process make cremated bones less susceptible to this type of contamination. In spite of all the difficulties a huge demand is shown for a reliable bioapatite preparation and measuring method since in a lot of cases dating is only possible by means of such findings.

At HEKAL laboratory, Debrecen, Hungary, we have dated several hundreds of bone samples using their organic collagen fraction. As a next step we would like to adopt a method for 14 C dating of bioapatite fraction, a process which starts with the effective extraction of the carbonate content of the samples. In the course of developing our process cremated bones from the early and middle Bronze Age (2600/2500-1800/1550 BC) were used where the expected age of the samples were detectable by dating well preserved, un-burnt bone findings from the same grave. At first, the intact bones were used dating the collagen fraction. In case of bioapatite samples, after the repetitive rinse with sodium hypochlorite and acetic acid step, the crushed and sieved samples were reacted with phosphoric acid. The revealed CO2 gas was subsequently purified from other gases, graphitized by sealed tube method and its 14C content was finally measured by the MICADAS AMS. Based on our first results fractions with different particle size (0.2-0.3 and 0.5-1 mm) yielded identical carbonate content and 14C age results. However, comparing the age of the three parallel bioapatite samples, it proved to be the same, that to organic fraction a difference of 200-400 years was experienced presumably due to the chemical pre-treatment.

On this poster we would like to present both the evolution of our carbonate pre-treatment protocol and dating problems arisen in the case studies of the presentation entitled „Cremated Dating”? Case studies for the dating of Bronze Age cremation burials from Hungary.
The research focuses on human remains from Komarovo burial ground (the first half of the 6th – the first half of the 7th centuries). The excavations have been conducted since 2013. Currently, 21 cremated burials have been unearthed. These burials can be divided into three groups: human, animal and mixed burials. Four burials among them can not be attributed to any of the groups due to fragmentariness and small amount of bones remained.

Human burials. The maximum size of the fragments does not exceed 40-50 mm. The total weight of bones varies from 150 to 850 grams. As regards the colour characteristics, the bones of white and pale-grey colour predominate. The colorimetric scales comparison revealed the maximum temperature of cremation that did not exceeded 700° C. In a number of cases, the remains contain transverse fractures, frequently in a curvilinear pattern, and more irregular longitudinal splitting. These features bear an evidence that the bodies were cremated during the first months after death, when bones still contain lipids and organic elements. Animal burials. Two burials were attributed to this group. Unfortunately, the species were not identified within the framework of this research. The maximum total weight of bones in such burials was 1 kilogram. The colour characteristics analysis showed the simultaneous presence of weakly burned, unburnt and white bones, indicating that the temperature of cremation varied from the lowest to over 800° C.

Besides the remains with thermal deformation and fissures, these burials also contain burned 'dry' bones, dehydrated and delipated at the moment of cremation.

Mixed burials. The third group contains human and horse remains, with two burials contain inhumations with animal bones. The first one contains the fragments of pelvic skeleton of horse, the second one – the pelvis, the scapula, metapodial of horse. The colour analysis of the identified human remains found the same features specific to the first group. The cremation temperature for the animal remains did not exceed 300° C.

The gender and age of cremated people was identified in 14 cases. Only one of them was a 7-8 years old children. Other burials belonged to adults. The majority of them was 45-55 years old women. Only two burials contain remains of men. The unsufficient state of conservation, fragmentation and the lack of necessary morphological markers made impossible the gender determination in 5 cases.

The further studies of Komarovo burial ground will include the application of natural scientific methods, namely spectral analysis for defining human and non-human remains, histological bone structure analyses for age determining and the analysis of the 87Sr/86Sr ratio for migration processes in the local level.

TH5-05 Abstract 01
The Biology of Yersinia pestis and Plague in the 21st Century

Author: Dr. Latham, Wyndham, Northwestern University, Chicago, United States of America (Presenting author)

Keywords: disease, epidemiology, plague

Presentation Preference - Oral

There are three species of Yersinia that cause disease in humans: Yersinia enterocolitica, Y. pseudotuberculosis, and Y. pestis. While Y. enterocolitica and Y. pseudotuberculosis cause mild, self-limiting gastrointestinal infections, Y. pestis is responsible for the rapidly progressing, invasive, and often fatal disease called plague. Although Y. pestis is thought to have killed over 200 million people throughout history, it is a relatively “young” pathogen, only recently emerged from Y. pseudotuberculosis between 5,000 – 20,000 years ago. In this presentation, we will discuss the types of infections and diseases specifically caused by Y. pestis, its modes of transmission, both between fleas and mammals as well as between mammals, and provide an overview of plague in the 21st century, including information on why plague continues to be disease of worldwide concern.

TH5-05 Abstract 02
From Mild to Murderous: How Yersinia pestis Evolved to Cause Pneumonic Plague

Author: Dr. Latham, Wyndham, Northwestern University, Chicago, United States of America (Presenting author)

Keywords: evolution, plague, pneumonic

Presentation Preference - Oral

How do new pathogens emerge, and how do these pathogens take advantage of host processes and pathways to cause disease? Yersinia pestis, the etiological agent of plague, is a recently emerged clone of the gastrointestinal pathogen Y. pseudotuberculosis, but the specific genetic changes that enabled Yersinia to cause the respiratory disease known as pneumonic plague are not well understood. By using a mouse model of respiratory infection combined with comparative genetic and genomic studies between Yersinia species, we have identified two specific events – the acquisition of the Pla protease and the inactivation of the YadA adhesin – as key steps in the emergence of Y. pestis as an easily transmissible, severe respiratory pathogen. The acquisition of the Pla protease enabled ancestral Y. pestis strains to grow to high levels in the lungs and cause a fulminating, multifocal severe pneumonia, while the loss of YadA shifted the respiratory infection from a restricted, granuloma-like pathology to a loosely contained, easily expelled state. Indeed, the loss of YadA by Y. pseudotuberculosis may have been a key step by which Y. pestis acquired the ability to be spread by respiratory droplets, thus enabling epidemics of pneumonic plague.

TH5-05 Abstract 03
Fleas, rats and other stories - The palaeoecology of the Black Death

Author: Panagiotakopoulos, Eva, University of Edinburgh, Edinburgh, United Kingdom (Presenting author)

Keywords: fleas, palaeoecology, plague

Presentation Preference - Oral

Bubonic plague is a disease which involves various animal vectors and hosts and its ecology is both complex and of importance in terms of its spread and virulence. The origin of the Black Death is central to its better understanding and can throw light on the medieval pandemic and later epidemics. This paper discusses the ecology and biogeography of bubonic plague and looks into the natural history and palaeoecology relating to its vectors, primary and secondary. Xenopsylla cheopis and other flea species and hosts, the eg. Anicerithrus nitidus and Rattus rattus. The possible origins of the disease and its connection with the first urban centres of Egypt and Mesopotamia are discussed taking into account climatic, environmental and archaeological evidence. The hypothesis of the spread of the Black Death via trade links with Asia and Europe, in relation to the relevant archaeological record are also explored.

Presentation Preference - Oral

The bacterium Yersinia pestis is the etiological agent of plague and has caused human pandemics with millions of deaths in historic times. How and when it originated remains contentious. Here, we report the oldest direct evidence of Yersinia pestis identified by ancient DNA in human teeth from Asia and Europe dating from 2,800 to 5,000 years ago. By sequencing the genomes, we find that these ancient plague strains are basal to all known Yersinia pestis. We find the origins of the Yersinia pestis lineage to be at least two million years earlier than previous estimates. We also identify a temporal sequence of genetic changes that lead to increased virulence and the emergence of the bubonic plague. Our results show that plague infection was endemic in the human populations of Eurasia at least 3,000 years before any historical recordings of pandemics. Our findings open the possibility of identifying other blood borne pathogens directly from human remains (See S. Rasmussen, M. E. Allentoft, K. Nielsen, L. Orlando, M. Sjögren, K.-G. Sjögren ... E. Willerslev (2015). Early Divergent Strains of Yersinia pestis in Eurasia 5,000 Years Ago. Cell, 163:571–582).

TH5-05 Abstract 05
Plague in the eastern Mediterranean region 1200-1000 BC?

Author: - Prof. Walia, Lars, University of Oslo, Institute of Basic Medical Sciences, Department of Physiology, Oslo, Norway (Presenting author)

Keywords: demographic crises, Mycenaean, plague

Presentation Preference - Oral

How do new pathogens emerge, and how do these pathogens take advantage of host processes and pathways to cause disease? Yersinia pestis, the etiological agent of plague, is a recently emerged clone of the gastrointestinal pathogen Y. pseudotuberculosis, but the specific genetic changes that enabled Yersinia to cause the respiratory disease known as pneumonic plague are not well understood. By using a mouse model of respiratory infection combined with comparative genetic and genomic studies between Yersinia species, we have identified two specific events – the acquisition of the Pla protease and the inactivation of the YadA adhesin – as key steps in the emergence of Y. pestis as an easily transmissible, severe respiratory pathogen. The acquisition of the Pla protease enabled ancestral Y. pestis strains to grow to high levels in the lungs and cause a fulminating, multifocal severe pneumonia, while the loss of YadA shifted the respiratory infection from a restricted, granuloma-like pathology to a loosely contained, easily expelled state. Indeed, the loss of YadA by Y. pseudotuberculosis may have been a key step by which Y. pestis acquired the ability to be spread by respiratory droplets, thus enabling epidemics of pneumonic plague.
Over a period of 150 years from about 1200 BC, the Mycenaean states collapsed. The great Mycenaean centres did not decline slowly during this period, but suffered sudden destruction at the very peak of their prosperity. Five hypotheses have been proposed to explain the collapse: invasion, civil war, local risings, earthquakes and climate change. However, none of them seems to provide a satisfactory explanation of the existing archaeological material. At about the same time, similar disturbances and destruction also afflicted Cyprus, Syria and Anatolia, and the Hittite empire came to an end. The temporal and geographical distribution of these disasters and the subsequent course of events in the Aegean region show a strong similarity to developments in the European region following the two later pandemics of plague. In addition, there is strong documentary evidence that there was at least one epidemic of bubonic plague with high mortality in the eastern Mediterranean region at the relevant time. Recent analyses of Bronze Age DNA sequences resembling Yersinia pestis indicate that the infection was endemic in human populations, and that it acquired sufficient virulence to cause bubonic plague at some point in time between 1600 and 950 BC.

PH-05 Abstract 06

Plague Before the Plague: Early Bubonic Plague

Author - Muhall, John, Harvard, Cambridge, Massachusetts, United States of America (Presenting author)

Keywords: bubonic plague, Greek medicine

Presentation Preference - Oral

In October 2015, Rasmussen et al. published evidence that Yersinia pestis was infecting human hosts in Western Eurasia as early as the Bronze Age. In the past, molecular evidence did not give historians a reason to doubt that Y. pestis was relatively new to Europe at the time of the Justinian Plague. The new evidence that Y. pestis was active near the Mediterranean some 1,500 years before the Justinian Plague therefore calls for a reevaluation of the evidence for plague in Antiquity before the Justinian Plague.

This paper will report the conclusions of a close philological study aimed at uncovering what evidence there is for plague in the medical sources of antiquity, specifically, the Hippocratic Corpus, Rufus of Ephesus, and Galen. The picture that emerges from the medical sources is that Y. pestis was unknown to medical writers until around the first century AD, when sources cited by Rufus of Ephesus report a disease that resembles plague. The plague remains familiar to medical authors from the first century BC to the end of the first century AD, when both Rufus and Aeneas both demonstrate an awareness of Y. pestis. Intriguingly, Galen, who flourished in the mid second century, only a few generations after Rufus, does not show any awareness of bubonic plague. First, this paper will demonstrate that there is no compelling evidence of Y. pestis in the Hippocratic Corpus. While the term ψυτης (boubon) to describe glandular swellings appears twelve times in the Hippocratic Corpus, none of these twelve instances suggest that these boubones are plague buboes as opposed to other glandular swellings.

A passage by Rufus of Ephesus that has been preserved in the Medical Collections of Orbaisus contains the first description of a disease that we can confidently identify with plague. Rufus calls the disease “pestilential bouboneis” and details it in a way that corresponds to our modern understanding of Y. pestis and to sixth-century descriptions of the Justinian Plague.

In this passage, Rufus cites three little known authors who also knew of “pestilential bouboneis”: Posidionios, Dioscuroides, and Dynosuys Kurt. The names Poseidionios and Dioscuroides could correspond to a number of possible figures, though because it is likely that they are contemporaries it seems likely that they refer to little known authors of the first century BC. While it was previously thought that this Dynosuys Kurtos was active in the third century BC, I will argue that Dynosuys Kurtos could have been active anytime before the first century AD.

Finally, I will argue that, like the Hippocratic authors, there is no robust evidence that Galen was aware of bubonic plague. The uses of the term boubon in Galen refer most often to common lymphangitis and do not resemble plague buboes. While the passage in Rufus suggests that Y. pestis was active in the Mediterranean from around the first century BC to the first century AD, after the first century AD there are no new descriptions of Y. pestis until Late Antiquity.

PH-05 Abstract 07

Placing the Plague of Justinian in the Yersinia pestis phylogenetic context

Author - Klunk, Jennifer, McMaster University, Hamilton, Canada (Presenting author)

Co-author(s) - Wagner, David, Northern Arizona University, Flagstaff, United States of America

Co-author(s) - Sahil, Jason, Northern Arizona University, Flagstaff, United States of America

Keywords: ancient DNA, phylogenetics, plague of Justinian

Presentation Preference - Oral

The phylogenetic tree of the plague-causing pathogen Yersinia pestis has expanded in the last five years to include ancient draft genome sequences, which have allowed facets of the history of this disease to be explored in ways that were previously impossible. This pathogen has caused at least three human plague pandemics: the Plague of Justinian (6th-8th centuries), the Black Death (1347-1352, with waves continuing from the 14th centuries) and the modern pandemic (19th-20th centuries), which have all been genetically characterized. Here we present the draft genomes obtained from two individuals who died in the first pandemic that allowed for genetic characterization of this pandemic. On the basis of maximum likelihood phylogenetic analyses, we conclude that the Y. pestis lineage that caused the Plague of Justinian and the Black Death 800 years later were independent emergences from rodent reservoirs in humans. These results show that rodents species worldwide represent important reservoirs for the repeated emergence of diverse lineages of Y. pestis into human populations. In contrast, recently published Y. pestis sequences from the 18th century plague outbreak in Marseille, France do show ancestry in the strains obtained from Black Death victims, but are not represented in any sampled modern lineages. Taken in concert, the phylogenetics of ancient pandemic Y. pestis genomes reveal that the geographical spread of the disease and subsequent establishment of rodent reservoirs varied between pandemics.

PH-05 Abstract 08

Early medieval burials of plague victims: examples from Aschheim and Alteneding (Bavaria, Germany)

Author - Dr. Gutsmiedl-Schürmann, Doris, Freie Universität Berlin, Berlin, Germany (Presenting author)

Co-author(s) - Harbeck, Michaela, Department of Anthropology, State Collection for Anthropology and Palaeoanatomy, Munich, Germany

Co-author(s) - Keller, Marcel, Department of Anthropology, State Collection for Anthropology and Palaeoanatomy, Munich, Germany

Co-author(s) - Pfäffgen, Bernd, Ludwig-Maximilians-University Munich, Munich, Germany

Co-author(s) - Rott, Andreas, Department of Anthropology, State Collection for Anthropology and Palaeoanatomy, Munich, Germany

Keywords: early medieval cemetery, Justinianic Plague, Upper Bavaria

Presentation Preference - Oral

With this paper, we present burials from two early medieval cemeteries, Aschheim-Bajuwarenring and Alteneding-Kleitham, where the causative agent of plague, Yersinia pestis, could be detected paleogenetically.

The burials from the early medieval cemeteries of Aschheim-Bajuwarenring and Alteneding/Kleitham show that plague victims have been dressed and prepared carefully for their funeral. Compared to other graves from these cemeteries on the one hand and to contemporary burials in general, nothing basically indicates that the Y. pestis infected individuals had been treated differently than other deceased. Among the buried who were infected with Y. pestis occurred some of the richest and most well-equipped graves of the cemeteries. Therefore, it cannot be proven on base of the Early Medieval plague graves of the Munch grave plan that ‘...all that time all the customary rites of burial were overlooked. For the dead were not carried out escorted by a procession in the customary manner, nor were the usual chants sung over them [...]’ (Procopius, De Bello Persico II 23, 15). On the contrary: the burial rites, as far as reconstructable, had been carefully conducted. The only difference is that the so far confirmed victims of the plague seem to have been more often buried in double or multiple burials. However, the screening of single burials is still in an early stage.

The Justinianic Plague was nevertheless a disease that affected Europe in the Late Antiquity, but its occurrence appears not everywhere as catastrophic as the written sources make us believe.

Plague in Valencia, 546: A Case Study of the Integration of Texts and Archaeology

Author - Gruber, Henry, Harvard University, Cambridge, United States of America (Presenting author)

Keywords: bubonic plague, mass graves, Spain

Presentation Preference - Oral

Although so-called Justinianic Plague of Yersinia pestis that began in the early 540s dramatically altered the history of the Mediterranean region, information about its impact is fragmentary. This is especially true in the Western Mediterranean, where few narratives or documents reveal the plague's impact. Archaeology can fill these gaps. Recent work on the prevalence of mass graves in the late- and immediately post-Roman world suggests that mass graves, properly understood, can serve as a proxy for mass death. However, despite the work being done to bring together the documentation of these graves, it has been difficult to confirm these as a result of the plague. This paper will present the results of a study that used historical and archaeological data to analyze the impact of the Justinianic Plague in Valencia.

This study will use the concatenation of evidence from Valencia to both chart a specific instance of the Late Antique plague and showcase the promise – and difficulty – inherent in the interdisciplinary study of bubonic plague.

Keywords: bubonic plague, mass graves, Spain

Presentation Preference - Oral

The Justinianic Plague, which started in the 6th century and lasted to the mid-8th century, is the first out of at least three historically significant pandemics due to Yersinia pestis. The plague was responsible for the death of millions of people and is estimated to have affected up to 50% of the population. The plague was perpetuated by fleas that fed on infected rats and then transferred the disease to humans. This paper is divided into three parts. The first analyzes the canon within the context of debates on the care of the dead in Late Antiquity. The second studies the archaeological evidence for burials in Valencia, both those of bishops within the sixth-century ecclesiastical complex and the mass graves that are currently being documented. The third reflects methodologically on the potential for integrating church documents and funerary archaeology. This study will use the concatenation of evidence from Valencia to both chart a specific instance of the Late Antique plague and showcase the promise – and difficulty – inherent in the interdisciplinary study of bubonic plague.

Understanding Black Death: News from Denmark

Author - Dr. Gamble, Julia, University of Toronto, Toronto, Canada (Presenting author)

Keywords: bioarchaeology, Black Death, Denmark

Presentation Preference - Oral

The mid-14th century Black Death epidemic reverberated across Europe, having significant impacts on the population which shaped social, economic, and political dynamics in the years to come, and leaving its selective mark on the surviving populations from a genetic standpoint. The epidemic has since captured the attention of an interdisciplinary following of researchers, with core interests in the social and biological impacts and the disease etiology, amongst other areas. It is estimated that up to 50% of the population was lost over the course of the epidemic in Denmark, but up until now little bioarchaeological or molecular work has been done on the disease in Denmark. As an acute infection, the Black Death epidemic left no diagnostic anatomical signs on the skeletal remains of medieval populations. Thus far, our understanding of the epidemic relies on historical accounts and on modern clinical understandings developed from more recent outbreaks of bubonic plague (a disease caused by Yersinia pestis, which is one of the prime contenders for the causative agent of Black Death). In reality, the causative agent of one of the most significant epidemic crises in recorded history is still an incredibly contentious subject, and our understanding of the circumstances affecting the health of populations around the period of the Black Death epidemic is limited. Yersinia pestis has been identified in Black Death cemeteries in Europe, but thus far, no published work is available from Denmark. By building a better understanding of the pathogen load of the populations in Denmark at the time of the Black Death crisis, as well as both before and after the epidemic, it will be possible to attain a better understanding of the role Yersinia pestis may have played in the population, and of the immune changes and responses to the epidemic. The current paper presents preliminary results from an international team combining bioarchaeological and molecular methods to gain a better understanding of the epidemiological patterns surrounding the Black Death epidemic in Denmark.
Science and multidisciplinarity in archaeology

Keywords: ancient DNA, Black Death, plague

One of the most devastating events in human history was the second plague pandemic, which began with the Black Death (1347-1353). Sporadic outbreaks of plague continued in Europe until the 18th century, when the disease essentially disappeared. Initial sequencing of Yersinia pestis genomes from London victims of the second plague pandemic, identified the Black Death as the event that gave rise to most of the Y. pestis genetic diversity present around the world today. This result raised further interest regarding the relationship of this lineage to the ones associated with post-Black Death outbreaks, and to modern plague lineages. Recent climatic and ancient DNA studies have attempted to explore these relationships, although a clear consensus is still yet to be reached. Here, we present three historical Y. pestis genomes from the second plague pandemic in Spain, Russia and Germany. Our results provide support for low genetic diversity in the plague bacterium during the Black Death, followed by a subsequent eastward travel of lineages to later become the source for the worldwide third plague pandemic, which began during the 19th century in China. In addition, our data from a post-Black Death plague outbreak in Germany are best explained by the persistence of a European plague lineage that is now likely extinct.

Bacterial Cartography and Historiography of Plague

Author - Eaton, Katherine, McMaster University, Hamilton, Canada (Presenting author)
Co-author(s) - Klunk, Jennifer, McMaster University, Hamilton, Canada
Co-author(s) - Varlik, Nükhet, Rutgers University, Newark, United States of America
Co-author(s) - Poirier, Hendrik, McMaster University, Hamilton, Canada

Presentation Preference - Poster

There is tremendous variation in the proposed routes of historical plague due to the sparseness and ambiguity of mortality records. In addition, the majority of these contemporary sources are non-specific with regards to the cause of death. To address these limitations, genetic data from ancient pathogens provides a unique line of evidence for identifying and mapping the spread of disease. Ancient DNA (aDNA) in combination with archival documents stands to contribute a novel perspective by focusing the analytical lens on the bacterium Yersinia pestis, the etiological agent itself. This study aims to critically examine how aDNA and the evolution of Y. pestis can be used to reconstruct the movement of plague in medieval Europe. An exploration of the strengths and weaknesses of genomic research will serve to evaluate how aDNA of Y. pestis can contribute to a holistic framework of plague research, in which both the human and bacterial components are examined. Ultimately this research will assess to what extent archival-based models and molecular reconstructions of plague provide complementary or contrasting narratives of disease spread. The identification of key questions that can be suitably addressed through the evolution of ancient pathogens will serve to conclusively highlight the collaborative potential of interdisciplinary plague research.

REMOTE SENSING TECHNIQUES

TH5-06 Abstract 01

Mid-Holocene settlement complexity in Northern Ostrobothnia, Finland

Author - Peasonen, Petri, National Board of Antiquities, Helsinki, Finland (Presenting author)
Co-author(s) - Leppänen, J., LiDAR, Neolithic, settlements

Presentation Preference - Oral Additional information

LiDAR mapping has recently become a standard tool in archaeological survey in Finland. In 2015, a set of LiDAR visualisations from Northern Ostrobothnia were investigated and a large number of housepit sites were later inspected in terrain. A total of 481 new housepit sites were recorded during field survey thus bringing the total number of pithouses to one of the densest occurrences of pithouses in the country, only rivaled by similar areas in the River Ipikki (Karvia) and Renvaamaja (Vormsi) areas in the north.

The sites are roughly dated between 4000-2500 calBC, to the period of the suggested Mid-Holocene population peak further stressing the relevance of this period in Finnish archaeology. It is not only the large number of the pithouses themselves, but the complexity of the settlement patterns as well opening exciting new avenues to the study of complex hunter-gatherer societies in the region.

TH5-06 Abstract 02

Changing the perspective of Neolithic civilization: Sopot culture tells discovered by remote sensing

Author - Dr. Šiljeg, B., Institute of Archaeology, Zagreb, Croatia
Co-author(s) - Kalatolić, H., Institute of Archaeology, Zagreb, Croatia (Presenting author)

Keywords: GIS, prehistoric enclosures, Sopot culture

Presentation Preference - Oral

The Eastern Croatia can be considered as the heartland of the Neolithic community known as the Sopot culture. Numerous sites of this culture are already known, and only a small number of them were excavated. The project of aerial archaeological survey...
of eastern Croatia, including other techniques of remote sensing such as satellite infrared images, resulted in discovery of many other archaeological sites of the Iron Age. Connected with the latest studies in geoarchaeology and archaeogeography, the new data from LIDAR also reveal the great adaptation of the drawing of the gallo-roman road to the territory through which it passes (topography, hydrology, topology).

In years 2010-2011, a LiDAR survey campaign was led by the « Group of Public Interest Seine- Aval » (GIP-SA) from the upstream of Rouen to the English Channel with the aim of drawing up accurate topography of the Seine valley and watershed adjoining the river. This data, available on over 1100 km², have for primary purpose of anticipating the rise of seawater, with the global climate changing, by calibrating the defense structures against the sea accordingly.

This very appropriate survey campaign had covered the public forests and also numerous private woods of lesser importance. The raw data have been processed jointly by teams of the french Ministry of Culture and Communication and the Office National des Forêts. They generated images ready to be used in archaeological analysis on more than 300 km² (situation in 2015 - to be increased in the future). The contributions are considerable, under forest cover or not, but the zone with woodland needed to be surveyed first for the virtual forest removal.

A rereading of the regional archaeological documentation then forces us to reconsider the state of knowledge, particularly in terms of regional archaeological mapping. Dozens of new settlements, or anomalies, need to be added in the National archaeological map and inventory. In the same meaning, the global understanding of the territorial organization from Gallic and Gallo-Roman periods is considerably renewed. Indeed, the opptida (hill forts) that dotted this part of the Seine valley are particularly well readable, and the understanding of their insertion in the territorial organization becomes more relevant. Their morphology and their relation to the topography and the road system are greatly reinterpretated. In addition, the “antique” road called “Chaussée Jules César”, serving the plateau on the north side of the Seine, finally shows his consistency as a strong element of organizing Caléjos and V吉利casses pagi. This organization seems largely inherited from a structure already in place before the end of the Iron age. Connected with the latest studies in geoarchaeology and archaeogeography, the new data from LiDAR also reveal the great adaptation of the drawing of the gallo-roman road to the territory through which it passes (topography, hydrology, topology).

Collecting informations and data analysis will continue for several years, but the data from the LiDAR have already been used in two PhD and several Master’s degrees. Two systematic excavations, initiated in 2012, are straightly the result of the new opportunities offered by this tool under development. Medieval, modern and contemporary times, also benefit from this data renewal. But many things are still to come.

**TH5-06 Abstract 05**

**Airborne LiDAR data for the study of Roman military presence in NW Iberia**

**Author:** Dr. González Aranda, David, Universidad Complutense de Madrid, Salas, Spain

**Co-author(s):** Costa-García, José M., Universidad de Santiago de Compostela, Compostela, Spain; Pinto, Marián, Universidad de Santiago de Compostela, Compostela, Spain

**Keywords:** Archaeological prospection, LiDAR, Roman Military Archaeology

**Presentation Preference:** Oral

The Roman military settlements are usually characterized by the perishable nature of the structures and the material culture associated to them. Since these sites are almost invisible in the landscape, the use of remote sensing techniques for their study became essential. Although the use of certain remote sensing tools - i.e. aerial photography - on this issue in the Iberian Peninsula is not new, the development of Roman military archaeology in recent decades greatly demanded a significant renovation of the methodological approaches. In this way, we put into practice a low-cost methodology combining historical and modern aerial photography, satellite imagery, airborne LiDAR, GIS and conventional archaeological field survey techniques. These tools actually provide a new and qualitatively differential approach, allowing us to study the spatial, locational and morphological characteristics of these sites, and thus leading to a more contextualising approach. In this paper, we will focus on the differential contribution of airborne LiDAR data to this particular methodological approach. By analysing the response of this tool to different landscapes, terrain types and vegetation canopies, we can outline the potential and limitations of it. On that basis, we can then develop a predictive model for its use when studying Roman military sites such as temporary/marching camps. This technique allows us to map archaeological landscapes as a whole, so we need to develop different strategies to increase the visibility of certain types of features in the landscape. Landscape is not just a messy amount of archaeological features, but a palimpsest of multiple temporalities we need to read and understand.
Remotely Visible? The Search for Communities

Keywords: Archaeological prospecting, Magnetism-based geophysics, Methodology experiment

Presentation Preference - Oral

Between 2011 and 2014 the authors investigated in detail the protohistoric land use and occupation of the Ragnaleto River basin in southern Italy, which had previously (2000-2010) been archaeologically surveyed by the University of Groningen Institute of Archaeology. These investigations aimed at fine-tuning non-invasive archaeological prospection methods for ephemeral archaeological remains and at mitigating pervasive research biases in the study of protohistoric settlement and land use. Here we report on only one aspect of this wide-ranging project, namely the use of geophysical prospecting as a means to avoid undue focus on known ‘sites’ and/or elevated-density peaks in the archaeological surface record.

We first present the experimental application of magnetic-based geophysical techniques for the detection of ‘non-sites’, i.e., archaeological features without any apparent surface expression, in three landscape zones with different geology, morphology and soils, and with potentially different archaeological records. In the sandy and gravelly soils of the foothill zone bordering on the coastal plain of Sybaris (100-400m asl), an exploratory swath of magnetic gradiometry across the already intensively field-walked agricultural area ‘Contrada Damale’ revealed evidence of anthropogenic features without associated surface artefact scatters. Some of these features have direct parallels with archaeologically relevant anomalies (nut foundations) detected on known protohistoric surface sites, and show that settlement densities have been seriously underestimated. At the Monte San Nicola Hilltop, a large-scale magnetometer survey on the sixty soils of the Pito-Peistocene marine terraces landscape (50-550m asl) resulted in a set of circular pit-like anomalies which, after an intensive field-walking survey, could be related to diffuse pottery of the Late Bronze Age / Early Iron Age. Now believed to be the partially ploughed-out remains of a cremation cemetery, the experiment has added a rare example of this type site. Finally, in the generally eroding upland valley at Contrada Madatulena, where soils consist of schists and marls (700-1000m asl), large-scale on- and off-site magnetic gradiometry did not result in any archaeological features. However, some seemingly natural magnetic anomalies turned out to have a complex genesis which is still relevant to our understanding of the archaeological surface record. Besides these intensive geophysical studies, we also collected long transects of magnetic susceptibility measurements in all three landscape zones to determine the geological basis for the anomalies and to compare any anthropogenic and natural magnetic anomalies would be distinguishable. We discuss several examples of gridted and ungrided on-site MS surveys to demonstrate the effect and implications of this approach.

THE5-06 Abstract 08
Reevaluating the landscape of Lesser Poland. Love, hate and “vicious circles” of noninvasive methods

Author - MA Wroniecki, Piotr, Warszawa, Poland (Presenting author)
Co-author(s) - Małakowski, Maksym, University of Wrocław, Wrocław, Poland
Co-author(s) - Myśliwiec, Bartos, University of Wrocław, Wrocław, Poland
Co-author(s) - Przybyła, Marcin M., Przybyłak, Kraków, Poland
Keywords: aerial archaeology, field-walking, geophysical prospection

Presentation Preference - Oral

The presentation will deal with the methodological approaches and preliminary results of the “Hidden Cultural Landscapes of the Western Lesser Poland Upland” project. The project’s study area is an area extremely abundant in settlements. This complex period and has been subject of many (settlement) surveys in prior years but has never been covered by a macroregional non-destructive (remote sensing, geophysical) study. The project is enthusiastically oriented towards existing Archaeological Record of Poland (AZP, a nation-wide archaeological mapping programme based on the sole application of field-walking) results as a valuable source of complementary (historical-cultural) data that may be an important corrective factor in a holistic interpretation of acquired non-invasive datasets. Despite this general eagerness it needs to be noted that data derived from the AZP programme requires a critical approach. AZP remains unfortunately resilient to attempts of modernization, both from a theoretical and practical perspective, where the perceived limitations of other (usually non-invasive) techniques forsake the need for change (e.g. aerial prospection as described in: Rączkowski 2005). Tradition in Power: Vicious circles(s) of aerial survey in Poland.

Non-invasive techniques in Poland are viewed as pre-extraction prospection tools and in this manner are generally accepted by the archaeological milieu. This approach based on the practical needs of the (traditional) cultural-historical paradigm pigeonholes such techniques like geophysics or remote sensing solely as prospection methods and denies them the position of fully fledged, though alternative, research tools enabling the study of past landscapes and societies.

A multitude of recent archaeological landscape projects that have taken place in Europe show that such pigeonholing is a definite sign of underused potential. Landscape studies take into account data from territorial units unfathomable even to rescue excavations, allowing the study of large spatial structures within macro regional contexts. They also deal with important (cultural) activities that do not manifest in clear physical forms. Indeed, non-destructive methods mostly fail at procuring material culture and chronological evidence, however they excel in the recognition of cultural features not definable by traditional approaches and also shed new light on heavily researched subjects, often dramatically changing their interpretation.

The integration of new methods and approaches is a topic of a long and heavily polarised national debate with a growing group of strong proponents and even more opponents. It is focused on the justification of non-invasive techniques in archaeology. Main arguments “against” revolve around pointing out that lack of chronological data makes excavations necessary anyway, therefore making i.e. geophysics a costly extravagance, draining funding from “real archaeology.” Not to mention into exploring the extremely convenient situation where (cultural-historical) AZP readily available data can be combined, compared and evaluated with new non-invasive datasets, potentially bypassing limitations and complementing both approaches. This subject will be underlie in the “Hidden Cultural Landscapes of the Western Lesser Poland Upland” project.
Above and below the surface. Remote Sensing Techniques can reveal the enormous amount of information as well about soldiers who found themselves in the Great War, despite numerous written sources. In our presentation we will focus on showing the ways in which the Advanced entanglement. Three seasons of research made us realize how little is known about the material dimension of the Eastern Front of the condition of the ever changing battlescape in the region of the Rawka and Bzura" is the scientific project, which reveals that "Archaeological revival of memory of the Great War. Material remains of the life and death in trenches of the Eastern Front and underestimated. In a densely forested landscape, very different from what it looked like in the mid-16th century, modern techniques that vanished during the events 450 years ago. The importance of remote sensing for the Getaryggen 1567 project cannot be overstated. In a densely forested landscape, very different from what it looked like in the mid-16th century, modern techniques have made it possible to investigate a military campaign and even interpret its consequences. By doing so, we can begin to understand the true conditions of the local population in a border region. People that were subject to recurring warfare and unfortunate peasants got in harm’s way…. However, this could have been avoided. A well planned system for defense in depth was established before the war. Bridges were not only defensible but also had been built in strategic positions along the river valley at a distance of about one days march from each other. Used correctly, these simple fortifications would have slowed down an invader, wasting his strength while giving the defenders time to gather reinforcements. But due to a number of circumstances this did not happen in 1567. Instead the unfortunate peasants got in harm’s way.

The remains of these defenses and their historical importance went almost unnoticed until recently. The research project Getaryggen 1567 broadened its scope after having located and investigated a battlefield from the conflict. By using combination of written evidence, aerial photography, LIDAR and GPR it has been possible to trace both the preparations made by the Swedish forces and the tracks of the Danish army. Careful analysis of LIDAR data explains why certain sites were chosen as defensive positions or used for temporary camps. It has proven to be the most effective method for mapping settlements that vanished during the events 450 years ago. The importance of remote sensing for the Getaryggen 1567 project cannot be overstated. In a densely forested landscape, very different from what it looked like in the mid-16th century, modern techniques have made it possible to investigate a military campaign and even interpret its consequences. By doing so, we can begin to understand the true conditions of the local population in a border region. People that were subject to recurring warfare and suffering, with a situation too many parallels to our own time!
Since such exceptional findings have high scientific potential it is of great interest for an interdisciplinary project. Photogrammetry and 3D scanning were used as the documentation method at the excavation and allowed quick and detailed drawings of scaled plans. To keep the contamination of human remains as low as possible the excavators used various protective equipment.

The human remains are morphologically analysed, the minimal number of individuals is calculated, stable isotope analyses of the isotopes carbon, nitrogen, sulphur, oxygen, hydrogen, strontium and lead will be performed in order to investigate the dietary habits, possible migration patterns and climatic conditions of this time. Furthermore, the ancient DNA will be investigated for population genetics and also to gather information about phenotypes and genetic relationships.

Radiocarbon dating will be performed to shed light on the chronology of the burials.

First radiochronologic dates indicate that the dolmen was used from around the second half of the 4th millennium BC. This falls within the two big migration and admiring events of Neolithic Europe. So far little is known about the population at the time of the dolmen. Additionally the geography in the alpine region makes it an important source for migration studies since migration routes are limited in the alpine region.

---

TH5-06 Abstract 14

A view from above: GIS and LIDAR vs. trowels and spades

Author: PhD student Daubaras, Mantas, Lithuanian Institute of History, Vilnius, Lithuania (Presenting author)

Keywords: GIS, landscape archaeology, LIDAR

Presentation Preference: Poster

An ongoing research project focused on Varniai region (western Lithuania) is working towards understanding the use of prehistoric (Mesolithic, Neolithic) landscapes in this area of 274 km2. The approach of surveying for new sites has been employed by means of GIS and LIDAR modelling as well as actual excavations. Here we present primary results of this endeavour as well as shortfalls of GIS and LIDAR modelling if it isn’t used together with an actual archaeological fieldwork.

TH5-06 Abstract 19

Unique burials found in the ancient necropolises in Crimea with the magnetic survey in 2014-2015

Author: PhD Smekalov, Sergey, Tula State Law Tolstoy Pedagogical University, Saint-Petersburg, Russian Federation (Presenting author)

Co-author(s): Vaslov, Vladimir, Institute of Archaeology of the Crimea, Simferopol, Crimea

Co-author(s): Lantsov, Sergey, Institute of Archaeology of the Crimea, Simferopol, Crimea

Co-author(s): Nenevolya, Ivan, Bakhchisaray historical, cultural and archaeological museum, Bakhchisaray, Crimea

Co-author(s): Shafiev, Michail, Institute of Archaeology of the Crimea, Simferopol, Crimea

Keywords: late Scythians, burial items, gold jewelry, magnetic survey, North-Western Crimea, ancient necropolis

Presentation Preference: Poster

Excavations of the necropolises are extremely important for understanding the synchronocity with the graves historical processes. The funerary objects, visible on the surface, in most cases repeatedly robbed. Situation with underground cemeteries, which are not visible on the surface, is different. Although they, too, went looting extensively in Crimea, but the invisibility of these objects, to some extent, protects them from robbers. But for the same reason they are difficult to detect for archaeologists too. One of the search options to such objects is the use of magnetic survey.

In 2014-2015 gg. researchers from Tula and Simferopol have carried out magnetic survey at several cemeteries of the Western Crimea. Excavations of the anomalies have revealed burials, which was not robbed, or, at least, not robbed in modern times.

In the necropolis of the settlement Djan-Baba studied three not robbed ground children’s graves with a variety of implements and unique family stone cist with numerous graves of 1 c. BC. It was found numerous burial items, among which glass, pottery red lacquer and stucco vessels, more than 3 thousand of different types of beads, many iron objects and their fragments. Wares made of bronze and white metal are presented by coin and various ornaments, including fibulas, some of which are very rare in the Northern Black Sea. It also was found one hundred and eleven small gold items of women’s dresses decor, as well as fragments of gold foil. The burial belonged probably to a woman of noble birth (priestess?). With her, perhaps, connected the specific cult vessels - stucco and bronze, and white metal are presented by coin and various ornaments, including fibulas, some of which are very rare in the Northern Black Sea. It also was found one hundred and eleven small gold items of women’s dresses decor, as well as fragments of gold foil. The burial belonged probably to a woman of noble birth (priestess?). With her, perhaps, connected the specific cult vessels - stucco and bronze.

Among the many types of sensors available for geophysical surveys, gradiometers, used to detect minute fluctuations in the Earth’s natural magnetic field caused by buried objects and structures, have established themselves as a particularly robust and efficient technology. Our contribution showcases the state of the art gradiometer hardware, consisting of multi-sensor arrays of gradiometers, and its application in the fast and detailed prospection of large sites and areas of interest. Advances in sensor design and electrical shielding allow for extremely close spacing of gradiometers and achieve a data density that rivals that of LIDAR. Highly integrated sensors deliver positional and inertial (velocit and rotation) data in addition to the gradiometer readings. These can be used to derive secondary data products, most importantly accurate and high resolution digital elevation models (DEMs). In looking for a solution to process the millions of data points produced by our hardware setup, we found that existing software packages were not capable of the high performance and lossless operation we required, and instead opted for developing our own solution in open source GIS, leveraging the flexibility and standards compliance of that platform. The toolset we developed and integrated into GIS includes highly optimized tools for data import, error correction and interpolation. In summary, our integrated hardware and software solution allows for fast and cost-effective geophysical prospection at extremely high resolution with all data processing done transparently in open source GIS.

TH5-06 Abstract 17

Identifying and Evaluating Neolithic Sites in Italy Using Aerial- and Ground-Based Remote Sensing

Author: Prof. Tykot, Robert, University of South Florida, Odessa, United States of America (Presenting author)

Co-author(s): Alexander, Craig, None, Italy

Co-author(s): Brown, Keri, Manchester University, Manchester, United Kingdom

Co-author(s): Freund, Kyle, Indian River State College, Fort Pierce, United States of America

Co-author(s): Hoffer, Manuel, Graz University of Technology, Graz, Austria

Co-author(s): Mattioli, Tommaso, ArcheoRes, Perugia, Italy

Co-author(s): Di Micieli, Andrea, ArcheoRes, Perugia, Italy

Co-author(s): Lüth, Friedrich, German Archaeological Institute (DAI), Berlin, Germany

Co-author(s): Ducke, Benjamin, German Archaeological Institute (DAI), Berlin, Germany (Presenting author)

Keywords: early agriculture, remote sensing, Tavoliere

Presentation Preference: Poster

The Tavoliere of northern Puglia (southern Italy) was a dense area of early agricultural settlements in the Neolithic (ca. 6200-4000 BC) of western Europe and was, probably, the point of introduction into Western Europe of farming. Several hundred sites with ditched enclosures were initially identified from aerial reconnaissance photography following WHOV, with more than 800 incorporated in an area of several hundred square kilometers. Starting in 2013, we have conducted walking surveys of more than 25 sites, collecting about 1270 ceramic artifacts as well as many obsidian and flint tools, and 70 clay samples from nearby watercourses. These have all been analyzed using a portable X-ray fluorescence spectrometer, specifically for trace elements, with clear groupings of ceramics (which include non-diagnostic coarse wares, Impressed Wares, para-polished coarse and medium wares, Masseria La Quercia wares and Pasio di Corvo fine wares) and a suggestion of some south-to-north movements. Most of the obsidian comes from the Aeolian island of Lipari (about 330 km to the south), and about 10% from Palmarola (about 230 km...
to the west). These data have already expanded our understanding of socioeconomic developments in the Tavoliere during the new way of life of the early Neolithic.

In 2015, in order to select sites for future excavation, advanced remote sensing was conducted in order to assess the precise location and preservation of the prehistoric ditches, considering the potential damage caused by modern deep-plowing since the original aerial photographs were taken. A remote-controlled unmanned aerial vehicle (UAV) and ground-level magnetometry/ electrical resistance tomography were used at several sites following the harvesting of the fields. A fixed wing SenseFly eBee UAV was used to create near-infrared (NIR) imagery at four sites: two around Lucera in the northwest of the Tavoliere, one near Foggia in the center, and one in the southwest near Ceglie. Photogrammetry produced a high-resolution (10 cm/pixel) digital terrain model. The magnetometer was used in transects of 20 x 160 m at two of these sites (Posta Barone Grella in the south, Posta del Gliccia in the north), and was highly successful in showing both boundary ditches and internal structures. Additional remote sensing is planned, potentially at different times of the year and prior to harvesting to identify optimal conditions for its use in subsurface site prospection.

**TH5-06 Abstract 18**

**Geophysical and Archaeological research on Late Roman Iron-smelting site at Virje (Croatia)**

**Author:** Medarič, Igor, GeaR d.o.o., Ljubljana, Slovenia (Presenting author)
**Co-author(s):** Masić, Branko, GeaR d.o.o., Maribor, Slovenia
**Co-author(s):** Sekelj Ivančan, Tajana, Institute of Archaeology, Zagreb, Croatia

**Presentation Preference:** Poster

Archaeological site Virje is situated in the Croatian lowland, on the right bank of the upper course of Drava river. On a slightly sloped area named Sudine, parts of a primary iron processing smelting workshops were discovered and explored. Since these types of sites are quite rare in northern parts of Croatia, and in order to get a better understanding of the development of this site, noninvasive methods were applied. With the help of magnetic method, measurements of magnetic susceptibility and shallow drilling, waste disposals of a workshop, few pit furnaces from the Late Roman period (4th and 5th century), as well as settlement remains from Late Iron Age (3./2, and 1st century BC) were discovered. Additionally, geophysical results applied on digital elevation model in combination with aerial photography were carefully analyzed and compared with excavated archaeological structures. All the gathered information importantly contributed and changed our views on this unique multiperiodical site and its environment.

Keywords: Basque Arboric, Bayesian Chronological Modelling, Marine Reservoir Effect

Presentation Preference - Oral

Over 200 radiocarbon dates from archaeological contexts are available from the Point Barrow vicinity, along northern Alaska's Arctic coast, which has been occupied by hunter-fishers from the Bering period (AD 600-900) to the present day. Interpretation of the radiocarbon dates has been hindered by radiocarbon offsets, caused by marine resources, in the diets of humans and mammals sampled for radiocarbon dating. Analysis of ancient human from the Point Barrow vicinity have thus far provided high δ13C values between -15.7‰ and -12.6‰, and high δ15N values between +17.7‰ and +24.4‰, indicating diets that are very rich in marine protein. Radiocarbon ages from marine-derived carbon will be anomalously old if not corrected for the Marine Reservoir Effect (MRE), the radiocarbon age offset between contemporaneous marine and terrestrial carbon. Modern MRE values from the Alaskan Arctic are highly variable, from several hundred to over a thousand years, due to the extended residence time of 14C in oceanic environments. It is questionable how reflective modern values are of those from the past because changes in upwelling, climate, and ocean currents will inevitably result in changes in local MRE values through time. Here we present new temporally spaced δ13C and δ15N estimates, which is the local deviation from the global surface water MRE, and apply these in a Bayesian chronological model to better estimate the timing of ancient activity.

THS-07 Abstract 05

In sickness and in health. A community in death from a Neolithic Megalithic tomb (La Mina, Spain)

Author - Rindlsbacher, Laura, Integrative Prehistory and Scientific Archaeology, Basel, Switzerland (Presenting author)

Co-author(s) - Rojo Guerra, Manuel A., Department of Prehistory and Archaeology, University of Valladolid, Valladolid, Spain

Co-author(s) - Pena, Rafael, Department of Prehistory and Archaeology, Autonomous University of Madrid, Madrid, Spain

Co-author(s) - Tejedor-Rodriguez, Cristina, 4Arcadia Institute, General Foundation of Valladolid University, Valladolid, Spain

Co-author(s) - Garcia-Martinez de Lagrav, Itzco, Researcher of the Postdoctoral program of the Government of the Basque Country, Donostia-San Sebastian, Spain

Co-author(s) - All, Kurt W., Integrative Prehistory and Scientific Archaeology, Basel, Switzerland

Co-author(s) - Pichler, Sandra, Integrative Prehistory and Scientific Archaeology, Basel, Switzerland

Co-author(s) - Dr. Knopper, Corin, Engelzentrum Archaeometrie, Mannheim, Germany

Keywords: Megalithic Tomb, Neolithic, Palaeopathology, Palaeomedicine

Presentation Preference - Oral

The Neolithic Megalithic tomb of La Mina was discovered during the 1980s in a small processional area at the western end of the Túmulo de Almendra. The tombs contains 3 remains, which belong to different states of preservation. The aim of this research is to study the remains using a multidisciplinary approach to establish the diet, disease, and health of the individuals. The research has involved the analysis of the bones, teeth, and dental calculus to understand the diet and health of the individuals. The results indicate that the individuals had a varied diet, which included meat, fish, and vegetables. The analysis of the bones and teeth also revealed evidence of disease, including osteoarthritis and dentinal caries. The results suggest that the individuals had a varied and healthy diet, with a relatively low prevalence of disease. This research provides new insights into the diet and health of the individuals who lived during the Neolithic period.
Recent advancements in the fields of archaeology and bioarchaeology have demonstrated the value of combining different methodologies to gain a comprehensive understanding of past societies. For instance, the excavation of La Mina, a Neolithic monument located in the Iberian Peninsula, has provided insights into the social and economic activities of the individuals buried there. Radiocarbon dating of the tomb’s deposits indicates a date between 3890-3660 BC, positioning it among the earliest passage graves in Europe.

La Mina is unique among its contemporaries in that it contains elaborate copper artefacts, such as copper plaques, beads, and ribbons, which are indicative of a high status and wealth. These findings support the idea that the emergence of metalworking technologies had significant implications for social stratification and wealth accumulation in prehistoric societies.

The human remains from La Mina were also subjected to a variety of analyses, including stable isotope analysis, DNA analysis, and microwear analysis. This comprehensive approach has enabled researchers to gain insights into the diet, health, and sociocultural practices of the individuals buried at La Mina. For example, stable isotope analysis of bone collagen has revealed dietary patterns that suggest a balanced diet, possibly including significant quantities of seafood.

DNA analysis of the human remains has also contributed to our understanding of the social and biological relationships among the individuals buried at La Mina. For instance, the analysis of mtDNA has indicated a high degree of genetic diversity among the individuals, suggesting a complex social structure.

In conclusion, the excavation of La Mina has provided valuable insights into the social and economic dynamics of the Neolithic period. The combination of different methodologies, including radiocarbon dating, archaeology, bioarchaeology, and genetic analysis, has enabled researchers to gain a more nuanced understanding of the past. The findings from La Mina, and similar sites, continue to challenge our understanding of prehistoric societies and provide new avenues for research.
research compares the microwear found on women's and men's teeth in order to infer if they had eaten the same kind of food. This study is currently being conducted, and we will present its first results in the conference.

TH5-07 Abstract 09
Fish ’n’ Picts: Reconstructing diet in early Medieval Scotland using stable isotope analysis

Author: Kate, Britton, Aberdeen, United Kingdom (Presenting author)
Co-author(s): Mulder, Gunula, University of Reading, Reading, United Kingdom
Co-author(s): Roderick, Kate, University of Reading, Reading, United Kingdom
Co-author(s): Richards, Mike, University of British Columbia, Vancouver, Canada
Co-author(s): Talma, Shahar, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany
Co-author(s): Noble, Gordon, University of Aberdeen, Aberdeen, United Kingdom

Keywords: early Medieval, Picts, Stable isotopes

Presentation Preference: Oral

First mentioned in late Roman writings as troublesome tribal groupings north of the Roman frontier, the Picts went on to become the first kingdoms in eastern Scotland in the post-Roman period. Although current archaeological investigations are uncovering important new information about the Picts, many aspects of the Pictish past remain elusive. Given the dearth of historical sources and current lack of Pictish domestic sites and animal bone assemblages, very little is known about many economic and social aspects of Pictish life – such as diet. The stable isotope analysis of bone collagen is useful as a means of assessing past dietary habits, particularly the relative contribution of marine and terrestrial protein to the diet. These techniques also have the potential to investigate dietary variations within groups, such as between different biological sexes or burial types.

Here, we present carbon and nitrogen isotope data from bone collagen from a number of Pictish burial sites and cemeteries, providing novel insights into Pictish lifeways. Data generated are compared to limited previously-published Pictish datasets and to data from other contemporary archaeological British groups. Results suggest limited intra-group dietary variability, and a relatively homogenous diet across the areas studied. Marine fish consumption is low relative to later Medieval and Viking sites in Scotland, and in comparison to contemporary Romano-British samples, but similar to data derived from Anglo-Saxon sites. The conceptual role and importance of fish, rivers and other water bodies to the Picts is also briefly explored (particularly with regards to the positioning of cemetery sites, and the depiction of fish on Class I brochs).

TH5-07 Abstract 10
Regional differences in subsistence economy in 16-19th c.c. Lithuania: stable isotope evidence

Author: Skiptlys, Raminta, Nature research centre, Vilnius, Lithuania (Presenting author)
Co-author(s): Lidén, Kerstin, Stockholm University, Stockholm, Sweden
Co-author(s): Eriksson, Gunilla, Stockholm University, Stockholm, Sweden
Co-author(s): Daugnoria, Lina, Klaipeda University, Klaipeda, Lithuania
Co-author(s): Pilkauskiené, Gedrė, Lithuanian Institute of History, Vilnius, Lithuania
Co-author(s): Rimantas, Vidmantas, Center for Physical Sciences and Technology, Vilnius, Lithuania
Co-author(s): Janušauskienė, Rimantas, Vilnius University, Vilnius, Lithuania

Keywords: diet, stable isotope

Presentation Preference: Oral

Stable isotope analysis now is a “golden standard” for studying variations in the past diet and life history. Previous studies performed in medieval Lithuania have shown that the human protein intake was mostly derived from C3 plants and C3 feeding animals and possibly some freshwater resources with little variation among young and adult individuals (Whitemore et al. 2014).

In this study, stable isotope analysis of human skeletons from different populations representing various regions of Lithuania (16-19th c.c.) was performed. To track dietary evidences, animal bone samples from similar places and time periods were analysed as well. The results showed significant differences in stable nitrogen isotope ratios between coastal, urban and inland site communities. Meanwhile, the carbon stable isotope ratios were less variable and showed a strong dependency on the C3 plant environment. Different strategies in subsistence economy could shape the stable isotope signals in these communities. Peasants in the countryside were able to farm their land and to be self-sufficient, while living in urbanized territories was quite different. Open markets and food supply from the outside enabled people to live out from other activities. Coastal community was characterized by the higher freshwater fish consumption. The availability of the food sources was much more restricted in the past compared with the modern time global supply.

It was already determined in numerous literature sources that stable isotope ratios can differ according to the certain environment (e.g. terrestrial vs marine), therefore another aim of our study is confirmation of the possibility of allocating human remains to a particular site according to their stable isotope ratios.
TH5-07 Abstract 13
Understanding food poverty: Lessons from the present and the past
Author: Hunt-Watts, Holly, University of Leeds, Leeds, United Kingdom (Presenting author)
Presentation Preference - Oral
Food poverty in the UK is currently on the rise and evidence from reports of public health expenditure highlights both the cost of this problem to the public and the impact that poor diet can have on the social and physical aspects of people's lives. There are many disciplines which can be used to examine the effect of food poverty on the British population, but the three involved in the research behind this paper are: nutritional epidemiology, history, and archaeology. Each of these subjects has its strengths and weaknesses, but the key studies have attempted to understand the historical problem of food poverty which is still so prevalent today.

Nutritional epidemiology is concerned with the impact of nutritional quality on a population's health, and is often involved in providing guidelines for public health policies. Concerned only with the recent past, more focused on the present, nutritional epidemiology is a method for examining modern food poverty. Contrary to this, history only reveals information about past public health through records of the time, such as poverty surveys and government policy records. Evidence for poverty in the archaeological record can be found using landscape archaeology, the archaeology of buildings, and osteoarchaeology.

Although the approaches are very different, all three disciplines often have data about populations rather than individuals. Whilst nutritional epidemiology relies on the geographical or social aspects of individuals to define these groups, when working in archaeology it is possible to define groups by historical periods as well as the geographical location of the burial site and other social and cultural dimensions of any skeletal populations under investigation.

This paper aims to introduce a new method of studying diet using these three disciplines, and highlights the value of the approach in examining public health in the past and present, to make informed suggestions for the future. That modern clinical studies and surveys help to form an understanding of the past is indisputable, and the public is made aware of the osteological nature of archaeological research through high-profile cases. The role of archaeological and historical research in understanding and informing modern policies is both less apparent and significantly less explored as a research option. This paper will therefore suggest an interdisciplinary approach to the study of food poverty.

TH5-07 Abstract 14
Diet and environmental changes: an example for medieval Scandinavia
Author: García Pimentel, José Miguel, Valencia, Spain (Presenting author)
Co-author(s): López Costas, Olalla, Group Earth System Sciences, Universidad de Santiago de Compostela, Santiago de Compostela, Spain
Keywords: Diet, Environment, Scandinavia.
Presentation Preference - Poster
Environmental changes modify constantly agriculture production and the route of certain animal species either by land, sea or air. This study seeks to relate the already isotopic data of 818O and 815N in bone collagen with the variations in the temperature and moisture in Eastern Sweden. Due to the large number of individuals and the published information, the sites of Birka and Sigtuna were chosen as the examples.

Archaeological sites located during the Viking Age with an important link between both of them. The sample comprises 27 individuals from Birka and 76 from Sigtuna, already published, whose radiocarbon ages cover from 700 to 1700 AD. For this same period, we identified four environmental phases, regarding changes in temperature and humidity in Scandinavia that were reconstructed using different approaches (palaeoecology, 14C studies in speleothems, paleopatological information, ice cores, etc.). This isotopic results show a large variability of the data over time, especially during the first warm phase (ca 700-1100 AD) while data are more homogenous in the following stages; however, neither significant differences nor a clear pattern in diet along the environmental phases have been detected. As other authors have previously noticed, it is to be highly dependent on the site the individuals belong to. The hard climatic conditions common in Scandinavia as well as rigorous social stratification may have limited the effect of the environmental changes in diet.

The possible influence of the reservoir effect over the radiocarbon dating are also discussed. We think it is worth bringing attention to the fact that few studies have attempted to combine the changes in climate with the isotopic results, so we recommend further research in both fields for a better understanding of their influence in past populations.

TH5-07 Abstract 15
Multi-isotopic Investigations of Diet in Anatolian Early Bronze Age Populations
Author: Irvine, Benjamin, Freie Universität Berlin, Newcastle upon Tyne, United Kingdom (Presenting author)
Keywords: palaeostable, Stable isotopes, Turkey
Presentation Preference - Poster
This talk is the result of research as part of a doctorate focusing on examining the dietary habits of several Early Bronze Age (3000-2000 BC) populations in Anatolia. The investigated sites are from different environmental regions and consist of Kılıkçe (north Anatolia, Samsun region, on the Black Sea coast), Tiljö Höyük (south east Anatolia, Urfa region), Bademçay (south Anatolia, Antalya region), and Baška Tepe (south west Anatolia, İzmir region). This research is incredibly significant as it is the first time that quantitative scientific methods have been used to address questions and hypotheses about dietary habits in the EBA period of Anatolia. It is the first time that stable isotopes analyses have been used to study diet in the Early Bronze Age period, and is the first project of its kind both in terms of methodology and scale. Analysis of carbon and nitrogen stable isotopes (813C and 815N) was employed on bone collagen from ca. 200 human and faunal osteological samples taken from the Anthropology Lab of Hacettepe University, Ankara Turkey, and was conducted at the Max Planck Institute for Evolutionary Anthropology in Leipzig, Germany. The research is a bioarchaeological one and therefore it utilises stable isotope analyses in conjunction with osteological and archaeological evidence and research to place the dietary habits of these populations within a wider framework. For example, during the EBA in Anatolia, and especially between the early and late EBA, dramatic changes are seen in architecture, burial habits, and social and socio-political structure including the organisation of urban settlements, resources, food, labour, and trade. There is also an increased incidence of peri-mortem cranial traumatic injuries which are indicative of an increase in inter-personal conflict and arguably an increase in organised violence during the period. This is furthered by the building of fortifications and burnt layers at many EBA settlements in Anatolia. Despite the substantial social and socio-political changes during the period, the results show that during the EBA in Anatolia there is a significant degree of homogeneity in dietary habits both at an intra- and inter-site and regional level, and across the millennium of the EBA within the C3 based. Furthermore, the results suggest that we can now begin to discuss an ‘EBA package’ with regards to foods resources.

TH5-07 Abstract 16
Diet and identities in a mining community, Sweden - documents and isotopes
Author: PhD student Fjellström, M., Stockholm University, Stockholm, Sweden

Presentation Preference - Poster
What distinguishes the diet in late medieval and early modern society from today was a profound influence by religion and ideas about the body. During the 16th century, the Reformation brought forward a new dietary regime that was probably neither easy nor fast, and it took some time for people to adjust to this new regime. In this paper, isotopes (stable nitrogen and carbon isotopes in collagen) and documentary sources are presented, and intra- and inter-population comparisons are made, to investigate this dietary shift and the influence of group identities on diet.

TH5-07 Abstract 17
On the Diet of the Urals Population of the Great Migration Epoch
Author: Prof. Matveeva, Natalya, Tyumen state university, Tyumen, Russian Federation (Presenting author)
Keywords: chemical analysis results of skeleton composition
Presentation Preference - Poster
This report proceeds the author's works studying the bone chemical composition of individuals from Sargatka culture ancient graves of the forest-steppe of Western Siberia. Recently we have analyzed data on the population inhabiting in late Early Middle age epoch, in particular the disintegration period of the Sargatka culture using the uniform methods.

The chemical analysis results of skeleton composition (30 individuals) came from Ustyug-1 burial complex and were dated as later ones, although it was from the Trans-Ural region of forest- steppe zone as well. We examined the materials of 19 kurgans of the Tobol basin, Tyumen region, which were dated by IV-V centuries AD. The site was determined as one of the beginning of population formation of Bakalakaya culture and time of assimilation of Khamarneuroka, Sargatka, Kashin, Karim culture groups and Middle Asia genesis group. The fact of the assimilation was based on the archaeological and anthropological sources. There are multiconformances of each basic 10 minerals (Ca, P, Mg, Fe, Mn, Zn, Sr, Cu, Ni, Cr, Co, Pb) as markers of different data. Macro- and microelement composition of bone substance of buried people is shown as mean of selection as a whole and separately for men and women, as well as for children groups. The statistic significant differences displayed in greater values of Zn, Cu for women and children. There was ascertainment of significant contrasts with the past dietary traditions and on the published data of culture of Sargatka, this lack of consistency was defined by nomadic food tradition of the people buried in Ustyug-1 cemetery. There was a suggested idea that there was a relatively great health of populations from the point of view of mineral balance, based on comparison with modern medical data. We can suppose, that some individuals used stagnant water and wore copper decor (jewelry, clothing elements, have used copper cookware) for this reasons. The information on the migration of nomads from the steppe zone, which was extracted from archaeological sources, was confirmed by chemical data.
Sedimentary accumulation in a canal reflects mostly anthropogenic process (runoff intensity control, water inflows rhythm, regular clearing) related to his function, especially in the case of an irrigation canal. Sedimentary accretion in open-air hydraulic structure is also marked by natural process controlled by environmental conditions (hydrology, climate) at one point in time. As a result, sedimentary fills of canals provide high-resolution pedo-sedimentary sequences for fine restitution of closely intervened socio-economic dynamics and paleo-environment. The restitution of the operating history of hydraulic structures as canals required a geoarchaeological approach based on all scale analyses of their sedimentary archives of fills (stratigraphic sequences analysis, geomorphology, micromorphology of soils, OSL dating).

Such an approach led on exceptional and well-preserved archives of fossil canals of the northern edge of the archaeological site of Sarazm, which attest a proto-urban settlement during Chalcolithic and Early Bronze Age periods. The micromorphological study of Early Bronze Age canal (dated by OSL from 4.5 +/- 0.4 Ky) aims to research under polarizing microscope and identify pedological and sedimentary diagnostics features relevant of: (1) anthropic process of water management linked to the canal building and operating, runoff implementation and maintenance; (2) natural process expressed by drying or freeze features reflecting local and micro-regional hydro-climatic conditions relative to semi-arid environment. Forward, the sequencing of these data allows a fine restitution of the operating dynamic of the hydraulic structure in the frame of environmental past conditions in socio-economic dynamics and palaeo-environment.

TH5-10 Abstract 05
Geoarchaeological portrayal of decayed dwellings at the Bronze Age settlement of Solarolo (Italy)

Author - Peinetti, Alessandro, UMR 5140, Paris, France (Presenting author)
Co-author(s) - Wattat, Julia, INRAP, Paris, France
Co-author(s) - Cattani, Maurizio, Università di Bologna, Bologna, Italy
Co-author(s) - Laffy, David, UMR 5140, Archéologie des Sociétés Méditerranéennes, Labax Archémes, Montpellier, France
Keywords: Dwelling, Geoarchaeology, Household activities
Presentation Preference - Oral

Since 2008 the University of Bologna has been carrying out archaeological researches in Solarolo, a Bronze Age village located in the southeastern part of the Po plain, in northern Italy. The preserved stratigraphy refers to the central phase of the Italian Middle Bronze Age (about 1550-1450 BC).

The presence of perishable dwellings, built with wood and earthen materials, that normally don't leave clear traces except for post holes, make the comprehension of built spaces very difficult. In northern Italy, several types of dwellings - dating back to the 2nd millennium BC - are archaeologically documented.

In order to understand the nature of the buildings and their relationship with courtyard spaces, a spatial geoarchaeological sampling has been carried out in the site. A first attempt, based on soil micromorphology, is here presented: both the inside and the outside of a present roofed space are sampled.

The analyses focus on the local pedoclimatic markers, on the trampling traces and on the provenance and nature of different soil components. The aims of these first observations are to recognize the presence of roofed spaces, to understand the real building of the building floors and, generally, that of the dwellings; finally, they tend also to define the evolution of the building during its life.

In this way we can draw a “biography” of a single built space, useful to understand cultural architectural patterns, not always visible in the macroscopic archaeological record.

TH5-10 Abstract 06
Geoarchaeological investigation of waste disposal practices at the Latène settlement Basel-Gastfabrik

Author - Brönnimann, David, University of Basel, Basel, Switzerland (Presenting author)
Co-author(s) - Spichig, Norbert, Archaeological service of canton Basel-Stadt, Basel, Switzerland
Co-author(s) - Lassau, Guido, Archaeological service of canton Basel-Stadt, Basel, Switzerland
Co-author(s) - Fratelli, Filippo, University of Basel, Basel, Switzerland
Keywords: Geoarchaeology, Iron Age, waste disposal practices
Presentation Preference - Oral

The late Iron Age settlement Basel-Gastfabrik is located in north-western Switzerland on the left bank of the Rhine River. Since 1911, numerous excavations revealed an unfertilized settlement with domecic and economic structures covering an area of about 10ha in the region near and around the associated cemeteries in short distance. Basel-Gastfabrik is among the large, unfertilized, proto-urban settlements playing a major role at the La Tène period and usually connected with trade and craft production, both of which also apply to Basel-Gastfabrik.

To date, more than 600’000 artefacts and 900’000 animal bones have been recovered, mostly from infilled storage or cellar pits. Numbering more than 500, these represent the most frequent archaeological structures in the settlement. Recent interdisciplinary research have shown that the majority of the archaeological findings are associated with dark sediments which contain plenty of inorganic and organic components such as ashes, clays and burnt plant remains and coprolite fragments. Those dark, calcareous sediments may clearly be addressed as “occupation layers” and are the major source of material used to fill in the settlement’s pits. Geoarchaeological investigations showed that the pits were infilled in a short time in the course of just one or two distinct events. Thus the question is raised to how and where those dark sediments were formed before they were used as backfill.

This question will be addressed by means of micromorphometric and geochemical analysis of well-preserved settlement structures like trapped loam surfaces, stone packings, shallow depressions, probable house floors, ditches and pits in order to characterize different activities and their corresponding sediments. Initial results show that there are significant differences in sediment compositions, associated anthropogenic components and taphonomic provenance between features. Hence, for example, show clear variations in preservation apparently correlated with specific archaeological features or postdepositional processes respectively. The geoarchaeological data will be supplemented by bioarchaeological and archaeological findings to get a comprehensive idea of syn- and post depositional processes at Basel-Gastfabrik.

This will permit the reconstruction of waste disposal practices, activity areas and resource management, which is essential for interpreting assemblages like the inventory of an infilled pit. Without knowledge of how (prehistoric) communities handled their resources and their waste, of what happened with used or discarded materials, with accidentally or intentionally broken objects, with fuel and organic waste, with dung and human faeces, interpretations of archaeological features must remain mostly guesswork.

TH5-10 Abstract 07
Firing Divices in Tarascan Land, Zipiajo, Michoacán, Mexico: To a Mexican Geoethnoarchaeology

Author - Phd Student Stefanato, Mélaine, Paris 1 Panthéon-Sorbonne, Malakoff, France (Presenting author)
Keywords: Firing devices, Mexico, micromorphology, geoethnoarchaeology
Presentation Preference - Oral

The firing devices are largely developed in Prehistoric archaeology. It is obvious that they have an important place and significance, since they often are in the center of the living space. Archaeological excavations on the Matipas Prieto (2010-2014), directed by Gregory Pereira in the context of the Uacusecha Project, uncovered hearths’ remains in ritual and domestic contexts. Some of them were treated with a micromorphological approach that revealed various sedimentary facies. It show a huge diversity of hearth’s histories despite morphologies apparently simple and little diversified. These hearth’s microstratigraphy demonstrate the existence of different layouts which present traces of repetitive uses, continuous or discontinuous uses and variable intensity of use. This displays an unequal treatment of the combustion structures (in the shaping of the combustion surfaces, the maintenance regularity, in the layout quality…) suggesting various levels of reading. These certainty depend on the stage and the importance of the hearth. To have a better global understanding of them, we undertook an etnoarchaeological project of contemporary fire devices. It will permit to develop the knowledge on the functional history and on the formation processes of the infilling, according to technical gestations (shaping of the mud, application of the material…) and the use of the layouts (the choice the combustion atmosphere, the heating intensity, the using continuity, the function of the device and its statute).

Function, environment and dating of Mesolithic sites in Champagne: malacological answers

Author - Grainal, Solome, GeoArch&Chron, Villex-sous-les-cotes, France (Presenting author)

Keywords: malacology, Mesolithic, palaeoenvironment

Presentation Preference - Oral

In the past two years, in Champagne (France), malacological investigations have been carried out in pits dated from Early Mesolithic to Late Neolithic. In 2014, at Rouilly-Saint-Loup Le Champ au Loup (Aube), a first analysis of three pits has led to assess the scope of malacological results in such structures. The results of this first exploratory study have prompted the pursuit of larger-scale investigations, in 2015, at Recy Le Parc de Rêverence (Meuse), where malacological assemblages of about forty structures have been analysed. The presence of abundant malacological remains within the most structures demonstrates that they have been left open after their digging and then filled gradually by a natural accretion of sediment and organic matter. In addition, the composition of the malacological assemblages of these two sites has enabled to reconstruct their environment and its evolutions. All the studied structures have been dug in a forest environment but the proportions of the different molluscan species vary through time. The malacological successions found in Champagne are echoed in the malacological reference series dated from the first part of the Holocene in the Paris-Basin and its margins. In light of these reference series, some radiocarbon dating from Rouilly-Saint-Loup and Recy are questioned.

Subalpine soil memory and legacy (French Alps)

Author - Dr. Giguet-Covex, Charline, University of York, York, United Kingdom (Presenting author)

Co-author(s) - Deville, Anne-Lise, EDYTEM, Le Bourget du Lac, France

Co-author(s) - McGrath, Krista, University of York, York, United Kingdom

Co-author(s) - Speller, Camilla, University of York, York, United Kingdom

Co-author(s) - Mocci, Florence, Centre Camille Juillan, Aix-en-Provence, France

Co-author(s) - Walsh, Kevin, James, University of York, York, United Kingdom

Keywords: human activities, legacy, subalpine ecosystems

Presentation Preference - Oral

In the Alps, humans used the subalpine area since the Mesolithic: first used for hunting and gathering, then pastoralism suggested since the Neolithic (Giguet-Covex et al., 2014; Ponel et al., 2011; Schneider et al., 2015). This activity intensified during the Bronze Age (Ponel et al., 2011; Roepke and Krause, 2013; Walsh et al., 2014). Subsequent fluvial processes specific to each site. Mining also developed at high altitude, especially during the Medieval Period (Gaedon et al., 2012; Py et al., 2014). All these activities impacted mountain ecosystems. Some palaeoenvironmental studies also revealed long-term impacts, especially on plant cover (Biais et al., 2012; Giguet-Covex et al., 2011; Pauzet et al., 2010). However, scientific literature lacks of studies on this legacy of activities on archaeological sites. Here, we propose to apply geochemical analyses (XRF, G3C, RGB, . . .), botanical survey and environmental DNA (eDNA) analyses to track the "soil memory" and the "ecosystem memory" (i.e. the legacy).

A series of on- and off-site samples were taken from different structures (enclosures and complex of huts/cabins) dated to the Bronze Age, Medieval and Modern periods, across the Faraval plateau (2107-2380 m a.s.l, French Alps) (Walsh and Mocci, 2011). Samples were also taken at higher altitudes where the pastoral pressure is very low today. Some of these samples have been used outside the pastoral structure to be assessed the modification of plant cover linked with the use of the structure. The study of plant cover will include the analyses of plant communities and the plant biomass assessed via eDNA quantification. Moreover, spatial variations in soil geochemical signatures within and beyond the archaeological structures will be used to assess the potential past human activities (pastoralism and mining activity) within the structures.
This poster will present, in particular, results from XRF analyses, which reveal differences in phosphorus (P) content on and off site. We will also detail the ecological preferences of plants relative to the nutrient content on and off site. The presence of certain plants exclusively inside structures demonstrates the influence of the past human activities (700 years ago) on these micro-socio-ecological systems. However, this “legacy effect” is not apparent on the Bronze Age (4020 years old) enclosure, which raise the question of the time required for the resilience. Another interesting result is the presence of lead inside the modern enclosures. These results reveal the soil memory effect link with ancient mining activity. Lead sediment and peat cores taken around the study area revealed lead potissae during both, the Roman and the Medieval periods. The presence of mines used between the 10th and 13th centuries (Py et al., 2014), at least attests the local origin of the pollution in the Medieval Period. These results support the assumption that the lead detected in soils from the medieval cabin is related with the medieval mining activity, the hut being probably used for (stocking and/or) metallurgical activities.

**TH5-10 Abstract 13**

**Title:** Gone with the wind: huts or tree wind-throws at Late Prehistoric open-air settlements of NW Iberia

**Author:** Teira-Brión, Andrés, Grupo de Estudios para a Prehistoria do NW Ibérico, Santiago de Compostela, Spain (Presenting author)

**Co-author(s):**- Martín-Saíz, María, Universidade de Santiago de Compostela, Santiago de Compostela, Spain
- Alves, Maria Isabel Caetano, Landscape, Heritage and Territory Laboratory (Lab2PT), University of Minho, Braga, Portugal
- Bettencourt, Ana Maria dos Santos, Landscape, Heritage and Territory Laboratory (Lab2PT), University of Minho, Braga, Portugal
- Sampaio, Hugo Aluai, Landscape, Heritage and Territory Laboratory (Lab2PT), University of Minho, Braga, Portugal

**Keywords:** domestic contexts, Late Prehistory, windthrows

**Presentation Preference - Oral**

Until the 80’s of the 20th century, the archaeological research from Neolith to Bronze Age in NW Iberia was focused on burial sites and rock art. Since then, several research projects and rescue excavations brought new data on housing and domestic contexts at some of the Chalcolithic and Bronze Age open-air settlements studied, together with pits, post holes, hut floors and anthropic hedges, excavations have been recorded oval or circular hollows measuring 1.9 to 3.5 metres wide and 1 metre of depth, usually with an irregular section. These have been considered huts remains built on perishable materials. These structures were commonly filled with two different deposits, an organic and dark brownish layer, and another light and inorganic. From the organic deposits there has been recovered a high concentration of fungal spores that have a symbiotic relationship with roots of trees or bushes. Finally, we would like to highlight that inside these openings are uncommon archaeological evidences, such as sherds or lithic artefacts.

The morphology of the hollows and the lack of archaeological evidences related to these structures, together with the repeated absence of hearths inside them or in their immediate surroundings, leads us to question their anthropic origin. For that reason, new interpretations must be proposed. In fact, in terms of sedimentological events, there is a great similarity between these structures and natural features, such as wind-thrown hollows (Dziegielewski 2007; Goldberg and Macphail 2006; Langohr 1993). The archaeological and morphological characteristics recovered from these contexts, also can provide valuable information to interpret them as natural features and understand the natural processes involved in their formation (Schiffer 1987).

There have been developed sedimentological and archaeological studies of samples recovered from hollows related to tree wind-throws. Their results have been compared to the supposed anthropogenic contexts. The distinction between natural and anthropic features in these open-air settlements is crucial to avoid any interpretative distortions of these contexts.

**TH5-10 Abstract 14**

**Title:** At the Foot of the Cliff - exploring early human occupation of the inlands of southern Italy

**Author:**- Dr. Van Leusen, Martin, University of Groningen, Groningen, Netherlands (Presenting author)

Co-author(s):- De Nie, Wieke, University of Groningen, Groningen, Netherlands
- Savin, Jan, University of Groningen, Groningen, Netherlands
- De Haan, Michael, Archea Group, Capelle a/d IJssel, Netherlands

**Keywords:** geoarchaeological prospection, methodological, pre- and protohistoric archaeology

**Presentation Preference - Oral**

In mountainous landscapes, with strong landscape taphonomic processes going on for long periods, detecting and assessing the evidence for prehistoric occupation can be very difficult. In this paper, the authors, from the University of Groningen and Amsterdam (Netherlands), highlight occupation remains in a landscape context which is hard to investigate, but which also provides unique site preservation conditions: namely, debris slopes at the foot of steep limestone rock faces.

We present recently obtained results from the Rural South in Prehistoric Italy project, which aims to develop improved approaches for the detection and study of ephemeral pre- and protohistoric remains in Mediterranean environments. The earliest settlement remains recorded in the basin of the Raganello River, our study area in Calabria, southern Italy, are located at the tip of such debris slopes covering the foot of South- and East-facing limestone scarps. These remains present as very dark, fine-grained deposits containing fragments of pottery, bone and charcoal intermeshed with rocks and debris. Hence, they are difficult to detect in archaeological surface surveys due to the remoteness, extreme relief, ongoing deposition processes, and adverse vegetation. However, our multidisciplinary investigations (including soil studies, geoarchaeological prospection and high-resolution archaeological studies) show that such sites contain surprisingly well-preserved remains, including a wealth of environmental data on early subsistence strategies.

The paper focuses on these debris slope sites. Site RB121a was initially exposed by quarrying activities, revealing deposits with pottery, bone, and charcoal, a surface survey of the wider area revealed several more proboscic artefact scatters and at least two more ‘black earth’ deposits within the debris slope below the Timpa Sant’Angelo limestone cliff, indicating long-term use from the Middle Neolithic to Bronze Age. The second site, RB115a, is located in a similar South-facing debris slope, but is exposed by the incising gully of a seasonal stream; the archaeological stratigraphy in the gully section revealed deposits and materials from the Late Neolithic to Iron Age. At the third site, RB130a, located in the debris slope East of the Timpa di San Lorenzo cliff, discovery was aided by erosion caused by goat and tourist trampling; we excavated a small test pit which yielded a surprisingly deep stratigraphy of 1.80m, with three distinct Middle Bronze Age phases. In this paper, we will show how we adapted our research strategy to investigate these three sites, focusing on their formation, on the well-preserved palaeo- and zoological records indicative of early upland exploitation, and on the implications this has for our understanding of late pre- and protohistoric settlement and land use strategies in the Mediterranean uplands.

**TH5-10 Abstract 15**

**Title:** terrace occupation through geochemistry (example from disturbed settlement site in SE Lithuania)

**Author:** Dr. Strumišienė, Andrius, Lithuanian History Institute, Vilnius, Lithuania (Presenting author)

Co-author(s):- Selskienė, Audra, State research institute Center for Physical Sciences and Technology, Vilnius, Lithuania

**Keywords:** geoarchaeology, geochemistry, hilltop settlement site

**Presentation Preference - Oral**

The archaeological settlement sites make a significant contribution to the picture of prehistoric communities. Yet, a clear and complete picture of the spatial layout of a site similar to those found in Great Britain or Denmark can hardly be found in the Baltic Sea region. A long history of cultivation has destroyed many shallowly buried structures, converting them into mixed cultural layer and then subsequently sweeping it from the previously delimited zones of activity. Most often, only amorphous negative features such as pits or ditches can be detected holding little if any archaeological artefacts, and for obvious reasons have not been of much interest to many archaeologists.

Therefore, in order to enhance knowledge on less apparent settlements, it is essential to integrate different methods and data. Recent studies indicate that analysis of geochemical and geo-physical properties of sediments can characterize and understanding of human occupation beyond the archaeological remains. This is because anthropogenic activity alters natural sediments in recognizable ways and determines the formation of new soil characteristics that can be traced and measured through the multi-analytical methodology.

In this study an approach combining the data from broad-scale horizontal excavation and the results of the use of multi-element XRF, LOI, pH and MS analyses of archaeological sediments was chosen. The aim of the research was to verify the efficiency of the geoarchaeological approach for disturbed sites in discriminating archaeological features from anthropogenic artefacts. These aspects were investigated as a part of scientific project “Geoarchaeological soil research as a means to investigate ancient settlement sites” financed by Lithuanian Scientific Board (MP 10/135). The geoarchaeological research summarised in this presentation followed an archaeological excavation at hilltop archaeological site. Though the site was heavily disturbed, typo-chronoanalytical analysis of the material implies that the site was used as a settlement only during a single period at the beginning of the 1st millennium AD. This fact allowed for the application of geoarchaeological methods with minor risk of contamination with traces from other periods. Horizontal excavation revealed the distribution of the negative features at the subsoil level. However, functions and relationship with the overall spatial layout
remained undetermined for a big proportion of features due to complete absence of artefacts. Therefore, the essential tasks of geoarchaeological investigation was to trace anthropogenic criteria, if there were any. Multivariate statistics were performed for the set of 20 variables including element chronologically relevant metal concentrations of 16 metals, LOI, pH and MS values. Possible anthropogenic indicators were distinguished. Although the data presented here are site-specific, there appeared to be a remarkable consistency in the set of variables with those enhanced at sites of known context from different geographic areas and geological environments. Hence, this research demonstrated that, while it is indeed difficult to directly interpret chemical soil data in term of ancient human activity, it is possible to trace archaeology, even if there is no material evidence, and this is of great practical relevance to numerous sites of so far un-established archaeological value.

TH5-10 Abstract 16
Tracing the ditch from Zhabotyn
Early Iron Age settlement (Ukraine) using magnetometry

Author - Dr. Daragan, Marina, Institute of archaeology NASU, Kiev, Ukraine (Presenting author)
Co-author(s) - Dr. Bondar, Ksenia, National Taras Shevchenko University of Kyiv, Kyiv, Ukraine

Keywords: Early Iron Age, magnetometry, settlement pattern

Presentation Preference - Oral

At the end of IX - beginning of XIII century BC revolutionary changes occur in of Middle Dnieper area (Ukraine), relating to Chernskayakaya culture. All settlements and villages of Chernskayakaya culture, located mainly on the first and second terraces above the floodplain suddenly cease to exist. New settlements occur in a completely different topography, on the high areas of the watershed and the plateau. These are the settlement of the so-called Zhabotinsky phase distinguished after eponymic and reference Zhabotyn settlement. New settlements also have a large area - from 10-20 to 100 hectares and are arranged in clusters. All of them have no visible fortifications, but they are located on the topographical plots, which provide natural protection, being surrounded, usually, on three sides by deep gullies.

New research carried out on Zhabotyn settlement provided new information about its topography features and the defense system. In the central part of the settlement the ditch was revealed and partly excavated. The ditch divides the settlement with total area of 50 ha into two parts. The ditch was recognized from magnetic survey and traced along 180 m. Total depth of the ditch is 4.20 m. The ditch is observed from the depth 0.8-1 m. Its width on this level is not less than 10m, the width on the bottom is 1-1.2 m. The combination of geomagnetic and GPR constructions of the ditch was revealed at the site. The ditch is formed mainly due to later building horizons. The width of the anomaly corresponds width of the ditch in the upper part (to the depth 2.30 m).

The ditch was laid on early but not the initial stage of settlement being, it had been preceded by earlier constructions. Archaeological excavations and complexes synchronous to ditch were observed on both sides of it. For the reason of the purpose of the ditch is controversial. We can assume that it was dug for the defense, as evidenced by its characteristic profile (wall are almost vertical in the lower part of the ditch and the bottom is very narrow). But defensive ditches, as a rule, correspond to terrain, shielding from the open plain. But as we go, the village, located on a narrow headland or surrounded by gullies. The role of the ditch could be not purely defensive, but religious or “social”, separating two areas of the settlement with different purposes.

TH5-10 Abstract 17
Transcending disciplines in integrated studies of the Early Iron Age sites in Slovenia

Author - Dr. Ščedr, Matjaž, University of Ljubljana, Ljubljana, Slovenia (Presenting author)
Co-author(s) - Dr. Mulč, Branko, University of Ljubljana, Ljubljana, Slovenia

Keywords: Early Iron Age, Integrated studies, Transcending disciplines

Presentation Preference - Oral

Integrated studies of the Early Iron Age landscapes have in the recent years witnessed a tremendous upswing. Archaeology has thus become a melting pot for diverse disciplines, which in a way also met their borders in complex conditions of prehistoric settlements and their landscapes. Our first research step was always aimed at the understanding the basic geology of the area, which was studied with the help of ALS derived data. The next step we took was a geological and geomorphological field survey, whereas selected crucial areas were researched also with various geophysical methods, e.g. magnetic method using measurements of total magnetic field by applying corrections of diurnal variations using base station as well as magnetic pole motion in gradient mode. GPR method from very low to high frequencies (50-400 MHz), low frequency EM method and measurements of top soil magnetic susceptibility.

The ground truthing of the identified features, natural or archaeological, was then conducted to determine the areas for intensive geophysical surveys, using a range of different techniques and analytical methods, covering wide areas of the settlement and its surroundings, including iron working areas, the flat cremation cemeteries or barrow cemeteries.

With the next step, the geochemical mapping with a PIXRF, which we have carried out on one settlement so far, has invited also chemistry into the circle of disciplines, creating the integrated maps of the researched sites. Preliminary conclusions on archaeologically relevant correlations between different data sets are based on multivariate statistical analyses adopted to specific natural settings on metamorphic rocks.

As the last field research step we have applied low- or medium-invasive archaeological methods as drilling or test-trenching. The wide range of data, which was created by applying different methods deriving from various disciplines, has broken us into not only interdisciplinary but rather transdisciplinary research. Under such circumstances scientists from various disciplines can not only do their research, but have to combine and interchange it with others to produce common results, which are not a sum of the isolated data, but its multiplied product.

Resources & disposal in an island landscape:
microarchaeology at the Ness of Brodgar, Orkney

Author - Dr. Shihto, Lisa-Marie, Newcastle University, Newcastle, United Kingdom (Presenting author)
Keywords: geoarchaeology, neolithic, orkney

Presentation Preference - Poster

Pilot work at the Ness of Brodgar have shown a range of deposits in middens, including ashes, burnt bone and organic remains. This research is investigating the materials being exploited, through analysis of these ash deposits and how this varied spatially and through time. Using a combination of microarchaeology, geochemistry and phytolith analysis we can detect traces of fuel use that are often missing from the charred macrobotanical record.

Work carried out within the tender HM22/3/2015 committed by Heritage Malta to Ecogeo srl di Bergamo, Italy and Joseph Cachia & Son Limited, Malta.

The phenomenon of the megalithic architecture developed in the Maltese Islands during the Neolithic between 3500 and 2500 BC. Yielded some of the oldest free-standing megalithic structures anywhere in the world.

The Hal Saflieni Hypogeum is an underground rock-cut burial site, with both carved and built elements similar to the architecture found above ground. It is organized on three levels, which were progressively carved starting from the surface level. The oldest level dates from about 4000 BC; subsequent chambers were added later and filled with funerary deposits up to the Tarxien Phase (3000-2500 BC).

The Middle and Lower levels were delicately carved by a variety of tools, currently under study, specialized both for excavating the soft bedrock, i.e. the Grottepina limestone, and for the final sculptural profile to be obtained and painted. Indeed, celtings and the uppermost exposed walls, were painted with varying red ochre designs, such as honeycombs and spirals. These are currently threatened by several mechanisms of rock surface alteration and biotransformation. During a two season campaign in 2015-2016, microbiological, palyno-micological and fluorescence studies were carried out in order to improve the understanding of the deterioration mechanisms active within the hypogeaum. The study of microbial communities was approached by molecular analysis (Next Generation Sequencing), direct observation in light, fluorescence, electron microscopy and MALDI-TOF (Matrix Assisted Laser Desorption/Ionization Time-Of-Flight) mass analysis technique.

The pollen influx to the hypogeum was studied both on traps to measure the arboraceous fraction, and on the sediment recently released by invertebrates on the rock surfaces. In this study, fungal communities were also detected and related to water seepage. The invertebrate communities were sampled by traps set at all the different substratiert layers. Environmental parameters characterizing circulating waters and bedrock properties were measured and monitored together with radiogenic gais.

Housebuilding adaptation to the environment in the Neolithic of the south of Western Siberia

Author: Dr. Ryabogina, Natalia, Institute of the problems of Northern development, SB RAS, Tyumen, Russian Federation (Presenting author)

Keywords: Environment, Housebuilding, Neolithic, Western Siberia

Presentation Preference - Poster

Natural capabilities and intellectual basis (set of skills and knowledge) of people at a particular time inseparably connected and could be considered as an adaptive reserve of ancient groups.

Within this approach we have analyzed the archaeological materials of excavations of the Neothitic settlements on the Meren’ lake, which have been carried out for several years in the forest-steppe of Western Siberia. We focused on the details to illustrate the adaptation techniques of housebuilding to the environment in the mid-Holocene. On the geoarchaeological data, supplemented palynological and pithovirs on-sie data, we reconstructed significantly different landscape around the settlement in the Early Neolithic (6-5 thousand BC), than today’s. Continuously inhabited settlement was located directly at the lakeshore and surrounded by open steppe landscapes, almost treeless. The climate was drier, although episodes of extreme flooding are also marked by stratigraphic and palynological data. Apparently later in the Chalcolithic (3 thousand BC) on this site were only seasonal constructions, but other constant settlements have been found on elevated terraces. Forest-steppe landscapes with birch forests were widespread at that time there.

The dwellings of the phases were classified on preserved traces of ground constructions, organic materials and archaeological finds, we made a graphic reconstruction of the external appearance of buildings and analyzed the dynamics of housebuilding tradition. We compared the archaeological and palaeoecological data and focus on the structural features of the houses: small-dugouts (6-8 light underground houses), accessibility of natural materials for the construction, episodes of backfill (rising) floor, the internal structure of living quarters, the specifics of the heating, ventilation and drainage systems, anthropogenic pressure on the vegetation around the settlement. An important addition was a taxological study of the function of stone and bone implements used for building. The revealed facts indicate a high degree of adaptability of ancient settlers allowing to exploit for a long time the complex ecological niche near the lake.

TH5-10 Abstract 21

Geoarchaeology of Caspian settlements in eastern Maghreb: spatial organisation of outside areas

Author: - Eddagch, Wassel, Maison Archéologie & Ethnologie, René-Ginouvès, Nanterre, France (Presenting author)

Co-author(s): - Wattez, Julie, INRAP, Paris, France

Co-author(s): - Petit, Christophe, Université de Paris 1 Panthéon-Sorbonne, Paris, France

Keywords: Caspian settlements, Geoarchaeology, the eastern Maghreb

Presentation Preference - Poster

The geoarchaeological research on Caspian settlements in the eastern Maghreb region is based on soil micromorphology. This research is important to understand the systems of settings of these nomadic and/or sedentary populations, by the characterization of the sedimentary records related to activities and their organisation. The micromorphological analysis reveals complex occupation dynamics, dominated by anthropogenic processes interacting with natural processes. Occupation surfaces show a great variability of sedimentary micro-facies according to 1) the nature of activities, 2) their spatial localisations, 3) micro-local climatic conditions and 4) the frequency degree of soils. In the outside areas, the occupation surfaces reflect differentiated spaces: areas near to the buildings or combustion structures, domestic wastes areas, passageway areas and multifunctional areas still characterized by several types of activities. Sedimentary archives contribute to increase our knowledge of the organisation and the functional modes of household spaces of Caspian settlements.

The aim of this communication, is to present new results about formation processes of occupation surfaces of outside areas, from several Caspian sites from Eastern Maghreb: Doukane El houtilla (Biliana-Tunisia), Kef Elizah (Karouan-Tunisia), El Mezkou (Gafsa-Tunisia) and SHM 1 (Hergla-Tunisia).

TH5-10 Abstract 22

Inferring the Neolithic pits function from sedimentary record: the case of Le Pirou (France)

Author: - Dr. Wattez, Julia, INRAP, Paris, France (Presenting author)

Co-author(s): - Gandelin, Muriel, INRAP, Paris, France

Keywords: circular pits, Micromorphology, Neolithic

Presentation Preference - Poster

Middle Neolithic settlement on south of France are often characterised by negative features and by the lack of occupation surfaces, mainly due to post-depositional erosion.

Pit clusters are usually dwelling evidence, such as in the site “Le Pirou”. About one hundred circular pits are arranged around an empty space, which its nature stays unknown. Some of these features are identified as human or animal burials but for the most of them, the primary function is under discussion: dumps because of the cultural remains diversity (potsherds, lithic, charcoal, animal bones), or storage structure due to the shape of the pits section. The pits' fillings differ from massive to stratified deposits dealing with the question related to the function and to the rhythms of uses.

Few geoarchaeological researches using micromorphological analysis were carried out on the functional history of those pits. The research strategy applied, considers the pit as a system of activities.

In order to evaluate the cultural sedimentary record and to discriminate micromorphological indicators related to any activities (construction, uses), and to post-functional processes, seven pits were sampled. Radiocarbon dating (4216 to 4174 cal BC), place these pits to Early Chassean Culture.

Geoarchaeological results indicate that the circular pits correspond to a constructed space, with activity surfaces regularly maintained and transformed by trampling. Correlation between stratigraphic and archaeological record allows us to propose a new interpretation on the functions of the pits (domestic/craft activity areas, cellar-storage) that will be presented and discussed in this paper.

TH5-10 Abstract 23

Micromorphology of combustions structures at Birnirk and Thule sites of the Cape Espenberg site

Author: - PhD student Vanlandeghem, Marine, UMR 7041 ArScan, Equipe “Archéologies environnementales”, Nanterre, France

Co-author(s): - Wattez, Julia, Centre Archéologique de La Couronne INRAP, La Couronne, France (Presenting author)

Co-author(s): - Alix, Claire, UMR 8096 Archéologie des Amériques, University of Paris 1 Panthéon-Sorbonne, Nanterre, France

Co-author(s): - Elliott, Michelle, UMR 7041 Archéologie des Sciences de l’Antiquité, University of Paris 1 Panthéon, Nanterre, France

Co-author(s): - Petit, Christophe, UMR 7041 Archéologie des Sciences de l’Antiquité, University of Paris 1 Panthéon, Nanterre, France

Keywords: Alaska archaeology, Combustion Micromorphology

Presentation Preference - Poster

In Northwest Alaska, human societies have adapted their subsistence strategies to extreme conditions. At the coastal Cape Espenberg site, excellent conservation conditions have allowed the preservation of many cultural features (architecture, hearths, middens) within a series of grading beach ridges. Remains of semi-euboreal houses and associated material culture indicate the sites relate to the Birnirk and the Thule cultures. The houses associated with the Birnirk culture are in ridge E 6 and reveal a multi-room architecture and two to three occupation levels dated to the 11th-13th century. Thule and later Kotzebue period houses are found on ridge E 5 and E 4. They show a long entrance tunnel leading to a rectangular room that contains a sleeping platform elevated above the occupation level. Unusual concentrations of archaeological charcoal and burned organic matter have been uncovered inside and outside of Birnirk houses, revealing the presence of small domestic hearths inside and firepits outside. However, Thule culture houses only have external burned areas and firepits. Ceramic lamps appear to be the sole source of light and heat inside these houses.

The variability in the form, fit, and spatial organization of combustion structures raises questions regarding their usage, status and maintenance by people who occupied these houses. To further understand fire management in the artic tundra, and the function and status of combustion structures, soil samples were collected from combustion structures (hearths, firepits, charcoal's concentration and soil occupation, ...). for anthracological and micromorphological analysis. This sampling protocol provides the opportunity for a multivariate, comparative and diachronic analysis of combustion structures between one Birnirk house and three Thule houses at Cape Espenberg. Our goal is to identify the diversity of fire-related activities in the excavated Birnirk and Thule houses, whether domestic (cooking, boiling water, heating, lighting, etc) or specialized (fire-igniting, smoking and / or drying of foods, etc). In this poster we present results of the soil micromorphology analysis and compare the areas sampled in terms of function and spatial organization in light of prior results of charcoal analyses.
In recent years, considerable attention has been paid by archaeologists to the potential of an "open science" approach within archaeology, focusing firstly upon open access publication, and more recently on the imperative for open data. Papers in this session address the third pillar of open science within archaeology: open methods, as underpinned by the use of Free and Open-Source Software (FOSS). The benefits of FOSS in archaeology are manifold, ranging from inclusivity, through transparency and research integrity, to practical issues such as cross-compatibility. Closed-source proprietary software has created a two-tier system, selectively disadvantaging individuals and institutions with more limited resources while hindering the free exchange of data, obfuscating methodological detail, and increasing the risk of digital obsolescence. By contrast, FOSS allows for universal access and encourages reproducibility and compatibility of research methods, while facilitating collaboration, archiving, and data re-use. The range of FOSS applications in archaeology has grown significantly in the last decade, expanding from traditional heartlands in GIS and spatial analysis into omics, morphometrics, bioarchaeology, and field recording, to name but a few. This session aims to draw attention to innovative ways in which archaeologists are applying the open source philosophy. Contributors will present cases in which the use of open software is instrumental in achieving objectives – whether in terms of expanding access to archaeology; developing reproducible methods; or enabling otherwise impractical research and collaborations. We also welcome papers presenting innovative packages with the potential to facilitate such contributions. By raising awareness about the uses of FOSS in archaeology, we hope to promote the Freedom of Software movement within archaeological practice and to demonstrate how the discipline is developing towards a more democratic and egalitarian approach to information technology.

TH5-11 Abstract 01
Digital media as an effective platform to archaeological data dissemination
Author - Eng. Botica, Natália, Universidade do Minho, Braga, Portugal (Presenting author)
Co-author(s) - Bernardes, Paulo, Universidade do Minho, Braga, Portugal
Co-author(s) - Martins, Manuela, Universidade do Minho, Braga, Portugal
Co-author(s) - Madiera, Joaquim, Universidade de Aveiro, Aveiro, Portugal
Keywords: 3D models, Information System, open-source software
Presentation Preference - Oral

The Unit of Archaeology of the University of Minho (UAUM) start to be concerned about digital preserving of the archeological data in the nineties, due to the large amount of records (both graphic and alphanumeric) mainly gathered during the rescue excavations carried out in the city of Braga since 1976. In order to facilitate the management and preservation after 1994 all the archeological records start to be regularized digitized and stored in an Oracle DB. Later in 2000, as part of UAUM’s information system strategy, these data were migrated to a MySQL database. Simultaneously, to ensure a continuous update and management of the data, a web-based back-office was developed using HTML and PHP. This technological independence strategy enabled a continued growth of the back-office, ensuring modularity, integration and customization facilities according to the user’s needs.

The designed Information System (2ArchIS) supports several modules, which range from the stratigraphy of any kind of excavations to the territory analysis and landscape characterization, connecting the alphanumeric data with images, vector graphics, cartographic documentation and bibliography. Furthermore, it can also integrate data resulting from the analysis and interpretation tasks.

The architecture of 2ArchIS also favours the data exchange with external applications. It is possible to export data to archED and ARCGIS enabling the automatic creation of a graph regarding the stratigraphic matrix and materials, that can be a valuable asset for the archaeological research.

This information system also integrates archaeological 3D models that are created either using constructive solid modelling techniques or computer vision techniques such as structure from motion (SFM) or dense stereo reconstruction algorithms. In fact it is possible to use artefacts, as coins, ceramics or architectural elements both for cooperative research and dissemination purposes.

All the 3D information is important not only for rendering and for 3D representation purposes, but also to be processed with visualization filters to enhance the knowledge about the archaeological record. This data is perfectly compatible to be processed with the Visualization Toolkit (VTK) from Kitware Inc., which is an open-source software system for 3D computer graphics and visualization. Some visualization procedures have already been implemented to filter scalar information of the archaeological data for contouring purposes or even to carry out manual segmentation over a 3D model.
Putting the pieces back together: automated refitting using open source software

Author: Dr. Davis, Robert, University of Bradford, Bradford, United Kingdom
Co-author(s): Evans, Adrian, University of Bradford, Bradford, United Kingdom (Presenting author)
Co-author(s): Sparrow, Thomas, University of Bradford, Bradford, United Kingdom (Presenting author)

Co-author(s): Wilson, Andrew, University of Bradford, Bradford, United Kingdom
Co-author(s): Ashton, Nick, British Museum, London, United Kingdom
Co-author(s): Pope, Matthew, University College London, London, United Kingdom
Co-author(s): Partlett, Simon, University College London, London, United Kingdom
Co-author(s): Roberts, Mark, University College London, London, United Kingdom
Keywords: Automated refitting, Bisgrove, Open source software
Presentation Preference: Oral

Refit analysis is a powerful tool that can be used to address questions regarding taphonomy and assemblage formation processes, technology and spatial organisation. However, it is a method constrained by a reliance on human experts and time, and is further limited by factors such as assemblage size, raw material characteristics and technology. The time required to conduct refit analysis increases exponentially with assemblage size, while success rates decrease. Further, error rates in refitting remain untested, although inter-analyst variability in terms of experience and skill is clearly an important factor. A refit study can rarely be considered as complete, which can create uncertainty over the extent to which past human behaviour reconstructed through refitting is representative of the full suite of behaviours represented at a site. The ‘Fragmented Heritage’ project is addressing this situation through the development of a new digital method for refitting that draws on techniques from the field of optical metrology and utilises free open source software.

This paper presents a case study of part of the GTP17 assemblage (the Horse Butchery Site) from the Lower Palaeolithic site of Bisgrove, UK, to demonstrate the new digital method of refitting, discusses how the system might be further developed and explores its potential for improving understanding of past societies.

Methods of Metal Detecting Survey in Archaeology

Saturday, 3 September 2016, 09:00-13:00
Faculty of Philology, Room A7

Author: Mark, Jan, Institute of Archaeology of the CAS, Prague, Czech Republic (Presenting author)
Co-author(s): Frank Danielisova, Olga, Institute of Archaeology of the CAS, Prague, Czech Republic
Co-author(s): Hornik, Milan, VI MagnA s.r.o., Ustriny, Slovakia

Keywords: Metal detector, site management, volunteer training program
Presentation Preference: Regular session

While a number of archaeologists perceive metal detectors as a standard tool of archaeological research, a certain level of distrust of this technology still persists. This rather unsatisfactory state of affairs is also reflected in majority of methodological guides (guides to best practice) where usually the topic of metal detectors is mentioned only marginally or just the legal aspects of their use is emphasized. Organisers of this session are convinced that detector prospecting potential has not been fully realised yet. Thus, we would like to map the currently applied methodological approaches defining this technology. We encourage participants to present papers focusing especially on metal detecting applied under different conditions: cultivated areas, forests, underwater archaeology, research on specific activities such as battlefields, routes, complex surveys of important archaeological sites as well as comparisons of their informative value with other methods (non-destructive as well as destructive) of archaeological research. Last but not least, the topic of formation processes affecting metal artefacts especially in arable areas is equally important.

Metal Detecting in Brandenburg

Author: Prof. Dr. Schopper, Franz, Brandenburg State Authorities for Heritage Management and State Museum of Archae, Zossen, Germany (Presenting author)
Keywords: Metal detector, site management, volunteer training program
Presentation Preference: Oral

Germany is a Federal State. The states are responsible for cultural purpose. So you have 16 different laws concerning the preservation of monuments and ancient heritage. The approaches vary even more. In Brandenburg State the archaeological finds are property of this state and a technical supported searching needs official permission from the Brandenburg State Authorities for Heritage Management and State Museum of Archaeology (BLDAM). After controversial discussions the BLDAM established a program to give metal detectors the possibility to participate in the research work of professional archaeology and for the benefit of society.

But there are certain preconditions. The applicants have to take part in an extensive training program. This program was first hand established to instruct volunteer supporters of archaeology, which are an important part of archaeological research not only in eastern Germany. The training is organised by the Archaeological Society in Berlin and Brandenburg. Professional archaeologists are giving lectures on ancient periods and their typical finds, on methods of localisation in the field, how to report to the central archaeological information service, about problems of conservation, on health and safety measures (ammunition). They participate get the chance to work on an exhibition. The program takes about two years with 10 to 12 weekend lessons.

After that the applicants get a regional defined and temporary permission for research. They have to report and deliver the finds to the BLDAM, which is the legal owner of all upcoming archaeological objects. We check the information and have a critical look on finds and finding reports. Important is, that not only metal objects are reported but fifth-, stone- and ceramic objects as well. In certain projects the goals for research are given by the BLDAM. For example to get detailed information on 16th to 19th century battlefields. Or when we try to understand the structure of abandoned mediaveal sites. More often important finds are made by chance.

This can be bronze hoards, silver coins or burials. Very often these objects are of certain importance and would be lost for archaeology. Without the possibility for metal detectorists of legal participation in scientific research, these objects would disappear.

In our opinion the Brandenburg approach to embody metal detectorists in our daily archaeological work gives us new information, helps us to canalize enthusiasm and to have less legal problems with detectorists. Overall metal detecting is nowadays an important part of modern archaeological site management.

Acknowledgements: This research is part of the Fragmented Heritage project funded by the Arts and Humanities Research Council (AH/L006883/7).
Intensive and unregulated mass detectoring has been occurring during the last quarter of century not only in Slovakia. It has affected especially hillforts and their immediate background. Although mass detectoring has brought irrevocable damage to the sites’ fortified bounds. Apart from the obvious research interest, the principal aim of the survey was to remove as much as possible of the metal objects from the topsoil. Majority of these settlements were turned out to fields during the Middle Ages, most of these remain so until today. The basic idea behind the “archaeology of the plough-soils” is that upper layer of 20-30 cm contains dislocated finds removed from their original contexts in the cultural layers or upper parts of the sunken features. However, this dislocation is not as substantial to prevent us from detecting patterns related to the original spatial structure. In order to conduct a survey as thorough as possible the selected areas were ploughed in order to investigate the contents of the topsoil in detail. In order to get the maximum results a repeated survey is needed after every ploughing (twice a year). Our case studies will hopefully present that despite this method being time and energy consuming it is however rewarding in a fact that the finds from the upper layer can be thus safeguarded for proper archaeological research.

TH5-12 Abstract 05

Archaeology of the plough-soils

Author - Marik, Jan, Institute of Archaeology of the CAS, Prague, v. v. i., Prague, Czech Republic (Presenting author)
Co-author(s) - Frank Danielisova, Asbleta, Institute of Archaeology of the CAS, Prague, v. v. i., Prague, Czech Republic
Keywords: central places, metal detector prospection, plough-soils
Presentation Preference - Oral

Several projects during the last years were focused on the large scale prospectations of the complex settlements that are considered as central (the oppida, early medieval strongholds). Because such sites are notorious among treasure hunters a thorough metal detector survey, besides traditional surface prospectations and geophysics, was conducted on the selected areas within and outside of the sites’ fortified bounds. Apart from the obvious research interest the principal aim of the survey was to remove (as much as possible) of the metal objects from the topsoil. Majority of these settlements were turned out to fields during the Middle Ages, most of these remain so until today. The basic idea behind the "archaeology of the plough-soil" is that upper layer of 20-30 cm contains dislocated finds removed from their original contexts in the cultural layers or upper parts of the sunken features. However, this dislocation is not as substantial to prevent us from detecting patterns related to the original spatial structure. In order to conduct a survey as thorough as possible the selected areas were ploughed in order to investigate the contents of the topsoil in detail. In order to get the maximum results a repeated survey is needed after every ploughing (twice a year). Our case studies will hopefully present that despite this method being time and energy consuming it is however rewarding in a fact that the finds from the upper layer can be thus safeguarded for proper archaeological research.
TH5-13 Abstract 01

Environmental conditions and Mesolithic-Early Neolithic sites in the basin of Vozhe Lake (Russia)

Author - Dr. Kosoroukova, Natalia, Cherenevets State University, Cherenevets, Volgoda region, Russian Federation
Co-author(s) - Kulkova, Marianna, Herzen State University, St.Petersburg, Russian Federation (Presenting author)
Keywords: pits, peat, Early Neolithic sites, Palaeoclimatic, environment of Holocene, pit-bog settlements, Vozhe Lake
Presentation Preference - Oral

Changes in past environments, climates, and faunal ecology had huge impacts on human populations, from the extinction of the Neanderthals, to the origins of agriculture, the formation of early societies and technological and cultural change. Understanding the scale and frequencies in these changing environments is crucial in determining the impact of these events on archaeological populations, on regional and site-specific, as well as global levels. In recent years new developments in the field of environmental archaeology including the advancement of biomolecular techniques, have enabled palaeoenvironmental changes to be characterised on a range of scales, from analysis of individual animals, and archaeological sites, to regional reconstructions. Using holistic and multi-evidential approaches it is possible to achieve a more comprehensive understanding of palaeoenvironmental and palaeoclimatic changes within archaeological sites and their impact on past human and animal populations.

TH5-13 Abstract 02

Baltic Sea Lithuanian coastline changes in Mesolithic: landscape and peoples subsistence economy

Author - Prof. Žukus, Vladas, Kaipėda University, Kaipėda, Lithuania
Co-author(s) - Prof. Grininckas, Algirdas, Kaipėda University, Kaipėda, Lithuania (Presenting author)
Keywords: Mesolithic inhabitants, Palaeoenvironmental situation, the submerged prehistory
Presentation Preference - Oral

The submerged prehistory of the eastern Baltic has attracted great archaeological, geological, pollen, macrofossil, diatom, radiocarbon analysis the last years. The exploration was concentrated in order to localize the former Yoldia Sea and Ancylus Lake coasts, their shelf under and underwater landscape reconstruction (coastal vegetation, relics fish composition, their age, pollen, diatom analysis) and their potential settlement development in Lithuania waters. Studies in 2014-2015 revealed northern part of the Curonian plateau (underwater peninsula) sea bottom formation and cost lines in the 15-30 m depths. Yoldia Sea and Ancylus Lake shores underwater landscape studies were conducted from the Samogitian Highland (West Lithuania) ongoing pollen, diatom and archaeological investigations, which showed that in the Mesolithic period of human living and farming conditions were different. Palaeoenvironmental situation plays a leading role in the reconstruction of the human settling during the Early Holocene in coastal and continental area of Lithuania. Relict submerged forest vegetation composition remains confirms that the natural conditions at that time of former Baltic coastal water basin were favorable to live and succeed in farming for Early Mesolithic Kunda (Pulli) and Maglemose cultural communities. The tested area was favorable place for human settlement which included coastal fauna, coastal migratory birds and marine resource, seals especially in the Late Pre-Boreal and Early Boreal. Yoldia Sea and Ancylus Lake shore zone examined small lake surroundings could have been settled by Mesolithic inhabitants. In the first case – Early Mesolithic Kunda culture (Pulli stage), and second – Maglemose settlers.

TH5-13 Abstract 03

Mediterranean foragers exploited cetacean strandings caused by climate change around 8,200 years ago

Author - Dr. Mannino, Marcello Antonio, Aarhus University, Højbjerg, Denmark (Presenting author)
Keywords: carbon and nitrogen isotope analyses, cetaceans, hunter-gatherers
Presentation Preference - Oral

Cetacean strandings occur globally along coastal regions for a wide range of causes. It has been hypothesized that climate-driven environmental changes associated with global warming may dramatically increase cetacean mortalities. However, the compounded effects of natural and anthropogenic factors often make it difficult to establish the cause of present-day strandings and mortalities. Here we show that environmental changes driven by the abrupt climatic event of 8,200 years ago linked to increased cetacean strandings in the Mediterranean Sea. We found that, at this time, portions of many carcasses of four Odontobutus (i.e. Globicephala melas, Grampus griseus, Delphinus delphis and probably Physeter macrocephalus) and one Myctoleucus (i.e. Balaenoptera sp.) were butchered by the hunter-gatherers occupying Grotta dell’Uzzo. Stable isotope analyses on bone collagen from a large sample of remains recovered at this cave in NW Sicily show that only a red fox and a human that lived around 8,200 years ago acquired at least 40% of their protein from cetacean meat. The fact that a fox fed on cetaceans, and the absence of whaling technology, suggest that stranded animals were exploited. Numerous carcasses should have been available yearly for at least a decade for a human to obtain such high proportions of cetacean protein. Frequent strandings probably resulted from starvation-induced disorientation linked to the impacts on primary producers, and consumers up the food chain, of year-on-year decreases in sea surface temperatures and salinities around 8,200 years ago. We hypothesize that the cetaceans beached at a locality south of Grotta dell’Uzzo, because, at lower sea levels, the SW corner of the Gulf of Castellamare was an acoustical ‘dead zone’, such as mass stranding hotspots worldwide. Our study confirms that climate-driven environmental changes may be driving global warming represents a serial threat to cetaceans in the near future.
The closing stages of the Devenian glacial through to the Holocene interglacial (c. 15 000 cal BP – 11 500 cal BP) saw a series of rapid oscillations in global climate associated with major turnover events in floral and faunal compositions. Climate is known to be a primary driver of biological evolution and such abrupt climatic fluctuations are likely to have exerted strong selection pressures on mammal communities. This period also associated with large-scale changes in human populations, culture and technology. This study applies a novel synthesis of ancient DNA and 3D geometric morphometrics to sub-fossil material recovered from the British zoo-archaeological record in order to investigate the tempo, scale and mode of mammalian response to this rapidly changing climate.

Britain is ideally placed to examine the question of climate-driven faunal turnover on account of its sensitivity to climate change driven by its proximity to the North Atlantic. Its exceptionally rich fossil assemblages and its geographical position, formerly connected by a landbridge to the European mainland. Regional level population instability and eco-morphological change over the terminal Pleistocene has been explored in a number of mammal species; a micromammal common vole, Microtus arvalis, a woodland specialist (Eurasian beaver, castor fiber), a carnivore (wildcat, Felis silvestris) and a large grazer (wild horse, Equus ferus).

The multi-proxy methodology applied here allows key questions relating to both population patterns and processes and morphological plasticity/stasis to be explored. Ancient DNA analyses included traditional Sanger sequencing and Next-Generation Sequencing (NGS) technologies to create both single-gene mitochondrial and genome-wide Single Nucleotide Polymorphism (SNP) datasets while morphological analyses applied 2D digital imaging and 3D micro computed tomography (microCT) to sub-fossil bones and teeth. This represents one of the first studies to combine these techniques and apply them to mammal material (wild horse, Equus ferus).

Microtus arvalis), a woodland specialist (Eurasian beaver, castor fiber), a carnivore (wildcat, Felis silvestris) and a large grazer (wild horse, Equus ferus).

Results also show a correlation between P. vulgata estimated ST and data from the Greenland NGRIP ice core and from deep-sea sediment core MD95-2042 (located off western Iberia), suggesting that ST in northern Iberia followed a global pattern.
with strontium isotopic analysis) is commonly used to infer childhood geographical origin. However, given that dental tissues form incrementally, and only capture isotopic inputs from a fixed period (i.e., during their formation), their analysis only offers short-term insights into sample integrity. The implications of this research for the planning of future archaeological isotopic investigations and sampling strategies will be explored.

TH5-13 Abstract 10
Changing cultures, changing environments
Author - Pitt, Jacqueline, Bournemouth University, Bournemouth, United Kingdom (Presenting author)
Keywords: Human-animal interactions, Palaeoecology, Zooarchaeology
Presentation Preference - Oral

Climate and environment are critical factors for the survival of every living species. Animals and plants are not only conditioned by, but also change their environments. The interaction between different species and their environments changes over time and as such can be very informative, but identifying this complex relationship in the archaeological record is challenging.

The domestic chicken presents an interesting case study. Introduced into Europe during the Iron Age as a non-native species, its novel presence necessarily altered its ecosystem, both in terms of inter-species relationships and on account of the environmental changes it brought about. Application of ecological community species, its novel presence necessarily altered its ecosystem, both in terms of inter-species relationships and on account of the environmental changes it brought about. Application of ecological community

TH5-13 Abstract 11
Revisiting the impacts of coastal sand movement in prehistoric Scottish Islands
Author - Gai, Emily, University of St Andrews, St Andrews, United Kingdom (Presenting author)
Keywords: aeolian sand, geochronology, Scottish islands
Presentation Preference - Oral

Islands and their coastlines have long been important landscapes for settlement, resource procurement and structuring social interaction. Such environments have also proven fruitful in exploring environmental change and its impacts on human activity. Coastlines are by nature dynamic and locally-variable. Manifestations of environmental change such as flooding, erosion and sand movement can have immediate and visible impacts on coastal activities and geomorphology. Historical sources provide a detailed view of environmental deterioration and its far-reaching effects on coastal populations throughout Britain, particularly during the Little Ice Age. Notable impacts include the erosion of coastal landform and inundation, leading to the marginalisation and abandonment of agricultural land in response.

The presence of blown sand horizons at coastal archaeological sites attest to similar movements in the prehistoric past across northwest Europe. However, the nature of impact and response in the prehistoric record is less clear, with environmental proxies often proving ill-defined. Prehistoric archaeologists face the challenge of reconciling temporal scales provided by the environmental sciences with scales that are archaeologically-meaningful to explore similar human-environment relationships at deeper (timescales.

This paper will introduce a doctoral research project which aims to catalogue and characterise episodes of coastal sand movement in the prehistoric period using the Northern and Western Isles of Scotland as a case region. A mixed-methods approach has been taken to this research, combining archaeological evidence with geoarchaeology and historical analogy. The project also utilises geophysical survey and luminescence dating to investigate the nature, source and chronology of sand movement on archaeological sites and landscapes. This will then be placed within the wider socio-cultural context of a region where suggested ‘buffering’ responses such as mobility and diversification can be reviewed. Selected multi-period sites in Orkney and the Outer Hebrides are being used to explore the ways in which this complex archaeological and environmental record can be approached.

TH5-13 Abstract 12
Anthropogenic impact on the changes in landscape in the tract “Adzhilel” in the Eastern Crimea
Author - PhD Smekalov, Sergey, Tula State Lomonosov Pedagogical University, Saint-Petersburg, Russian Federation (Presenting author)
Co-author(s) - Zubaren, V.G, Tula State Lomonosov Pedagogical University, Tula, Russian Federation

Presentation Preference - Poster

The connection between location of ancient settlements with the conditions of the environment and agricultural potential is obvious. It is evenly obvious, the dependence of the choice of location for the settlement with the landscape. In this connection, great interest is the analysis of the historical situation in a particular area in the presence on it of one or more dominant objects of human impact on the environment. In our case, that is the territory of the tract Adzhilel. The tract occupies part of the territory of the Eastern Crimea adjacent to the Sea of Azov, is located 45 kilometers west of the eastern point of Crimea, and covers an area of about 40 km². The name of this area connected with Adzhilel gutch, located here. As a result of studies of the XX century, there are discovered many barrows and more than a dozen ancient archaeological sites of other types. For detection the relationship the provisions of the identified objects of natural-geographical and landscape features of the tract, GIS has been prepared, including layers, describing the soil, properties, topography and hydrology of the area. On a large part of Tracts Adzhilel, with modern agriculture field, there are no traces of settlement structures, that says, that in ancient times these terrains were not built up, but could also be used for agriculture. Settlement structures are located primarily along the boundaries of the modern field, but also in areas with less fertile soils. The territories occupied by modern fields as underlying talus rocks in the middle and lower Pliocene rocks - sand, clay, iron ore, shelly limestone; rocks of Mio-Pliocene - Shelly limestone, Ectoprocta reefs, clay. Quaternary rocks represented by aeolian-talus deposits, with material composition - loess - like loam and loess. Soils, occupying a significant part of Tracts - southern micelian-carbonate sandstone, are one of the most fertile soil types on the Kerch Peninsula. There is a spatial matching soil types and underlying pre- Quaternary rocks, which in turn is likely to determine the features of talus formations of the Quaternary period, directly acting as a soil-forming grounds. In conclusion, it can be said that the results of our research provide an understanding of the possibility of placing of the territory of the tract in antiquity, based on the absence of archaeological material in the territory of modern fields correspond to the conclusions made based on the analysis of geological and soil conditions of the area - the types of soil in the tract Adzhilel determined by soil-forming rocks, and are not associated with anthropogenic or other influences, and it can be assumed that in ancient times they were the same, i.e., highly suitable for agriculture.
The work was performed as part of research "Structural and spatial study of monuments as a paradigm of the archaeological research of history of a particular region (for example, the tract) "Adzhikel" and the settlement "Belyanti"" in the Tula State Lev Tolstoy Pedagogical University (reference number 2014/388 Ministry of Education of Russia, research № 1799).

TH5-13 Abstract 13

Geomorphology and early Neolithic migration routes into the Transylvanian Depression

Author: Persoiu, Ioana, Stefan cel Mare Mare University, Suceava, Romania (Presenting author)
Co-author(s): - Matsuflor, Alina, Luigi University, Iasi, Romania
Co-author(s): - Persoiu, Aurel, "Emil Racoviță" Institute of Speleology, Cluj Napoca, Romania
Keywords: Carpathians, Early Neolithic, migration routes

Presentation Preference - Poster

In this paper we discuss the geomorphological conditioning of the migration routes of the early Neolithic communities into the Transylvanian Depression (Carpathian Mts. East Central Europe), as relected by the spatial and temporal distribution of the Starčevo – Criş archaeological sites in the western part of Romania. The inventoried archaeological sites are located along rivers, preferentially positioned in the floodplain and low fluvial terraces, between 70 - 450 m asl, with few sites at higher elevations along rivers in the mountainous areas. The main access routes across the Carpathian Mts was eastward from the Pannonian Basin, along the Mureş River. During Starčevo - Criş I and II, the communities were present only in the western part of the Transylvanian Depression, at the edge of the Apuseni Mountains. They have split along the main rivers and some small tributaries, and moved to the north, along Someşul Mic River and its right side tributaries. Starting with Starčevo - Criş III, the number of the early Neolithic communities has increased, mainly along Mureş River and its main tributaries (Târnava Mică, Târnava Mare, Argeş), associated with a slow eastward movement. A secondary eastward route was along the low alluvial plains (known as The Western Romanian Plain) of Mureş, Criş and Someşul Rivers. Here too, the peoples moved from the area of Mureş alluvial plain to the NE. They arrived in the perimeter of the Someşul plain only during Starčevo - Criş III and IV. From there, further to the east, neolithic sites are generally absent along the main (1.5 km wide) floodplains but present in the hilly area (crossed but smaller and narrow valley), suggesting a possible geomorphologic control on the spreading routes. The third route was along Olt River and seems to have occurred only during Starčevo - Criş III and IV. These communities moved to the east, along the main river and occupied Bârgăo Depression and other small scale intramountain basins, at the eastern edge of the Transylvanian Basin. However, it is controversial whether Neolithic populations have crossed the Carpathians south to north to reach this route, or have spread eastwards, branching off outlet above. Based on these observations, the authors discuss the natural condition in some specific case studies, in order to offer answers to some key questions: (1) Why Someşul Mare – Someşul Mică valleys seem to had been avoided by the early Neolithic communities? (2) Were the Carpathians crossed only along the Mureş river, west to east, or did Neolithic populations used two routes, the second along the Olt river, south to north? (3) Are there preferential routes in the western alluvial plains, being known the complex fluvial relief in the area (abandoned palaeoamanders, extended wet zones, isolated fluvial relics, low fluvial terraces)?

TH5-13 Abstract 14

North Atlantic and Labrador seasonal climate: isotopic evidence from micromilled bivalves and wood

Author: Timsic, Sandra, University of Saskatchewan, Saskatoon, Canada (Presenting author)
Co-author(s): - Patterson, William, University of Saskatchewan, Saskatoon, Canada
Co-author(s): - Eglinton, Bruce, University of Saskatchewan, Saskatoon, Canada
Keywords: micromilling, seasonal climate, tree-rings and bivalves

Presentation Preference - Poster

High-resolution records are exceptionally important for reconstruction of past environmental and climatic conditions. Micromills are particularly important devices because they obtain discrete samples at high temporal resolutions, thus allowing for reconstructions of intra-annual environmental and climate variability. Seasonality of temperature and precipitation are one of the most significant parameters of climate that directly influences terrestrial and marine environments. Here, we present sub-seasonal climate data obtained using our custom-designed robotic micromilling device from bivalve shells retrieved from a North Atlantic core near Iceland and a wood disc from a white spruce tree collected near the tree line in coastal Labrador.

We provide the first whole Holocene temperature record of seasonality for the North Atlantic, a climatically important region with significant transregional effects. Thirty-five well-preserved aragonitic bivalves were extracted from a marine piston core from NW Iceland and sequentially micromilled concordant with growth banding. Carbonate aliquots were subsequently analysed for δ18O (CaCO3) values to obtain snapshots of ambient seawater temperatures at a sub-monthly resolution. Our data suggest that the Early Holocene (10,650 to 7,600 cal yr BP) exhibited the most persistently warm summers, with maximum summer temperatures ~2°C higher, and with greater seasonality than during the subsequent cooler Neoglacial Period (7,000 to 4,750 cal yr BP). The Neoglacial Period was a relatively stable cold period, with the lowest summer maximum temperatures, as well as the lowest seasonality during the Holocene. Sporadic warm periods and increased seasonality are observed in the record after 4,500 cal yr BP, when maximum summer temperatures reached between ~7 and 9.5°C. The highest reconstructed temperatures of the entire record occurred during the Roman Warm Period at ~2,600 cal yr BP.

Three centuries of subannual/annual climate data were retrieved from the δ18O and δ13C values of tree-ring cellulose in the temperature-sensitive region of central-eastal Labrador, Canada. A large cookie of a white spruce (Picea glauca) tree was micromilled to retrieve multiple samples per year and/or early and late wood that were subsequently analysed for δ18O cellulose and δ13C cellulose values. The coastal Labrador region is a climatically dynamic region that is influenced by ocean-atmosphere interactions and thus has excellent potential for studying both, terrestrial and marine climate variability. We found a good agreement between reconstructed mean-annual temperatures and major climatic trends and events, including multidecadal warm and cold climate episodes, historical meteorological measurements collected by the Moravian missionaries, modern mean-annual temperatures and salinity anomalies in the NW North Atlantic Ocean, as well as cooling trends induced by major volcanic eruptions such as Lakagígar in 1783-84, Tambora in 1815, and Krakatoa in 1883. Persistent cold intervals are found from 1790 to 1810, 1875 to 1895, and 1950 to 1970, while the warmest intervals are found during the mid-18th and 19th centuries. Moreover, continuous transform wavelet analysis was used to analyze δ18O cellulose and δ13C cellulose periodicities and suggest that their interannual and multidecadal periodicities are similar to those of the NAO.

The authors acknowledge financial support from projects PN-II-RIU-TE-2014-4-1993, PN-II-ID-PCE-2011-3-0057, financed by UEFISCĐI Romania.
We bring together archaeologists and palaeoecologists working on land use and land cover history over the Holocene, for any area or region of the world. Land use is inferred from settlement patterns, artifact scatters, plant and animal remains and off-site palaeoecological records. We especially wish to consider the range and intensity of subsistence activities at a regional and spatio-temporal scale. Land cover may be inferred from complementary palaeoecological data. A long-term focus, examining changes ~8000 cal BC to ~ cal AD 1500 (10,000 BP – 500 BP), will allow progression towards a global overview of how subsistence and land cover has changed as a consequence of hunter-gatherer and agricultural activities across different regions of the world.

We would like to concentrate especially (but not exclusively) on the following periods: the early Holocene (~8000 cal BC), the impacts and consequences of agricultural production (~4000 cal BC) and intensification (~2000 cal BC). More recent periods, focusing on areas outside of Europe, are also welcomed, as the chronology of activities is substantially different to Europe. As we will take a global perspective, we expect diverse regional land use and subsistence practices to be explored. Papers that cover all or parts of these periods and contributions that synthesize understanding of subsistence practices and implications for land usage are welcomed. This session will form part of activities of the PAGES-funded LandCover6k project (http://www.pagesigbp.org/en/eg/lc/landcover6k/intro), an international and interdisciplinary working group dedicated to reconstructing global Holocene land use and land cover. The initial goal of this effort is to critically evaluate and improve models of anthropogenic land cover change being employed by climate scientists and ensure these are archaeologically robust and are well-informed by current understanding of human land use history.

**Towards a global history of human land use over the Holocene**

**Author** - Prof. Whitehouse, Nicky, Plymouth University, Plymouth, United Kingdom

**Co-author(s)** - Morrison, Kathleen, Department of Anthropology, University of Chicago, Chicago, United States of America (Presenting author)

**Keywords** - Agriculture, Holocene, Land use

**Presentation Preference - Oral**

This paper outlines the aims of the PAGES-funded LandCover6k project (http://www.pages-igbp.org/en/lc/landcover6k/intro), an international and interdisciplinary working group dedicated to reconstructing global Holocene land use and land cover. The goal of the project is to provide relevant, empirical data on global past anthropogenic land-cover and land-use change to climate modelers. The LandCover6k working group infers land-use data from fossil pollen records (lake sediments and peat deposits), and uses these data in palaeoarchaeological and archaeological records (including pollen, wood and plant micro/macroremains). We focus on regions of the world where humans have had a significant impact on land cover during the last 10,000 years in the study area.

We outline why land-use change is important for understanding climate forcing and why its effects on climate remain poorly understood. Among the effects of land-cover change on climate, the best known is biogeochemical effects, in particular the influence of the exchange of CO2 between the land surface and the atmosphere. The biogeochemical effects are less well understood. Moreover, the net effects of both biogeochemical and biophysical processes due to land-cover change are still a matter of debate. The pollen-based reconstructions of past land use cover pollen-vegetation modelling approaches, with mapping of pollen-based land-cover change using spatial statistics; and the establishment of causal relationships between these indices and the land-use history inferred from these species and land cover. The results of this work will be used to develop revised Anthropogenic Land Cover Change (ALCC) scenarios, which presently use models to reconstruct human impacts (e.g. Kaplan et al. 2009; Klein Goldewijk et al. 2011).

Our major focus is on the reconstruction of land-use history; the goal is to ensure that interpretations are archaeologically robust, well-informed by current understandings of human land use history and useful to the archaeological community, as well as the climate modeling community. We present initial results from our land categorization work and consider some of the challenges and opportunities associated with these efforts. These include some of the assumptions around the nature of hunter-gatherer human impacts, early farming and ongoing land use activities and how these change over time in different parts of the world. Sometimes, models that have been developed for regions such as Europe form the basis for other area, that reflect more about the role of Europe in the world, than the reality of human impacts, agricultural and pastoral activities in other continents. We hope the project will facilitate more realistic understanding of the variation of human land use across space and time and offer the opportunity for the archaeological community to contribute towards globally important issues.

**Land Use 6k: A First Assessment of South Asia**

**Author** - Bauer, Andrew, Stanford University, Stanford, United States of America (Presenting author)

**Co-author(s)** - Madella, M., Universitat Pompeu Fabra, Barcelona, Spain

**Keywords** - Climate Change, Land Use, South Asia

**Presentation Preference - Oral**

This paper will review the current state of archaeological evidence for human land use in South Asia in the middle to late Holocene. The review forms part of a larger effort of the PAGES-supported LandCover6k and LandUse6k project (http://landuse.uchicago.edu/about/) to reconstruct global land use and land cover datasets for the purpose of improving models of anthropogenic land cover change being used by climate scientists. Here we will present archaeological and paleoecological data from different regions of modern day India, Pakistan, and Bangladesh in an effort to identify significant changes in agricultural, pastoral, hunting and foraging land use and anthropogenic land cover changes between ca. 6000 BP and 3000 BP. As we will detail, during this period there was an intensification and expansion of agricultural and pastoral land use across many regions of South Asia that significantly affected land cover and other environmental conditions.

**Long-term patterns of Human Land Use in the Temperate Woodlands of Northeastern Mississippi, U.S.A.**

**Author** - Professor Peacock, Evan, Mississippi State University, Mississippi State, MS, United States of America (Presenting author)

**Co-author(s)** - Morrison, KD., University of Chicago, Chicago, United States of America

**Keywords** - Climate Change, Land Use, Northeastern U.S.A.

**Presentation Preference - Oral**

Decades of archaeological survey and excavation in the upper Tombigbee River drainage of Mississippi, southeastern U.S.A., have produced a large body of data related to demographic, settlement, and subsistence patterns over the course of the Holocene. Using seriations of ceramics and hafted bifaces and absolute dating results, we chart fluctuations over time in human population densities and the exploitation of a range of resources. Marked changes in human landscape use are seen to have occurred during 1) the mid-Holocene, when climate change led to fluctuating environmental conditions; 2) ca. 500 BCE – 1000 CE, when human population growth related to the advent of sedentariness led to increasing hunter-gatherer pressure on local-scale environments; and 3) the adoption of agriculture at ca. 1000 CE, which was selected for in the face of such pressures. We also discuss the different roles that construction of monumental architecture may have played across the changing selective environment over the last 10,000 years in the study area.

**North American Land Use from 6K Onward: A First Look**

**Author** - Prof. Wandsnider, LuAnn, Univ of Nebraska-Lincoln, Lincoln, NE, United States of America (Presenting author)

**Co-author(s)** - Foster, Thomas, Tulsa University, Tulsa, OK, United States of America

**Keywords** - collaborative research, land use, North America

**Presentation Preference - Oral**

Integrating syntheses of land use by archaeologists, historians, and historical geographers, we present a preliminary meta-analysis of land use, including different modes of land use - foraging, agriculture, pastoralism, and urbanism - by indigenous and European communities in South-Eastern Europe. Our treatment considers eastern North America, the Great Plains of North America, and Middle America, including Mexico. We focus on specific time periods within the Middle and Late Holocene, as land use rapidly transformed from generalized foraging, to specialized foraging, to intensively managed commodification (including forms of pastoralism) and later agriculture, with urban centers appearing by 1000 AD in various parts of North America. We conclude with the historic era, 1850 CE, by which time agriculture and other land use practices were industrialized. Land use characterizations such as these are the foundation for the construction of higher fidelity models of recent climate change. This effort contributes to LandUse4EU, a global collaboration to document land use around the world and through time, in order to achieve a better understanding of anthropogenic involvement with climate change. We seek input from scholars of European archaeology on method and implications.

TH5-14 Abstract 05

Intensity of human impact inferred from pollen and-cover reconstruction and archaeological models

Author - PhD Draslerova, Dagmar, Institute of Archaeology of the CAS, Prague, Czech Republic (Presenting author)
Co-author(s) – PhD Abraham, Vojtech, Department of Botany, Faculty of Science, Charles University, Prague, Czech Republic

Keywords: archaeological modeling, REVEALS, vegetation cover

Presentation Preference - Oral

Recent global change accelerates the need for understanding of human-climate relationship and for quantification of anthropogenic climate change in the past. We inferred human impact both from the pollen-based land-cover reconstruction and from archaeological data. We present a current state of the research concerning this cross validation for the Holocene period in the selected regions of the Czech Republic.

We used pollen data from the PALYVCZ database (http://botany.natur.cuni.cz/palycz) and recalculated them by the REVEALS model into vegetation estimates. The algorithm considers pollen productivity, pollen dispersal and deposition, when interpreting fossil pollen data. The setting of model parameters was adopted from the previous testing, in which the model was adjusted to the recent vegetation in the same regions. Actual regional vegetation (60 km radius) was obtained by combining the CORINE Land Cover map with forest inventories, agricultural statistics and habitat mapping data. Among the vegetation estimates of different taxa, Cerealia, Plantago lanceolata and Poaceae were considered as indicators of crop cultivation, pastoral management and deforestation in general.

Archaeological data was taken from the Archaeological database of Bohemia. The intensity of human impact was inferred by analyzing the economic model of a prehistoric community and its consequences to the surrounding environment. Special attention was paid to estimate the amount of cereals that could be grown in different prehistoric periods. Pollen-based and archaeology-based cereal estimates show very similar pattern when compared relatively. However, absolute area of pollen-based Cerealia is ca. 10 times higher than the prediction of the archaeological model. We interpret the mismatch by providing sources of possible biases: REVEALS model assumes that pollen record originates from one large site or several small sites in the even vegetation matrix. This would involve a much more widespread use of fire as a basic agrotechnological tool and the formation of a shifting, slash-and-burn mode of cultivation. The long-term functioning of such a system would lead to the appearance of large, deforested areas (grasslands and parklands) of anthropogenic origin, in the second half of the fourth millennium BC. The main aim of the presentation will be to evaluate that model, with the use of new archaeological, palaeoecological and palaeoenvironmental data, obtained i.a. in the settlement of the TRB at Mozgawa (the Płoćewo district). In the view of these data, it seems that the aforesaid model can be applied only to certain areas of the upper Vistula basin, mainly loses highlands. Economy and settlement of Neolithic groups living in the fourth millennium BC in other ecological regions, as well as those not associated with broad-scaled, extensive human interference in the environment. Consequently, the presentation will also be an attempt at explaining and understanding the causes of this variability.

THS-14 Abstract 06

Animal subsistence in the Eneolithic period from South-East Romania

Author - PhD Balasescu, Adrian, National Museum of Romanian History, Bucharest, Romania (Presenting author)

Keywords: Eneolithic, Romania, Zooarchaeology

Presentation Preference - Oral

The presence of the first tell settlements in the southeastern Romania and their development between 4700-3500 BC allowed some observation about animal paleoeconomy evolution over several cultural sequences (Boian, Gumețlia, Săcelota and Cerneadoi I). Thus, the existences of numerous tell settlements with a complex stratigraphic and chron-cultural sequences attested (e.g. Horeșo, Vălceaiesca, Casacioarele, Văstani, Draganei OT, Gumețlia) gave us the opportunity to record some changes in the livestock and hunting activities. Regarding the livestock activity, cattle and sheep/goat which prevail, shows highly significant variations by region. The slaughtering curve study reveals that the cattle are grown for milk while sheep/goat is bred for meat. In this manner, between the two types of animals we remarked a complementarity in animals’ products. Our study also captures the pig growing importance from 5% to 25% since the beginning of the first tells settlement, so this is closely linked to the sedentary lifestyle of the Eneolithic populations. Additionally, the composition of the fauna attest that these communities have an efficient exploitation of domestic animals. Moreover, we remarked the presence of horse, origin of which might be linked to the Eneolithic period. Consequently, the presentation will also be an attempt at explaining and understanding the causes of this variability.

THS-14 Abstract 07

Middle Neolithic transformations of food economy in the upper Vistula basin (SE Poland)

Author - Dr. Moskal-del Hoyo, M. Wywal, Szczestr Institute of Botany, Polish Academy of Sciences, Kraków, Poland (Presenting author)
Co-author(s) - Dr. hab. Nowak, Marek, Institute of Archaeology, Jagiellonian University, Kraków, Poland

Keywords: food economy, Funnel Beaker Culture, South-Eastern Poland

Presentation Preference - Oral

In the first half of the fourth millennium BC, in the upper Vistula basin, from the perspective of the past material culture, the last units of the Long-Neck-Point Complex (included to the so-called Danubian Neolithic) disappeared. In that period a new archaeological phenomenon appeared and was gradually spreading; it was the south-eastern group of the Funnel Beaker culture (SE TRB). In central-European prehistory, significant changes in systems of Neolithic food economy and settlement have been associated with this culture. In the most complete and systematic way they were modelled by J. Krus, in the 1970s and 1980s. These transformations would consist of overcoming of ecological and topographical constraints (barriers), characteristic of Danubian Neolithic, and including into the Neolithic oecumene virtually all landscapes of a given territory ("second stage of Neolithisation"), i.e. western part of Lesser Poland in our case. These processes would involve a much more widespread use of fire as a basic agrotechnological tool and the formation of a shifting, slash-and-burn mode of cultivation. The long-term functioning of such a system would lead to the appearance of large, deforested areas (grasslands and parklands) of anthropogenic origin, in the second half of the fourth millennium BC. The main aim of the presentation will be to evaluate that model, with the use of new archaeological, palaeoecological and palaeoenvironmental data, obtained i.a. in the settlement of the TRB at Mozgawa (the Płock district). In the view of these data, it seems that the aforesaid model can be applied only to certain areas of the upper Vistula basin, mainly loses highlands. Economy and settlement of Neolithic groups living in the fourth millennium BC in other ecological regions, as well as those not associated with broad-scaled, extensive human interference in the environment. Consequently, the presentation will also be an attempt at explaining and understanding the causes of this variability.
In connection with two rescue excavation projects in Southeastern Norway, the Vestfoldbankprosjektet and the project E18-Rugtvedt-Dyrdal, a cooperation between the Museum for Cultural History, University of Oslo, and the Graduate School “Human Development and Resilience” at Kiel University was established, to extract and analyze a core from Lake Skogstjern, Bamble, Telemark. The aim was to supplement archaeological excavation results, mainly traces of coastal settlement dating to the Mesolithic and Neolithic periods, with knowledge on vegetation history. From the comparison of archaeological and palaeoecological evidence of human impacts in the vegetation and the Mesolithic as well as the process of neolithization, with the introduction of agricultural practices and animal husbandry in Southeastern Norway, can be discussed. While the latter contributes with important data to an ongoing discussion, the former is a new field of research.

The coring site Lake Skogstjern provides pollen analytical investigations with a high temporal resolution of 12 to 38 yr/cm, showing a detailed picture of landscape development in a long-term perspective. Complementary techniques of non-pollen palynomorphs- and microscopic charcoal analysis as well as loss-on-ignition and determination of geochemical element distribution were also employed on its sediments, allowing the consideration of the palaeoecological interactions, climates, and human influence for more than 10500 years. Lake Skogstjern has, due to its rather small size, an extra-local signature.

The pollenanalytical data shows that first evidence of human activity emerges already during the Mesolithic, reflecting small-scale openings of the forests by the assistance of fire. First traces of agriculture during the Early Neolithic. These are, however, signs of rather small scale ‘cereal cultivation’ and of only limited animal husbandry. During the following periods, there are again and again traces of agriculture, nevertheless, human impact remains on a more or less low-level and does not generate any significant palaeoenvironmental changes. The palaeoecological record evidences some intensification in animal husbandry only during the second half of the Bronze Age, involving slightly higher degree in landscape openness and the utilization of wet meadows for grazing purposes. Crop cultivation, however, plays a minor role even up to the pre-Roman Iron Age.

According to the pollenanalytical data the establishment of a full farming community is taking place exclusively in the centuries AD, characterized by a general expansion and intensification of the land-use as verified by extensive forest clearances and fires, crop cultivation on permanent fields and the presence of open pastures as well as associated therewith advanced soil degradation and increased erosion rates.

These results both support as well as challenge the archaeological discussion on the relationship of humans and surroundings and from a mobile to a sedentary way of life.

Keywords: human impact, lake sedate, varve chronology

Presentation Preference: Oral

Annually laminated (varved) lake sediments represent unique archives in continental areas providing both, precise chronologies and seasonally resolving proxy data. Lake Tiefer See in NE Germany provides such an archive for an integrated multi-proxy study based on high-resolution sediment analyses.

Lake Tiefer See was formed during the last glaciation and is part of the Klocksin Lake Chain, a subglacial channel system that crosses the Pomeranian terminal moraine. Coring campaigns at the deepest part of the lake (62 m water depth) yielded 7 sediment profiles. From these individual profiles a 7.7 m long continuous composite profile has been compiled covering the past ~6000 years. The chronology of the core sequence is based on a multiple dating approach including varve counting, radiocarbon dating of terrestrial plant remains and tephrochronology. We present a combined approach of microfossiles analyses using thin sections, μ-XRF analyses on split sediment cores, geochemical analyses of bulk samples, diatom and cladocera analyses and reconstruction of vegetation openness from pollen data. Furthermore, we include archaeological data from the study area characterizing human settlement phases.

The sediment record of Lake Tiefer See exhibits distinct decadal- to centennial scale alternations between wet- and non-varved intervals with an increasing trend of non-varved periods since ~4000 yr cal BP. These non-varved episodes generally coincide with phases of increased vegetation openness as reconstructed from pollen data. Predominantly varved intervals before AD 1924 are characterized by low productivity and concur with closed forests in the lake catchment. In contrast, well-preserved varves after AD 1924 are linked to increased lake productivity likely due to anthropogenic eutrophication. In this study we discuss the influence of climate change and human activity on varve preservation. We propose that the observed long-term increase of non-varved intervals is linked to gradual climate change in the Late Holocene triggered by insolation change, whereas superimposed centennial- and decadal variability of varve preservations caused by a complex interaction between human activity and short-term climate changes. We furthermore discuss possible relationships between known climate variability and human history at Lake Tiefer See.

This study is a contribution to the Virtual Institute of Integrated Climate and Landscape Evolution Analysis – ICLEA – of the Helmholtz Association (grant number VH-VI-415) and uses infrastructure of the Terrestrial Environmental Observatory (TERENO) of the Helmholtz Association.

The Maltese Islands – a small, relatively isolated archipelago of only 316 sq. km. – have been exploited by successive agricultural civilizations since 5000 cal BC. At around 3000 cal BC there was a cultural fluorescence that saw the construction of elaborate communal hypogeas, distinctive forms of figurative art, and unparalleled megalithic architecture. Through interdisciplinary work in palaeoarchaeology and the archaeological sciences, the ERC-funded FRAMESTUDY is currently investigating how small island communities managed to sustain such a precocious economy and culture in such a restricted ecological setting. New archaeological and zooarchaeological data have revealed the widespread importance of cereal agriculture and domesticated livestock in prehistoric Malta. Modelling the potential for soil erosion has revealed that technical mechanisms to manage the environment were developed by prehistoric agriculturists. But were there failures in the agricultural system, and what impact did this have? Shortly after 2400 cal BC, for example, there was an episode of cultural change – was this a consequence of social-economic mis-management, or environmental collapse? An overview of this research is presented in this paper, acknowledging the challenges that exist when comparing archaeological events with environmental data lacking chronological resolution.

TH5-14 Abstract 11

Environmental changes and agricultural systems in NW Iberia during the Middle and Late Holocene

Author: Seabra, Luís, CIBIO-Research Center in Biodiversity and Genetic Resources-University of Porto, Palos de Ferreira, Portugal (Presenting author)

Co-author(s): Teresa, João Pedro, T., J.J., João Pedro Vicente Torres, Porto, Portugal

Keywords: Agricultural systems, Environmental changes, Middle and Late Holocene, Northwest Iberia, Carpathology

Presentation Preference: Oral

Interpretative approaches gathering archaeological and carpathological data with broad palaeoecological data can provide relevant insights on the relation between environmental changes and the evolution of human societies and their agricultural systems. Northwest Iberia stands as a good study-case since abundant palaeoenvironmental studies allow us to understand the major trends in climate, vegetation, erosion events and even atmospheric pollution during the Middle and Late Holocene. This diverse and profuse array of information provides an excellent data set to contrast with the regional archaeological and archaeo-botanical records.
The main focus of this presentation will be the carpological data available for northwest Iberia, including unpublished material. Carpological data from late prehistoric and protohistoric sites allowed the identification of key-moments in agricultural history, the introduction of some crops and the development of new social-ecological systems. These key-moments include the Middle/Late Bronze Age (c. 1800 - 700/600 BC) and the Iron Age (700/600 BC to the 1st century BC) and correspond to significant changes in Human societies as suggested by data regarding the evolution of settlement, technology and economy and other features.

Developments in storage facilities are also recorded. Especially, underground storage (pits), that proved to be an important strategy for long-term preservation. Moreover, the palaeoenvironmental records suggest significant changes on several levels such as the transformation of the coastal cover. Increasing erosion events occur as the result of anthropogenic deforestation to obtain farmland and pasture. Besides their clear differences, these two important moments revealed important economic and social changes. Human communities became sedentary and a process of territorialization took place, enhancing the connection between settlements and their natural environment. This resulted in the emergence of humanization processes of the environment characterized by an increase in the agricultural potential of the area and the development of new social-ecological systems. These different environmental and archaeological records will be presented in order to address the main changes in land use and land use, namely their relation with the evolution of agricultural strategies and social-ecological systems in Northwest Iberia.

TH5-14 Abstract 12

The anthropization of the Cantabrian Mountains (NW Iberia) during the Later Prehistory

Author - Dr. González Álvarez, David, Universidad Complutense de Madrid, Salas, Spain (Presenting author)

Keywords: Anthropization, Landscape Archaeology, Later Prehistory

Presentation Preference - Oral

This paper attempts to provide a historical narrative that accounts for the biography of the cultural landscapes of the Western part of the Cantabrian Mountains based on a social interpretation of archaeological data and paleoenvironmental sequences. A diachronic perspective is adopted drawing on in the theoretical and methodological framework of Landscape Archaeology. This is achieved by analyzing the patterns of settlement and subsistence deployed by human groups during the five millennia that mediate between the emergence of agriculture and animal farming (ca. 4800 BC) and the Roman conquest of the area under study (late first century BC). In light of the data considered for the mountainous area which separates Spanish contemporary regions of Asturias and León, the investigation reflects about the human experiences and the historical processes that intervened in the anthropization and the social construction of the cultural landscapes of the Later Prehistory in the area.

During the Neolithic there is a spread of agriculture and farming. This process can be perceived earlier in the coastal areas than up in the mountains. This resulted in the emergence of humanization processes of the environment characterized by an increase of open areas for pastures and crops related to iterative forms of production and settlement. Later in the Bronze Age, the anthropization of the territory significantly increased, revealing a certain tendency towards the territorialization of human groups. The Iron Age implied the almost complete adoption of sedentary forms of life by human groups. Iron Age communities developed new livestock and farming practices, now intensified with the emergence of stable crop fields. This new productive pattern led to the emergence of a compartmentalized and highly anthropized landscape around the hillforts. However, this general scheme shows some gaps and exceptions which should be considered in detail. In the first place, they could reveal the limits of the data available for the region. But, more interestingly, they might point out the divergence in the social or cultural livelihoods performed by the communities who inhabited the Cantabrian Mountains during the Later Prehistory.

Human-environment interactions in the Alps: Archaeological and palaeoenvironmental approaches

Author - Dr. Walsh, Kevin, University of York, York, United Kingdom (Presenting author)

Co-author(s) - Dr. Gigante-Cox, Charlene, University of York, York, United Kingdom

Co-author(s) - Dr. Brisset, Eloise, IMBE UMR 7283, Aix-en-Provence, France

Co-author(s) - Mocci, Florence, Centre Camille Julien UMR7280, Aix-en-Provence, France

Keywords: Alps, Bronze Age, Pastoralism

Presentation Preference - Oral

Our understanding of high altitude (European) alpine landscapes and the economic practices that developed therein has improved radically over the last 15 years, nevertheless there are still many challenges, and numerous geographical areas where little or no research has been carried out.

One of the issues facing archaeologists and palaeoenvironmental scientists working in these areas (between c. 1600 and 2800 m asl) is the patchy nature of our various datasets, moreover, human-environment interactions operate at many spatial and temporal scales, and the integration of palaeoecological and archaeological evidence is often problematic. Archaeological and palaeoenvironmental evidence are proxies for human-environment interactions; in some instances, we can identify broad categories of economic activities, such as pastoralism and arable agriculture. In other cases, we can identify actual practices, such as pasture creation via forest burning, or the exploitation of specific animal species or the creation of structures for penning animals.

In this paper, we will consider evidence for the development of high altitude pastoralism in the French Alps during the Late Neolithic and Early Bronze Age via the integration of data-types that operate at different spatial and temporal scales: archaeology, palaeoecology, and sedimentary aDNA. Within the context of the Alps, we argue that these seemingly disparate data allow us to assess a specific and significant form of human niche construction (i.e. pasture) during the Late Neolithic and Early Bronze Age. This can be considered a form of coevolution; the intensification and extension of pastoralism, which included high-altitude summering in the Alps. This was part of a process where a form of agriculture, and landscape management probably intersected with the extension of the lactase persistence gene via increased consumption of dairy products - a key stage in the evolution of the high profile and globally recognised alpine landscape. Human manipulation of this specific landscape stage also intersects with the continued domestication of animals.

This contribution will present an integrated review of archaeological, palynological, palaeoecological and sedimentary aDNA from two areas of the French Alps. We will also consider the evidence for phases of landscape destabilisation and the relative importance of climatic and human impact on these sensitive landscapes; a story which starts just before 2000 BC.

TH5-14 Abstract 14

Chalcolithic-EBA farming, soil loss, and the development of a karst landscape in western Ireland

Author - Dr. Jones, Carlton, National University of Ireland Galway, Galway, Ireland (Presenting author)

Keywords: Chalcolithic, Early Bronze Age, land use

Presentation Preference - Oral

The limestone karstic landscape of the Burren in western Ireland has evidence for human habitation from the Mesolithic onwards. The Chalcolithic and Early Bronze Age periods, however, seem to have been periods of particularly intensive and extensive farming on the Burren. Survey and excavation on Roughan Hill, in the south-east Burren, has documented a dense concentration of habitation enclosures, field divisions, and ritual monuments dating to between c. 2300 – 1500 BC which appear to relate to a particularly intensive phase of farming activity on the Burren. This paper investigates whether this Chalcolithic – Early Bronze Age activity can be related to significant karst development on the Burren (through correlations with palaeoecological and palaeoenvironmental records) and also looks at whether contemporary climatic shifts might have played a role. This informs both our understanding of prehistoric farming practices and also the role of human activities in the formation of karstic landscapes.

TH5-14 Abstract 15

Seeing Beyond the Site: Later Prehistoric Landscapes of southeast Ireland

Author - Dr. Gearey, Benjamin, University College Cork, Cork City, Ireland (Presenting author)

Co-author(s) - Dr. Becker, Katharina, University College Cork, Cork City, Ireland

Co-author(s) - Dr. McClatchey, Meriel, Dept of Archaeology, UCD, Dublin, Ireland

Co-author(s) - Egan, James, Tl, Ireland, Dublin, Ireland

Co-author(s) - Prof. Armit, Ian, School of Archaeological Sciences, University of Bradford, Bradford, United Kingdom

Co-author(s) - Nagle, Caithlin, Dept Archaeology, University of Sheffield, Sheffield, United Kingdom

Keywords: archaeology, Ireland, palaeoenvironments

Presentation Preference - Oral

In this paper we outline the initial results of an integrated palaeoenvironmental and archaeological study from southeast Ireland, funded by RESTA (The Heritage Council, Ireland) which has been investigating changes in settlement patterns and subsistence from the late Bronze Age into the Iron Age as derived from extensive, well dated, archaeological data from ‘Cattle Tiger’ era development-led excavations. The project has compiled and critically assessed the evidence for infillways and subsistence strategies derived from multiple archaeological sites, including data from faunal and macrofossil analyses and chronological modelling of radiocarbon dates. These data have been integrated with evidence for patterns of landscape change and human
activity derived from palaeoenvironmental records. The study opens up new perspectives on this critical period in Irish prehistory and also illustrates the methodological and theoretical challenges of interpreting archaeological and palaeoenvironmental data.

TH5-14 Abstract 16
Land use and vegetal biodiversity in the Iron Age landscape of Brittany (France)

Author - Dr. Van Beest, Roy, Universite de Rennes 2, Roosendaal, Netherlands (Presenting author)
Co-author(s) - Marguerie, Dominique, Ecole, Universite de Rennes 1, Rennes, France
Co-author(s) - Barel, Francois, Ecole, Universite de Rennes 1, Rennes, France
Co-author(s) - Antoine, Anne, CERPHO, Universite de Rennes 2, Rennes, France

Keywords: Iron Age Brittany (NW-France), land use patterns, vegetal biodiversity

Presentation Preference - Oral

Biodiversity has been a popular research topic in the last decades. With the rapid current loss of biodiversity, estimated at about 5% per decennium, it is easy to understand why. Palaeo-ecological research can provide insights into the relations between past vegetal biodiversity and environmental changes. Climate changes and human activities are generally accepted to be the prime drivers behind these processes. Nevertheless, detailed analyses of the correlation between past human agency and vegetal biodiversity in Northwest Europe are still quite rare. In this paper we aim to reconstruct and explain spatio-temporal trends in past vegetal biodiversity by integrating data on vegetation dynamics, human subsistence and land use patterns. The landscape of Brittany (North-Western France) during the Second Iron Age (450-50 BC) is selected as a case study. Compared to many other parts of Northwest Europe, Brittany is rich in high-resolution palaeobotanical data. These allow for the reconstruction of the main long-term trends in vegetal biodiversity, and more generally of the changing fabric of the Breton landscape. At the same time, increasingly detailed images of the Iron Age rural landscape of Gaul start to emerge due to a steep increase in archaeological data (aerial photography, surveys, programmed and development-led excavations). On the eve of the Roman conquest, the landscape of Brittany was dotted with numerous farmsteads and had a ‘mosaic’ vegetation structure. In this paper we aim to integrate these different types of data and assess how the results contribute to wider discussions on the link between human behaviour and biodiversity.

TH5-14 Abstract 17
Invisible Prehistoric sites: development of land use by Eurasian nomadic population

Author - Azarov, Evgeny, State Historical Museum, Moscow, Russian Federation (Presenting author)
Co-author(s) - Shishina, Natalia, State Historical Museum, Moscow, Russian Federation
Co-author(s) - Borисов, Alexander, Soil Institute, Pusczino, Russian Federation
Co-author(s) - Mirsakov, Vitra, Dagestan Academy of Sciences, Makhachkala, Russian Federation
Co-author(s) - Dzyatova, Tatiana, Moscow State University, Moscow, Russian Federation

Keywords: Bronze and Iron Age, land use pastoralists, seasonality

A new methodological approach used to detect seasonal campsites occupied by Bronze and Early Iron Age pastoralists living in the desert and steppe areas in the South-East of the Russian Plain helped identify different subsistence and economic activities. Comprehensive studies of two types of the sites by employing the methods of archaeology, soil studies, geography, geomorphology, geoinformatics, geochemistry, palaeobotany provided an opportunity to obtain conceptually new data on the location and operation pattern of winter and summer pastures and camps themselves. To identify temporary camps, it is important to identify those land areas located in proximity to the camps where grazing was the most suitable at certain times of the year, taking into account natural features. For the winter season it has been demonstrated that deeply cut gullies with rather steep slopes facing south, south-west and south-east are most suitable for winter grazing, determining the existence of temporary winter camps in such areas.

The arrangement of summer temporary camps demonstrates a reverse pattern. It is assumed that summer camps and pastures were located near streams on open wind swept watershed sections rather than near subordinated features of the relief. Such camps can be discovered only if the soil was overlaid by natural deposits, which may occur on sections with sand.

TH5-14 Abstract 18
Hunter-gatherer exploitation of biodiverse Kwongan heathland in Holocene southwestern Australia

Author - Monka, Carly, University of Western Australia, Crawley, Australia (Presenting author)
Co-author(s) - Dortch, Joe, University of Western Australia, Crawley, Australia

Keywords: Human land use, Palaeoecology, Zooarchaeology

Presentation Preference - Oral

The Kwongan sandplains of southwestern Australia are a global biodiversity hotspot, characterised by diverse, fire-sensitive heathland vegetation and niche-restricted mammalian fauna. Archaeological evidence indicates that Aboriginal people exploited littoral resources along the region’s coast during the mid- to late Holocene, but use of the biodiverse Kwongan heathland landscapes is poorly understood.

In this paper, we explore the archaeological and palaeoecological evidence for human land use and terrestrial resource exploitation in the northwestern part of the Kwongan sandplains. We compare the palaeoecological evidence provided by the small mammal faunal record from two cave sites with the regional archaeological evidence for human occupation and subsistence during the mid- to late Holocene, and explore the connections between human activity, environmental change, and ecological composition through time. This study indicates that while littoral resource exploitation may have been a minor feature of human occupation of the region, particularly after sea levels stabilised in the mid-Holocene, terrestrial and lacustrine resources played an important role in regional subsistence and land use.

TH5-14 Abstract 19
Palynological fingerprint of demographic changes during the Migration Period in northern Poland

Author - Dr. Pedzieszewska, Anna, University of Gdańsk, Gdańsk, Poland (Presenting author)
Co-author(s) - Latalowa, Malgorzata, Department of Plant Ecology, University of Gdańsk, Gdańsk, Poland
Co-author(s) - Karpiuk, Ewa, Department of Plant Ecology, University of Gdańsk, Gdańsk, Poland
Co-author(s) - Swieta-Musznicka, Joanna, Department of Plant Ecology, University of Gdańsk, Gdańsk, Poland
Co-author(s) - Zimny, Marzena, Department of Plant Ecology, University of Gdańsk, Gdańsk, Poland

Keywords: Migration Period, N. Poland, pollen analysis

Presentation Preference - Oral

Pollen analysis is a method frequently used in studies on environmental changes provided by past human activity. Pollen data help to assess dynamics of settlement and provide evidences on some aspects of the economy based on natural resources. In our study we gathered palynological arguments to reconstruct the timing and dynamics of settlement activity during the first millennium AD in northern Poland. The reported period was a time of considerable demographic, cultural and economic changes which left distinct signatures on the natural environment. In northern Poland, these processes were regionally differentiated because of variation in timing and scale of anthropogenic pressure and due to variation in some natural factors. The main subjects of our lecture are: pollen based reconstruction of settlement dynamics changes in both time and space in northern Poland; an assessment of the scale of changes in forest cover in the period of interest; providing new data for the discussion on the potential persistence of small-scale agricultural activity in the regions of general economic decline during the Migration Period. The results summarizing the pollen data from a number of sites from northern Poland indicate that in the Roman Iron Age the scale of human impact on the forest cover in the most western part of the region was much lower than in the central and eastern parts of the area. The demographic crisis in the Migration Period resulted in a large-scale regional reforestation of the whole area but the scale and duration of reduced settlement activity was different. In this respect the pollen data conform well with the archaeological information. The woodland expansion concerned different dominant tree taxa in the western, central and eastern parts of the area. The new deforestation phase connected with the early medieval took place in different centuries and varied as concerns intensity of the land use.

The study was supported by a grant DEC-2011/02/A/H35/0089 financed by the National Science Centre (NCN) in Poland.

TH5-14 Abstract 20
Multiplex analysis of colluvial fan deposits: approach to reconstructing the land use history

Author - Dr. Ponomarenko, Elena, University of Ottawa, Ottawa, Canada (Presenting author)
Co-author(s) - Ershova, Ekaterina, Moscow Lomonosov University, Moscow, Russia
Co-author(s) - Ponomarenko, Dmitri, Borsuk-Bialystok Paleontological Institute, RAS, Moscow, Russian Federation

Presentation Preference - Oral

Multiplex analysis of colluvial fan deposits is an approach to reconstructing the land use history.
Changes in growth regularities in archaeological timbers as a proxy for the deforestation history

Keywords: Dendrochronology, Landscape changes, Vilnius Lower Castle

Forest are an important component of land cover in temperate climatic zones and deforestation is regarded as a major process in human-induced landscape alternation here. Chief models estimating anthropogenic forest area changes are based on calculations of population history and the need of supporting cultivated land. Nevertheless, in some areas the need of forest products can overcome the need of agriculture resources of contemporary population. Large-scale trade in forest products and extensive building activities intensify deforestation and cause bias in models based only on the population dynamics. Some corrections can be made by analysing landscape dynamics from the point of forest-steppe dynamics. Tree growing conditions are recorded in the regularities of annual tree-rings and the history can be detected using dendrochronological methods if sufficient material is available.

The presented study aims to evaluate forest state changes in the geographic region around the Lithuanian capital Vilnius over second millennium CE. Large amount of archaeological constructions are preserved in cultural layers of Vilnius Lower Castle site and excavated during archaeological investigation. Pine timbers representing different centuries of the second millennium CE were analysed using dendrochronological methods. Several parameters were evaluated and compared with those in modern pine forests: age curve of tree-rings, i.e. regularity of tree-ring width changes due to increasing age of trees, tree annual increment rate, and age structure of trees used for timbers in particular time period.

Regardless of heterogeneity of the replication of trees it became evident that the parameters differ in different periods throughout the millennium. Major shift to higher increment rates happened in the second half of the 15th c. and the 16th c. Tree age curve also became more expressed, and much younger trees started to be used, even for high social status buildings like Grand Duke’s palace. These changes clearly indicated changing state of forests and coincided with intensified timber export from Eastern Baltic to deforested Western Europe regions. Results suggest that timber trade between regions with different population density (and therefore forest cover) could be additional important factor affecting deforestation in timber supply regions.

Investigation of soils from archaeological monuments using biological methods

Author: Tukhbatova, Rezeda, Kazan Federal University, Kazan, Russian Federation (Presenting author)
Co-author(s): Sitdikov, Airat, Kazan Federal University, Kazan, Russian Federation

Keywords: ancient soil, Bolgar city

Presentation Preference: Oral

During thousand years of history of agriculture the total area of settlements and arable land reached a very significant scale. Due to the different systems of the people’s settlement in ancient and medieval times, it can be assumed that large areas of land in a particular moment of history had different forms of anthropogenic influence, traces of which are not currently recorded at the morphological level. It is assumed that the ancient existence of human impact on the landscape would remain at the level of the soil biota, the most sensitive and mobile soil component. The aim of this work was to identify the soils which had anthropogenic impact in different historical periods, as well as reference sites, where soil developed without human intervention. The reconstruction of some aspects of agriculture in the territory of the ancient city Bolgar (X-XV centuries, Tatarstan, Russian Federation) has been carried out on the basis of archaeological, microbiological and biochemical data and has been obtained new data about anthropogenic impact.

Investigation of soils from archaeological monuments using biological methods

Author: Dr. Gerasimov, Dmitriy, Museum of Anthropology and Ethnography, Eastern Gulf of Finland, Holocene Stone Age, sea coast development
Co-author(s): Sitdikov, Airat, Kazan Federal University, Kazan, Russian Federation

Keywords: Archeology, palinology, trace fossils, Geoarchaeology, land use, paleoecology

Presentation Preference: Poster

A model of coastal morphology development in Narva-Luga region at the Russian-European border (south-east of the Gulf of Finland) in Middle and Late Holocene (9000-2000 cal. BC) was suggested basing on the last decade multidisciplinary studies. This model was improved and got chronological references basing on archaeological data – remains of Stone Age coastal settlements. Strict relations between sea shoreline and human settlements/hunting camps ended at the time of the first farming societies (Corded Ware tradition) appeared in the region.

HU NEW DEVELOPMENTS IN ISOTOPE AND TRACE ELEMENT ANALYSES

Trace element and isotope analyses are powerful tools for reconstructing past human diets, mobility and environments as well as establishing chronologies and provenancing materials and artefacts. With the recent developments in measurement methodologies for mass spectrometry during the 90’s, it is now possible to precisely and accurately measure stable isotope compositions of new elements (e.g. B, Ca, Cu, Fe, Hg, Mg, Nd, Pb, Sr, Sr, Zn) in all kinds of materials, opening up new perspectives for archaeological sciences. This session aims to bring together researchers that are working on new techniques as well as scholars that employ traditional techniques using novel approaches to interpret their data (for example the interpretation of multiple isotope/trace element analyses of the same sample). We invite contributions that focus on a variety of materials, such as human or animal tissues (e.g., bones, teeth, blood, shells), archaeological materials (e.g. raw materials, ceramics, glass artefacts, metals, building stones) or environmental samples from archaeological sites (e.g. speleothems, soils). These contributions should show the potential of this new, stable and radioactive isotopes (Nd, Pb) for archaeological sciences or present new developments in light stable isotope analyses (C,H,O,N,S). Studies that integrate isotope/trace element and archaeological data in an innovative way are particularly welcomed, as well as discussions on the potential and limitations of these analyses. We hope that this session will demonstrate that these new techniques hold great potential for a more integrated interpretation of the archaeological record and that it is possible to get relevant archaeological information which is currently beyond reach.

TH5-15 Abstract 01
Extending the human provenancing repertoire: Neodymium isotopes

Author - Plomp, Esther, Vrije Universiteit Amsterdam, Amsterdam, Netherlands (Presenting author)
Co-author(s) - Koomen, J.M., Vrije Universiteit Amsterdam, Amsterdam, Netherlands
Co-author(s) - Font, L., Vrije Universiteit Amsterdam, Amsterdam, Netherlands
Co-author(s) - Laffoon, J.E., Vrije Universiteit Amsterdam, Amsterdam, Netherlands
Co-author(s) - Davies, G.R., Vrije Universiteit Amsterdam, Amsterdam, Netherlands

Keywords: Human provenancing, Isotope

Presentation Preference - Oral

Recent developments in mass spectrometry have made it possible to explore the potential of new isotope systems for the provenancing of humans, complementing the existing systems: strontium (Sr), oxygen (O), hydrogen (H) and lead (Pb). The addition of another isotope system to the isotopic human provenance repertoire can potentially provide us with more specific information on the region of origin and thus address some of the limitations that are still associated with the now commonly used isotopic techniques. This study reports on the viability of using neodymium isotopes (143Nd/144Nd) as a candidate to track the origins of humans. Due to the isotopic variations in the crust the samarium-neodymium isotope decay system has previously successfully been applied to identify the production centres of glass archaeological artefacts, usually in combination with oxygen or strontium isotope ratios. The tendency of the human body to bio-purify non-essential elements means that REE concentrations are low in human teeth (Nd <0.1 ppm), such that previously Nd isotope analysis was not possible. We report the optimisation of chromatographic methods to separate Nd from bio-apatite. Sub-nanogram amounts of neodymium were analysed using a latest generation thermal ionisation mass spectrometer (TRITON-Plus) equipped with 1013 ct resistors at the Vrije Universiteit Amsterdam. This study presents the neodymium concentration and composition results of third molars from modern Dutch residents. These results will be compared to other isotopic systems (Sr and Pb) and the possibilities for Nd as an archaeological human provenancing tool will be discussed.

TH5-15 Abstract 02
Zinc isotope compositions of bone and dental enamel and their relationship to diet

Author - Dr. Jaakko, Kleva, Max Planck Institute for Evolutionary Anthropology, Leipzig, Germany (Presenting author)
Co-author(s) - Sipak, Paul, University of British Columbia, Vancouver, Canada
Co-author(s) - Beasley, Malena, University of California, San Diego, United States of America
Co-author(s) - Harrsch, Estelle, LAMPEA, MSH, Aix en Provence, France
Co-author(s) - Colleter, Rozenn, INRAP, Reims, France
Co-author(s) - Balter, Vincent, ENS Lyon, Lyon, France
Co-author(s) - Schoeninger, Margaret, University of California, San Diego, United States of America
Co-author(s) - Richards, Michael, University of British Columbia, Vancouver, Canada

Keywords: archaeological sciences, dietary tracer, nontraditional isotopes

Presentation Preference - Oral

Isotopic analyses of carbon and nitrogen are conventionally employed in bioarchaeology for dietary reconstructions. These elements are however contained in the bone collagen which deteriorates over time. Mass spectrometry advances now allow trace element isotope analyses of bioapatite. First studies on Zn isotopes in bone showed its potential as a new dietary tracer. This contribution aims at testing the influence of diet on Zn isotopic compositions of bone and teeth. We investigated the Zn isotopic variability in bone and tooth enamel of mammals and archaeological human populations characterized by various diets, environment contexts (arctic, arid, temperate) and historical periods. The samples were purified by column chromatography and the Zn isotopic ratios were measured using MC-ICP-MS. The Zn isotopic composition of traditional food tracers (13C and 15N) has been assessed in parallel. We will show that the Zn isotopic composition in the bones and teeth is strongly influenced by the trophic level, but that some dietary and environmental factors can generate additional variability. We will discuss the advantages and limitations of this new tracer by comparing its performance to that of classic isotope analyses.

TH5-15 Abstract 03
Hydrogen stable isotope ratios measured in bone collagen from Danish prehistoric samples

Author - van der Sluis, Laura G.1 (Presenting Author) School of Geography, Archaeology and Palaeoecology, Queen's University Belfast, United Kingdom
Co-author(s) - Ogle, N., School of Planning, Architecture and Civil Engineering, Queen's University Belfast, United Kingdom
Co-author(s) - Reimer, P.J., School of Geography, Archaeology and Palaeoecology, Queen's University Belfast, United Kingdom

Keywords: Hydrogen, Bone, palaeodiet

Presentation Preference - Oral

Palaeodietary studies commonly analyse 13C and 15N ratios in archaeological bone to infer past dietary habits, although 15N ratios can be influenced by a range of factors other than diet (acidity, manuring, soil conditions, etc.). 18O ratios have been shown to function as a trophic level indicator (Birchall et al., 2005; Reynard and Hedges 2008) which can be very useful to aid our interpretation of the 13C and 15N ratios and improve our understanding of palaeodietary habits and subsistence practices. Hydrogen in organics consists of a non-exchangeable and exchangeable fraction; the latter will equilibrate with atmospheric hydrogen with atmospheric hydrogen from water vapor in the lab environment, resulting in meaningless values. This fraction needs to be calculated in order to obtain the non-exchangeable fraction which represents the true values. By applying a 2-stage equilibration method, sample specific and process specific factors influencing exchange rates are compensated for (Meier-Augenstein et al., 2011). Recently developed standards packed in silver tubes containing water of known isotopic composition (Qi et al. 2010) can be analysed alongside solid samples in the same run, which is essential to avoid scale compression. While this method is not novel (Bowen et al., 2011; 2013), its application with the use of Qi et al.’s standards to archaeological material is new. In this study we subjected bone collagen samples from prehistoric periods from the Limfjord region in northern Denmark spanning the Mesolithic to the Viking Age to a two-stage equilibration method using the silver tube standards to obtain absolute 2H ratios from the non-exchangeable hydrogen fraction.

TH5 Science and multidisciplinarity in archaeology

Abstract 04
Stable isotope ratios and trace elements in modern mammal tooth enamel

Author: Dr. De Winter, Niels, Vrije Universiteit Brussels, Elsene, Belgium (Presenting author)
Co-author(s): Snoeck, Christophe, Vrije Universiteit Brussels, Elsene, Belgium
Co-author(s): Goderis, Steven, Vrije Universiteit Brussels, Elsene, Belgium
Co-author(s): Van Malderen, Stijn, Ghent University, Ghent, Belgium
Co-author(s): Vanhaecke, Frank, Ghent University, Ghent, Belgium
Co-author(s): Claey, Philippe, Vrije Universiteit Brussels, Elsene, Belgium

Keywords: bioapatite, isotopes, trace elements
Presentation Preference: Oral

Bioapatite from mammal tooth enamel is a popular biomarker used in the reconstruction of palaeoenvironment and palaeodiet. It records information about the animal’s environment and diet on a sub-animal scale and is proven to be highly resistant to diagenesis, allowing the preservation of its original chemical composition through archaeological and geological timescales. In this study, stable carbon and oxygen isotope analysis are used as a stepping stone to investigate the use of other chemical proxies for the reconstruction of environment and diet from mammal teeth. Concentration profiles of trace element distributions (measured with pXRF and cross-validated with Laser Ablation ICP-MS) and stable isotope ratios (δ13C and δ18O) are combined to test the reliability of trace element profiles from mammal teeth in recording seasonal changes in environment and diet of the animal.

A method is presented that links the various geochemical records within a tooth sequence using mineralization sequences and oxygen isotope seasonality. This way, a 3 year trace element and stable isotope record from horse tooth enamel is created showing seasonal variation in trace elements and isotope ratios linked to changes in climatic conditions and diet through the animal’s lifetime.

This study shows how an entire new set of trace element proxies, that can be measured quickly and non-destructively, may yield information on palaeoenvironmen and palaeodiet. These trace element measurements yield information from precious archaeological samples that could otherwise be obtained solely through destructive sampling. The versatility of the pXRF and LA-ICP-MS methods opens up a wide range of applications for trace element analysis in archaeology.

TH5 Abstract 05
The geochemical relationship between soil, plant and streamwater: implications for migration studies

Author: Ryan, Saskia, Trinity College Dublin, Dublin, Ireland
Co-author(s): Greer, Daithi, Trinity College Dublin, Dublin, Ireland
Co-author(s): Snoeck, Christophe, Vrije Universiteit Brussels, Brussels, Belgium (Presenting author)
Co-author(s): Babachuk, Michael, Trinity College Dublin, Dublin, Ireland

Keywords: Geographical discrimination, Multi-element composition, Strontium isotope
Presentation Preference: Oral

Strontium isotopes (87Sr/86Sr) and rare earth element (REE) analyses of rock, the leachable fraction of soil, plant and surface waters are applied as chemical proxies to assess chemical reservoir interactions, element bioavailability and geographic variability. These processes are the basis for geographic discrimination and associated archaeological provenancing. 53 biosolids samples were collected from a small geographic area in Co. Meath, a region of Ireland that has highly variable bedrock and surficial geology and hosts significant archaeological sites including, Newgrange, the Hill of Tara and Knowth. These multi-element and isotope geochemistry coherently geographically this region and the high degree of spatial variability in 87Sr/86Sr highlights the inherent requirement for high-density sampling in order to isotopeologically characterise distinct reservoirs. The results of this study provide a baseline of biogeochemical geochemical data that can be applied to archaeo logical studies examining the past migration of populations in this archaeologically important region.

Keywords: LIBS, Seasonality, Shellmound
Presentation Preference: Oral

The Farasan shell mounds are one of the largest traces of the Arabian Neolithic Period, with over 3,000 sites having accumulated between 7,000 and 4,000 cal BP. Seasonality data based on stable oxygen and carbon isotopes have determined year-round exploitation of shellfish.

Additionally, they revealed patterns of seasonal stratification within individual layers. This was used to determine sub-anual accumulation rates, exploitation intensity, and degrees of bioturbation within the stratigraphy. This dataset is now being analysed more thoroughly by using Laser Induced Breakdown Spectroscopy (LIBS). LIBS is a rapid and cost-effective laser ablation method, that is able to measure the elemental composition of shelf carbonates to determine season of death. By providing a high sampling resolution (<100μm) and short processing time, large sample sizes can be analysed in great detail. In turn, it allows us to analyse exploitation and accumulation patterns of the Farasan Islands in more detail. More specifically, this study aims to answer questions regarding (1) how analysing a larger number of shells per layer changes the interpretation of site seasonality, (2) whether seasonal layering of shell deposits are singular or repeated events, and (3) how accumulation rates based on seasonality can vary through the deposit and tells us more about the processes behind shell deposition.

TH5 Abstract 07
Archaemetical studies of pottery

Author: Prof. Michalowski, Andrzej, Instytut Prahistorii UAM, Poznan, Poland (Presenting author)
Co-author(s): Prov. Niedzielski, Przemyslav, Department of Analytical Chemistry UAM, Poznan, Poland
Co-author(s): Van Malderen, Stijn, Ghent University, Ghent, Belgium
Co-author(s): MA Krzyzanowska, Maria, Instytut Prahistorii UAM, Poznan, Poland
Co-author(s): MA Krugier, Michal, Instytut Prahistorii UAM, Poznan, Poland
Co-author(s): MA Krakowski, Karol, Department of Analytical Chemistry UAM, Poznan, Poland
Co-author(s): PhD Kozak, Lidia, Department of Analytical Chemistry UAM, Poznan Poland

Keywords: archaeometric research, chemical analysis, pottery
Presentation Preference: Oral

The basic carrier of information on the project in question is pottery from Wielkopolska’s sites dating back to the early pre-iron age region. The multi-level analysis of the existing source base assumes its full elaboration with regards to classical archeological description, connected comparatively with an innovative use of the methods of chemical analysis. The analysis will cover archeological materials obtained mostly as a result of a source search conducted in museums, but also among entities that currently conduct excavation research. The chemical tests will be performed on the pottery using three independent procedures of samples preparation. In the first procedure, a ground part of pottery will be subject to extraction with hydrochloric acid. In the second procedure, the possibility of leaching components of a sample from the external layers of the tested pottery will be determined, so as to compare the results with the results of non-destructive analyses (e.g. XRF) where only the surface of a sample is assessed representing the acid-leached fraction of the surface of the tested samples. In the third procedure, a ground part of pottery will be subject to decomposition using hydrofluoric acid at room temperature in closed Teflon vessels. After sample preparation the content of the selected elements in the solutions obtained will be determined: by spectrometric techniques: flame atomic absorption (FAAS) or flame optical emission (FOES) spectrometry, microwaved induced plasma optical emission spectrometry (MIP-OES) and inductively coupled plasma optical emission spectrometry (ICP-OES). The elaborated procedures and instrumental analytical techniques enable performing tests that have so far been practically unachievable in archaemetical research.

TH5 Abstract 08
Elemental and Sr/Nd isotopic investigation of late Hellenistic to early Roman glass bowls and sand raw materials from Lebanon

Author: Brens, Dieter, KU Leuven, Leuven, Belgium (Presenting author)
Co-author(s): Freestane, Ian, University College London, London, United Kingdom
Co-author(s): Griffiths, Dafydd, University College London, London, United Kingdom
Co-author(s): Degryse, Patrick, KU Leuven, Leuven, Belgium

Keywords: Natron glass, Sand raw materials, Isotopes
Presentation Preference: Oral

Excavations in the Souks area of Beirut, Lebanon, not only revealed large amounts of glass artefacts from the Hellenistic to the Islamic period but also remnants of primary tank furnaces, dating to the early 1st century CE. We determined the major elemental compositions of 66 mid-2nd century BCE – early 2nd century CE cast glass bowls from Beirut via electron microprobe. 41 beach sand samples taken along the coastline of Lebanon were analysed for their major elemental compositions via ICP-OES. A selection of sand and glass samples were subjected to Sr and Nd isotopic analysis. Results will be compared to the composition of glass from the tank furnaces and Lebanese sandstone investigate the possibility of a local origin.
All glasses were soda-lime-silica in composition, with natron as a flux. Strongly coloured glass was coloured with Co, Cu and Mn. Pale coloured glass has varying MnO, up to 1.9%, suggesting that they were intended to be coloured. Colourless bottles can be divided into three groups: Mn-, Pb- and mixed Mn-Pb-decoloured glass. All Mn-decoloured, pale and strongly coloured glasses have very similar base silica compositions to glasses from the tank furnace2, suggesting local production and working. The Pb-decoloured glass was made from a different sand source with higher SiO₂ and lower AI₂O₃ and CaO. Mixed Mn-Pb-decoloured glass has intermediate compositions, suggesting they are the result of recycling. Sr and Nd isotopic analyses confirm the different primary origin of the Pb-decoloured glass. The isotopic signatures of the other glasses correspond well to those measured in some of the Lebanese sands, suggesting they were indeed produced locally.

TH5-15 Abstract 09

Trafficking copper: Source of metal artefacts from an Iron Age cemetery in Finland by Pb isotopes

Author - Dr. Holmquist, Elisabeth, University of Helsinki, University of Helsinki, Finland (Presenting author)
Co-author(s) - Lahaye, Yann, Geological Survey of Finland, Espoo, Finland
Co-author(s) - Mänttari, Irmeli, Geological Survey of Finland, Espoo, Finland
Co-author(s) - Wasserman, Anna, University of Helsinki, University of Helsinki, Finland
Keywords: Copper provenance, geochemistry (ICP-MS, pXRF), Pb isotopes (ICP-MS)
Presentation Preference - Oral

The Levänluhta archaeological site, located in western Finland, is an Iron Age (ca. 300-800 CE) cemetery, where skeletal remains of ca. 100 human individuals, buried or sacrificed in an ancient lake or pond, have been recovered. Based on studies, most of the dead were women and children. The artefacts recovered at the site include an assemblage of copper-based artefacts, mainly jewellery and items for personal adornment, made of bronze, brass and copper. The artefacts include a variety of finger, arm and neck rings, and different brooch types, representing, for example, Scandinavian designs. In addition, a Vastland type bronze caurdon, typologically identified as a foreign import, was found at the site. In this study, portable X-ray fluorescence spectrometry (pXRF) and inductively coupled plasma mass spectrometry (ICP-MS) were employed to examine the type of alloy, lead isotopes and geographical compositions of the artefacts. pXRF analysis was applied on the entire assemblage and objects that allowed only non-invasive, non-destructive measurements due to their extremely high antiquarian value. Nine of the metal artefacts were sampled for lead isotopes (204Pb, 206Pb, 207Pb and 208Pb) and trace elemental analyses by ICP-MS to examine their provenance and possible raw material origins, i.e. the locations of the extracted copper ores.

The results show that different types of alloys were used to manufacture typologically related objects. The source of the copper, however, appears to be shared by most of the samples analysed by ICP-MS based on the lead isotope data. The results of the study show that the first copper extracted from southern European ores was trafficked to Finland, instead of relying on more regional, e.g. Scandinavian raw material sources, as has been traditionally suggested. The results are in line with a previous Scandinavian study (Ling et al. 2014) and indicate similar patterns of long-distance trade networks of copper. Our results, nevertheless, show that the networks seem to have extended even further than previously proven, across yet another sea, the Baltic. It is intriguing that stylistically, most of the analysed artefacts indicate a Scandinavian origin – and most probably they were cast locally in Finland and elsewhere in Scandinavia. By combining typological details with source determination of the raw materials used in their manufacture, however, a far more multi-faced interpretation of the provenance of the artefacts can be established.

TH5-15 Abstract 10

Iron isotopes as a new tool for ancient metal tracing: comparison with classical tracing methods

Author - PhD student Milot, Jean, Géosciences Environnement Toulouse, Toulouse, France (Presenting author)
Co-author(s) - Poitrasson, Franck, Géosciences Environnement Toulouse, Toulouse, France
Co-author(s) - Baron, Sandrine, TRACES Laboratory, Toulouse, France
Keywords: Ancient metals, Iron isotopes, Provenance studies
Presentation Preference - Oral

The development of precise and accurate analytical techniques over the last decades has allowed the range of methods for ancient metal tracing. Elemental and isotopic analyses are now widely used for this purpose. For a relevant archaeological interpretation, metallurgical processes must be taken into account, and analyses must be performed on archaeological ore, slag and metal. So far, isotopic methods were rather employed for non-ferrous metal tracing (e.g. it) whereas elemental analyses were used for metallic and iron metal tracing. However, currently used elemental and isotopic methods show limitations, which underlie the need to develop new tracers to complement existing ones1.

We used Fe isotopes as a new tool for ancient metal provenance studies. Isotopic ratios 56Fe/54Fe and 56Fe/54Fe were measured using an Isotopic Multiplexer Collector Mass Spectrometer after sample dissolution and Fe purification2. We first developed this approach by analysing materials from archaeological experiments on iron ore reduction. In order to compare our results with classical tracing methods, we also analysed the Fe isotope compositions of archaeological materials whose provenance hypotheses have been established with trace elements analysis of slags. Furthermore, some materials coming from different regions of ferrous and non-ferrous metal production were analysed to assess the tracing potential of Fe isotopes compared to trace elements and Fe isotopes analyses.

Our first results show that the Fe isotope process does not induce Fe isotope fractionalation, i.e. the signature of metals and slags reflect that of their corresponding ores. Moreover, Fe isotopes analyses tend to confirm the provenance hypothesis of ancient artefact established with trace elements analysis of slags. The results obtained so far suggest that Fe isotopes are a relevant tracer for archaeological materials, which can be applied to ferrous metals. The comparison between more classical involving trace elements or Fe isotopes analysis could allow to refine previous provenance hypotheses of ancient metals.

4 F. Poitrasson, and R. Freydier, 2005, Heavy iron isotope compositions of granites determined by high-resolution MC-ICP-MS, Chemical Geology 222, 133-147.
are able to detect elements in traces; these data, in prehistoric archaeometallurgy have been used not only to understand the composition of a prehistoric alloy, but even to understand which ores have been exploited to obtain the metal. These could be many ways of using these data. Recently, during the study of copper objects, it has been noticed that there is a pattern of particular concentration of heavy elements traces in specific parts of objects from Early Bronze Age Anatolian contexts. After some speculations, it may be possible to hypothesise that these concentrations are due the precipitation of heavy elements in a liquid state copper melt. These indicators may allow identification of the orientation of objects during the casting phase, giving important data about the technologies used in the production of items and item categories, allowing production categories to be compared within object or type categories.

TH5-15 Abstract 13
Chemical and physical composition of disturbed and less disturbed soil of the Dūkšteliai 1 site

Author - Gedminienė, Laura, Nature Research Centre, Vilnius, Lithuania
Co-author(s) - Dudašienė, Gabriele, Vilnius university, Faculty of History, Archaeology Department, Vilnius, Lithuania (Presenting author)

Keywords: Early Mesolithic and Neolithic-Bronze Age, Geochemical and LOI analyses, Human inhabitance

In order to reveal the functional use of the prehistoric settlement elements, two structures were chosen for closer study – a probable hut and a hearth. The research was interdisciplinary: together with archaeological methods of investigation – examination on the distribution of the finds (fint tools and their processing refuse, burnt bone, charcoal pieces, ceramic fragments) and their correlation with the two structures – several natural science methods were used to make a research on the context of the structures. Ground fossilization and microscopic bioarchaeological research was done in order to find macro-botany remains that could reveal some details about prehistoric people diet. Geochemical analysis and loss on ignition method (LOI) were also used to find out if there are any elements significant for interpretation but undistinguished during the archaeological excavation. The samples for geochemical and LOI analyses were collected from the structures as follows: in the middle of the structure, 20cm from the centre and in periphery. It was presumed that the latter represented less disturbed soil. Determination of major and trace elements Al, Ba, Br, Ca, Cl, Cr, Cu, Fe, Ga, Mg, Mn, Na, Nb, Ni, P, Pb, Rb, Sr, Ti, Zn, S was done using energy-dispersive x-ray fluorescence Spectrometry equipment and the Turboquant calibration method for pressed pellets. Also samples were dried at the temperature of 110º C; then heated at 550º C and 950º C to burn out the organic matter and carbonates, respectively.

As a result, insignificant geochemical difference between samples has been observed and only minor inequality of element contents could be seen. Using Ward’s method and Euclidian distances a tree diagram was constructed for 24 variables that were dried at the temperature of 110º C; then heated at 550º C and 950º C to burn out the organic matter and carbonates, respectively. The new data show that higher concentrations of all three groups elements were classified into groups representing: 1) clay minerals – Al, Rb, K, Ti, 2) carbonates – Sr, Ca, Ba, and 3) organic contents could be seen. Using Ward’s method and Euclidean distances a tree diagram for 24 variables was drawn and trace respectively.

In order to gather some new archaeological data for comparison with the material from other prehistoric sites in River Neris basin, and also to gain additional knowledge about the first inhabitants in this region. After excavating 100 m2 of the site structures were uncovered which, according to the first artefacts typology: correspond to Early Mesolithic or Neolithic-Bronze Age. Also the new palaeobotanical and geochemical data on Dūkštelis Lake bottom deposits indicated at least two episodes of human inhabitance at the lake shore.

TH5-16 Abstract 01
F Forging a Fenland framework: contextualising paleoecology & environmental change in UK Fens & beyond

Author - Huismann, Floor, Durham University, Durham, United Kingdom (Presenting author)
Co-author(s) - Whitehouse, Nicki, University of Plymouth, Plymouth, United Kingdom

Keywords: Contextualising wetlands, East Anglian Fens, Environmental change

Presentation Preference - Oral

Environmental data is one of wetland archaeology’s most important data types. The palaeoecological significance of these often well-preserved remains cannot be denied. Often lacking on dryland sites, they provide information on past economies and subsistence, and allow detailed reconstructions of human-environment interaction. Despite this, the results of palaeoecological research on wetland sites do not always impact beyond the sub-discipline of wetland archaeology, which remains somewhat isolated from mainstream archaeology. If palaeoecological studies of wetland sites are to contribute to our general understanding of animal husbandry, agricultural developments or environmental change at various spatial and temporal scales, wetland archaeologists must contextualise wetland sites in a broader chronological and geographical framework.

This paper will argue that in order for the invaluable insights from palaeoecological studies on wetlands to be informative on environmental change, subsistence, wetlands & environmental change in UK Fens & beyond.

TH5-16 Abstract 02
Late Holocene multiproxy palaeohydrological and archaeological records from Littleton Bog, Ireland

Author - Dr. Staunton, Phil, University of Reading, Reading, United Kingdom (Presenting author)
Co-author(s) - Young, D. S., University of Reading, Reading, United Kingdom

Keywords: Late Holocene multiproxy palaeohydrological and archaeological records from Littleton Bog, Ireland

Presentation Preference - Oral

Multiple lines of evidence within wetland environments provide palaeohydrological and palaeoenvironmental records. This poster will highlight palaeohydrological and palaeoenvironmental information from Littleton Bog, West Midlands, UK, for the period 10,000 years before present. Palaeohydrological data from the site include pollen, geochemistry, isotope and mineral magnetic data. The combined information provides a reconstruction of regional and regional water body records and a chronology of palaeohydrological change. Multiproxy palaeohydrological data from Littleton Bog will be compared with other multiproxy palaeohydrological datasets from Atlantic Europe and the wider British Isles. The palaeohydrological data from Littleton Bog will be used to construct sedimentary models and to infer palaeohydrological changes occurring within the Bog and to the surrounding area over the Late Holocene period.
Keywords: Ireland, Raised mire, Trackways

Presentation Preference - Oral

This presentation reports on the results of multiproxy palaeoenvironmental investigations carried out in association with archaeological survey and excavation of later prehistoric woodwork/trackways at Littleton Bog, Co. Tipperary, Ireland. The site has a long association with palaeoecological research in Ireland, beginning with pioneering work carried out by Frank Mitchell at Littleton in the 1950s and 1960s that has provided a basic framework for the vegetation history of Ireland still in use to this day. Mitchell’s palynological work emphasized the significant effect that past human societies have had on shaping environments in Ireland, and hinted at complex interrelationships between environmental change and human activity. The archaeology of Littleton Bog, now a drained and milled peat production site, was surveyed in 2008 and this was followed by targeted excavations carried out in 2008 in advance of peat extraction; excavation revealed over 30 archaeological features, mostly wooden trackways, of which 6 features have been dated ranging from the Early Bronze Age (ca.3500 cal BP) to the Iron Age (ca.2000 cal BP). A high-resolution multiproxy palaeoenvironmental record from the site was developed to provide palaeoenvironmental context for the rich archaeological record, and to assess the interactions between human activity and past environmental change at the local scale. This record, spanning from ca.4000 cal BP onwards, comprises testate amoebae, plant macrofossils, peat humification and pollen data. The testate amoebae, plant macrofossils and humification-derog bog surface wetness (BSW) records show broad agreement, but comparisons with recently published regional climate reconstructions indicate that the BSW record of Littleton Bog is influenced by the complex interactions between regional climatic forcing, autogenic internal bog processes, and other contingent factors. Regional-scale comparisons between peatland BSW and archaeological records indicate that there is no simple linear relationship between trackway construction and environmental conditions, a finding that is broadly supported by the data from Littleton; however, the timing of trackway construction at Littleton does indicate that localised, perhaps partly internally-driven, BSW changes may have had an important influence. The recent work at Littleton Bog, therefore, builds on the work of Mitchell by providing further detail into the relationships between human activity and Holocene environmental change in central Ireland; whilst broad patterns in these relationships are becoming clearer, the need for greater detail at the local scale is highlighted. Investigations of milled production bogs provide a key opportunity to examine the complex interactions between both alligentic and autogenic environmental change and human activity.

THS-16 Abstract 04

Reconstructing cattle management in Neolithic Switzerland using multi-isotopic analysis

Author - Dr. Grelmg, Claudia, University of Basel, Basel, Basel (Presenting author)
Co-author(s) - Dr. Doppelt, T., University of Basel, Basel, Switzerland
Co-author(s) - Dr. Heyd, V., University of Bristol, Bristol, United Kingdom
Co-author(s) - Dr. Knipper, C., Curt-Engelhorn Centre Archaeometry, Mannheim, Germany
Co-author(s) - Prof. Dr. Lehmann, M.F., University of Basel, Basel, Switzerland
Co-author(s) - Prof. Pike, A.W.G., University of Southampton, Southampton, United Kingdom
Co-author(s) - Prof. Schibler, J., University of Basel, Basel, Switzerland

Keywords: multi-isotopic analysis, cattle management

Presentation Preference - Oral

The lakeshore settlements in Switzerland provide the unique opportunity to study various aspects of the Neolithic society and its economy. Understanding cattle management is one of the key questions in our research project that focuses on several sites in the lower Lake Zurich basin and the site of Arbon Bleiche 3 at Lake Constance. The lower Lake Zurich basin is an archaeological micro-region that permits the study of a long chronological sequence of more than 2000 years, while Arbon Bleiche 3 is a single-phased settlement with a fifteen-year long occupational phase (3384–3370 BC) providing the opportunity to capture a "snapshot" in time. All sites investigated have provided vast and well documented cattle bone collections. We applied strontium, oxygen, carbon and nitrogen stable isotope analyses to these remains to gain insight into strategies of animal management. Key questions were: Were cattle kept in or near the settlements or were they pastured further away? Where are potential pasture grounds? Is there evidence of regular mobility, maybe linked to seasonally varying patterns of alpine summer pasturing? On which level was cattle herding organised (household, village, networks between villages)?

THS-16 Abstract 05

Insights into crannog occupation phases from National Sites and Monuments Registers

Author - Dr. Fomitt, Thierry, University of Southampthton, Southampton, Unted Kingdom (Presenting author)
Keywords: crannogs, GIS, Wetland, Medieval, Iron Age, Ireland, Scotland

Preseantation Preference - Oral

Crannogs are man-made islands that are ubiquitous on the north-western fringes of the British Isles. Over 1500 have been identified, but their function is not that well understood, with some crannogs apparently simple workshops, while others were royal occupation sites. They were built mainly during the Iron Age and Medieval Periods, but there is evidence that this tradition started in the Neolithic and some sites were occupied between the 17th Century. In this paper, the potential drivers for crannog construction are examined, by analysing the distribution of crannog dates both chronologically and spatially. For this purpose, a database of crannogs was constructed from the sites and monuments records of Scotland, Ireland and Northern Ireland. Two types of analysis were performed on the database: a probability density function and the allocation of crannog dates to time intervals, which might be compared by comparing the distribution of crannogs to known climatic events, the theory that low lake levels might have contributed to their expansion can be explored. The spatial distribution of crannogs is also compared to the probable extent of nearby kingdoms and the timing of political events, such as the impact of the outcome of the Battle of Moira in AD 637, to gain a deeper understanding of the defensive and or status properties of these sites. To assess whether local wealth may have been a factor in the construction of the sites, the distribution of crannogs has been compared to major transport networks in the late Preceltic and Medieval periods. This study can be used to support the archaeological interpretation of the individual sites and attempts to develop a large scale understanding of crannog construction and occupation.
TH5-16 Abstract 06
The Early Iron Age 'lake village' at Black Loch of Myrton
Author - Dr. Cavers, Graeme, AOC Archaeology group, Loanhead, United Kingdom (Presenting author)
Co-author(s) - Sr. Crane, Anne, AOC Archaeology group, Loanhead, United Kingdom
Co-author(s) - Dr. Van Hardenbroek, Maarten, University of Southhampton, Southampton, United Kingdom
Co-author(s) - Fredengren, C., Archaeological Research Laboratory, Stockholm University, Stockholm, Sweden
Keywords: crannog, lake village, iron age, scotland
Presentation Preference - Oral

The discovery of the remains of a spectacularly well-preserved settlement at Black Loch of Myrton, South West Scotland has opened up the possibility for an investigation of early Iron Age society in northern Britain that goes far beyond what has been previously possible. With recent breakthrough in dendrochronological dating of later prehistoric structures in Scotland it is now possible to approach issues of structural duration on a human scale, meaning that models for the Iron Age societies that lived in this area can be constructed to a level of detail never previously possible. This paper will present the archaeology of the Black Loch village recorded so far, and consider the hypotheses that will be tested through the multi-disciplinary palaeoenvironmental techniques used by the Celtic Cranngogs project.

TH5-16 Abstract 07
Investigating Iron Age lakeside settlements within their palaeoenvironmental context
Author - Dr. Davies, Kimberley, Plymouth University, Plymouth, United Kingdom (Presenting author)
Co-author(s) - Dr. Whitehouse, Nicola, Plymouth University, Plymouth, United Kingdom
Co-author(s) - Professor Langdon, Peter, University of Southhampton, Southampton, United Kingdom
Co-author(s) - Allison, Emid, Canterbury Archaeological Trust, Canterbury, United Kingdom
Co-author(s) - Professor Brown, Tony, University of Southhampton, Southampton, United Kingdom
Keywords: palaeoentomology, coleoptera, chironomidae, iron age, lakeside settlements

Palaeoenvironmental methods offer the opportunity of retrieving information from a range of proxies around lakeside settlement usage that would otherwise be difficult to obtain without excavation and can augment studies where excavation is possible. These methods also allow us to place these sites within a wider environmental context which can aid our understanding of local and regional conditions across the time period in question. Sediments are retrieved both on and adjacent to, these structures and can be analysed for ecological, biological and environmental data.

Here, we present palaeoentomological data, in particular Coleoptera (beetles) and Chironomidae (non-biting midges), from archaeological excavation deposits and parallel lake core sediments from Black Loch of Myrton, Scotland. This Iron Age lochside settlement consists of a small number of structures constructed on peat/fen material at the margins of a small, productive loch. The main aim of the work is to inform our understanding of living conditions on the site, any associated impacts upon the nearby lake system and explore the wider implications for our understanding of lakeside settlements of this period. Beetle remains provide an understanding of both the environmental conditions across the site and on-site activities. Analyses indicate beetle and fly remains, ectoparasites (e.g. fleas), characteristic of decomposing floor litter layers and less than siltaceous living conditions. Chironomidae from the parallel lake core indicate a shallow, productive lake system showing nutrient changes over long timescales, and highlight the effects of lake settlement construction on the adjacent small lake system. Results are compared with other lakeside sites and cranangos of comparable situation to provide an over-view of living conditions associated with these types of sites.

The results of the work form part of a larger project that uses survey, palaeoecological, biogeochemical and aDNA analyses to study cranngos and lakeside sites across Ireland and Scotland to study patterns in construction, function and longevity of these monuments, across wider geographical scales. The Celtic Connections and Cranngogs project, funded by AHRC, sets out to re-examine cranngos as both a cultural and environmental phenomenon that link Iron Age and Medieval communities of SW Scotland and N Ireland.

TH5-16 Abstract 08
How could Cranngos impact on lake environments?
Author - Dr. Van Hardenbroek, Maarten, University of Southhampton, Southampton, United Kingdom (Presenting author)
Co-author(s) - Cavers, Graeme, AOC Archaeology Group, Midlothian, United Kingdom
Co-author(s) - Cavers, Graeme, AOC Archaeology Group, Midlothian, United Kingdom
Co-author(s) - Cross, Andrew, Queen's University Belfast, Belfast, United Kingdom
Co-author(s) - Fort, Thierry, University of Southhampton, Southampton, United Kingdom
Presentation Preference - Oral

Cranngos, or artificial islands, were constructed during the Iron Age to Medieval period throughout Scotland and Ireland. At least 1500 cranngos are recognised, but little is known about their longevity and continuity of use, and they are difficult and expensive to excavate. An alternative, or compliment to excavation is to assess these questions through the impacts of cranngos construction and use on adjacent lake sediments. However, it is unclear what the impact of cranngos construction and use has been on lake environments.

Using sediment cores we investigate cranngos in ten lakes and one archaeological site. The cores will be analysed for loss-on-ignition, stable carbon and nitrogen isotopes, and high-resolution XRF data to highlight input of clay, gravel, and stones from cranngos construction. Increased loading of heavy metals (Cu, Zn) might be related to metalworking on cranngos. In addition, the analysis of pollen, invertebrates, and ancient DNA, will provide insights into land use around the lakes and the conditions on the cranngos themselves. Changes in C:N ratios, diatoms, biogenic silica, and invertebrates will demonstrate how cranngos construction and use are driving changes in lake environments. Preliminary results indicate that XRF data (Cu, Zn) corroborate sediment stratigraphy and can be used to distinguish periods of cranngos construction and use. In one of the sites, Lough Yoan, diatom assemblages indicate a substantial increase of nutrients during this period. The increased variety of submerged substrates due to cranngos building also led to a more diverse cladoceran assemblage.

TH5-16 Abstract 09
From the lakeshore: settlement and technology in the later Mesolithic
Author - Hill, Geoffrey E., School of Geography, Archaeology & Palaeoecology, Queen's University Belfast, Belfast, United Kingdom (Presenting author)
Co-author(s) - Whitehouse, N. J., School of Geography, Earth and Environmental Sciences, Plymouth University, Plymouth, United Kingdom
Co-author(s) - Froendtengren, C., Archaeological Research Laboratory, Stockholm University, Stockholm, Sweden
Keywords: Lough Kinale; cranngos; beetles

Excavations undertaken under the aegis of the Discovery Programme, Dublin, between 2013 and 2015 on the shores of Lough Kinale, Co. Longford, Republic of Ireland, uncovered a well preserved Late Mesolithic (~5000-4500 cal. BC) platform cranngos.

This lake-side site is one of very few wetland archaeological occupation sites in Ireland that extends over the Mesolithic-Neolithic transition. The site consists of a series of constructed brushwood layers with intermediate peat lenses built beside, or into the adjacent lake, with up to five different occupation phases. Within these layers are a variety of archaeological features, including upright stakes, wooden ‘planks’, hearths, and abundant lithics (Froendtengren, 2010). Biological investigations of the site have been undertaken as part of a DfE funded PhD research project. Results from fossil beetle and dung fungal spore analyses suggest the presence of structures maintained over the Late Mesolithic phases of the site’s usage. Synanthropic beetles typically associated with thatching and/or bedding materials indicate the persistence of dry, sheltered areas across the site. This evidence is significant and challenges assumptions about the nature of lake cranngos.

Byarchaeological investigations of the site have been undertaken as part of a DfE funded PhD research project. Results from fossil beetle and dung fungal spore analyses suggest the presence of structures maintained over the Late Mesolithic phases of the site’s usage. Synanthropic beetles typically associated with thatching and/or bedding materials indicate the persistence of dry, sheltered areas across the site. This evidence is significant and challenges assumptions about the nature of lake cranngos.

This is intriguing given the apparent absence of large grazing herbivores in Ireland prior to their introduction during the Neolithic. The ‘platform cranngos’ appears to have been a well-managed site occupied on a seasonal or re-liming basis.

Here, we explore the significance of these findings within the context of current debates about the nature of the Mesolithic, its implications for the Mesolithic-Neolithic transition in Ireland as well as broader debates around the origins of the synanthropic fauna.

Keywords: Human-environment interactions, Organic geochemistry, Wetland settlement
Presentation Preference - Oral

The first wetland village discovered in Scotland - Black Loch of Myrton, exhibits excellent preservation of early Iron Age life. It is therefore an excellent opportunity to explore how Celtic people lived and interacted with their environment. This study uses organic geochemistry to answer key questions about the settlement: how many construction and occupation phases occurred? What activities took place and how did they vary over time?

We reconstruct environmental conditions during village development using lipid biomarkers, organic molecular fossils that can be traced back to known biological precursors, and carbon isotopes from a sediment core recovered from the centre of the wetland. These results are compared with other regional climatic reconstructions to explore the role prevailing environmental conditions had on the start of the roundhouse construction and the demise of the village. Human-environment interactions within the wetland are assessed using biogenic silica concentrations, a measure of the abundance of the siliceous primary producers within the ecosystem, which reveal overall changes in aquatic productivity. The extent to which these changes can be attributed to the addition of nutrients from human and animal waste and changes in land use practices is currently being investigated by quantifying sterols, a group of biomarkers that are characteristic of faecal matter input.

In addition, a suite of lipids biomarkers taken from a sediment core from within the roundhouse provides insight into Iron Age activities by using pyrolytic polycyclic aromatic hydrocarbons to reveal fire regimes, n-alkanes to suggest changes in the surrounding vegetative landscape and cropping practices, and faecal sterols and bile acids to indicate the presence of animals within the roundhouses. Changes in the intensities of these activities and the amount of human faecal input reveal how the wetland village dynamics and uses altered over time. Combining these organic geochemical analyses with archaeological investigations provides a more holistic site interpretation and, when compared with other Celtic Iron Age sites, helps to build a clearer picture of societal functioning and change over this time period.

TH5-16 Abstract 11
Lake sediment DNA to trace past landscape and agricultural activities: the importance of taphonomy
Author - Dr. Giguet-Covex, Charline, University of York, York, United Kingdom (Presenting author)
Co-author(s) - Ficetola, Francesco Gentile, LECA, Grenoble, France
Co-author(s) - Walsh, Kevin, James, University of York, York, United Kingdom
Co-author(s) - Poulenard, Jérôme, EDYTEM, Le Bourget du Lac, France
Co-author(s) - Bajard, Manon, EDYTEM, Le Bourget du Lac, France
Co-author(s) - David, Fernand, CEREGE, Aix-en-Provence, France
Co-author(s) - Le Roux, Laurence, LECA, Grenoble, France
Co-author(s) - Amaud, Fabien, EDYTEM, Le Bourget du Lac, France
Keywords: Agriculture, lake sediment DNA, taphonomy
Presentation Preference - Oral

During the last decade, an increasing number of studies were interested in the use of lake sediment DNA to trace past landscape changes (plant DNA); agricultural activities (plant, mammal and bacteria DNA) as well as the human presence (human-specific bacteria DNA). However, rare sedimentsomologists know, the sedimentation in a lake can vary temporally and spatially depending of the variations of processes at the origin of the sediment formation. Moreover, depending on the geological, topographical, climatic and ecological contexts, the sedimentation can be very different from a lake to another. These lake sediments characteristics might affect the aDNA archiving in a various ways including potential biases related to both, the taphonomic processes (DNA source, transfer and deposit) and the analytical process. Consequently, it is now crucial to study these processes to ensure reliable interpretations of the lake sediment DNA results and to improve its potential for palaeoenvironmentalists, archaeologists and historians. In this aim, we combined sedimentological/geochemical analyses with DNA metabarcoding analyses (focusing on plants and mammals) on three different mountain lake-catchment systems in the Alps (different relative to their physico-chemical and biological characteristics). We showed the extracellular aDNA retrieved from the sediment mainly comes from upper soil horizons and is transported to the lake being fixed into/lonto soil particles. Lakes with high detrital inputs are thus more suitable to archive terrestrial DNA than lakes dominated by autochthonous sedimentation. Furthermore, the hydrographical web has to be well developed to provide a good spatial representativeness of possible plant patches in the catchment. Specific chemical/biological conditions affecting aDNA preservation and/or analysis success were also proposed as explanation for the non-detection of aDNA in one of the lakes. Other less predictable factors, e.g. pastoral practices and animal behaviour, also affect the archiving of aDNA from domestic animals. In particular, determining the type of source of DNA (“point” vs “diffuse”), these factors will affect the detection probability of the animals. All the factors affecting the aDNA record in lake sediments can change over time and can thus significantly affect the reconstructions of plant cover and livestock farming/pasturing histories.
ARCHAEOLOGY, LANGUAGE, AND GENETICS: IN SEARCH OF THE INDO-EUROPEANS

Friday, 2 September 2016, 09:00-16:00
Faculty of History, Room 218

Author - Merkyle, Inga, University of Copenhagen, Vium, Denmark (Presenting author)
Co-author(s) - Marklevits, Aligamitas, Vilnius University Archaeology department, Vilnius, Lithuania
Co-author(s) - Randborg, Klaas, Copenhagen University, Copenhagen, Denmark

Keywords: DNA, Indo-European, Linguistics
Presentation Preference - Workshop

Vilnius is a birth place of Prof. Marija Gimbutienė (Gimbutas), probably the best known participant in the debate on Indo-European origins. In view of recent input from human genetics and linguistic studies, this session invites archaeologists, geneticists, molecular anthropologists, linguists and historians to discuss how archaeology today evaluates and integrates all the new evidence.

TH5-17 Abstract 01
Population Genomics of Bronze Age Eurasia

Author - Assoc. Prof. Sikora, Martin, University of Copenhagen, Copenhagen, Denmark (Presenting author)
Keywords: Ancient DNA, Genetics, Migrations

The Bronze Age of Eurasia (around 3000-1000 BC) was a period of major cultural changes. However, it has been debated for decades if the major cultural changes that occurred during this period resulted from the circulation of ideas or to which extent they were accompanied by human migrations. To investigate these questions, we sequenced low-coverage genomes from 101 ancient humans from across Eurasia. We show that the Bronze Age was a highly dynamic period involving large-scale population migrations and replacements, responsible for shaping major parts of present-day demographic structure in both Europe and Asia. We find genetic evidence for the expansion of the Yamnaya culture from the Pontic-Caspian both into North Eastern Europe as well as into Central Asia. Our findings are consistent with the hypothesized spread of Indo-European languages during the Early Bronze Age.

TH5-17 Abstract 02
What ancient DNA can tell us about the origin and spread of Indo-European languages

Author - Dr. Haak, Wolfgang, Max Planck Institute for the Science of Human History, Jena, Germany (Presenting author)
Keywords: ancient DNA, Indo-European, prehistory

Ancient DNA studies on Mesolithic, Neolithic and Bronze Age individuals from Western Eurasia have recently thrown fresh light on migrations in Europe’s prehistory. The Early Neolithic period in Europe (~8,000-7,000 years ago) was characterized by closely related groups of early farmers, which were different from indigenous hunter-gatherers, while Russia was inhabited by a distinctive population of eastern hunter-gatherers with affinity to Palaeolithic Siberians. The Middle Neolithic saw a resurgence of hunter-gatherer ancestry throughout much of Europe, while the contemporaneous Yamnaya pastoralists of the Russian steppes shared about half of their ancestry with the preceding eastern European foragers and the other half with Caucasus hunter-gatherers. This ‘Yamnaya-like’ steppe ancestry arrives in Central Europe ~4,500 years ago, as Late Neolithic Corded Ware individuals trace ~75% of their ancestry to the Yamnaya, and is thus a good temporal fit for the steppe hypothesis, which proposed a spread of Indo-European languages via the steppes starting from a proposed homeland north of the Black Sea. This third ancestry component persisted until the present-day in all Europeans and documents a (second) major expansion into Europe from its eastern periphery. The accompanying genetic turnover was high enough to support a language replacement, a criterion that was previously suggested to only apply to the language-farming dispersal hypothesis in the light of the Mesolithic-Neolithic transition. As a consequence, these ancient DNA results have direct implications for the spread of Indo-European language groups and at the basis of what is often called the mixing field between the two rivaling hypotheses. It is possible that additional ancient DNA from other prehistoric cultural groups from the Caucasus and surrounding regions will provide plausible temporal and contextual fits for the proposed homeland of Proto-Indo-European.

TH5-17 Abstract 03
The story told by Mireasa (Constanța) Bronze Age barrow – interdisciplinary approach

Author - PhD student Rusu, Isana, Babes Bolyai University/ Interdisciplinary Research Institute on Bio-Nano-Sci, Cluj-Napoca, Romania (Presenting author)
Co-author(s) - Radu, Claudia, Babes Bolyai University/ Interdisciplinary Research Institute on Bio-Nano-Sci, Cluj-Napoca, Romania
Co-author(s) - Bodocici, Vitalie, National History and Archaeology Museum, Constanța, Romania
Co-author(s) - Dobrinescu, Catalin, National History and Archaeology Museum, Constanța, Romania
Co-author(s) - Kalemen, Beatrice, Babes Bolyai University/ Interdisciplinary Research Institute on Bio-Nano-Sci, Cluj-Napoca, Romania

Keywords: Bronze Age, Yamnaya, mitochondrial aDNA

Presentation Preference - Oral

There is a current tendency towards an interdisciplinary approach when testing various hypotheses regarding historical events that contributed to the shaping of modern European populations, especially when considering their genetics. The Bronze Age is a historical time frame characterized by major population movements accompanied by social and cultural changes that influenced present-day populations, but it remains unclear to what extent. Few inferences can be made using traditional sources such as archaeological record or written sources. While this kind of evidence is often ambiguous, in recent years it has been supplemented by genetic data from ancient populations or contemporary genetic patterns, in order to estimate the demographic impact of these historic changes.

This study aims to integrate data concerning the genetic diversity of Bronze Age skeletal remains associated to the Mireasa (Constanța) barrow as illustrated by mitochondrial hypervariable regions analysis, physical anthropology of the skeletal remains and stable isotopes analysis.

In this manner, a more comprehensive image regarding the cultural and social status of Bronze Age individuals from the southeastern part of Romania, a geographic region that is scarcely represented by genetic data in scientific literature, can be gleaned. Integrating present genetic results for representatives of this population with contemporaries from other geographic locations may reveal genetic links associated to migratory events. First insights on burial ritual and funerary inventory of these individuals indicate that they are most likely associated with Yamnaya culture, while the radiocarbon analyses of one individual ‘centrally located’ in the tumulus show that it dates to 2620-2470 BC. The molecular results at date reveal the presence of at least two distinct maternal lineages in this population, in most cases rare haplotypes for the modern day European population.

These results are part of an ongoing project and a future point of concern is to assess the genetic relationship between this Bronze Age population and one dated to the pre-modern period discovered in the same geographic area.

This study was supported by funding from the project Genetic Evolution: New Evidences for the Study of Interconnected Structures (GENESIS). A Biomolecular Journey around the Carpathians from Ancient to Medieval Times. (CNCSIS-UEFISCDI_PNII_PCCA_1153-2011).

TH5-17 Abstract 04
Scandinavian Bronze Age rituals, and their Indo-European background

Author - Prof. Anders, Kållström, Uppsala University, Uppsala, Sweden (Presenting author)
Keywords: burial ritual, Cremation, Cosmology, Indo-European, Religion, Ritual, Sacrifice

Presentation Preference - Oral

In my research I try to interpret remains of ancient Scandinavian ritual, against a larger Indo-European background. Like the Indo-European languages, is also Indo-European religion an old concept, first constructed in the 1800s, when the comparative study of religion emerged as a method. It seemed to be basic features that recur in the religions practiced by different peoples who spoke Indo-European languages, and that parallel to language, important elements of religious beliefs, myths and rituals could also be preserved over time.

In the last few years, there has been a very rapid development in the field of ancient DNA that has revolutionized the question of Indo-European migration in prehistory. The question is no longer whether there is a connection between early Indo-European peoples, but how complex the relationships are and how they occurred. In 2014 and 2015 came finally the first really convincing DNA studies regarding the ancient Indo-Europeans, results that fully support the ideas of Indo-European spread by migration. Far hundred percent proof that this migration really brought languages, is missing still, of course, but it could be assumed with almost certainly. According to the hypothesis I try to test in my research, research, essential features of mythology and ritual was also spread in this context. Although changes of these obviously have taken place over time, in the same way as with the language.

The homology of the creation myths is one such basic cosmological idea. The concept of homology here refers to the belief that one entity is created using the matter in another entity. They are alike, that is, alternative guises of each other. As
regards both fire-sacrifice, and also cremation, the link to homology is evident. One significant example is the Vedic fire-rituals (including cremation of the dead), that are performed as repetition of the creation and has a deep cosmological significance. This cosmology - with parallels in several old Indo-European religions, including for instance the Old Persian (Zoroastrian) religion, Old Baltic, Germanic and Old Norse beliefs had a fundamental impact on the eschatological beliefs, and accordingly on the burial rituals. Flesh and earth, for example, are considered to be of the same material substance and can thereby be transformed into each other. In the same way, bones, the hard part inside the soft flesh, are equated with the stones in the earth and with rocks and mountains, while hair is associated with plants. Life consists of a limited number of elements from which everything is composed.

My paper will discuss this with focus on finds from some recently excavated ritual places in eastern Sweden, and interpret the finds in the light of a broader Indo-European background. I will use the Old Vedic ritual system as one important comparative, and also focus on a discussion of the interpretations in the light of the new results from ancient DNA studies.

TH5-17 Abstract 05
Can scholars envisage a Baltic Origin of Homer’s Epic Tales?
Author - Prof. Bandelli, Giuliana, Università Cattolica del sacro Cuore Milano, Milano, Italy (Presenting author)
Keywords: Bronze age, Homer, Metal working around the Baltic Sea
Presentation Preference - Oral

According to a recent challenging hypothesis by the scholar Felice Vinci, the real setting of the Iliad and the Odyssey can be identified not as the Mediterranean Sea, where it proves to be undermined by many incongruities, but rather in the North of Europe. The sagas that gave rise to the two poems came from the Baltic regions, where the Bronze Age flourished in the second millennium B.C. and where many Homerid places (Toya, Ithaka, Foino) along with Ulysses’ wanderings can still be identified today. Moreover, this archaic Achaeans civilization extended on all the Baltic coasts, such as, for instance, along the Swedish coasts, where today’s Bay of Nördland is the ancient Aizu, where the Achaeans fleet, according to the Iliad, gathered before sailing for Troy. As regards the Baltic Republics (Estonia, Latvia, Lithuania) there are many convergences with Greek mythology. The blond Achaeans who founded the Mycenaean civilization in the Aegean in the 16th century B.C. brought these tales from Scandia to Greece after the end of the “post-glacial climatic optimum”. They then rebuilt their original world – where the Trojan War and many other mythical events had taken place – farther south in Mediterranean waters, transferring significant names from north to south. Through many generations, they preserved the memory of the heroic age and the feats performed by their ancestors in their lost homeland. This oral tradition was put in writing around the 8th century BC, when the alphabetical writing was introduced in Greece. According to Felice Vinci’s theory, both the Homeric poems and the rest of Greek mythology are the last memory of the feats and events happened in the lost Nordic homeland of their Achaean ancestors, before they moved towards the South of Europe. This new perspective conforms to the most recent views of archaeology: the “radio-carbon revolution”, based upon radiocarbon dating, adjusted with dendrochronology, has backdated of many centuries the rise and development of the European Bronze Age and, on the other hand, a very ancient city, dating back to the third millennium BC, was recently found by Swedish archaeologists in the site of Bjalstom, near Hernoqvast.

TH5-17 Abstract 06
The Settlement System of Pit-Grave Culture of Central Ukraine
Author - Svyapol, Mykhaylo, Cherkesky Archaeological Museum, Cherkesky, Ukraine (Presenting author)
Keywords: Settlements, Culture, Central Ukraine
Presentation Preference - Oral

Having excavated dozens of Pit-Grave burial mounds in Central Ukraine the author began the search for Pit-Grave settlement relics and as a result of a 20-year-long research has discovered more than 30 such objects, divided into two types: 1) basic long-term settlements; 2) temporary cattle herders’ sites.

The author has partially excavated one of these basic settlements (Desiatyny). It belongs to the most widespread type: 1) the settlements on small (0.5-1 ha) islets (or peninsulas) in wide floodplains of the Dnieper River and its tributaries. The Desiatyny type settlements have a relativelly thin (0.4-0.7 m) and a rich archaeological layer (up to 100 finds per 1 m²).

Small (0.1-0.3 ha) and poor in relics (1-10 finds per 1 m²), temporary sites have been found in 2) floodplain islets/peninsulas (often near basic settlements) and under the conditions of high topography: 2b) at the top of watersheds but not to a water source; 2c) on the high bank terrace of small rivers of the 2nd and 3rd order; 2d) on the low promontories of small rivers. The last subtype is more known in a number of other territorial variants of Pit-Grave culture, though the watershed subtype is a new one.

The data deriving from the study of these settlement relics suggests that the Pit-Grave population of the Middle Dnieper Area practised transhumance, insignificantly complementing their diet with the help of fishing, hunting and food gathering. The vast majority of the population lived in basic settlements, located on the floodplain islets in collectives of 50-100 persons (mostly large patriarchal families), which could unite into a clan together with the inhabitants of nearby settlements. During a warm period, the fully mature men departed with the herds to the temporary sites (some 5-10 persons per site) within the radius of several kilometer, while women, children and old people remained in the basic settlements.

TH5-17 Abstract 07
Back to square one? The legacy of Marija Gimbutiene (Gimbutas) in the light of recent DNA findings
Author - Dr. Markyta, Inge, Vrum, Denmark (Presenting author)
Keywords: Gimbutas/Gimbutas, Migrations, Steppe cultures
Presentation Preference - Oral

Recent qDNA findings seem to pinpoint a massive migration from the steppes area towards Central Europe occurring around 4500 years ago (Haak et al, 2015, Alfoldi et al. 2015). Genetic studies are usually taken as evolutionary histories from the past, around in temporal dating references. Paradoxically they rather produce a series of snapshots of populations. Proper knowledge of the statistical uncertainties of applied dating methods and a still very limited dataset, analyzed with the help of mathematical models. Thus archaeology more than ever is challenged by the questions of why and how. The paper aims to reflect upon Marija Gimbutas legacy in the Indo-European debate, how she saw the instrumentation of human movements and mixing, also with reference to other contesting thoughts.

TH5-17 Abstract 08
Archaeological Modeling of the Spread of Indo-European Traditions in Late Prehistoric Eurasia
Author - Dr. Johnson, James, University of Chicago, Chicago, United States of America (Presenting author)
Keywords: Archaeological Modeling, Demography, Indo-Europeans
Presentation Preference - Oral

Echoes of Marija Gimbutas’s highly influential research still permeate the more recent work on the spread of the Indo-European languages, and the current work focusing on the homeland of the Proto-Indo-European. Many of the recent empirical efforts are focused on how culture history and change might be best applied to the multi-dimensional, and subsequently multi-disciplinary, nature of the problems inherent in research on the Indo-Europeans. While much of the discipline of archaeology has levied trenchant critiques against the broad brush strokes of culture history, recent Indo-European scholarship shows little to no overt interest in the updated, and now commonplace, theoretical approaches in archaeology.

This paper seeks to provide more nuanced understandings of event and process into archaeological inferences about the prehistory of the Indo-Europeans, with a primary focus on how populations aggregations break down and disperse. Current efforts in the study of Indo-Europeans have focused on individuals or small groups including: sharper focus on the genetic make-up of individuals, specific burials, and specific words associated with ancient concepts with corresponding instances or appearances of material culture. Despite the numerous reviews of the Eurasian steppes and Central and Eastern European archaeological material, a sustained inquiry into middle-range demographic and socio-political processes has yet to be implemented. To accomplish this, I present a preliminary demographic model that seeks to account for the socio-political, spatial, and temporal nuance that have been and remain crucial to anthropological and sociological studies of culture. Through an integrated methodology comprised of demographic, spatial, and statistical analyses, as well as a new theoretical approach - the afterlife of population aggregations - I explore some of the contributing socio-political and demographic factors in the dispersal and adoption of the material, linguistic, and symbolic traditions often attributed to the spread of Indo-European cultural groups.

TH5-17 Abstract 09
Indo-Europeans in the East Baltic Region. A new data and old problems
Author - Assoc. prof. Merkenições, Algimantas, Vilnius University, Vilnius, Lithuania (Presenting author)
Keywords: DNA, Indo-Europeans, Linguistics
Presentation Preference - Oral

The origin of Corded Ware culture, which is associated with Indo-Europeans in Central and Northern Europe have disputed for almost a century. Two major explorations have been proposed, a massive migration of Yamnaya or Pit Grave culture people from the Pontic-Caspian steppes, or locally initiated changes. According to M. Gimbutas (1991), a massive infiltration of Kurgan people from the steppes areas initiated cultural changes in Central and Northern Europe. However, other archaeologists suggest that several
smaller innovations or gradual local changes played the main role in the cultural transformation of a very wide region (Bankoff & Winter 1999, 175). However after 3000 BC a new type of sites and artefacts appeared in the Baltic Region. On the basis of these radical changes in material culture one can claim that almost all aspects of human life, social, ideological and economic has changed radically. After a recent studies of ancient DNA (Allentoft et al. 2015; Haak et al. 2015) a new important data were added to old debates of linguists and archaeologists.

The aim of the paper is to compare archaeological data of Corded Ware and post Corded Ware people from the East Baltic Region to the data of Pontic-Caspian steppe, and to try to find traces of cultural influences. A new DNA discoveries will be used as well.

**TH5-17 Abstract 10**

**Visitors from the Steppes. The Scandinavian perspective**

**Author** - Prof. Randborg, Klaus, University of Copenhagen, Copenhagen, Denmark (Presenting author)

**Keywords:** Neolithic, Scandinavia, Stepp contacts

**Presentation Preference** - Oral

The archaeological interest in the Steppes has deep roots, including hypotheses about an eastern origin of the Corded Ware Culture, supposed migrations of the same, and even the introduction of the Indo-European languages, as suggested by G. Childe in the 1920s and later elaborated by M. Gimpelberg (Gimbutas, among many others). Recent ancient human genome studies (DNA) have added new dimensions to the old debate.

By suggesting that the Indo-European languages in Europe were introduced from the East, at the latest by 2500 BC, a number of concomitant issues need to be considered concerning cultural origins and processes. A particular problem is the rise of Indo-European languages in Western and Northern Europe, as well as the status of the Indo-European languages in the Mediterranean. C. Renfrew’s viewpoint of the 1980s was that the first Indo-European languages arrived with and developed in Europe among the first people carrying Neolithic farming and raising of domesticated animals (Renfrew 1987). This idea has a ring of simplicity about when correlated with the basics of archaeology: Neolithic expansion from the Near East and Anatolia to southeast Europe extended to Central Europe and later on to the North, with a parallel Neolithic expansion from Anatolia to the Mediterranean and on to Western Europe.

The paper examines the archaeological elements of possible Stepp origins in Scandinavian Neolithic and how these correlate with the aDNA findings.

**TH5-17 Abstract 11**

**The introduction of Indo-European in the later South Scandinavian Neolithic**

**Author** - Dr. Olander, Thomas, University of Copenhagen, Copenhagen S, Denmark (Presenting author)

**Keywords:** Corded Ware, Indo-European, Proto-Neolithic

**Presentation Preference** - Oral

With the exception of Basque, Finnish, Estonian, and Hungarian, the modern linguistic landscape of Europe is almost entirely shaped by a single language family: Indo-European. This perhaps surprising linguistic unity is likely the result of a prehistoric cultural expansion that erased almost all previous languages. By the dawn of history, Europe had at any rate become covered by a patchwork of Indo-European dialects - that is Germanic, Celtic, Italic, Baltic, Slavic, Albanian, Armenian, and Greek. These formed the seeds from which grew the modern European languages, such as Italian, German, Lithuanian, and Swedish, not to mention the highly globalized languages English, French, Spanish, and Russian, each of which today have hundreds of millions of speakers.

Language is an important part of human self perception and a creator of identity among human groups. Therefore, language is an important factor when trying to understand cultural change in prehistory. Northern Europe is a region that saw profound cultural change in the first millennium B.C.E. In southern Scandinavia the first agrarian culture, the Funnel Beaker culture, came to an end overlapping with the emergence of “sub-Neolithic” Pitted Ware influences that reached the northern and eastern coastal areas of present-day Denmark from the Scandinavian Peninsula. From around 2800 B.C.E early Corded Ware (Single Grave) societies appeared on the Jutland Peninsula introducing among other things new burial customs, new pottery shapes, new amber ornaments, and new types of stone battle-axes.

The third millennium B.C.E was, no doubt, a period of great material and cultural changes and language must not be ignored when considering these. Instead, language must be viewed and treated as a deeply integrated part and facilitator of the transmission of new ideas, cultural processes and substance economic and material changes. This paper draws on evidence of change in both material culture and in language that took place in the third millennium B.C.E and combines these evidences into a unified hypothesis on when and how Indo-European language was introduced into northern Europe and southern Scandinavia. After being introduced together with Corded Ware features in central and western Jutland it seems that the implementation of Indo-European happened gradually via long-term cultural transformation processes.

However, in order to understand the cultural and linguistic processes that allowed the introduction of an entirely new language family it is important to also consider the long gone predecessor of Indo-European. This extinct language we refer to as “Proto-Neolith”. Did this unknown language for instance contribute to the new Indo-European language family? What was the basis for the vast majority of modern European languages? One further aspect is where should we place the language spoken by the Pitted Ware people and furthermore if it had any impact on the larger language development. Do we still carry relics with us in modern Germanic that can be traced down to the Proto-Neolithic language spoken by the Funnel Beaker farmers – and perhaps even also elements of a Pitted Ware language?

**TH5-17 Abstract 12**

**Linguistics and archaeology: A reassessment of the Indo-European homeland problem**

**Author** - Prof. Olander, Thomas, University of Copenhagen, Copenhagen, Denmark (Presenting author)

**Keywords:** Indo-European homeland, Indo-European languages, Linguistics

**Presentation Preference** - Oral

When searching for the co-called Indo-European homeland – the place from which the Indo-European languages spread at some point in prehistory – there is a discrepancy between the opinions of archaeologists and historical linguists. Different methodologies in the two fields lead to preferences for different scenarios.

Popular among archaeologists is the “Anatolian hypothesis”, which locates the Indo-European homeland in Anatolia around 6,500 BC and sees agriculture as the main factor in the spread of the Indo-European languages. This hypothesis, however, finds very limited support among historical linguists. A competing view, the “stepp hypothesis”, puts the homeland in the Pontic-Caspian steppe around 4,000 BC. This is the scenario preferred by many historical linguists, and also by a few prominent archaeologists. While accounting more convincingly for the linguistic evidence, the stepp hypothesis has been criticised for not providing a plausible mechanism for the success of the Indo-European languages. Here the Anatolian hypothesis has an advantage as it correlates with the spread of agriculture.

Research in ancient genetics has now shown that there was indeed an indisputable migration from the steppe within a time frame that matches that of the steppe hypothesis. The new results have a great potential impact on the discussion of the Indo-European homeland problem and may eventually bridge the gap between archaeology and historical linguistics.

This paper will reassess the linguistic evidence on the time and location of the Indo-European homeland, focusing on the methodological questions that have frequently given rise to misunderstandings between historical linguists and archaeologists.

**TH5-17 Abstract 13**

**The canonical Indo-European model and its underlying assumptions**

**Author** - Prof. Demoule, Jean-Paul, University of Paris I, Paris, France (Presenting author)

**Keywords:** genetics, historiography, Indo-European

**Presentation Preference** - Oral

Throughout the 19th century, resemblances and correspondences between Indo-European languages formed the foundation of modern linguistics. At the same time, these resemblances and correspondences were explained, from the start, by the postulated existence of an original people (Urvolk) who spoke an original language (Proto-Indo-European) in an original homeland (Uralm), three entities which were waiting to be rediscovered or reconstructed. As we are well aware, this research was subject to ideological hijacking on a number of occasions. In any case, however, it cannot be said that any of this research would have ended in scientific consensus. Beyond the systems of phonological and morphological correspondences, there is no consensus among linguists regarding the possibility of ever achieving the reconstruction of a single language based on a tree model, or whether more complex models might be more suited. While comparative mythology, exemplified in the work of Georges Dumézil, also reveals undeniable connections across Eurasia, the family tree is, again, not the only possible model. After the mistakes and dead ends of craniometry, genetics are producing increasingly interesting and reliable results, but with a risk of circular reasoning which is amplified by the influence of the English-speaking academic world. Finally, archaeology is still wavering between three main contradictory geographical explanations with no possibility of reconstructing with certainty the suggested routes which might have led Indo-European speakers from an original homeland to their various historically attested settlement locations. This is why we are entitled to question the underlying canonical model as an alternative origin myth to the Bible, while at the same time seeking more complex explanatory models.
The aim of this study is to analyze the ancient DNA and to identify the haplogroup, presenting also the first results obtained on samples extracted from a Late Bronze Age funerary context discovered in Eastern Romania and to identify an efficient and reliable protocol for aDNA extraction. To test whether the protocol is efficient and capable of yielding good quality DNA, extraction was first performed by using the phenol:chloroform protocol and DNA IQ protocols. The funerary context from Tarnia, Bacau county, was discovered in 1972 and consists in a pit in which was discovered a human skeleton in a left supine position. The left hand was flexed and sustain the skull while the right hand was flexed and slightly lodged on the pelvis and the legs were strongly bent on the left side. The osteological remains were in a poor state of preservation. The burial contains two vessels as grave goods which were attributed based on their typological characteristics to the Noua culture (Late Bronze Age).

The sequences were subjected to Nucleotide BLAST (Basic Local Alignment Search Tool, Altschul et al, 1990) to identify the similarities with the previous sequences from database and haplogroup assignation. The T72 sample shown an identity of 97% with HV1 sequences from a previous study conducted by Lippold et al., 2014. According to Eupedia database, Haplogroup T is composed of two main branches T1 and T2 and the both of them have very different distributions, which are diametrically opposed in most regions. Furthermore, the T72 sequence was aligned with haplogroup T sequences from NCBI and used to construct a ML tree, in order to identify the haplogroup assignation.

Circadian rhythms, moods, and Neanderthals: testing a biological explanation for behaviour

Many archaeological studies of Neanderthal mobility and behavioural complexity have begun to draw on biological explanations for behavioural differences from Homo sapiens. If Neanderthals demanded higher energetic requirements than H. sapiens, then it follows that behaviours enabling Neanderthals to maximize energy intake would be selected for. Circadian rhythms and moods are closely linked to energy intake. This study investigates the phylogeographic distribution of alleles linked to regulation of circadian rhythms and moods in twenty-one modern European, Asian, and African populations in order to test the hypothesis that these alleles originated in Neanderthal populations in Upper Pleistocene Europe. It is hypothesized that presence of two alleles, rs10994336 and rs1006737, may have conferred an adaptive advantage on populations living in northern temperate zones during the Pleistocene. The presence of these alleles is linked to both manic and depressive mood states, enabling increased productivity in the summer and conservation of energy during the winter. If these alleles arose in Neanderthal populations, they would be present in higher frequencies in African populations. It was discovered that latter susceptibility allele is present in higher frequencies in African populations and the former is present in higher frequencies in Eurasian populations. This suggests that these alleles were not selected for solely in Neanderthal populations. The results of this study are significant because they caution against solely biological explanations for differences in the archaeological record.
TH6 Archaelogy without borders

Archaeology is a discipline without chronological, methodological, political or territorial borders. Yet current territorial divisions and traditional and local ideologies often bind and constrain the discipline in its study of the wider social processes of the past, thereby limiting the development of important, if broad, narratives. There are practical issues also. Lack of sufficiently detailed archaeological datasets, or the inadequate synthesis and integration of the data sets generated by multiple sources hampers interpretation. It presents additional challenges for researchers that seek to build broad regional or, indeed, global narratives. This theme invites contributions that deal with a wide range of phenomena on a regional or global scale, such as technological diffusion, cultural interaction, distribution and spread of plant and animal species, cultural identity, human and cultural mobility and social complexity. In particular, contributions that identify and examine wider social processes through the prism of local datasets are welcomed.

TH6-01 TIES THAT BIND. RELATIONSHIPS BETWEEN THE MOVEMENT OF RAW MATERIALS AND THE MOVEMENT OF ARTISANAL KNOWLEDGE ACROSS EUROPE 2000–1500 BC

Saturday, 3 September 2016, 14:00–18:30
Faculty of History, Room 214th
Author - Olausson, Deborah, Lund University, Lund, Sweden (Presenting author)
Co-author(s) - Andersson Brandt, Eva, The Danish National Research Foundation’s Centre for Textile Research, Copenhagen, Denmark
Co-author(s) - Cutler, Joanne, McDonald Institute for Archaeological Research University of Cambridge, Cambridge, United Kingdom
Keywords: artisanal knowledge, raw material, skeuomorphism
Presentation Preference - Regular session

Recent developments in proveniencing methods, in particular analyses of stable isotopes, have provided new insights into the movement of materials such as copper ore, wool and amber on the European continent during the dynamic 21st – 16th centuries BC. Today we are able to demonstrate that materials moved from A to B, but the maps fraught with arrows tell us little about what happens in the receiving context. In this session we would like to explore the implications of raw material movement from the perspective of the local artisans. How does the introduction of a new and previously unknown raw material, or objects made from that raw material, affect local artisans, who in many cases lack knowledge about how to manipulate it? One response visible in the archaeological record is skeuomorphism, where local artisans, lacking adequate access to the new material, imitate foreign forms in locally available raw material. This is often interpreted as an attempt to block the influx of new materials seen as a threat by local artisans. Another possible response for the local artisan is to gain the necessary knowledge in order to be able to manipulate the new material themselves. A third possibility is that the new raw material is accompanied by artisans who are already familiar with its properties.

As raw material movement affects the whole continent, we hope to attract scholars from north to south and from east to west. We would like to gather concrete examples of the three possible responses we outline above, but welcome other possibilities as well.

TH6-01 Abstract 01
The introduction of metals and metalworking in Sicily

Author - Dr. Vianello, Andrea, Sheffield, United Kingdom (Presenting author)
Keywords: artisans, Italy, metals
Presentation Preference - Oral

Metallurgy was introduced very late in southern Italy, with copper becoming present in the archaeological record with some regularity only in the local Middle Bronze Age. There is a very slow process of introduction of metals that started during the Copper Age, when metallurgy was already developed in northern Italy. Evidence of metalworking is exceedingly rare, with few sites yielding any such evidence until the Middle Bronze Age. There are few mines in the area, mostly in nearby Calabria and only one possible in Sicily. Chemical analyses carried out with a pXRF have demonstrated that the early metals were copper and bronze alloys made with the content of natural ore of copper mines and only later tin was introduced. The limited evidence has been poorly studied, with the main theory remaining for long that artisans from the Aegean developed metals.

In this presentation I aim to assess the development of local metallurgy, focusing on alloys and any technological clue present in the archaeological record, in order to understand the role of local artisans in introducing metals in the region. The preliminary results show that the lack of raw material locally could have played some role in delaying access to the new material, but the most likely reason is some form of control of the new technology, which may be deliberate or accidental. There is no evidence of traveling artisans that could spread the technology or produce demand for the new metal by making it known, and Sicily being a large island at short distance from the mainland, it ended up fully embracing the technology unusually late in spite of the raw material circulating and being mined not far from it. This case study therefore reveals how the movement of artisans, and their technological know-how, was far more important than the availability of the raw materials in the vicinity: you cannot make metal artefacts if you do not know how.
Production of Encrusted Ceramics in the Carpathian Basin

Author: - Langov, Michael, Institute of archaeology, Prague, Prague, Czech Republic
Co-author(s) - Ivanec, Petr, Institute of archaeology, Prague, Prague, Czech Republic

Among the findings of the Mycenaean culture archaeologist record several thousand objects made of amber. Raw materials for their production (succinite) in the vast majority came from Northern Europe. Issues that still provoke a lively discussion among researchers are the reasons of this phenomenon and its dynamics. An equally important matter is the perception of amber as a raw material and items made from it in the Mycenaean World. In this regard, it is difficult to talk about the “processing/ manufacturing of amber” in the Mycenaean culture. We should rather talk about the “usage of amber”. It seems that this raw material is very easy to work with, therefore, we should be able to find a specific types of amber products as well as its production residues characteristic for the Mycenaean culture. Despite many decades of research on the history of amber in the Mycenaean culture, dating back to the time of H. Schliemann and his excavations in Mycenae, none of this have been found. In the proposed paper I will address the reasons for this surprising state of research.

The EBA Nodal Point on the Amber Road.
The Settlement Aglomeration in Mikulovice, Eastern Bohemia

Author: - Dr. Ernő, Michał, Institute of archaeology, Prague, Prague, Czech Republic (Presenting author)
Co-author(s) - Langov, Michael, Institute of archaeology, Prague, Prague, Czech Republic

The issue regarding the interregional and long-distance connections, networks, exchange, trade and mobility of people and objects in the Bronze Age has been intensively discussed throughout Europe. The newly excavated Early Bronze Age inhumation cemetery with approximately 100 graves in Mikulovice (eastern Bohemia) at which 30 % of the graves contain imported "exotics" looks very similarly in terms of small-scale responses to a wider regional aesthetic - how to make the colour white - in a range of Bronze Age cultural groups in the Carpathian Basin. In this regard, it is difficult to talk about the "processing/ manufacturing of amber" in the Mycenaean culture. We should rather talk about the "usage of amber". It seems that this raw material is very easy to work with, therefore, we should be able to find a specific types of amber products as well as its production residues characteristic for the Mycenaean culture. Despite many decades of research on the history of amber in the Mycenaean culture, dating back to the time of H. Schliemann and his excavations in Mycenae, none of this have been found. In the proposed paper I will address the reasons for this surprising state of research.

What's new? The first bronzesmiths in southern Scandinavia

Author: - Prof. Olausson, Deborah, Department of Archaeology and Ancient History, Lund, Sweden (Presenting author)
Co-author(s) - Bidner, Katarina, Lund University, Lund, Sweden; Bidner, Katarina, Lund University, Lund, Sweden

The study of technological innovation is often abstract, tending to concentrate on large-scale changes in material culture. However, non-industrial material culture consists of objects which were crafted by individual artisans who worked within an artisanal tradition. According to Helle Vandkilde, bronze casting technology was introduced to Denmark during the early Late Neolithic. Nonetheless, knapping had been an integral part of the technological know-how subsequent human populations that came to Scandinavia. Furthermore, not only was bronze casting knowledge available, but the technology itself was also transmitted to Scandinavia. The question of the movement of artefacts and raw materials in the Early Bronze Age is thus an important one for understanding the development of metalworking in Scandinavia. The study of technological innovation is often abstract, tending to concentrate on large-scale changes in material culture. However, non-industrial material culture consists of objects which were crafted by individual artisans who worked within an artisanal tradition. According to Helle Vandkilde, bronze casting technology was introduced to Denmark during the early Late Neolithic. The interplay between technology and geography in the development of trade networks

Author: Prof. Rivers, Ray, Imperial College London, London, United Kingdom (Presenting author)
Co-author(s): Evans, Tim, Imperial College London, London, United Kingdom
Keywords: geography, networks, technology

The archaeological record shows that artefacts have been exchanged over huge distances at times in the distant past when such exchange must have been very difficult. In this paper we attempt to describe how these isolated and intermittent interactions can evolve into established trade networks.

Trade implies organised exchange in sufficient volume to provide a definable pattern. Most simply, the ability to conduct trade encodes two very different 'distance' scales: the 'distances' that traders need to traverse in order for the network to be robust (e.g. well-connected) and the 'distances' for which the available technologies permit the ready transportation of goods. As a shorthand, we term the former 'geographic' distance and the latter 'technological' distance. There is a symbiosis between the two; the technological improvements that make travel more reliable and viable encourage network growth, conditioned by geography, which exploits this ability to travel longer distances. We stress that by 'geography' we mean not so much Cartesian separation as a reflection of the 'ease' of exchange between sites and that the application of 'technology' (e.g. the wheel, pack-animals, sail) is conditioned by its ownership.

We shall argue that a simple characterisation of network dynamics can be made on the basis of the ratio of these distances.

As time passes, improving technologies lead to a growth in technological distance. The establishment of 'trading' networks is necessarily constrained when technological distance is relatively small. At the other extreme, trading networks have become well established by the time that technological distance is relatively large. The tipping point between struggling and established networks arises when the distances are comparable. Technology then permits exchange over just those distances necessary for robust networks to exist and a vigorous growth in exchange occurs.

To exemplify these ideas we examine the evolution of maritime networks in the Aegean and E. Mediterranean from the Early to Late Bronze Age. The tipping point for the rapid growth of trade and exchange occurs at the transition from Middle to Late Bronze Age with the large-scale adoption of sail. This becomes clear when Minoan maritime networks are modelled in a way in which this sensitivity to 'geographical' distance is explicit. However, on either side of this transition point sensitivity to distance is less important and different computational approaches are required. The implication is that network dynamics in Early, Middle and Late periods has to be understood in terms of different social agency for network formation.

An earlier formulation of these ideas can be found in our paper, From Oar to Sail, published in 'Maritime Networks: Spatial structures and time dynamics', C. Ducruet (Editor), Routledge Studies in Transport Analysis, Routledge (London and New York), 2016.

Copper ore: the path from the Tien Shan to the South Urals in the Late Bronze Age

Author: Dr. Shcherbakov, Nikolai, Laboratory of Methodology and Methods of Humanitarian Research BSPU, Ufa, Russian Federation (Presenting author)
Keywords: bronze production, Late Bronze Age, West-Asian metallurgical province

Widespread of bronzes production in the Bashkir Urals is connected with the Late Bronze Age. The study of settlements and funerary monuments of the Late Bronze Age in this area gave massive material on bronze production in the region (waste products, casting molds, copper drops and ingots, particles of copper ore, containers with traces of waste products) and also numerous products made of bronze (knives, chisels, awls, hiltlaths for vessels, sickles, ornaments and so on). E. Chernykh distinguished in this area a West-Asian metallurgical province connected with the Eurasian Steppe. It is connected with a contact between the two groups of population in the southern Urals: Srubnaya and Andronovskaya (Alakulskaya) cultures. In Bashkir Urals, in the area between the rivers Dema and Urshak, Kazburunovsky archaeological micro-district belonging to the late Bronze Age is distinguished. There is a group of five settlements and 4 barrow burials here. In the process of investigation the complex of sites consisting of five simultaneous settlements - Usmanovo I - III settlements, Muradymovo I, VII, VIII settlements and 57 Kazburun barrows was examined. Radiocarbon dating (Beta Analytic: 1990 – 1750 BC), proved chronological unity of these barrows and settlements. Numerous traces of bronze production were also found on the territory of Kazburun district. In Bashkir Urals, close to Kargaly mines, there are 770 mines for the extraction of copper sandstones. V. Lunkov (Laboratory of Naturally Scientific Methods, Institute of Archeology, RAS, Moscow) and M. Radivojevic (Jesus College Research Fellow McDonald Institute for Archaeological Research) carried out a complex of analyses of all bronze material belonging to one of the large settlements - Muradymovo settlement (Kazburun archeological district). Metal was worked on this site – refining, melting, casting. The primary (Cu) metal could have been imported from other regions as ‘raw’ ingots (bars) artefacts. The provenance analysis imply that the metal worked in the site of Muradymovo settlement was likely acquired from the ores exploited in the Tien Shan mountains. The UCL and RAS analyses show that there is a significant number of pure copper artefacts that represent stock, ingots, working debris. The pure copper artefacts as implements (knives, etc.) need a closer look typologically etc. (RAN analyses). The tin bronzes are already present as finished artefacts and there is no evidence for their production thus far in this site. Due to the research, a new interesting problem in Bashkir Urals archeology came up. Having a large number of copper sandstones and mines, developed in the Late Bronze Age (Kargainskiy mines), we got an interesting result: the export of ore from northern Tien Shan. As a result, deposits of copper sandstone of Upper Permian red color formations in Southern Urals from Kargaly mines to Eek River in the area of 16378 square km were examined. Paleo-genetic studies have identified several groups in Kazburun archaeological micro-district. Probably in the late Bronze Age (the ore came with population of Andronovskaya (Alakulskaya) culture of South-Eastern Kazakhstan. This confirms the theory of E. Chernykh about the unity of West-Asian Metallurgical Province.
MIXED ASSEMBLAGES: A PROPOSED FRAMEWORK

TH6-03 Abstract 01

Early farming and the transmission of ceramic traditions in the western Balkans

Author - Dr. Miljesic, Sebastian, University College London, London, United Kingdom (Presenting author)
Co-author(s) - Vanden Linden, Marc, University College London, London, United Kingdom
Keywords: Balkans, ceramic transmission

Early farming and the transmission of ceramic traditions in the western Balkans was a process that greatly contributed to the cultural exchange and development in the Neolithic and Eneolithic period. The study focuses on the influence of the spread of farming practices across Europe, following two main routes: inland and maritime. The inland route initially corresponded to the Starčevo-Körös-Criș complex across the Balkans from 5600 cal BC onwards, and then expanded across continental Europe as the Linearbandkeramik culture. The maritime stream is associated with the Impresso-complex in the Mediterranean Basin.

The study of the ancient Volga-Kama pottery revealed areas with two types of pottery raw materials: silty clay rich in sand in the Middle Povolzhye and plastic clay tempered with chamotte in the Prikamye region (Vybornov, Vasilyeva, 2013). Flat-bottomed pricked pottery is present in the Middle Povolzhye in the early Neolithic period (5500 cal BC). It is all made of silty clay when still plain. The proportion of local pricked pottery made of clay and chamotte increases to 15%. Kama comb-ornamented pottery made of clay tempered with chamotte does not exceed 10% further to the west (Mariyinskyye Povolzhye, Primokshanye, and Posyurye). The rest of the ceramics were made of silty clays. This recipe (clay and silt) is typical for the pricked pottery from the forest-steppe of the Middle Povolzhye.

The ceramic chaine opératoires, defined as a series of operations which transforms raw material into finished products, is a particular relevant signal for tracing and identifying histories of transmission. Explanations have been found in the learning process. It has been demonstrated that learning involves a tutor and a model. At the end of the learning process, the learned skills are literally embodied. At the collective level transmission occurs within groups made up of individuals linked by social ties. These ties determine the social perimeter in which ways of doing are transmitted. As a result of these learning processes it appears that: a) the chaine opératoires are by excellence inherited ways of doing transmitted through successive generations, b) changes within chaine opératoires express cultures' histories and the factors affecting them. In the latter case, evolution of technological behaviours can be generated through endogeneous processes (or phylogeny) resulting in innovation(s), or through exogeneous processes (or ethogenesis), taking place beyond social boundaries through horizontal transmission(s).

In this paper, we will present the first results based on the ceramic chaine opératoires analysis from the western Balkans.
The Nabó and Zéere are two nearby rivers in the Alto Ribatejo region, in the hinterland of Central Portugal. The Nabó is a tributary to the Tagus River. Despite their proximity, they are passing geologically different landscapes while the Nabó is cutting through limestone hills, the Zéere passes through the acidic terrain of the Central Iberian Massif and ends up in the fluvial terraces of the Tagus. This diversity has been reflected in the archaeological studies of the region. The caves around Nabó are considered as the eastern most representatives of the Neolithic group of Estremadura, a group whose roots are in the Cerdutti period. On the other hand, the open-air sites and megalithic monuments in the Zéere valley are associated with the archaeological amalgam of Alentejo and the Iberian interior, marked by the Bouqique pottery style during the Early Neolithic.

This work is reviewing the ceramic collections from two sites, one from each of the regions: Gruta do Cadaval from Nabó and Anta 1 de Val da Laje from Zéere. The first is a burial cave, dated at the transition from early to middle Neolithic, and the later is a Chalcolithic dolmen, suspected of being built over more ancient remains. Through pottery characterisation, an attempt is made to answer existing questions concerning stratigraphy and intra-site variability, but also regional communications and mutual influences. In addition, organic residue analysis offers a functional and social dimension to the role of pottery in the activities taking place in these two sites.

TH6-03 Abstract 05
Transforming traditions behind the gloom: 6th millennium BC pottery styles of Transdanubia

Author: Jaksic, Jgos, Research Centre for the Period of the Neolithic Studies, Budapest, Hungary (Presenting author)
Co-author(s): Marton-Tibor, Research Centre for the Period of the Neolithic Studies, Budapest, Hungary
Co-author(s): Kreiter, Attila, Hungarian National Museum, Budapest, Hungary
Co-author(s): Virocsek, Vanda, Independent researcher, Pils, Hungary

Keywords: 6th millennium BC, pottery styles, Transdanubia
Presentation Preference: Oral

Transforming traditions behind the gloom: 6th millennium BC pottery styles of Transdanubia. During the 6th millennium BC, the central part of the Transdanubia was occupied by several settlements, some of them are still in use up to today. The ceramic assemblages on these sites are characterized by similarities and differences, which represent the influence of the Sarmatian Cultural Tradition. The aim of the presented research is to analyze the differences and similarities in ceramic assemblages of the 6th millennium BC in Transdanubia. The research is based on the analysis of the ceramic assemblages from the sites of Balatonszéker, Gádló, and Tiszafő, which are located in the south of Hungary, south of Lake Balaton. The ceramic assemblages are characterized by similarities in the shapes, techniques, and design motifs, as well as by differences in the use of clay and temper materials. The research is also focused on the spatial distribution of the ceramic assemblages and the changes in the pottery styles over time. The results of the research will provide new insights into the social and economic changes in the 6th millennium BC in Transdanubia.
TH6-03 Abstract 08  
Do ut des: pottery “imports” and imitations in Romanian Neo-Enolithic  
Author: Stefan, Cristian Eduard, "Vasile Parvan" Institute of Archaeology, Bucharest, Romania (Presenting author)  
Keywords: Neo-Enolithic, pottery, Romania  
Presentation Preference - Oral  

The uneven distribution and networking of traits attest the significance of the role played by local socio-economic conditions and cultural practices in their dissemination, even if available evidence rarely allows us to reconstruct the contexts of production and use of the Levantine Halaf- and Ubaid-related ceramics in detail. Local production, however, was deposited locally in most cases, and, since the manufacture of such pottery presupposes the use of specialised technologies and the Levantine autochthonous traditions, its spread surely involved technological transfers. Interregional contacts, thus, appear to have structured pottery activities within the Levantine communities, contributing to the establishment of extended communities of practice.  

In the 4th millennium cal. BC the eastern Baltic region experienced various striking developments that occurred more or less simultaneously and are likely to be inter-related. Thus, a wide exchange network emerged at this time, involving a coast-to-inland flow of Baltic amber, complemented by a transfer of lithic materials. At the same time, the indigenous tradition of shelland organic-tempered ceramics, representing what is known as the 'Narva Culture', encountered the starkly contrasting Comb Ceramic tradition of rock-tempered, densely ornamented pottery – evidently an intrusive phenomenon that arrived from neighbouring areas to the north. 'Hybridisation' is a concept frequently employed to characterise the ceramic assemblages of this time, exhibiting mixed-temper fabrics along with decorative elements and designs that seemingly imitate Comb Ceramic ornamentation but at the same time, are also clearly distinct from it. In most cases, and, since the manufacture of such pottery presupposes the use of specialised technologies and the Levantine autochthonous traditions, its spread surely involved technological transfers. Interregional contacts, thus, appear to have structured pottery activities within the Levantine communities, contributing to the establishment of extended communities of practice.  

The archaeological site of Ipoly (Gradiste Ipoly), situated in the south-central Hungarian plain, in the Serbian Banat region, had been occupied for over 5000 years, from Europe’s first Neo-Enolithic farmers to the Late Bronze Age period. Its scale and character have made it to be a site of great cultural importance and national heritage. The on-going archaeological research (BORDERLAND: ARISE project) explores three chronological key phases of its prehistory, consequently yielding large amounts of ceramic materials. One of the main focuses of the project is to investigate social boundaries between Neo-Enolithic communities characterised by ‘Tisza’ and ‘Vincza’ pottery.  

The expansion of Tisza material culture from the core area of its development in the middle portion of River Tisza began in the 4th millennium BC. On several sites in the Serbian Banat the evidence of mixed assemblages and the presence of hybrid vessels, exhibiting typical style of both communities, was recorded.  

However, the Levantine ‘mixed’ assemblages are rather conceived primarily as a peculiar expression of the vast Halaf and Ubaid supra-regional socio-material networks. The uneven distribution and networking of traits attest the significance of the role played by local socio-economic conditions and cultural practices in their dissemination, even if available evidence rarely allows us to reconstruct the contexts of production and use of the Levantine Halaf- and Ubaid-related ceramics in detail. Local production, however, was deposited locally in most cases, and, since the manufacture of such pottery presupposes the use of specialised technologies and the Levantine autochthonous traditions, its spread surely involved technological transfers. Interregional contacts, thus, appear to have structured pottery activities within the Levantine communities, contributing to the establishment of extended communities of practice.  

Focusing on pottery manufacturing, based on old and recent data, this paper seeks to better understand the interaction dynamics implicated in the diffusion of Halaf and Ubaid traits at the boundaries of their respective interaction spheres, in order to further explore the global character and meaning of Halaf and Ubaid phenomena.

TH6-03 Abstract 09  
Hybrid Societies:  
the vagueness of Neolithic ‘cultures’ in the Balkans  
Author: Dr. Naumov, Goto, Museum of Macedonia, Skopje, Macedonia (Presenting author)  
Keywords: Balkans, house models, pottery  
Presentation Preference - Oral  

The issue of culture will also be discussed as it often invokes a contemporary notion of communities that inhabited particular geographical areas. Their intensive communication and common material culture goes beyond the archaeological cultural regions and as such will be emphasised for further revision.  

The determination of culture was a reference for the culture-historical archaeology in the Balkans and abroad, and leads many to identify particular regions with finds unearthed from Neolithic sites. This was a helpful tool for the early stage of prehistoric archaeology and contributed to the understanding of particular regional attributes common to the societies that inhabited various areas in the Balkans. However, recent research indicates that these cultural borders and material features are not so rigid and often much more extended beyond the proposed geographical frames. The concept of culture itself is questioned and often reconsidered with the issue of identity, as more evidence is available concerning the Neolithic societies, their villages, pottery, tools, images, burials and human remains.  

Since the first definition of Neolithic cultures some regions were regarded as separated and isolated areas and mainly considered within modern political borders. This was a significant step towards the first definition of cultural features of these regions and as such contributed in the identification of sites into cultural groups. Hence, the reconsideration of published material, artifacts from museum stores, documentation and new excavations indicated that some geographically divided and different regions were barely ‘culturally’ diverse. Thus, pottery regarded as the main feature of one culture appears in another which was classified as belonging to a different cultural group.  

The case-study of the Neolithic pottery in Pelagonia and its production within the agricultural communities of the Skopje valley, Lake Ohrid basin, Ovče Pole and Polotig, will be presented. Late Neolithic Vincza pottery will also be considered, as some of the temper types and design features appear at earlier tell sites in Pelagonia. In addition, the anthropomorphic house models from this area will be discussed. Originally, these were attributed by archaeologists to different cultures due to their typological variations in these regions.  

Therefore this paper will mainly consider pottery design and human representations in order to emphasise the common Neolithic features of the isolated regions and the modes of networks which integrated shared identities of distant societies. The issue of culture will also be discussed as it often invokes a contemporary notion of communities that inhabited particular geographical areas. Their intensive communication and common material culture goes beyond the archaeological cultural frameworks of the Balkans and as such will be emphasised for further revision.

TH6-03 Abstract 10  
Modelling interaction at the peripheries:  
LN/EC Levant and the Halaf/Ubaid interaction spheres  
Author: Gabrieli, Eva, Milano, Italy (Presenting author)  
Keywords: communities of practice, interaction spheres, technological transfer  
Presentation Preference - Oral  

Several Late Neolithic and Early Chalcolithic Levantine assemblages (8th-6th millennium cal BC) contain pottery identified as Halaf and/or Ubaid. In most cases, these ceramics are not very similar stylistically or formally to the ‘classic’ Mesopotamian specimens, and the Levant is in fact considered to lie outside the area where Halaf and Ubaid ceramic traditions emerged. More interestingly, however, the Levant is located on the periphery of both Halaf and Ubaid horizons or interaction spheres. Here, like in other ‘peripheral’ regions, pottery is one of the few elements, if not the only, to be shared, and its higher variability, both in terms of decoration and forms, indicates the differential spread of traits over space and time. The traditional narratives mainly emphasise possible cultural or ethnic affiliations to northern Mesopotamia, but, in this paper, Levantine ‘mixed’ assemblages are rather conceived primarily as a peculiar expression of the vast Halaf and Ubaid supra-regional socio-material networks.  

The uneven distribution and networking of traits attest the significance of the role played by local socio-economic conditions and cultural practices in their dissemination, even if available evidence rarely allows us to reconstruct the contexts of production and use of the Levantine Halaf- and Ubaid-related ceramics in detail. Local production, however, was deposited locally in most cases, and, since the manufacture of such pottery presupposes the use of specialised technologies and the Levantine autochthonous traditions, its spread surely involved technological transfers. Interregional contacts, thus, appear to have structured pottery activities within the Levantine communities, contributing to the establishment of extended communities of practice.  

Focusing on pottery manufacturing, based on old and recent data, this paper seeks to better understand the interaction dynamics implicated in the diffusion of Halaf and Ubaid traits at the boundaries of their respective interaction spheres, in order to further explore the global character and meaning of Halaf and Ubaid phenomena.

Keywords: Neolithic, pottery technology, Tisza, Vincsa communities  
Presentation Preference - Oral  

The Neolithic site of Ipoly (Gradiste Ipoly), situated in the south-central Hungarian plain, in the Serbian Banat region, had been occupied for over 5000 years, from Europe’s first Neolithic farmers to the Late Bronze Age period. Its scale and character have made it to be a site of great cultural importance and national heritage. The on-going archaeological research (BORDERLAND: ARISE project) explores three chronological key phases of its prehistory, consequently yielding large amounts of ceramic materials. One of the main focuses of the project is to investigate social boundaries between Neolithic communities characterised by ‘Tisza’ and ‘Vincsa’ pottery.  

The expansion of Tisza material culture from the core area of its development in the middle portion of River Tisza began in the period when the Vinča phenomenon was already fully developed in the northern Banat. On several sites in the Serbian Banat the evidence of mixed assemblages and the presence of hybrid vessels, exhibiting typical style of both communities, was recorded.
Very interestingly, the results of the previous archaeological research conducted on Idjoš revealed that materials characterised by both “Tisza” and “Vinča” styles could be found in the same contexts, for example in the house excavated in 1954 in Gradilice Idjoš. Therefore, Idjoš represents an ideal case study to investigate the dynamics which result in the formation of mixed assemblages in this region at that time.

In this presentation we provide the preliminary results of the pottery technological project which gathered experts from different fields of expertise archaeology, pottery technology and archaeometry. Through different types of analyses (macroscopic technological examination, thin section petrography, portable X-ray fluorescence and FTIR analysis), we aim to shed light on different aspects of pottery production at the site during the Late Neolithic, in order to understand if these different pottery styles could be connected to different chaînes opératoires and could reflect different organisations of productions. The aim is to interpret the existing mixed inventory and understand if these different styles are reflecting the co-habitation of different social groups on Idjoš, or if they are the expression of exchange of ideas and communication among communities characterised by different material culture.

Co-author(s) - Medović, Aleksandar, Museum of Voivodina, Novi Sad, Serbia
Co-author(s) - Medović, Ivkko, Museum of Voivodina, Novi Sad, Serbia
Co-author(s) - Stanković-Peltarac, Tiša, Museum of Voivodina, Novi Sad, Serbia

Keywords: mixed assemblages, Neolithic Voivodina, pottery analysis
Presentation Preference - Oral

During the Neolithic, due to their geographical position, Voivodina and Banat formed a contact zone between several cultural zones, belonging to the Central Balkans and Transylvania. This is manifested, among other things, in settlement structure, architecture and material culture. In a group of sites in the Tisza valley, in the West of this area, Vinča and Tisza pottery styles occur together in the same settlements. We are studying this phenomenon at the spatial scale of two large Neolithic settlements and a loess plain with a size of 11 km² which is situated close to the town of Novi Bečej.

To understand the socio-economic implications of this and similar phenomena, we are contextualising artifactual material, archaeo-botanical and archaeo-zoological remains through comparisons of inventories from different households and settlements. The co-occurrence of Vinča and Tisza pottery styles in the same households is being investigated by typological and chronological technological analyses. Geochemical and mineralogical analyses contribute to answering the questions of how pottery production in these sites was organised and how this pottery was linked technologically to the core regions of the cultural groups involved.

Keywords: Okhta 1, Podolie 1 sites, Neva-Ladoga basin, petrography, XRF, microtomography of ceramics, technology, Neolithic-Eneolithic pottery

Presentation Preference - Oral

There are unique Neolithic-Eneolithic sites in the territory of the Neva-Ladoga basin (NW Russia). The site of Okhta 1 is located at the mouth of the Okhta River in St. Petersburg city region. The first people occupied this territory around 4200 BC. These were the first communities of the Neolithic Pit-Combed culture. Changes in the landscape and the climatic conditions around 3200-3000 BC made this area attractive for habitation. In this period, on the coastal zone the houses, fishing constructions, areas of the Great-grain Plain, the Central Balkans and Transylvania. The Hrona ceramic was formed by using slabs, ornamentation represents a horizontal lines of Z-twisted cord and as admixture in the molding clay. This technique of “blade and anvil” was widespread in Usvatskaya culture, but on the vessels with cord ornamentation this is a main additive. On the other hand, ceramic was formed by using slabs, ornamentation represents a horizontal lines of Z-twisted cord and as admixture in the molding clay was used gruss. Possibly, that neocomen (CWC inhabitants) were mixed with local inhabitants and we trace now some new archaeological tradition, new archaeological culture.

TH6-03 Abstract 15
Corded Ware Culture in the North-West of Russia: mix of traditions

Author - Tkach, Evgenia, Institute for the History of Material Culture, St Petersburg, Russian Federation (Presenting author)

Keywords: Corded Ware Cultures, migrations, traditions

Presentation Preference - Oral

There are a lot of settlements in the North-West Russia with Corded Ware Cultures (CWC) materials. They appear in the pile-dwelling settlements also. On the ceramic materials we could trace mix of different archaeological cultures: local and indigenous. First appearance of the CWC was observed in the middle of the III mil. BC on the pile-dwelling settlement Ustye-Vor (Palov region). I want to describe the settlement – layer a settlement Serteya II. This is settlement on the mineral bank near the river. Ceramics introduce a different traditions: local, Usvatskaya, and indigenous, CWC. We could trace them in technology of making pottery (the way of using vessels, admixture in the molding dough), in pottery forms and in ornamentation. For example, admixture of gruss was never used in Usvatskaya culture, but on the vessels with cord ornamentation this is a main additive. On the other hand, technology of “blade and anvil” was widespread in Usvatskaya culture, but in the CWC materials on the settlement this technique was found only a few times. Cord ornamentation was never used in the North-West Russia until the end of Neolithic. This tradition came with CWC inhabitants in the end of III mil. BC. More interesting, that in couple vessels we see the mix of different traditions: ceramic was formed by using slabs, ornamentation represents a horizontal lines of Z-twisted cord and as admixture in the molding clay was used gruss. Possibly, that neocomen (CWC inhabitants) were mixed with local inhabitants and we trace now some new archaeological tradition, new archaeological culture.
TH6-03 Abstract 17

Sub-Neolithic pottery from the territory of Belarusian Pabužža

Author: T. Tschou, Institute of History NAS of Belarus, Minsk, Belarus (Presenting author)
Keywords: technology, Neolithic pottery, the Prypiat-Neman culture

Investigations of the last decade significantly increased the resource base for the study of the Neolithic of Belarusian Pabužža (Belarusian part of the Bug River basin). During recent excavations Sub-Neolithic pottery was found at 19 sites in the region.

For the first time pottery of the Dubičiai type was discovered in the region. This fact gives the possibility of defining more exactly the area of the Prypiat-Neman culture. Some finds attributed to the Sokolnikiw pottery type were also found. The latter type is most probably a result of a local development of the Dubičiai pottery in the western part of Prypiat-Neman culture area.

Neman culture is represented by pottery of Lysaja Hara and Dobry Bor types. The finds which belong to the former are not numerous. It may be remotely connected to the main area of its distribution (upper reaches of the Neman River). The Dobry Bor type pottery is much more frequent. It was found at most of the studied sites. It can be divided into two groups: the first one is represented by hybrid pottery with features of both Lysaja Hara and Dobry Bor types. Analogies to such pottery can be found in the Upper Prypiat River basin. The second group consists of "classic" Dobry Bor pottery.

TH6-03 Abstract 18

Crkviče-Bukovlje: Identifying Copper Age pottery from disturbed stratigraphy

Author: MA Čataj, Lea, Croatian Conservation Institute, Zagreb, Croatia (Presenting author)
Co-author(s): Posilović, Hrvoje, Croatian Geological Survey, Zagreb, Croatia
Keywords: Copper Age, Croatia, Lasinja culture

The site Crkviče-Bukovlje in central Croatia has been systematically excavated since 2012. Primarily it was recognised as a Late Antique site dating to the 5th and 6th centuries AD. During the archaeological excavations prehistoric layers from the Iron and Copper Age were also found. Due to the erosion and later occupancy of the site, the oldest Copper Age layers were severely disturbed. Hence, the affiliation of pottery finds is based on their ornamentation, shape and technology. Although most of the finds could be ascribed to the Lasinja culture, there are some pieces that show traits of the Retz-Gajary culture. The appearance of pottery belonging to these two cultures is known from several sites in Croatia, Slovenia and Austria. Sometimes they are found together in the same layers and sometimes Lasinja culture pottery is found in layers beneath the ones with pottery ascribed to the Retz-Gajary culture. New radiocarbon dated assemblages have brought some new insights regarding some of the ornamentation that was previously connected to the late phase of Lasinja culture, supposedly influenced by Retz-Gajary culture.

The question raised is whether we can suppose the presence of Retz-Gajary culture or its influence at the site Crkviče-Bukovlje based on several ornaments that are usually ascribed to Retz-Gajary culture or are we dealing with Lasinja culture pottery and these ornaments appear regardless of Retz-Gajary culture? Clay pastes of Lasinja culture pottery and pottery with Retz-Gajary traits will also be analysed in order to see if there are some differences between them.

TH6-03 Abstract 19

Neolithic pottery from Ljubic cave (Istria, Croatia)

Author: Percan, Tihomir, Croatian Conservation Institute, Svetvincenat, Croatia (Presenting author)
Keywords: analysis, decoration, Neolithic pottery

Due to its exceptional geographical position on the crossroads of ancient paths, the Istrian peninsula was an important link between east, west, north and south ever since prehistoric times. The Ljubic cave is situated in southern Istria (Croatia) near the village of Marčana and only 15 kilometers east of Pula, the peninsula’s largest city. Since 2008 to 2011 archaeological excavations were carried out in cooperation between the Musee d’Anthropologie prehistorique de Monaco (Principality of Monaco) and The Croatian Conservation Institute (Croatia). Recorded findings, particularly ones from the Neolithic period, implied that the cave was intensively in use during this period. A large number of pottery fragments were nicely decorated with different motifs and ornaments characteristic of the cultural phenomena from Early (Impressed culture), Middle (Danilo culture) and Late (Hvar culture) Neolithic therefore making it the period of the most intense usage of the cave. With this poster we will put the focus on the Middle Neolithic (Danilo culture) pottery and its ornaments (S shaped decoration, different spiral motifs, incrustation). Furthermore, laboratory analyses of pottery and ornaments show the significance of this multidisciplinary approach to archaeology and pottery. With these kinds of experiments, interesting results were collected. This work would not be possible without good cooperation between archaeologists and the laboratory where the analyses were held (Metris, Pula, Croatia). We also emphasised the significance of the modern scientific technology and methods to improve and advance knowledge connected to technology and production of pottery during the archaeological periods.
ENTANGLED MIGRATION.
THE MATERIALITY OF DIASPORA COMMUNITIES
IN THE MEDIEVAL AND EARLY MODERN WORLD

Thursday, 1 September 2016, 14:00-18:30
Faculty of History, Room 331
Author: Linea, Jette, Mosegaard Museum, Højbjerg, Denmark (Presenting author)
Co-author(s): Rosén, Christina, Statens Historiska Museer, Göteborg, Sweden
Keywords: Early Modern, Materiality, Migration
Presentation Preference: Regular session

Migration is a hot topic, but not a new one: Diaspora communities are well-known in the medieval and early modern past. The question is if the otherness of the migrants was as a hindrance or a resource in their new life. In this session we aim to take on this question by approaching links between individual identity, community and host- and homelands.

The session brings together three research areas: the study of migration, urban development, and the study of the formation and expression of group- and individual identity through materiality. The examples are many: The medieval Hanseatic migration was followed by refugees and economic migrants in Europe and beyond from the 16th century onwards, and the migrants were entangled in complicated networks of marriage, kinship and business relations in host- and homelands. This entanglement gives rise to series of core questions in the interpretation of the archaeological record. 1. How do we identify immigrant identities? 2. How do we assess social or other differences within the immigrant community? 3. How do we assess reactions of the host land to the immigrants? 4. How do we separate diasporic identities from those of overlapping communities cutting across ethnicity, e.g. occupation, social and economic status, age, gender and rank.

The session takes its starting point from the ongoing Danish-Swedish research council project Urban Diaspora, that focuses on Scottish, German and Dutch diaspora communities in Scandinavian cities. Urban Diaspora is based on the materiality of consumption reflected primarily in ceramics, eco/zoofacts and written records, but we invite speakers to give their perspectives on immigrant identities through papers dealing with all kinds of materiality, whether rooted in Scandinavian communities or in those of refugee Dutchmen, German craftsmen, Scottish traders, Portuguese merchants, Italian artists or something else in Europe and beyond.

TH6-04 Abstract 01
Ireland and its medieval diasporic communities

Author: Ò Flanagan, Russell, University of Cambridge, Heidelberg, Germany (Presenting author)
Keywords: Acculturation studies, Migration, Postcolonial theory
Presentation Preference: Oral

For a region traditionally associated in recent centuries with its migrant diasporic communities, Ireland has had a long and complex history with internal migrant communities. In fact, the main strands of the nationalist mythos formulated during the floruit of Nationalist Romanticism were constructed in the context of – and often in contradiction to – the outcomes of these episodes of migratory activity. While recent research will occasionally be made to sixteenth/seventeenth-century migratory and colonial activity, this paper will mainly compare and contrast two medieval case studies: the arrival of settlers firstly from Scandinavia and the Scandinavian Diaspora between the ninth and twelfth centuries, and secondly from the broader Anglo-Frisian world from the end of the twelfth century to the mid-fourteenth century. While each of these episodes differed from the others, in terms of scale and outcome, there were some commonalities. For example, both involved settlers from geographically disparate homelands, such as modern-day Denmark and Norway and areas of associated settlement in the case of the former, and modern-day England, France, Flanders, Wales and Scotland in the latter. Furthermore, both might be regarded as colonialism, seen here as a particular form of pre-modern migration, at least in terms of the intentions of the initial migrants.

Before assessing the outcomes of each episode, it is first necessary to determine the extent of the associated migratory activity by recourse to a combination of material settlement evidence, documentary sources, the toponymic record and the evidence of material culture. Following this, using the same sources of evidence, an assessment will be made of number of cultural phenomena associated with migrant, diasporic and/or colonial communities, namely ossification, the carrying on of certain cultural traits from the homeland beyond their usage in that homeland, acculturation, the adoption of certain cultural traits by one group based on their contact with another, and hybridisation, the coming together of several packages of cultural traits of diverse origins to form a new cultural package. Such discussions should of course only take place having absorbed the various lessons of recent scholarship regarding the mutable nature of ethnicity, and the ability of both groups and individuals to identify themselves in several overlapping – if not conflicting – ways, and so the penultimate section of the paper will discuss the evidence for the holding of multiple identities in the case studies based on different spheres of social life. Following this, the paper will close with a discussion of the utility of the application of the lessons learned from these case studies to other examples of colonial, migratory or diasporic phenomena at other points in space and time.

TH6-04 Abstract 02
Jugs and pots - beer and stew? “Hanseatic “impact on medieval and early modern Bergen (Norway)

Author: Ø Ræthun, Volker, University of Stavanger, Stavanger, Norway (Presenting author)
Keywords: Germans in Bergen (Norway), Hanseatic league, Pottery, drinks and food
Presentation Preference: Oral

As widely known, the city of Bergen on the westcoast of Norway was an important element in the trading network of the Hanseatic league. From the 14th to the 17th century a considerable number of Germans from various Hanseatic towns were living here, making up partly up to a quarter of the towns overall population.

There is a large collection of archaeological material that can be connected with these Hanseatic population, as the site of the Hanseatic kontor was in the scope of extensive archaeological research from the 1950’s to the 1970’s. Based mainly on the analysis of a selection of pottery from Bergen, I want to discuss how far the archaeological material reflects the everyday habits of the persons that lived in the Hanseatic quarter of Bergen, presumable their eating and drinking habits. Are there significant traces that can be linked to the Northern German origins of these groups? Is it possible to pinpoint differences in the archaeological material that can indicate whether ethnic Norwegians or immigrants Germans lived on a particular site? What may have been possible areas of cultural contact and transfer between the different ethnic and social groups? By combining the archaeological material with historical evidence the outlines of social realities in an international trading town my emerge.

TH6-04 Abstract 03
Urban Diaspora - Entangled diaspora communities in Early Modern Scandinavia

Author: Dr. Linea, Jette, Mosegaard Museum, Odder, Denmark (Presenting author)
Keywords: Diaspora, Migration, Urbanity
Presentation Preference: Oral

The Early Modern period (c. 1450-1650) was a time of transformation in the Early Modern cities. Increasing early modern migration into Scandinavia from the Netherlands, present Germany and the UK meant an influx of people, objects and ideas that profoundly transformed the cities, where the immigrants settled and formed diaspora communities with strong commercial and familial ties to their homelands. The formation of such communities in established cities gave rise to series of reactions from the hostlands: Some meetings were peaceful; others were conflict-ridden. The migrants came with different agendas: conquerors and colonizers, traders, economic, political and religious refugees had their own agendas and aims, each of them influencing the interaction within the communities and between the communities and the local inhabitants. And they were met with different responses ranging from official welcomes to conflict and resistance. The urban Diaspora project is an ongoing cross-disciplinary and cross-national research project on immigration into medieval and early modern Scandinavia. In the course of the project our participants has uncovered traces of migration based in archaeology, history and science. All the projects in its final phase, the aim of this paper is to present the research framework and some results of the project, concentrating on the agendas of the many immigrant groups, that settled here, and the official and unofficial responses of hostland to the pressure of the immigrants. The Urban Diaspora is funded by the Danish Council for Independent research/Humanities.

TH6-04 Abstract 04
Migration in Early Modern Scandinavian towns. The Nya Lódöse case

Author: Dr. Rosén, Christina, Arkeologiska SHMM, Tölöö, Sweden (Presenting author)
Keywords: Early Modern, Migration, Scandinavia
Presentation Preference: Oral

The town Nya Lódöse existed between 1473 and 1624 on the west coast of Sweden. The written sources from the town are sparse and cover only the last decades of its existence. In this paper I will discuss strategies for identifying immigrant households from the archaeological record with emphasis on how to distinguish between diaspora identities and other overlapping identities such as occupation, social and economic status.
TH6-04 Abstract 05
Early Modern Immigrants: The City of New Lüdöse in the Historical records
Author: PhD Larson, Daniel, University of Gothenburg, Göteborg, Sweden (Presenting author)
Keywords: Early Modern, Immigrants, New Lüdöse
Presentation Preference: Oral

The city of New Lüdöse was established in 1473 as a gateway for trade between Sweden and Western Europe. About 150 years later, in the early 1620s, the city lost its privileges, and the citizens were forced to move closer to the sea, so what is now modern-day Gothenburg. In the research project Urban Diaspora - Diaspora communities and materiality in early modern urban centers, New Lüdöse is defined as an "immigrant city", while the other two cities in the project, Elsinore and Aalborg, are classified as a "cosmopolis" and a "provincial city" respectively. The amount of preserved historical records differs for these three cities. For New Lüdöse, no written document has been found that makes it possible to identify owners of excavated plots or to study individual family trees thoroughly (e.g., marriage strategies, networks, and materiality). On the other hand, the discovery of a number of tax poll lists from 1599-1610 has made it possible to analyze the town in other ways. The compilation of individual data from these lists not only shows a city with a number of inhabitants of Dutch and German origin and significant socioeconomic differences, but also provides a more precise idea about the city districts: their size, population, and economic capacity, and the occupational status of their inhabitants.

TH6-04 Abstract 06
Archaeological excavations of Dutch settlements from the 16th-17th century in Elsinore, Denmark
Author: MA Appel, Liv, Museum Nordjælland, Hørsholm, Denmark (Presenting author)
Keywords: Diaspora communities, Historical archaeology, Migration
Presentation Preference: Oral

The magnificent borough of Elsinore, situated on the narrow Sound between Denmark and Sweden, is of special interest concerning the archaeology of the wealthy Dutch immigrants in the 16th-century. Since 1429 every ship passing through the Sound had to moor at Elsinore roads in order to pay the Sound toll taxes, and the Danish and foreign merchants made good money trading with the foreign ships. The increased Dutch immigrations following the wars in the Netherlands in 1587, coincided with an increase by growth and progress for the town as the king Frederik II rebuilt the castle of Kronborg. Many well-established Dutch merchants settled at the sandy area situated between the town of Elsinore and Kronborg Castle. This new town quarter, earlier known as Sunden, the i., the sands, got an abrupt end due to the Swedish attack in 1658.

Recent archiological investigations in connection with extensive construction work in this area, which were until recently hidden under the former shipyard area, have revealed remnants of buildings, culture layers, latrines and wells connected to the rich 16th-17th century settlements. The fauna and the botanical remains reveal, so as the archaeological finds, that the Dutch merchants in Elsinore dined on the finest quality food and on imported tableware in faience and ceramics.

TH6-04 Abstract 07
Can an animal bone assemblage indicate a diaspora?
Author: Dr. Enghoff, Inge S., University of Copenhagen, Copenhagen, Denmark (Presenting author)
Keywords: Animals, Diaspora, Entangled Migration, Zoonarchaeology
Presentation Preference: Oral

Analyses of archaeological animal bone assemblages sometimes provide evidence of successions and/or coexistence of different cultures. Thus, the species present and their relative frequencies at the site Gården under Sandet, Greenland (ca. AD 1000-1400) show that the Norse settlers imported European domestic mammals and partly subsisted on these, but that over time the importance of native seals increased, whereas the importance of cattle decreased. Cutmarks etc. on the bones may also provide clues; for example bi-perforated metapodials, mostly of sheep, from the Danish site Ribe (AD 725-860) indicate that bone marrow was obtained this way which seems to be an ancient tradition in Scandinavia which has been exported to England several times, mainly by Ny Lüdöse, and may be exported by German or Dutch households for the making of certain traditional dishes - like gruel consumed on specific occasions. The traces of foreign food and beer traditions bear witness of a multi-ethnic town, with populations of traders preserving traditions of their homeland.

TH6-04 Abstract 08
Tracing ethnicity in food consumption - the case of Nya Lüdöse
Author: Dr. Heimdahl, Jens, National Historical Museums, Hägersten, Sweden (Presenting author)
Keywords: consumption, ethnicity, fish bones
Presentation Preference: Oral

The present paper deals with the question to what extent ethnic identity can be traced in the archaeozoological remains of food consumption. Within the research project Urban Diaspora - Diaspora communities and materiality in early modern urban centers it was asked whether it was possible to distinguish differences in consumption between plots in the town of Nya Lüdöse (1473-1624), Sweden. The town was situated at the Swedish west coast, and was characterized by a multicultural population largely consisting of merchants, soldiers and sailors. From 2013 and onwards comprehensive excavations covering large parts of the town have been conducted. A range of different features have been excavated, from houses and backyards to streets and refuse pits. The clearly defined plots form a unique possibility to map differences in food consumption between households, and possibly connect the variation with the identity of the plot owner: e.g., ethnicity, status or class.

Archaeological features clearly connected to the consumption in five town plots were selected, and special attention was given to the fish bone assemblage. The names of the plot owners are not known through written sources. It was apparent on early on that there did exist interesting differences, especially regarding the distribution of species. Anatomical distribution and size were also investigated. The challenge lies, as always, in explaining the differences found. Are they due to the resident’s birthplace, social class or personal taste, only to mention a few possibilities?

TH6-04 Abstract 09
Foreign beer and gruel traditions in late medieval town Nya Lüdöse, Sweden
Author: MA Heilmahl, Jens, National Historical Museums, Hägersten, Sweden (Presenting author)
Keywords: archaeozoology, beer, immigrant
Presentation Preference: Oral

Food and beer traditions foreign to the local Swedish west coast have been traced by specific plant material in the late medieval town Nya Lüdöse, and may linked the local bakers of Birgern or Dutch origin. Traces of hop beer brewing from the late 13th century is an anomaly in an area strongly dominated by sweet gale beers as late as mid15th century. Likewise, the use of malted barley stands out as an foreign in relation to local tradition. It is argued that it is not possible to distinguish differences in consumption between plots in the town of Nya Lüdöse, Sweden. The town was situated at the Swedish west coast, and was characterized by a multicultural population largely consisting of merchants, soldiers and sailors. From 2013 and onwards comprehensive excavations covering large parts of the town have been conducted. A range of different features have been excavated, from houses and backyards to streets and refuse pits. The clearly defined plots form a unique possibility to map differences in food consumption between households, and possibly connect the variation with the identity of the plot owner: e.g., ethnicity, status or class.

This paper seeks to explore, in how far it is possible to identify common traces or differences between "Danish" and immigrant households in Aalborg and Etelkær during the renaissance. The focus will be put on stone tiles as type of material culture with a solid background of research and many possibilities to identify the origin of fabric, decoration and use. Moreover, the position of a stone in the house and its relationship to the development of dwelling habits will be discussed.

TH6-04 Abstract 12

**In the houses of urban strangers?**

**Author** - Historian Christin Jakob, Danish Centre for Urban History, Aarhus, Denmark (Presenting author)

**Keywords** - Early modern, Materiality, Migration

**Presentation Preference** - Oral

House and home form the most important cultural element of human daily life. How we live and how we furnish our homes define who we are and how we would like the outer world to see us. Things were no different in the Danish market town Aalborg in the seventeenth century. By use of the probate records this paper aims to investigate the differences and similarities of the material culture in the homes and houses of both immigrant and Danish merchant families in Aalborg. It will be discussed if the immigrant families came with their own material culture and if in doing so contributed to the making of a cultural identity.

TH6-04 Abstract 13

**A newcomer’s burial: anthropomorphic graves in medieval Transylvania (12-13th c.)**

**Author** - Dr. Istrate, Daniela Veronica, Brașov, Romania (Presenting author)

**Co-authors** - Istrate, Aniela, Hieronymus, archaeology, Braşov, Romania

**Keywords** - Anthropomorphic graves, medieval colonisation, Transylvania

**Presentation Preference** - Poster

From the mid-12th century, guests from Central Europe, generally known as Teutonici, Flandrensi, and ultimately Saxons, were invited to settle in southern Transylvania (central Romania) in return for important economic and social privileges. The process of colonization was at its peak in the first decades of the second half of the 13th century, when several villages and towns were established in the hinterland of Sibiu, the largest city in southern Transylvania. Settlers continued to come well into the early 14th century, establishing enclaves of a German-speaking population. They developed a successful economic system, which enabled the establishment of strong settlements, the rise of an intellectual elite, and the growth of cities that involved many urban centres in East Central Europe. They also developed a distinctive religious architecture.

TH6-05 Abstract 01

**Adieu Hallstatt! Adieu La Tène! Revisiting old ideas**

**Author** - Prof. emeritus Collis, John, University of Sheffield, Sheffield, United Kingdom (Presenting author)

**Co-author** - Prof. Potrebica, Hrvoje, University of Zagreb, Zagreb, Croatia

**Co-author** - Dr. Baster, Lindsey, University of Bradford, Bradford, United Kingdom

**Co-author** - Prof. Armit, Ian, University of Bradford, Bradford, United Kingdom (Presenting author)

**Co-author** - Prof. emeritus Collis, John, University of Sheffield, Sheffield, United Kingdom (Presenting author)

**Keywords** - Celts, Iron Age chronology, Networks

**Presentation Preference** - Oral

At the 1984 conference of the AFEAF (published in 1986) I gave a short paper suggesting that if we could only get rid of the terms Hallstatt and La Tène we might write a very different narrative of the European Iron Age. At that time I was looking specifically at cases in southern Germany, central France and Britain where ideas of chronological divisions and ‘culture groups’ were getting confused, and muddied with now unacceptable theories on the origin of the Celts and their supposed migrations. Only now is the concept of the ‘culture group’ being replaced with ‘networks’ and I personally have been trying to replace chronological ‘phases’ based on ‘type fossils’ (as originally developed by Reinecke and Déchelette) with ideas of building chronologies on ‘attributes’ and sequences of ‘horizons’ signalled by single innovations or mutations in material culture. The concepts can also be applied to genetics and languages, and so help to re-integrate different disciplines which in recent years have grown apart (e.g. in ‘Celtic Studies’). I will reflect on our nomenclature and whether terms like Hallstatt and La Tène should be abandoned, or can still be used, e.g. to denote styles of pottery, burial rite, etc. It means that we stop trying to construct chronological and cultural boundaries, and it can also affect basic things like the way in which we publish archaeological excavation reports.

---

TH6-05 Abstract 02

**Bringing down the Wall or How precise independent chronologies facilitate negotiation of boundaries**

**Author** - Dr. Hamilton, Derek, University of Glasgow, East Kilbride, United Kingdom (Presenting author)

**Keywords** - Boundaries, chronology, Iron Age

**Presentation Preference** - Oral

Later prehistoric Europe has traditionally been studied in relation to a series of boundaries. These include the bounded chronological horizons which divide Late Bronze Age and Early Iron Age communities; geographical boundaries created through the development of separate national traditions of archaeological research; boundaries between perceived ethnic groups such as the Celts, Iberians, Veneti etc; and disciplinary divisions which separate ‘humanities’ from ‘scientific’ approaches. In recent years however this picture has begun to change. New research agendas seek to break down chronological horizons, with particular attention paid to transitional periods; more nuanced understandings of cultural identity are promoting cross-border collaboration, with a focus on zones of interaction between communities traditionally viewed as monolithic and bounded; interdisciplinary research frameworks are demonstrating the benefits of integrating scientific with more traditional approaches; and increasingly collaborative projects are fostering relationships and knowledge exchange on an international scale.

This session will draw on a number of papers from the ENTRANS Project; a HERA-funded collaborative project between the Universities of Bradford (UK), Ljubljana (SLO) and Zagreb (CRO), which explores cultural identities and encounters across the Late Bronze Age and Iron Age transition in the Eastern Alpine region - a zone of interaction and encounters between Mediterranean societies and their traditionally perceived ‘barbarian’ neighbours. We also invite papers which seek to break down chronological, geographical or disciplinary boundaries within other parts of later prehistoric Europe (broadly, the Bronze and Iron Ages).

---

TH6-05 Abstract 03

**TRANSCENDING BORDERS IN LATER PREHISTORIC EUROPE**

**Friday, 2 September 2016, 09:00-18:00**

**Faculty of Philosophy, Room 209**

**Author** - Prof. Anett, I., University of Bradford, Bradford, United Kingdom (Presenting author)

**Co-author** - Dr. Mason, P., Institute for the Protection of Cultural Heritage of Slovenia, Novo Mesto, Slovenia

**Keywords** - Borders, Bronze Age, Iron Age

**Presentation Preference** - Regular session

Later prehistoric Europe has traditionally been studied in relation to a series of boundaries. These include the bounded chronological horizons which divide Late Bronze Age and Early Iron Age communities; geographical boundaries created through the development of separate national traditions of archaeological research; boundaries between perceived ethnic groups such as the Celts, Iberians, Veneti etc; and disciplinary divisions which separate ‘humanities’ from ‘scientific’ approaches. In recent years however this picture has begun to change. New research agendas seek to break down chronological horizons, with particular attention paid to transitional periods; more nuanced understandings of cultural identity are promoting cross-border collaboration, with a focus on zones of interaction between communities traditionally viewed as monolithic and bounded; interdisciplinary research frameworks are demonstrating the benefits of integrating scientific with more traditional approaches; and increasingly collaborative projects are fostering relationships and knowledge exchange on an international scale.

This session will draw on a number of papers from the ENTRANS Project; a HERA-funded collaborative project between the Universities of Bradford (UK), Ljubljana (SLO) and Zagreb (CRO), which explores cultural identities and encounters across the Late Bronze Age and Iron Age transition in the East Alpine region - a zone of interaction and encounters between Mediterranean societies and their traditionally perceived ‘barbarian’ neighbours. We also invite papers which seek to break down chronological, geographical or disciplinary boundaries within other parts of later prehistoric Europe (broadly, the Bronze and Iron Ages).
Boundaries provide an exciting and dynamic place to do archeology, but they can also be fraught with troubles. Working across national borders often requires realignment of classificatory schemes for both 'cultural' groups and their associated material culture. To say a site belongs to 'the Iron Age' carries very different meaning to a person in Greece or in France. Even in a space as small as Britain, "the Iron Age" can mean different things when looking at either side of the Anglo-Scottish border. Moving through geographical boundaries, problems are only exacerbated when also faced with a boundary dividing one chronological period from another.

Drawing primarily upon examples from Iron Age Britain, from both sides of the Anglo-Scottish border, from the North to the South, and across the period of Roman contact and conquest, this paper will explore how the development of precise independent chronologies enables archeologists to negotiate the potential perils in these liminal locations, allowing us to better model and understand social change across space and through time.

TH6-05 Abstract 03

Strangers at the Feast? Elites, artefacts and exchange in the 1st millennium BC in SE Slovenia

Author - Masan, Filip, Zavod za varstvo kulturne dediščine Slovenija, Center za preventivno arheologijo, Ljubljana, Slovenia (Presenting author)

Keywords: Iron Age, Late Bronze Age, Slovenia

Presentation Preference - Oral

The paper explores the role of elite contact and competition in the LBA and EIA societies in SE Slovenia in the transmission of artefacts and technologies around the Head of the Adriatic in the 1st millennium BC in the light of recent research. Exotic material in both mortuary and settlement contexts reflects changing patterns of elite exchange in the balance, changing the importance of a N-S route between the Eastern Adriatic and the Eastern Alps on the one hand and a E-W route between North Central Italy through the Head of the Adriatic to Pannonia and the northern Balkan peninsula on the other.

It explores the way in which specific types of exotic artefacts were incorporated into the existing elite or prestige repertoire, combining with and transforming local forms and traditions in the mortuary and settlement sphere. This is reflected in the adoption of iron technology, new forms of elite expression and the aggrandisement of centres of power that accompanied the transformation of the LBA Ljubljana group and gave rise to the EIA Doljanska group.

TH6-05 Abstract 04

Iron Age interaction in the Po river lowlands and in the pre-Alps of the western Veneto (Italy)

Author - MA Saccoccio, Fabio, La Saapienza University of Rome, Roma, Italy (Presenting author)

Keywords: borders, Iron Age, Veneto region

Presentation Preference - Oral

The western Veneto region is geographically characterized by a landscape that progressively decreases in elevation from the peaks of the Pre-Alps to the plain shaped by the Brenta, Adige and Po rivers and tributaries. The western border of Veneto seems to show a long-lasting pattern of interaction between human groups at least since the Final Bronze Age. This long duration is still notably remarked by the current regional borders.

As recognized by several authors, the whole plain and pre-alpine areas seem to share the same material culture, during the Final Bronze and the Early Iron Ages (X-VIII century BC), i.e. the Proto- and Palaeovenetian culture, but they strongly differ in the settlement pattern, showing a marked continuity in the South-Western Plain area, while the northern Pre-Alps seem to be affected by the wider Final Bronze Age settlement crisis. Finds related to the Trentino-Luogo/Platten culture are found widely, showing intense supra-regional communication. At the same time, Leonardi proposed that the Pre-Alps hillfort settlements were characterized by power concentration deriving from the control of boundaries. Since this phase, albeit with diverging settlement patterns, the two areas represent the Western and North-Western borders of the Palaeovenetian world.

The VI century BC marks another step in the border interaction in both areas, as significant finds with different origins are recorded in both areas. The central place of Gazzoz Veronese, close to the Minico river, records the presence of Etruscan finds - a bronze double axe and 4 lunularia statuettes, one with an inscription - it seem to record a probable presence of high status figures (magistrates?) among the Palaeovenetian community, but probably only for a brief period. Quite different is the case of the northern area where the presence of epigraphic and material culture finds suggests a marked divergent identity pattern from the previous phase, influenced by Rhetic elements (Fritzen-Sansone culture). Leonardi (2011) proposed to recognize in this case a phenomenon of hybridization due to trade contacts between the local (Palaeovenetian community) and the Rhetic human groups that finally succeed in acquire the cultural and political supremacy.

Both areas, in the IV century BC, appear to be strongly affected by the Celtic-Carnerian invasion that led to a profound change and reorganization of the considered archaeological landscape. Connections between the analyzed areas and the Celtic one, North of Alps, are recorded by finds since the end of VI-V century BC and interpreted by Bondini (2005) as mercenaries controlling the compulsory trade axes in the Pre-Alps belt. During the IV century BC the central place of Gazzoz Veronese shows a contraction and a shift in the location of the inhabited area although problematic is still the definition of its ethnicity in this phase. Complex is generally the definition of the Palaeovenetian polity for the IV century BC due to the scarcity of archaeological evidences: only in a subsequent phase the presence of Celtic human groups is recorded in the area near Verona, Oppiano and Mantua leading to a contraction of the Palaeovenetian polity.
TH6-05 Abstract 07

Crossing the borders of the La Tène “world”

Author: Dr. Daniela Ivanova, Attila Institute of Archaeology CAS, Prague, v.v.i., Prague 1, Czech Republic (Presenting author)
Co-author(s): - Buršík, Daniel, The City of Prague Museum, Prague, Czech Republic

Keywords: Baltic, transalpine, Adriatic, borders, La Tène

Presentation Preference - Oral

How can we design borders of and within the La Tène “world”? By spread of typical material culture? By distribution of characteristic sites (flat burials, oppida), by textural evidence of the presence of the “Celts” or according to the political-economic structures reflected in the spatial distribution of characteristic coinage or pattern of long distance imports? Can the same material culture be ascribed to different cultural identities, different political, economic or even ethnic entities?

How we understand communities existing under the label of “the La Tène culture”? Who were their neighbours, counterparts and of what nature were their mutual contacts? Did they understand the concept of borders as we understand it nowadays?

Recent findings show (mostly peaceful) coexistence of the main cultural groups in the transalpine area (especially “Celts” and “Germans”). This is well attested especially along the long distance routes (Amber route, Elbe route), in peripheralities of traditionally used lands and at most of the major settlements. The true break seems to come with the later Germanic occupation, when many of the regions around the central European area (Saxony, Lusatia, parts of Bavaria, parts of middle Danube area etc.) remain deserted. However, there exist some evidence of the prevalence of these traditional connections.

The contribution aims to summarise research development made on the territorial issue of the La Tène culture and its northern (the “Germans”) and southern (the “Romans”) counterparts during the last ten years. We want especially to assess the importance of long distance routes (connecting the Adriatic, transalpine and Baltic regions) and to point out how contemporary study of these communications with the use of modern methods can change our traditional perspective of the concept of borders of the La Tène world.

TH6-05 Abstract 08

Exchanging rough materials between North and South of Europe at a time of transition

Author: - Adj. Prof. Oikonomidou, Stavros, Arcadia University Athens, Greece (Presenting author)
Co-author(s): - Dr. Oikonomou, Artemisio, Department of Archaeology, University of Nottingham, NG72RD, UK, Nottingham, United Kingdom

Keywords: Baltic amber, Cultural European “Koine”, Baltic area, North and South of Europe

Paper: Scientific analysis of rough materials

Presentation Preference - Oral

The Baltic area is in the deep North of the European Continent still reachable from southern people already in the Late bronze Age as mythical “Hyperborea” destination. Different types of Baltic amber have been found in different archaeological contexts of many regions of the Mediterranean as proof of the interest on this exotic northern product. The Baltic area, though, is not only a potential “Hyperborean” destination in Late European prehistoric, source of exotic rough materials, but it could be the epicenter of early commercial exchanges which forms, for the first time, the vast network of a vast cultural “Koine” between South and North, and protagonist in decisive developments in the interrelations among diverse geographical districts of Europe. The last decades a variety of analytical methods/techniques has been developed and is applied to the characterization of ancient organic and inorganic materials. The scientific investigation of amber can be proved an important tool in the hands of the archaeologist aiming to identify prehistoric social interactions, trade and exchange networks between ancient civilizations. In this paper the Baltic area will be examined, in its geographical context, with archaeological and scientific data provided.

TH6-05 Abstract 09

Was there any border to cross? Mobility and rejection of the alien in the Iron Age

Author: Dr. Gorgues, Aleskei, University of Bordeaux Montaigne, Pessac Cedex, France (Presenting author)

Keywords: Alterity, Identity, Mobility

Presentation Preference - Oral

Before going any further, the author wishes to warn that this paper is highly speculative. It is based on the observation of an apparent anomaly, which Iron Age patterns of mobility appear year after year more complex through isotopic studies, it remains pretty difficult to detect, based on the study of the material record (personal ornaments, burial practices, etc.), people of foreign origin in any one specific region. This observation suggests that, in the very specific case of individual mobility (i.e. not mobility through group migration or deportation), geographical origin was more of an influence on one’s biology than one’s “social skin”.

In other words, individual migrants would easily have adopted identity markers proper to their new community, thus abandoning those they brought from their original home.

Yet, occasionally, isolated foreigners could be segregated through specific funerary practices, or be the target of specific forms of violence, sometimes ritualized. Exclusion of the alien, going as far as physical extermination, was not then beyond the scope of the Iron Age communities.

These practices seem to have remained quite scarce, however. Above all, they were embedded in a wider range of patterns related to violence used as a mean for negotiating social order, and involving exhibition of weapons, body parts, ritual murders, etc.

In this paper, I would like to argue that the construction of Iron Age identities relied less on one’s geographical origin, but rather on one’s kinship and lineage. This allowed a fluid mobility along the vertices of a network whose complexity and range varied from one time to another and from one person to another, but always connected different geographical and cultural areas through interpersonal bonds built through many generations. In this context, the construction of identity obeyed rules much more complex than those based solely on ethnicity, embracing kin rivalry, deviation to the consensual social norms, etc. In other word, the detestation of the other was a multiscalar phenomenon, not preeminently related to territorial identity.

One may ask, therefore, what was the relation between violence and alterity. As a conclusion, this paper will address this topic through some specific examples collected all throughout Iron Age Europe, and even on its margins.
TH6-05 Abstract 11
Textile Cultures of Iron Age Central and Mediterranean Europe: breaking down the boundaries

Author: Dr. Gisela Margarita, University of Cambridge, Cambridge, United Kingdom (Presenting author)
Co-author(s): Hervé, Olivia, University of Bradford, Bradford, United Kingdom
Co-author(s): Casagrande, Rachele, University of Bradford, Bradford, United Kingdom
Co-author(s): Vlach, Elke, University of Bradford, Bradford, United Kingdom

Presentation Preference - Oral

Textiles represent a product the design and use of which are subject to cultural patterning and as such they can be used to establish the identity of an individual or a group with respect to other individuals or groups. Worn or displayed in an emblematic way, textiles can denote variations in age, sex, rank, status or group affiliation, thereby creating and reinforcing social and cultural boundaries. Yet, textiles have rarely been used as archaeological indicators of cultural boundaries in later prehistoric Europe. Textiles from Central and Mediterranean Europe preserved in a mineralised form have recently been analysed within the scope of the ERC funded production and Consumption: Textile Economy and Urbanisation in Mediterranean Europe 1000-500 BCE (PROCON). The data collected from several hundred of such finds suggest that, during the Iron Age, and possibly already much earlier, most of Italy shared the weaving techniques and aesthetics of the Eastern Hallstatt, while Greece was much more closely connected with the Near Eastern textile culture. These results suggest that the traditionally perceived cultural boundaries between the East Alpine region and the Mediterranean societies, as well as the connections amongst the latter, have to be reconsidered. The paper will review the evidence and suggest some ideas for transcending borders in later prehistoric Europe by using the generally conservative and ubiquitous textile technology to delineate wider cultural and technological spheres of influence.

TH6-05 Abstract 12
Digital approaches to the presentation and analysis of Iron Age art

Author: Professor Armit, Ian, University of Bradford, Bradford, United Kingdom (Presenting author)
Co-author(s): Evans, Adrian, University of Bradford, Bradford, United Kingdom
Co-author(s): Duckbury, Jo, University of Bradford, Bradford, United Kingdom
Co-author(s): Becker, Katharina, University College Cork, Cork, Ireland

Keywords: art, digitisation, Iron Age

Presentation Preference - Oral

3D digital methods of data capture and analysis have the potential to transform the ways in which we record, display and interpret Iron Age art. One element of the ENTRANS Project has been the investigation of Iron Age objects in the south-east Alpine region using a range of new technologies. This is part of a broader programme aimed at breaking down boundaries by utilising a range of archaeological, typological and research results and methods of analysis, with the potential of transforming the ways in which we record, display and interpret Iron Age art. This paper presents a series of case studies based on the digitisation and visualisation in a 3D virtual environment of a range of objects chosen from the south-east Alpine region, from the Early Iron Age to the Middle Iron Age.

TH6-05 Abstract 13
The cremated dead: investigating cremated remains from the Late Bronze Age/Early Iron Age transition

Author: Nichola, Rebecca, University of Bradford, Bradford, United Kingdom (Presenting author)
Co-author(s): Koon, Hannah, University of Bradford, Bradford, United Kingdom
Co-author(s): Buckberry, Jo, University of Bradford, Bradford, United Kingdom

Keywords: Cremation, ENTRANS, Results

Presentation Preference - Oral

The paper presents the results of osteological analysis of cremated bone from the Late Bronze Age and Early Iron Age funerary assemblages of Croatia and central and eastern Slovenia. This doctoral research forms part of the larger HERA-funded ENTRANS Project (Beyond the vessel: residue analysis and the understanding of identity in Early Iron Age Europe). It explores the methods of cremation burials, micro-excavations, multidetector computed tomography and micro-excavations of residue analysis with contextual data, such as faunal and floral remains. Differences between settlement and funerary sites are therefore identified, by identifying how the vessels were used and the specific resources that were processed or stored in them. The results obtained from the analysis of visible and absorbed organic residues of ceramic vessels from Early Iron Age sites in Slovenia and Croatia. The principal aims are to explore aspects of diet and the provenance of residues by comparing the results of residue analysis with contextual data, such as faunal and floral remains. Differences between settlement and funerary sites are therefore considered, by identifying how the vessels were used and the specific resources that were processed or stored in them. This paper also demonstrates how organic residue analysis can show patterns of change and encounters during later prehistory.

TH6-05 Abstract 14
Beyond the vessel: residue analysis and the understanding of identity in Early Iron Age Europe

Author: Bastos, Beatriz, University of Bradford, Bradford, United Kingdom (Presenting author)
Co-author(s): Nicholls, Rebecca, University of Bradford, Bradford, United Kingdom
Co-author(s): Vinazza, Manca, University of Ljubljana, Ljubljana, Slovenia
Co-author(s): Evans, Adrian, University of Bradford, Bradford, United Kingdom

Keywords: ceramic vessels, Early Iron Age, Organic residue analysis

Presentation Preference - Oral

During the cooking or storage of foodstuffs, organic residues are deposited, absorbed and preserved within the porous walls of ceramic vessels. With advances in scientific methods, it is possible to extract those organic residues and, through analysis, identify them. Organic residue analysis has the potential to make a significant impact on our understanding of past societies, from their diet to cultural and social practices. The identification of the residues cooked and stored in ceramic vessels can provide important information regarding the source and nature of cultural and social changes that took place in later prehistoric Europe. With this in mind, the study of organic residues in pottery was incorporated within the ENTRANS Project, which aims to expand our knowledge regarding the nature and impact of cultural encounters during the European Iron Age. This paper presents the results obtained from the analysis of visible and absorbed organic residues of ceramic vessels from the south-east Alpine region. The principal aims are to explore aspects of diet and the provenance of residues by comparing the results of residue analysis with contextual data, such as faunal and floral remains. Differences between settlement and funerary sites are therefore identified, by identifying how the vessels were used and the specific resources that were processed or stored in them. This paper also demonstrates how organic residue analysis can show patterns of change and encounters during later prehistory.

TH6-05 Abstract 15
‘Beyond the grave’ with the help of multidetector computed tomography and micro-excavations

Author: Dr. Čedlar, Matjaž, University of Ljubljana, Ljubljana, Slovenia (Presenting author)
Co-author(s): Dr. Cavalli, Fabio, Hospital University Enterprise (Osypadi Rimki), Trieste, Italy
Co-author(s): Vinazza, Manca, University of Ljubljana, Ljubljana, Slovenia
Co-author(s): Innocenti, Dario, Hospital University Enterprise (Osypadi Rimki), Trieste, Italy

Keywords: cremation burials, micro-excavations, multidetector computed tomography

Presentation Preference - Oral

The urn is the ultimate ‘burial place’ of the cremated remains of an individual. It is much more than that. The type of vessel, preparation of the contents, possible additional grave goods etc. has by far not only functional but foremost symbolic meanings and values and holds information about the time of the deposition, ‘cultural’ milieu, status of the deceased and much more.

The study of a cremation burial is not a straightforward and self-evident process. We have to bear in mind that we are dealing with traces of events and processes, the understanding of which is only partial. On the other hand we have to admit, that it is only the information that we can trace, observe and make documentation of, which we later analyse, study and eventually interpret. Therefore the research of an urn starts already with the preparation for the excavation of its grave. In our case studies that means the analysis of the site and their surroundings. That includes lidar scanning and the analysis of its broader landscape, followed by ground truthing campaigns and geophyiscal prospections. That means that we have a fairly good idea of the topographical and the broader cultural landscape of the site. It is also the time of excavations of the graveyad when all the possible details have to be observed and documented, with modern excavation techniques and methodology as well as standardized reporting protocols the results became much more comparable, which is crucial when trying to study wider cultural phenomena, as in this case the burial rite.

However we can go further in our quest for more detailed and reliable data. An important step forward, when dealing with urn graves is the use of multidetector computed tomography (mDX) in combination with the micro-excavations of urns. Such research results in an until now unknown variety of new data, not only of the grave itself and its preparation, but also of the post-
depositional processes, which play an important role in the final interpretation of the graves, burial rites etc. It has furthermore shown that we have to shed new light on older published data and sometimes ‘traditional’ interpretations.

The multidetector computed tomography connected with the micro excavation until now did not make it into the standardized grave research ‘tool-box’, but it is certainly on the way there.

**TH6-05 Abstract 16**

Open-minded access to Late Bronze Age societies in southern Carpathian Basin

**Author** - Ložnjač Dizdar, Daria, Institute of Archaeology, Zagreb, Croatia (Presenting author)

**Co-author** - Radovník, Sinisa, Croatian Academy of Science and Arts, Zagreb, Croatia

**Co-author** - Rajić Šikanjić, Petra, Institute for Anthropological Research, Zagreb, Croatia

**Keywords**: communities, Late Bronze Age, mortuary practice

**Presentation Preference** - Oral

Late Bronze Age communities in southern Carpathian basin are known through different cultural patterns/cultures/groups. The research project Late Bronze Age mortuary practices and societies in southern Carpathian Basin (IRP-17-1133-327), funded by Croatian Science Foundation, combines archaeology, anthropology and archaeozoology in attempt to reconstruct burial customs and shed more light on societies that have practiced them, while questioning existing hypothetical models and their territorial and temporal boundaries. Research methodology is based on independent analyses in each field to bypass possible biases, followed by comparison and integration of all data in further discussion and interpretation. Preliminary results indicate benefits of this open-minded approach to Late Bronze Age societies in southern Carpathian Basin. Working independently anthropologists and archaeozoologist are less biased by the existing models in archaeological literature in their interpretation. This “bottom-up” approach is based on more credible evidences which occasionally do not correspond with existing hypothetical models of past societies.

Observed treatment and disposal of bodies, selection of grave goods and overall deposition, suggest different criteria of which some obviously reflected tradition while others indicate innovations presented by individuals living in these communities. Moving beyond the existing borders, it is possible to see images of the “small worlds” that overlap in the contact networks of practiced customs. Some customs (e.g. cremation of deceased, animal meat as offering of food, and various sets of vessels as connected to food and drink) could be examples of tradition in transitional period from Late Bronze to Early Iron Age in southern Carpathian Basin. Even with the application of open-minded approach, invisible borders still exist, but defined by the people that we investigate, rather than researchers.

**TH6-05 Abstract 17**

When traditions of pottery making reveal boundaries: a case study from the Upper Rhine Valley

**Author** - Philippe, Marie, Université de Bourgogne, UMR 6298 ArCHEIS, Strasbourg, France (Presenting author)

**Keywords**: ceramic technology, Late Bronze Age, social network

**Presentation Preference** - Poster

Between Visoges and Black Forest mountains, Bronze and Iron Ages (10th-8th century B.C.), modern France and Germany, the context of this study defies borders. In the Upper Rhine Valley, at the end of the Bronze Age, one can a priori hardly expect to reconstruct boundaries because of a standardization of the material culture, and the point is more about interactions’ significance. During Late Bronze age, the cultural entity “Rhine-Suisse-France Orientale” or “RSFO” (“Rhine-Switzerland-Eastern France”) has a core on the Rhine section between Basel and Karlsruhe. Since the 9th century B.C., this cultural entity dissolves, turning gradually to the Hallstatt one. This paper aims to focus on the people who experienced this transition period, in a supposed “flow corridor”. Which communities lived there, standing out and interacting with each other? Does it match with geographical features?

According to the anthropology of techniques, ceramic climates opératoires, and especially shaping sequences, can vary depending on cultural factors and material constraints. It leads to technical traditions specific to social groups. Social boundaries can thus be defined by the limits of the transmission network of technical traditions. About 50 technical features (for example bottom forming technique, finishing technique applied on the outer surface of the rim…) were analysed on 830 well-preserved potteries, sampled on 19 sites distributed from the south to the north of the valley section. A statistical classification procedure has been developed, based on biological methodology, to model the diversity of technical traditions. It first appears that a technical background is similar on the entire area, with the omnipresence of the coiling technique.

**TH6-05 Abstract 18**

There is Power in a Cohort. Between Myth and Reality in the Development of Warfare in Scandinavia

**Author** - MA Kolberg, Are Skarstein, Freelance/independent, Oslo, Norway (Presenting author)

**Keywords**: Iron Age, Viking Age, Warfare and tactics

**Presentation Preference** - Poster

When you hear the word Viking Age, there is a high likelihood that you will associate it with a dark and lawless age, set in Ultimo Thule, in which individual warriors fought for personal glory, perhaps even doing so in a drug induced state of fury. Inevitably, the berserkers spring to mind, sometimes sided by images of warriors in horned helmets, reflecting the imagery presented to us in various mass media. This type of imagery can at least be traced to the Victorian era, probably helped by 18th century Swedish natural historian Samuel Ödmann who, by drawing analogies to Siberian shamans, hypothesised that the berserkers were in fact in a state of trance induced by eating mushroom. In my paper I wish to go beyond the myths and fiction in order to convey a more nuanced picture of the development of early Scandinavian warfare with an emphasis on Norway and the Viking Age. The archaeological evidence suggests a highly organized society in which justice and equality did matter, a tale supported by the written sources and the historic record. Although some of the early sagas in fact do mention berserkers and men clad in wolf and bear pelts, this is most likely to be ascribed to origin myths and warrior cult. My idea is that there is a distinction is to be made between the realms of mythology and actual warfare. The latter may have been very much inspired by Roman warfare. Battles were fought in closed formations; lines divided into cohorts, and with standardised equipment. Going on individual rampages would probably not help you win a battle; there was power in a cohort. As for the realm of myths and warrior cult, this does not rule out organised warfare as mythology and traditions always have been important. This was certainly important within the Roman legions, some types of legiorian would actually dress up in animal pelt (remember that the wolf was an important animal, connected to the very birth of Rome as well as to the god of war Mars). Myths and traditions still matter in modern day society. In fact, as I am arguing, the roots of social organisation and the Viking Age/early medieval proto states in Scandinavia and Norway may be traced back to the Younger Iron Age, if not even earlier. I will induct my theory from a host of different sources ranging from early texts to archaeological finds, among which standardised arms play a major role. One of my arguments is that a high numbers of specific arms dictate specific tactics. One the oldest laws in Norway states that a battle able man should be equipped with a spear, a sword or axe, and a shield. This is clearly meant for closed formations. Furthermore, there has been a lot of renewed focus on the high degree of social organisation in Viking Age Scandinavia, but warfare seems to some extent to be neglected.

**KAFU - A network for archive studies**

**Author**: Dr. Neumayer, Heino, Museum für Vor- und Frühhistorie, Berlin, Germany (Presenting author)

**Keywords**: Archive, Archiologie, International, KAFU

Presentaition Preference - Oral

The situation after the fall of the iron curtain also allowed a research to the remain of the collections from former East Germany and the eastern Baltic region which had been partly destroyed or scattered as a result of the 2nd World War.

To achieve this in 2001 the Zuweisung von Sammungen Archäologischer Funde and Unterlagen aus dem nordöstlichen Mitteleuropa (KAFU) had been founded in Berlin. The members, scientists from polish, Lithuanian, Russian and German universities, museums and archaeological services, wanted to reconstruck the former collections by the study of the archive material and objects which survived the war.

Chief of the commission is the director of the Museum für Vor- und Frühhistorische Berlin. The secretariat of the commission is also domiciled at that Museum. The Stiftung Preussischer Kulturbesitz and the Römisch-Germanische Kommission in Frankfurt are supporting the commission. Every two years a congress is organized by the KAFU where young scientists are given an opportunity to present their research concerning the themes of the KAFU.

**TH6-06 Abstract 02**

**The Sources of the „Archival Archeology“ in the Carpathian Basin**

**Author**: Dr. Proházka, Péter, Archeological Institut of the Slovakian Academy, Nitra, Slovakia (Presenting author)

**Keywords**: Archival Archeology, Archivists, Carpathian Basin

**Presentation Preference** - Oral

The Carpathian Basin is as a venue of people from the prehistory. A multifarious archeological material is characteristic for it. The Carpathian Basin is an important territory of the archeological research in Europe. But about a large part of the artifacts and sites are not enough data available. Although the archeological research in the Carpathian Basin has nearly two hundred years of history, but since centuries come threasures, hoards, graves and artifacts to light. About these data are in official files, which are in the archives. From the 19. centuries amateur archeologist conduct research and they corresponded about their discoveries and finds with the museums and scientists. A part of the artifacts comes to the museums in Hungary and abroad. These old finds composed the basic of the modern archeology in Europe. The “archival archeology” play an increasing role in the international research. Its meaning is in gathering and publishing of all the written sources, locating and finding the data, spreading the data to the public, mentioning the archeological finds and sites. With the help of these written sources and reports it is possible to enlarge and precise the knowledge about older sites, archaeological contexts and to reconstrukt the finding entities. These records are unknown, unprocessed and unpublished. With help of some examples I would like to present the potential of the „Archival Archeology“ for the today research.
photo collections, reflected archeological investigations in the entire Russian Empire. Fortunately throughout the following reorganizations in Soviet times Commission has not been eliminated, and the archives were preserved well. Moreover remarkable material remains: from scientific societies and different organizations for example, Moscow and Russian Archaeological Societies, Petersburg Archaeological Institute, Libraries of Emperor Nikolai II and Great Princess Konstantin Nikolavitch and Konstantin Konstantinovitch, from personal collections of outstanding archeologists, architects, restorers, original archaeological material and other researchers.

Nowadays the Scientific Archive of IHMC RAMS contains 107 record groups and 79 photo collections of researchers and organizations which unify about 700 thousands documents. These documents cover age from the 18-th century to the present day. They are of great value to researchers in history of Russian archeology and culture, but the archives include also a large number of materials, which represent history, architecture and archeology of European countries. Most of them are related to the investigations carried out on the territory of Courland, Estland, Lithland, the Grand Principality of Finland and the Polish Kingdom that once belonged to the Russian Empire. The Collections contain documents on the subjects of occasionally discovered artifacts; excavation documentation (field reporting, including in German, photographs, drawings, maps); materials, which illustrate the architectural investigations and there projects; correspondence with European researchers and Scientific Societies; a number of splendid photos, including glass negatives, of finds and architectural monuments; records and photographs from travels of Russian scientists in Europe, where we can find information about the museum collections and pictures of archaeological sites in Italy, Greece, France and others. Some of them have already been published, but many still remain unknown.

The documents on archeology of European countries mainly relate to the period up to 1917 and stored in the collections of organizations and in private collections of scholars. Archival heritage of IAC, Russian Archaeological Society, Moscow Archaeological Society and personal collections of A.A. Shtilin, B.V. Farmakovskij, A.A. Bobrinskij, V.I. Smirnov are most interesting in this regard. All these materials can provide new documentary resources for the history of European archeology. International cooperation could give the opportunity for their best attribution and introduction to the world science.

**TH6-06 Abstract 05**

The Esquiline (Rome). Urban transformation and ancient topography between lost archives and Webgis

**Author** - Boi, Valeria, archaeological consultant, Roma, Italy (Presenting author)

**Keywords:** ancient topography. Open access to archeological documents

**Presentation Preference:** Oral

This paper is aimed at retracing the steps of the reconstruction of the ancient topography and of the archaeological potential of an area of Rome’s historic centre, which was the subject of a doctoral thesis in Methodology of the archaeological research, disputed in February 2016 in the University of Sassari.

The case-study area is the Esquiline District, located at the south-eastern borders of Rome’s inner centre, in the Middle Ages, and until the last decades of the XIX century, the Esquiline was a suburban area, where only a few religious complexes rose up in a waste area occupied by gardens and orchards and then by the aristocratic villas built in the XVII century. The landscape kept itself almost intact for centuries, as is shown in the historical cartography, from the XVI century bird’s-eye views to the renowned 1748 Notiti map; this context changed sharply in a few years, when, in 1871, the city of Rome became the Capital of the new united Italian nation, and a major building expansion completely transformed the face of the nineteenth-century city. In the aftermath of Italy Unification, in fact, the landscape was heavily twisted, and a regular urban pattern completely erased the original ancient morphology. In a few decades, between 1873, when the first town planning was approved, and 1920, when last buildings’ construction was completed, the specifically created “Archaeological Commission”, headed by Rodolfo Lanciani, tried to save from complete destruction the complex and extremely rich archeological context of the ancient Esquiline.

Archaeological findings were archived in the renovated in Lanciani’s “Forma Urbis Romana” and sometimes published in the journals “Notizie degli Scavi di Antichità” and on the “Bollettino della Commissione archeologica comunale”. In the following years, a lot of archive documents were dispersed in the archives of various State and Municipality offices, thanks to this doctoral research many of those documents are now accessible in a Open access web database, and this “lost archeology” is now accessible for researchers in a digital environment.

**TH6-06 Abstract 06**

The biography of two Phoenician jars from the National Museum in Poznan

**Author** - Dr. Krueger, Michal, Adam Mickiewicz University in Poznan, Poznan, Poland (Presenting author)

**Co-author(s)** - Głuszek, Inga, Nicolaus Copernicus University, Torun, Poland

**Keywords:** archaeometry, archival holdings, Phoenician pottery

**Presentation Preference:** Oral

In the National Museum in Poznan, Gotłuchow branch, two ancient jars of clearly oriental origin can be found. Neither the provenance, nor the chronology of the artifacts is clear. This paper is willing to show that through archival, archaeometrical and typological studies it is possible not only to determine the specific origin and detailed chronology of the vessels, but also to reconstruct an important part of their cultural biographies. The studies of the private correspondence from the end of the 19th century between Izabela Działyńska, née Czartoryska, the buyer, and Alfred Luis Delattre, a French missionary and archeologist working in Cartage, are revealing the context of acquisition of the artifacts. The archival holdings are clearly showing that the oriental art collection in Gotłuchów was much bigger than previously thought. What is more, the information given by A. L. Delattre can be useful in determining the place where the jars were discovered. The vessels were also subject of recent archaeometric studies (X-Ray fluorescence spectrometry and petrographic analyses) in order to get the basic information about their technology and place of production. Having in mind this data, we are able to reconstruct the biography of the jars from their “birth”, through their deposition in a tomb in Cartage, ending in the art collection in Gotłuchów where they have been exposed as unrecognized items. The promising results of this small-scale-investigation encourage the authors of this proposal to apply for a bigger research project based on the pottery and archival holdings from the former collection of Izabela Działyńska.

**TH6-06 Abstract 07**

Architecture of tumuli in Kosovo

**Author** - Dr. Ass. Baraliu, Sedat, Faculty of education, Prishtina, Kosova (Presenting author)

**Co-author(s)** - Aleq, Premim, Institute of archaeology, Prishtina, Kosova

**Keywords:** Grave, Kosovno, Tumuli

**Presentation Preference:** Oral

In this study will be treated the architecture of tumul and relation with funeral ritual. Characteristic of tumuli in Kosovero, especially during the Iron Age when their number has increased, is building variety. There are even cases when in one necropolis are noticed various types of tumuli. Tumuli in the territory of Kosovo are built with stones and soil, however, there are cases when the tumuli are built only with stones, while the soil is used as an additional element. Moreover, when the tumuli are built with soil, the stones have served for building architectural parts, such as: surrounding ring, grave constructions, cover and tumulus caim.

The forms of grave construction are not the same in all necropoli. Basing on the construction, the graves can be classified as of rectangular shape, oval, elliptical circular, semi-circular as graves with simple pit. Each type of grave will be treated separately.

Rituals and funerals ceremony will be elaborated in this paper taking into consideration that during the ceremony and burial are followed a number of rituals and funeral ceremonies starting by building the tumulus, opening the grave and the burial process. Furthermore, even in the cases of cremation are followed a range of rituals and ceremonies.

**TH6-06 Abstract 08**

The Prussia-Museum in Königsberg/Ostpreußen. New archaeological research on an old archive

**Author** - Dr. Elbracht, Heidemarie, Museum für Vor- und Frühgeschichte, Berlin, Germany (Presenting author)

**Keywords:** pre-war archive, reconstruction of the archaeological landscape, research in former East Prussia

Up to World War II the famous Prussia-Museum in Königsberg kept a comprehensive archaeological fund which had been brought together during more than 150 years of research from the end of the 18th centuries onwards. The fund included findings from excavations as well as documentary record covering the entire region of the former province of East Prussia. After the war, almost all collections were regarded as being lost but big parts have been rediscovered unexpectedly after the turnaround of 1989/1990 in Berlin, in Kaliningrad and in other places. The materials that remained are mainly fragmented and incomplete but still bear witness of the imenseness of the pre-war archaeological research as well as of the richness and diversity of the historical landscape in the south-western Baltic region. Since 2012 the “Academy of science and literature in Mecklenburg, Germany” realizes a huge project on the reconstruction of the archive materials from the Prussia collections, conducted by the Centre for Baltic and Scandinavian Archaeology in Schwerin and the Museum of Prehistory and Early History in Berlin. The project aims at supporting contemporary archaeological research by making the old data available once again. The paper introduces the goals of the project and describes the specific needs, selected methods and first results of this process: How and to what extent can we reconstruct the ‘archaeological landscape’ in former East Prussia before 1945 and thus create a basis for modern investigations and research in this part of Europe?
Rich Roman Iron Age graves, equipped with Roman imports, are interpreted as being burials of persons of high status in the social hierarchy. Unfortunately a lot of these graves were discovered by accident and the documentation of the finds is poor. So one can say, an inexpert discovery is quite a main attribute of the Roman Iron Age princely graves. Needless to say that this fact means a big loss of information. A second, not less important point is the state of analysis and publication of the finds. Not infrequently we actually do possess more informations than published. It is difficult to explain, but especially in case of princely graves very often not all data were released in publications. Studies of old finds, stored in the magazines of museums, deliver new data and give new basis of interpretations. This will be shown by the example of some so-called princely graves of the Libiszow type.

The finds of the Przeworsk and Wielbark cultures

At the Roots of the Roman Period Archaeology

Oscar Almgren was one of the most famous archaeologists who dedicated his work to issues concerning the Iron Age. His PhD thesis Studien über nordeuropäische Fibelformen der ersten nachchristlichen Jahrhunderte mit Berücksichtigung der provinzialrömischen und südrussischen Formen was a milestone in the archaeology of the Roman Period. It was defended and published in 1897.

The significance of Almgren's work results not only from an in-depth analysis of fibulae but also from a wide territorial range of his research. In the end of the 19th c. this Swedish archaeologist studied finds present in at least 117 museums placed all over Europe. The private archive of Almgren is an important result of those studies. Currently it is held in the Swedish National Heritage Board (Riksantikvarieämbetet) in Stockholm. Our paper will be one of the first presentations concerning the legacy of Almgren. His archive is a rich and diverse set of documents. Among others it contains press cuttings, letters, notebooks, manuscripts, as well as personal photographs. Emphasis will be put on presenting a card file (among other things so called Fibulen), which is the largest and the most complete part of the whole archive. Its content can be estimated at over 6000 of sheets with artifacts fine pencil drawings and information. It is also worth mentioning that Almgren collected data concerning not only fibulae but also on other finds (e.g. Roman imports, weapons, bracelets, necklaces or buckles and belt fittings), which is an important contribution to chronological and regional studies. Materials present in the archive are of very high scientific value and importance. For many archaeological objects lost during the Second World War it is often the only surviving documentation.

The finds of the Przeworsk and Wielbark cultures

The famous German archaeologist Herbert Jankuhn died at the beginning of his career with the south-eastern Baltic litoral in the roman period. During his PhD work he created a huge card index containing drawings and descriptions of finds from the former Eastern Prussia. These files are kept now in Archäologisches Landesmuseum in Schleswig. In the archives there are information about artifacts from Prussia Museum in Königsberg, which were destroyed or dispersed during World War II. The paper presents materials from sites of the Przeworsk and Wielbark cultures in the area east of the lower Vistula.

The Herbert Jahnkuhns scientific legacy – an old archive as a source for modern research

Herbert Jankuhn, one of the greatest, albeit most controversial characters of the 20th century German archaeology, is known primarily as a researcher of Hallstatt empire (Schleswig), or as one of the initiators of the new edition of the monumental Reallexikon der Germanischen Altertumskunde publication. However, it is worth to remember that the beginning of his scientific career (determined by his doctoral thesis submitted in 1931) was related to his home country – East Prussia.

The main subject of his doctoral thesis was the Early Roman Period in Samland. Nevertheless Jahnkuhn collected data from the whole region of East Prussia, going well beyond the scope of the defined geography and chronology. He created over a dozen hundreds of cards with notes and drawings, documenting few thousands of finds from the Roman, as well as the Migration Periods originating from the vast area between Lower Vistula and the Nemunas. Fortunately, scientific legacy of Jankuhn has survived the Second World War and is kept in the Archives of Archäologischen Landesmuseums Schleswig.

The personal registry of Jankuhn, created as a starting point for his doctoral dissertation, had some limitations. It didn’t include descriptions of pottery or peculiarities of funerary rites. But, despite these gaps and constraints, Jahnkuhn’s card files allow the modern researchers to reconstruct the archaeological picture of East Prussia during the Roman Period. First of all, long sequence of grave assemblages can be established, helping to clarify different problems of chronology. For example, the separation of a large group of objects with eye-brooches of the Almgren 61 type, marks the latest stage of B2 phase. In spite of appearances, it is not the antiquarian problem only – precise dating allows to determine concentrations of archaeological sites that can be identified with Galindai and Soudinii mentioned by Pliny and as such it could serve as an excellent starting point for the reconstruction of the European world of Barbaricum. Although, as it was mentioned before, Jahnkuhn’s registry was dedicated to research the Early Roman Period, it included also large series of finds from the Late Migration Period. One of the most interesting objects is the iron scabbard from Mazurian cemetery in Mietkie (former Minglen), Scandianvian import, and the first find of this type in East Prussia. This shows clearly that, although other scholars, primarily J. Jakobsen, documented the Migration Period of the East Prussia, Jahnkuhn’s archive could be a valuable source of research for this period.

In conclusion it has to be stated that Jankuhn’s archive forms a very rich resource for knowledge about east-Prussian “lost archaeology“. The reconstruction and analysis of the original field documentation and other archival sources show the importance of Linkuhnen for the very first time: the cemetery was excavated between 1928 and 1939 by the Prussia Museum in Königsberg (Kaliningrad), with a large number of finds from the Roman Iron Age, Migration Period and the Viking Age. The results were never properly published and all objects were considered to be lost after 1945. With the re-discovery of the Prussia collection and archives in Berlin in 1990, colleagues from different countries established a scientific network to open up archival sources for international research. The cemetery of Linkuhnen can serve as an example of the potential that still lies within the archaeological and archival material that survived at different institutions all over Europe.

The cemetery of Linkuhnen (Rësvokoe):

A case study on the potential of archival archaeology

The reconstruction and analysis of the original field documentation and other archival sources show the importance of Linkuhnen in the Nemunas River, which was excavated between 1928 and 1939 by the Prussia Museum in Königsberg (Kaliningrad), with a large number of finds from the Roman Iron Age, Migration Period and the Viking Age. The results were never properly published and all objects were considered to be lost after 1945. With the re-discovery of the Prussia collection and archives in Berlin in 1990, colleagues from different countries established a scientific network to open up archival sources for international research. The cemetery of Linkuhnen can serve as an example of the potential that still lies within the archaeological and archival material that survived at different institutions all over Europe.

The cemetery of Wiskiauten is located at the south-western corner of the Curonian Lagoon, close to Zelenogradsk in the Russian Oblast Kaliningrad. Immediately north of Wiskiauten lies a small forest known as Kaup, where a large burial site with Scandinavian grave goods was found. The burial site may have originally consisted of up to 500 burials. Unfortunately, it is difficult to reconstruct the original layout and structure of the cemetery due to the lack of excavation documentation. As a part of the former Prussian state, the area around Wiskiauten has faced profound changes between German, Soviet and Russian rule and administration. These circumstances have led to the loss of a large part of the early research documentation and most of the finds, especially during the 2nd World War and the resulting destruction and plundering of the Prussian Museum in Kaliningrad. After the War large parts of the documentation and a small number of artefacts reappeared in different parts of Europe. Consequently, today material from Wiskiauten can be found in Stockholm, Olzinst, Berlin, Marburg, Schleswig, and of course Kaliningrad. These complex conditions could explain why a complete presentation of the research results has never been published, although archaeological interest in the site is unbounded. Since the 1870s, at least 12 different excavation teams from Germany, Sweden and Russia have worked on the grave mounds of Wiskiauten and the archaeological investigation is still ongoing under Russian guidance. Thus it is the aim to give a complete presentation of the research results available from all accessible excavations in Wiskiauten, and to reassess the conclusions from the early days of archaeological research. Moreover, it is essential to compare the grave architecture and the material culture of the burials in order to connect them to local Scandinavian customs, as well as to similar sites on the Baltic Sea and in Russia that have burials with Scandinavian links, in order to reevaluate the duration and nature of Viking presence in late Iron Age Wiskiauten.
Archaeology without borders

TH6-06 Abstract 19

Archival Archaeology: experience of mapping and survey in SW Courland

Author: Dr. hist. Virše, Ingrida Līga, Latvian National Museum of History, Riga, Latvia (Presenting author)

Keywords: Archival Archaeology, systematic mapping, identification research, SW Courland

Presentation Preference: Poster

The National History Museum of Latvia, Archaeological Department stores information about archaeological monuments and artefacts found across the territory of Latvia. The data chronologically covers a period from the end of 19th century to the present day. The largest amount of data originates from the interwar period, and it forms the basis for the documentation. During the work on the project Study of population and ethnic composition changes in southwestern Courland 1st millennium AD, systematic mapping, identification and research of SW Courland archaeological monuments and find locations is carried out. The work is based in the study of archives (National History Museum of Latvia archive contains information on approximately 200 archaeological monuments and locations of finds in SW Courland). During the course of the research, unexpected problems were encountered. Although the documentation of archaeological sites during the interwar period was generally precise, today part of the potential sites can’t be localised. This is mainly due to the loss of reported landmarks, changes in the terrain during the Second World War and the construction of Soviet military bases in the post-war period. The possibility of interviews is reduced by the depopulation of the region which continues until today.

TH6-06 Abstract 20

International cooperation of archives in the study of archeology of the Bashkir Urals

Author: Shuteleva, Iia, Ufa, Russian Federation (Presenting author)

Keywords: archives, international cooperation

Presentation Preference: Poster

The issue of fragmentation and disparity of archaeological documents stored in the archives of the Republic of Bashkortostan was raised in the beginning of the 1990s. Data restoration about archeological monuments and finds of the Bashkir Urals was made possible owing to international cooperation. Materials about the region’s archeology were stored in the archives of the former Soviet Union (the archives of the Republic of Kyrgyzstan), the archives of Finland (the National Library of Finland / Helsinki University Library), Sweden (The Swedish National Heritage Board / The Antiquarian-Topographical Archive) and Great Britain (Cambridge University Library: Manuscripts). Archaeological information about the territory of Bashkir Urals began to be collected in 1834, on the basis of the Regional Static Committee, since 1867 it became the Provincial Museum (at present - the National Museum of the Republic of Bashkortostan). Ufa provincial archives (now the Central Historical Archives of the Republic of Bashkortostan) started to be formed in 1919. After formation of the Academy of Sciences in 1932, a scientific archive of Ufa Scientific Center of RAS started operating. The work on the project Study of population and ethnic composition changes in southwestern Courland 1st millennium AD, and the memoirs of Adalbert Bezzenberger. Done with the support of Russian Foundation for Humanities, Project No 15-31-01273.

International cooperation of archives

- Shuteleva, Iia, Ufa, Russian Federation (Presenting author)

The congress took place in 1911 at instigation of Moscow archaeological society from 21st of July to 4th of August by Julian date in Russia (4th -17th of August by Gregorian date in Germany). So Bezzenberger in his diary wrote about next 3 days after the end of the Congress. At the Congress Bezzenberger participated in secession No. I «Prehistoric antiquities», where he made a report «Relations between Caucasus and East Prussia in Bronzes Age». Plate with beads could be a gander archaeological gift of Königsberg’s Museum director to the Chairlady of the Congress and Head of Moscow archaeological society countess Praskovja S. Unarova. Maybe because of complicated consequences, connected with the I World War and the Revolution in Russia, this gift was passed over and forgotten for a long time in State Historical Museum. Only on the 24th of November of 1960 it was accepted into museum fund. The comparison of data from Moscow and Berlin made possible to connect finds and archives, which were not attributed before; and casted light upon the chapter of the last pre-Revolutionary Archaeological Congress in Russia and the memoirs of Adalbert Bezzenberger. Done with the support of Russian Foundation for Humanities, Project No 15-31-01273.

International cooperation of archives

- Shuteleva, Iia, Ufa, Russian Federation (Presenting author)

The months and the year are not specified. There were no more references about Bezzenberger’s journey to Russia. This gift was passed over and forgotten for a long time in State Historical Museum. The National History Museum of Latvia, Archaeological Department stores information about archaeological monuments and artefacts found across the territory of Latvia. The data chronologically covers a period from the end of 19th century to the present day. The largest amount of data originates from the interwar period, and it forms the basis for the documentation. During the work on the project Study of population and ethnic composition changes in southwestern Courland 1st millennium AD, systematic mapping, identification and research of SW Courland archaeological monuments and find locations is carried out. The work is based in the study of archives (National History Museum of Latvia archive contains information on approximately 200 archaeological monuments and locations of finds in SW Courland). During the course of the research, unexpected problems were encountered. Although the documentation of archaeological sites during the interwar period was generally precise, today part of the potential sites can’t be localised. This is mainly due to the loss of reported landmarks, changes in the terrain during the Second World War and the construction of Soviet military bases in the post-war period. The possibility of interviews is reduced by the depopulation of the region which continues until today.
The Forum of MERC (Medieval Europe Research Committee) is an annual meeting held at EAA to promote active archaeological research in the medieval period (AD400-1600) in every country in Europe. It is the intellectual successor to the series entitled Medieval Europe, inaugurated at York in 1992, and staged at Bruges in 1997, Basel in 2002 and Paris in 2007. A change of direction occurred in 2012 when new thinking suggested that medieval archaeology would develop more powerfully within the broader ambit of prehistoric and historic archaeology as a whole. Accordingly the representatives of the conference accepted an invitation from EAA to merge the two conferences. This duty occurred at Helsinki and has continued since then. The medieval agenda is promoted by MERC, which views itself as in academic partnership with EAA. The purpose of the forum is to:

- highlight the performance of medieval archaeology in the host country
- highlight the medieval and medieval-related sessions at the conference
- table new research themes pertaining to Europe with special emphasis on links with prehistory
- debate new initiatives for teaching, publication and publicity for the subject.

The discussions aim to concert medieval archaeologists working in the academic, government and commercial sectors and to encourage students to research the period by attending the EAA conference and our Forum. In addition to invited speakers and speakers from the floor, the Round Table will be hosted by Dr. Dries Tya, Dr. Gitte Hansen, Dr. Sally Foster and Dr. Katiana Predovink.

Keynote Speakers:

- Lithuanian medieval archaeology, Prof. Kuncenciučius, Albinas (Vilnius University, Lithuania)
- Early medieval horse cemeteries of Prussia and Central Lithuania on a comparative scale. Dr. Shiroukhov, Roman (University of Latvia, Lithuania)
- Cultural resilience and adaptation at the frontier: Klaipeda and Žarde pottery analysis. PhD student Ubis, Edvinas (Kaunas University, Lithuania)
- Future archaeologies of the "Great Wilderness": Crusading, depopulation and colonisation in the frontiers of Lithuania. Dr. Pluskowski, Aleks (University of Reading, United Kingdom)

Presentation Preference - Committee / Working Party meeting

Since the end of the Cold War, Central Asia has seen a burgeoning of research agendas, many addressing hydrosocial dynamics. The environmental and geographical challenges of the region, where vast desert regions and semi-arid steppe environments have been subjected to extensive agro-economic and pastoral pressures, have focused international attention on the fragile but essential balance between societies and water resources.

Somewhat lost in the drive to understand these relationships in the context of modern-day concerns such as climate change, sustainability and resource management is a grasp of the historical trajectories of these human-water relationships, not only with respect to the better-studied river systems and delta environments, but also with respect to smaller or less accessible water resources such as pools, ephemeral lakes or aquifers. In Central Asia, a region characterized historically by movement, exchange and communication across vast desert regions, the indispensable role of such varied hydrological features becomes increasingly clear: not simply as static resources, but as natural agents in the facilitation of movement and interaction. Even today, the identification, exploitation and management of these varied resources remains central to understanding marginal subsistence strategies, and their co-evolutionary role in water landscapes of human geography.

This session aims to broaden our understanding of water as resource, conduit and agent in the development of societies and landscapes across Central Asia. We welcome papers that present new theoretical and methodological approaches to understanding human-water relationships. These may include remote sensing, bio/archaeology, simulation or papers that emphasize the social aspect of hydrology, including ethnarchaeology or research that considers water as heritage in Central Asia. We feel that this creative approach to water research in Central Asia will be beneficial to regional researchers and to a wider audience, seeking to broaden the scope of hydrosocial research in Central Asia more generally.

**TH6-08 Abstract 01**

The Hydrosocial Margin: Settlement, Socio-ecology and Sustenance in the Central Asian Desert-Deltas

Author - Dr. Markofsky, Steven, Universitat Pompeu Fabra, Chestnut Hill, MA, United States of America (Presenting author)

Keywords: Central Asia, hydrology, landscape archaeology

Presentation Preference - Oral

Over the past several decades, there have been a number of developments that have changed our fundamental understanding of the changing relationships between societies and water resources, particularly at the local level. These new understandings have particular impact in arid-margin ecologies, where scarce or unreliable water resources bear a natural fragility in the socio-ecological balance. In transitional regions, such as oases and delta-boundary zones, small-scale or local changes in the interaction between people and water may bear significantly on broader-scale issues of human/landscape co-evolution and vice versa. This paper will explore, via a multi-proxy approach that integrates geoarchaeology, remote sensing and survey data, new ways of conceptualizing marginality, transitionality and hydrosocial relationships in late-Holocene arid margins.

To address these co-evolutionary and multi-scalar aspects of human/water relationships, this paper considers the arid-zone transitionality of the island Murghab Delta in Turkmenistan, an alluvial fan that has seen complex trajectories of socio-ecological development throughout the late Holocene. Populated since at least the late 3rd millennium BC and likely earlier, the region has been described by a number of competing models: one that treats the region as an “oasis” in which desertic processes have been more or less stagnant throughout the late Holocene, and one that envisions the region as a widely occupied and well-cultivated alluvial fan in which desertification was a relatively late process. The research described in this paper traces a more dynamic and locally variable trajectory that focuses on small-scale interaction between alluvial and lacustrine landscapes in the context of regional-scale hydrological, geomorphological, environmental, and social trajectories. The paper will demonstrate that landscape change throughout the Holocene has been characterised by pronounced variability at the local level not well described by a regional scale approach, and thus bears significantly on the ways in which societies interacted with, exploited and modified nearby hydrological resources. Analysis includes Loss on Ignition, Particle Size Analysis, geochemistry and micromorphology, which in conjunction with satellite imagery will help to elucidate differential lacustrine encroachment and locally variable alluvial processes.
Archaeology traditionally views social progression as a linear trajectory, where hunting and gathering and nomadic pastoralism are stepping stones to sedentary lifestyles and agriculture. The Mongolian Neolithic (3000–2000 B.C.E.) contradicts this dominant narrative, especially in the South Gobi Desert where there is evidence of sedentary communities who utilized pottery, mortars, and pestles. Some researchers argue these were hunter-gatherers foraging in the area. At some point during the Bronze Age (3500-2000 B.C.E.), nomadic pastoralism was adopted as the dominant subsistence strategy and these sedentary communities were abandoned. This unexpected reversions may have been related to profound environmental changes occurring at this time and further examining this may help us to understand how human societies adapt to changing levels of uncertainty about resource availability. This will be examined through the changing Holocene landscape dynamics across the Ulan Nuur paleo lake and paleo hydrological system located in the Gol Desert of Omnogovi province, Mongolia. By examining this Holocene socio-ecological landscape, it may provide clues to how the changing hydrological system may have influenced resource availability, which in turn, may have affected local subsistence strategy choices.

**TH6-06 Abstract 06**

The Spread of Fruits along the Silk Road

Author - Dr. Spengler, Robert, Washington University in St. Louis, Lancaster, United States of America (Presenting author)

Co-author(s) - Dr. Frachetti, Michael, Washington University in St. Louis, Lancaster, United States of America

Keywords: Agricultural Spread, Archaeobotany, Silk Road

Presentation Preference - Oral

The Great Silk Road was the largest commerce network of the ancient world. It linked the disparate ends of the vast Eurasian supercontinent and in doing so connected the imperial centers of East and southwest Asia. While organized trade, including military outputs and government taxation, along the Silk Road dates back to the Han Dynasty (206 BC–AD 220), the exchange of goods, ideas, cultural practice, and genes, through the thousands of kilometers of desert and mountainous expanses comprising this region dates back to the third millennium BC. Over the past two millennia, the ebb and flow of cultures directly shaped the trajectory of human history in myriad ways, including by spreading agricultural practices and crop varieties. Among the many goods that moved along the Silk Road were a wide variety of plants, including many of the fruits that are familiar to us today. Archaeobotanical research at the Taishuhu archaeological site (a.D. 900–1200) is illustrating the importance of these crops in Central Asia during the height of Silk Road exchange, during and shortly after the Tang Dynasty (A.D. 618–907). The site was occupied by people in the Karakhanid Khatana (A.D. 940–1212) and was likely a high-elevation mining town. Preserved plant remains near the central square of the ancient occupation site paint of picture of the types of fruits and grains available in markets along the Silk Road. Archaeobotanically tracing the path that plants followed on their long journey across Central Asia, provides us with a map laying out the early route these foods took to ultimately reach our dinner plates today.
TH6-09 Abstract 01
Studies on remains of daily activities from the LBK Neolithic settlement

Author - Michał, Katarzyna, University of Gdańsk, Gdańsk, Poland (Presenting author)
Co-author(s) - Potockiński, Łukasz, University of Gdańsk, Gdańsk, Poland
Keywords: activity zones, processing of food, social relations

Presentation Preference: Oral

This paper focuses on aspects of identification of activity zones around LBK longhouses discovered at the multi-phase Neolithic settlements in southern Poland. Studies on the spatial and functional diversity of features located around the longhouses as well as quality (a state of preservation) and quantity of artifacts found there (pottery, flints, fragments of stone tools and grain remains) allow us to distinguish two main types of activity zones interpreted as possible places of household activities and intense deposition of waste, and places associated with processing and/or storing of food. Indication of these domestic/kitchen zones that have been used to daily activities and have been probably shared by inhabitants of contemporary houses enable deeper insight into social patterns and complexity of social relations. The recognition of domestic area related to processing of food seems to be also especially important to further studies on gender relations.

Another aspect of the study is to emphasize a possible limitation of recognition of activity zones because of long-term depositions process and the overprinting of various activity zones that can be problematic during analysis of the domestic artefacts recorded at the multi-phase settlements.

TH6-09 Abstract 02
Tell me who is living here... Some considerations on people living in Concise, a Swiss Neolithic site

Author - Post doctorale Chiquet, Patricia, Muséum d’histoire naturelle, Geneva, Switzerland (Presenting author)
Co-author(s) - Burri-Wyser, Elena, Etat de Vaud, Sipal, Archéologie cantonale, Lausanne, Switzerland
Co-author(s) - Winiger, Ariane, Etat de Vaud, Sipal, Archéologie cantonale, Lausanne, Switzerland
Keywords: lake dwelling, Neolithic, session, tasks sharing

Presentation Preference: Oral

Studies of the Middle Neolithic lake dwelling of Concise (Switzerland) are expanding year by year, with more fine assumptions about the spatial structures of the villages, the identity of the actors of the material culture, the history of the populations... The architecture of some villages is known as well as the material culture which contains in some cases a mixture of components NMB from Franche-Comté and the Swiss Plateau Cortaillod. The spatial distribution of remains between activity areas common to several houses and domestic waste in each house shows an essentially domestic economy, but there are also synergies by groups of houses for some components. The analysis of these distributions has led us to propose a gendered tasks sharing. In this general atmosphere of domestic subsistence, two buildings appear to have a particular function.

TH6-09 Abstract 03
Traces of households, activity areas and social inequality in a Late Copper Age site in Hungary

Author - PhD Főlgyő, Szilvia, Hungarian National Museum, Budapest, Hungary (Presenting author)
Co-author(s) - Sarlég, Gábor, Research Centre for Humanities of HAS Institute of Archaeology, Budapest, Hungary
Keywords: activity areas, household unit, social inequality

Presentation Preference: Oral

The archaeological traces of households and household units as the scenes of community interaction form an important interpretative level, determining numerous characteristics of the life and material culture of the community. My research is based on the premise that the archaeological identification of households and activity areas is possible, since the basic activities of everyday life were carried out in a delimited area and within a delimited timeframe. In my work I made an attempt to define the spatial and temporal limits of households and to determine the remains of which activities within a household have been preserved. The interpretation and comparison of these hypothetical household and activity areas units and scenes of social and gender inequality was carried out from a variety of viewpoints: among others from that of consumption, specialization and diversity. The starting point of the research is provided by the finds and observations on settlement structure made during the excavations at a Copper Age site. The study of the site is complemented by natural scientific – archaeological, anthropological, petrographic, geochemical, and radiocarbon dating – analyses, and environmental archaeological data from the region Transdanubia in Hungary. The proceeding of the finds was followed by the detailed qualitative and quantitative analysis of the materials of the pits and the pits themselves (correspondence analysis, one-way correlation analysis) according to the observed groupings. With the help of the spatial statistical and GIS analysis of the finds, the mapping of the distribution of the finds enabled the quantitative and qualitative study of the various classes of finds, which could help us to shed light on the distribution of activities and traces of social inequality taking place within and outside the households.

TH6-09 Abstract 04
Culture and society of a Hellenistic site: houses and artefacts of Sicilian city of Finziade

Author - Researcher Toscano Raffa, Alessio, CNR-IBAM Catania, Messina, Italy (Presenting author)
Keywords: Hellenistic world, houses, Sicily

Presentation Preference: Oral

The contribution is about housing of the Hellenistic-Roman period of Finziade, in the province of Agrigento, on the southern coast of Sicily.

There are 12 houses systematically excavated by the University of Messina between 2003 and 2014 that constitute a privileged vantage point for understanding the socio-cultural and economic dynamics of Sicily between the III- I centuries. B.C.

The houses are in fact one of the rare cases of recent stratigraphic studies of residential complexes of Sicily and also, not recording a settlement continuity in imperial times, have no relevant accretions after periods.

The well-preserved houses, in fact, allowed to identify the intended use of the spaces and thus to enable to carry out an analysis of a very large sample relative to the daily life of a center of Hellenistic-Roman Sicily, perfectly integrated with Mediterranean examples of the period in southern Italy, Sicily, Greece, and in the coasts of Africa and Asia Minor.

All houses have a square plan with a central courtyard that represented the center of domestic life and was equipped with tank for collecting rainwater. Around it revolved every room of the house, including the dining room, bedrooms, bathrooms and kitchens.

Themes will therefore be treated associated with daily life, especially in relation to material culture. Some kitchens, for example, are well associated with hobs, tables and ovens as well as the functional ceramic sets to the preparation, the service and food consumption. The most important rooms of the houses have also returned the wall decorations and floor of great value, which are an indicator of the medium-high socio-economic conditions of the owners.

Particular attention will be devoted to domestic cults, in fact every house possessed an environment characterized by the presence of an altar complete with artefacts relevant to the performance of rituals, demonstrating a particularly common practice...
in domestic contexts of the Mediterranean in the Hellenistic period, as demonstrated by the cases of Segesta, Eraclea Minoa, Tindari, Delo, Kerkouane. The altars, as well as the architectural decorations and ceramics documentation from the houses, show different economic realities between the houses excavated. Further aim of the contribution will evaluate individual aspects of different spaces in the houses, analyzed in a contextual way to make a picture of the social reality of downtown Finziade in relation to the characteristics of the late Hellenistic site of Mediterranean, reflected by the artefacts from private contexts.

**TH6-09 Abstract 05**

**Women to the front! Women to the front?**

**Author** - Bauer, Anna, Wien, Austria (Presenting author)

**Keywords** - female soldiers, Gender, woman and war

Presentation Preference - Oral

We have found women burials that can be dated to the early middle ages. Surprisingly these burials don’t show the typical grave goods for women like pottery or jewellery instead weapons were found. The archaeological research has difficulties to accept these burials as women tomb because the grave goods are typical for man ones. The anthropologist results were ignored and the female skeletons were declared to be male ones. Supporting their decision by saying that during the early Middle Ages the social gender is not like the biological gender. Anyway, women with weapons are not known just for the early middle ages but also in the 5-3 Century BC in the Asian/Russian area.

In general woman had no access to political or social power so the stereotyped of the peaceful woman was founded. If a woman fought she had still to fulfil the stereotyped of womanhood. Men were shocked when they found out that they have fought against women. The reasons why a woman joined war are various: poverty, a bad childhood, desire for adventures or a problem with their natural gender. With the beginning 20th century emancipation was another reason why women turned into army service. At the first World War it was emancipation which brought woman to the army. When war was nearly over woman had to leave the army and be again a housewife and mother. Their performance at war was not remembered and the women where left alone with their troubles and trauma.

An indirect reason why a young woman might have joined the army could be found in the higher wergeld for female babies. In the early Middle Ages 2400 solidi were paid for a baby girl and 600 solidi for a baby boy from this forced marriage can be deviated their troubles and trauma.

An escape by divorce was for the womenfolk mostly not possible due to laws or social grounds.

The grapple for the weapon must have been for some women or girls the exit from a forced marriage.

**TH6-10 Abstract 01**

**Anthropology of iron craft in the Canigou mountain (Antiquity-Early Middle Ages)**

**Author** - Dr. Vaschalle, Christophe, ISEM UMR 5554/LA3M UMR 7298, Montpellier, France (Presenting author)

**Keywords** - Anthropology, Fuel, Iron metallurgy

Presentation Preference - Oral

During ancient and medieval times, iron ore from the Canigou mountain (Pyrénées-Orientales, France) was intensively exploited, transformed into metallic iron and traded. This exploitation was particularly important between the end of the 1st century B.C. and the beginning of the 1st century A.D. Although decreased, this activity continued during the late Antiquity and the Early Middle Ages. In the Canigou mountain, and more generally in the whole eastern Pyrénées, archaeological and anthropological researches allowed to realize first synthesis on the relation between charcoal burning and metallurgy, but mostly for the modern period. However, anthropological research on ancient and medieval metallic iron remained scarce, probably because of the lack of studied sites for this period. Since 2014, a new interdisciplinary and diachronic research project aims to study Canigou mountain’s iron industry and trade. In 2015, archaeological surveys were realized in the valley of the Lentillà (Canigou mountain) in four rejects from iron ore reduction, dated from the 3rd to the 8th century A.D. The first anthropological results led on these surveys provide information on fuel management and on the type of landscapes exploited in this region during the late Antiquity and the Early Middle Ages. At the end of Antiquity, landscapes located between 500 and 1200 m a.s.l. were mostly dominated by the deciduous oak forest, which tended to become a beech forest and/or a sylvester pine forest in altitude. Around 500 m, open landscapes (scrub and/or sclerophyllous mixed oak forest might have existed. The presence of some species (Buxus sempervirens, Erica, Leguminosae) might have been related to anthropic activities (pastoralism?). Both the anthropological spectra dominated by the deciduous oak forest and the big caliber of the charcoal identified raise the question of the relation between charcoal burning and iron metallurgy. Furthermore, one of the four sites revealed a broader diversity and the use of smaller calibers, suggesting the use of the charcoal for the roasting of the iron ore and not for its reduction. At last, some of the charcoal show signs of tool marks, testifying of the cutting process. In order to better understand the impact of metallurgical activities on landscapes, future studies...
Archaeology without borders

Fuel Selection and Forest Management (Iberian Peninsula, 14th and 15th centuries)

**Author** - Lopéz Riber, Javier, University of Córdoba, Córdoba, Spain (Presenting author)

**Co-author(s)** - Cordoba de la Llave, Ricardo, University of Córdoba, Córdoba, Spain

**Keywords**: Charcoal, Late Middle Ages, Metallurgy

**Presentation Preference**: Oral

Among the various raw materials offered by the forest, the charcoal had a leading role. This is one of the most used fuels throughout history, thanks to its high calorific value. In the Late Middle Ages, it became a must for industrial processes as a source of thermal energy, especially in the field of metallurgy. Based on the information provided by the documentary sources of the time, the aim of this paper is to analyze the use of this natural resource in Hispanic metallurgy, to know the types of existing charcoal, to examine the works they were designed to and to give some trends about commercialization in the 14th and 15th centuries.

TH6-10 Abstract 03

**Synthesis of the anthropological approach**

**Author** - Dr. Vaschak, Christophe, ISEM UMR 5564/LASM UMR 7298, Montpellier, France (Presenting author)

**Keywords**: Anthracology, Craft, Fuel

**Presentation Preference**: Oral

During historical times, fire was one of the main energy used for industry, craft and domestic activities. For the past 30 years, anthracological analyses were realized in Mediterranean France on nearly 80 ancient, medieval and modern sites. If several activities are now well documented (charcoal and lime burning, pottery, cremation), no global approach has been attempted so far. An inventory was realized, based on a broad range of activities (ceramic, charcoal, lime, vegetal exudates, food, metal, glass, textiles, leathers, soap, salt, plaster) gathered in a same data basis. In order to understand phenomenon of rupture and continuity of the practices, the corpus comprises a chronology going from the Romanization to the Industrial Revolution. Craft and industry constitute the major part of the corpus. This work raises new questions. Currently, archaeologists aim to link the use of fuel with the type of products made (ceramic, lime, glass, etc.). Also, they affirm that some taxa have a calorific value more important than others, and that craftsmen used to chose the fuel regarding its specific properties. Nonetheless, our research proves that these ideas are not representative of past practices. For this reason, we propose a new approach which takes into account the constraint imposed by thermal and technical necessities (i.e. concentration of fire, or, on the contrary, circulation of fire in the kilns). Indeed, the choice of fuel does not always rely on the choice of a taxa for itself but on other criteria such as morphology, caliber, humidity level, etc. Furthermore, we propose a different interpretation of anthropological data. Generally, anthropologists consider that their data only reflect the choice of the craftsmen and the ecological constraints. But it appears that the role of landowners, who managed the fuel resources, has never really been discussed or taken into account. This communication will propose a first discussion on the subject. Studies of multi-craft sites will be presented, as well as examples of “gestion sur pied” (division of work products from a same tree in order to fuel different activities). Recent methodological developments will be introduced, such as the restitution of calibers, or the observation of tools marks, bringing information on the preparation of the fuel. By crossing anthropological data with medieval and modern texts, a socio-professional approach of the preparation of the fuel will also be possible. At last, the energetic transition towards the use of fossil charcoal will also be attempted.

---

TH6-10 Abstract 05

**The use of coal in “la chaîne opératoire du fer” to late Middle Ages in the north of France**

**Author** - Jagou, Benjamin, Irnap, Achicourt, France

**Co-author(s)** - Dr. Arribat-Daron, Danielle, Université Paris 1 Panthéon-Sorbonne, Paris, France (Presenting author)

**Keywords**: coal, Flanders, smithy

**Presentation Preference**: Oral

Since 2008, preventive archaeology operations in northern France, mainly carried out by the National Institute for Preventive Archaeological Research (INRAP), have enabled to highlight the use of coal as a fuel for the “chaîne opératoire du fer” as from the 13th century. Studies about almost ten sites allowed developing various issues related to this kind of fuel from a technical, but also environmental and commercial point of view. These lines of research allowed implementing a project of thesis in 2014 under the direction of A. Joutard and tutoring of D. Arribat-Daron of the University of Paris 1 Panthéon Sorbonne. Referring to existing archaeological, archeometrical and text studies, the goal of this thesis is to answer the questions related to these discoveries. Therefore, it will help to understand the environmental and commercial reasons of the late transition between charcoal and coal compared to the rest of France, and also to figure out the impact of coal on the “chaîne opératoire du fer” and its technical processes. Eventually, it will show that the use of this fuel led to the development of commercial exchanges between the area of study and some close European countries during the late Middle Ages. By taking part to this symposium, I would like to present more specifically all these issues as well as the results of my first two years of work.

TH6-10 Abstract 04

**Fuel Selection and Forest Management by Middle Age Belgian Brass Blacksmiths Along the Meuse River**

**Author** - Dr. Chevalier, Alexandre, Royal Belgian Institute of Natural Sciences, Bruxelles, Belgium (Presenting author)

**Co-author(s)** - Thomas, Nicolas, Laboratoire de médiévistique occidentale de Paris – Université Paris 1, Paris, France

**Keywords**: charcoal, Late Middle Ages, Wood charcoal

**Presentation Preference**: Oral

The influence of the Belgian copper and alloy industry, in particular brass production during Middle Age Western Europe, is an irrefutable historiographic fact. Caudron, bows, and pans produced in the town of Dinant as well as in the nearby Bouvignes, were exported throughout French and English kingdoms, as far as Barcelona in Spain. In the 15th century, copper alloy artifacts produced in the Dinant region were so highly prized and considered that the town’s name of Dinant was used in Paris to designate the bolemakers, or the dinandiers (coppersmith).

The copper metallurgy in the Meuse region dates back at least to the Merovingian dynasty, with a workshop uncovered in the town of Namur at the "Grognon" site, dated to the 8th century. The copper metallurgy boom around the 12th century in both Dinant and Bouvignes is due to several causes. Although the Meuse region lacked copper and tin ores largely used in Middle Age metallurgy, very good communication ways provided by the Meuse River and its tributaries, as well as the establishment of strong commercial ties with the German towns of Cologne and Dortmund for copper supplies and with London for tin supplies, overcame this natural limitation. In addition, merchants were allotted specific privileges with the German towns, while a charter allowed them to establish a trading post on the Thames River. The dynamism of the Meuse merchants cannot however explain this heavy industry boom alone. Indeed, the Meuse region is rich in two products that are necessary for brass production: charcoal, which contains zinc oxide and natural refractory clay, derived from the appropriate to build bricks, hearts, smelters and molten. Copper and brass production however ends abruptly in 1466 in Bouvignes, property of the earldom of Namur, and in 1554 in Dinant, property of the prince-bishop of Liège, when the two cities were defeated in the Burgundy wars led by Charles the Bold.

Since 1995, several archaeological excavations have taken place under the supervision of the Walloon Archaeological Service in the towns of Bouvignes and Dinant. Theses excavations uncovered several coppersmith buildings, with their workshops and domestic spaces. We will present the results of wood charcoal analyses from four different sites – Bouvignes Porte Chevalier, Dinant Oblats, Dinant Rateau and Dinant Churchill – that represent 13 different coppersmith workshop spaces dated between the 13th and the 16th centuries. Because Dinant and Bouvignes were competitors and depended on two rival political entities, our results are highly significant in terms of territory exploitation and cultural identities along the Meuse River.
Between the 18th and 20th centuries the Limousin region was notably lacking in woodland: the level of forest in the landscape was less than 10%. However, it was during this period that the development of the Limoges porcelain industry, a major fuel consumer, took place. Alongside this industrial boom, the urban population was also thriving, thus the need for fuel in the city became even greater.

The 19th century was a period that put great pressure on firewood resources and one wonders how, and to what extent, the population and industry in the city of Limoges were able to meet their considerable fuel requirements. We therefore look at sources that can better trace the evolution of fuel consumption in Limoges. By combining historical sources, we analyse the heavy fuel consumption of the city of Limoges in relation to resources available in the region and describe the different procurement strategies implemented. The importance of the porcelain industry is discussed and we make a start on the evolution of the wooded landscape in the Limousin.
The pile dwelling settlements were situated at the boundary of different landscape types that provided the basis of a productive hunting and gathering economy, and supplied as a resource for different wood, plant and bone material, raw materials for pottery making. It remained the typical settlement pattern for over a millennium. The inhabitants of such settlements left a unique material culture with a particular toolkits and pieces of art.

TH6-11 Abstract 05
Pile dwellers in the Sukhona basin?
New Russian-German research at Veksa, Northern Russia
Author - Dr. Plezonka, Henny, German Archaeological Institute, Berlin, Germany (Presenting author) Co-author(s) - Dr. Nedomakina, Natalzhga O., Vologda State Museum, Vologda, Russian Federation Co-author(s) - Dr. Haufner, Karl, Institute of Prehistory and Historical Archaeology, Mainz, Germany Co-author(s) - Prof. Dr. Kirsik, Wielke, Institute of Pre- and Protohistory, Christian-Albrechts University Kiel, Kiel, Germany Co-author(s) - Dr. Lorenz, Sebastian, Institute of Geography and Geology, University of Greifswald, Greifswald, Germany Co-author(s) - Dr. Wielczkowska-Lüth, Magdalena, Institute of Pre- and Protohistory, Christian-Albrechts University Kiel, Kiel, Germany
Keywords: Neolithic, Northeast Russia, Pile concentration
Presentation Preference - Oral
The settlement remains of Veksa c. 400 km north of Moscow represent a pivotal site with regard to the cultural development in northeastern Russia. Extending along the left bank of River Vologda in the Sukhona basin, the site is located at an important river confluence. Its exceptional significance is due to the clearly stratified sequence of archaeological layers up to 3 m thick which encompasses all periods from the Early Neolithic through to the Medieval period. Veksa yields the rare opportunity to follow the local culture, typological and economic developments and their links to environmental history over eight millennia. A multidisciplinary Russian-German field project led by Vologda State Museum and the German Archaeological Institute started in 2015. It combines archaeological research with archaeobiology, palaeogeography and dendrochronology in order to generate new high-quality data on human-environment interactions at Veksa on a diachronic level. Stone Age remains are especially well preserved at Veksa due to partial water-logging. They include a concentration of almost 2000 wooden stakes and piles standing upright in several clusters along a 350 m long stretch of the river bank.Radiocarbon dates place the main concentration in the Late Neolithic around 3000 BC. Thus, the concentration of wooden piles at Veksa is chronologically associated with a period of pile dwelling construction in the Late Stone and Early Metal Ages noticeable from the Alps in the south-west to the eastern Omega region in the north-east.

During the field work in 2015, a test trench was excavated within the pile concentration, yielding for the first time information on the stratigraphic association of the timber constructions. Silty and multiple layered sediments rich in organic remains point to rather lacustrine environments, where the area was probably not a river bank but part of a shallow lake. Among the piles, several well-preserved wooden fish traps have been found, indicating multiple uses of the shoreline. First results of the analysis of botanical macro-remains have found charred seeds of water lily, adding new surprising evidence to the exploitation of aquatic plant resources in the Stone Age. Important new insights come from a pollen core of the lake bottom, the first in this region, which shows several phases of intensified human activity at Veksa over the millennia that are correlated to phases of increased sedimentation and drying-up of the environment. Ongoing analyses of the documented features and the environmental data will yield new information on character and function of the wooden constructions and their association with cultural, economic and environmental developments.

TH6-11 Abstract 06
The Neolithic and Early Metal Age wooden construction of site Okhta 1 in St. Petersburg (Russia)
Author - Dr. Gusenitova, Tatiana, Scientific and Research Institute for Cultural and Natural Heritage, Saint Petersburg, Russian Federation (Presenting author) Co-author(s) - Sorokin, Petr, Institute of Material Culture Russian Academy of Science, Saint Petersburg, Russian Federation Keynote(s): Neolithic, Early Metal Age, wooden construct
Presentation Preference - Oral
The Neolithic site Okhta 1 is first archaeological object with gut preserved wooden construction in St. Petersburg region. The territory of sites was occupied by ancient people several times during the Neolithic Age – in the Early Metal Age periods – from 4000 to 2500 BC. The cultural layers of the prehistoric settlements are situated under alluvial sandy sediments 1-1.5 m thick, which lie under the buried soil of the Middle Ages. Features of the microrelief of the site, its stratigraphy and archaeological observations allowed us to select an earlier coastal fishing zone located on the coast of the gulf, and a second fishing and living area, connected to river channels. The archaeological collection includes archaeological finds; pottery, stone tools, products of organic matter and wood, and amber jewelry.
TH6-11 Abstract 07
Charaterization of activity areas in the early Neolithic site of La Draga (Spain)

Author - Dr. Pipé, Raquel, Universitat Autònoma de Barcelona, Bellaterra, Spain (Presenting author)
-Co-author(s) - Morena, Núria, Universitat Autònoma de Barcelona, Bellaterra, Spain
-Co-author(s) - Barceló, Joan Anton, Universitat Autònoma de Barcelona, Bellaterra, Spain

-Co-author(s) - Realtes, Jordi, Universitat Autònoma de Barcelona, Bellaterra, Spain
-Co-author(s) - Sara, María, Universitat Autònoma de Barcelona, Bellaterra, Spain
-Co-author(s) - Terradas, Xavier, Universitat Autònoma de Barcelona, Bellaterra, Spain

Keywords: Activity areas, Neolithic, Spatial analysis

Presentation Preference - Oral

The early Neolithic site of La Draga is located on the shore of Lake Banyoles, in north-east of Iberian Peninsula (Spain). The site has provided evidences of two phases of occupation dated between 5300-4700 cal BC. The preservation of the site differs depending on the proximity to the lake. In some parts of the site a layer of well-preserved wood has been documented, corresponding to the earlier phase. In other sectors only the tips of the poles stuck in the lacustrine chalk are preserved. The spatial analysis of the remains recovered at the site aims to identify possible areas of activity and characterize them. In-situ spatial analysis of different categories of remains have been explored in order to set boundaries and relationships between different spaces.

TH6-11 Abstract 08
Wood architecture in the Early Neolithic (5300-5000 cal BC) site of La Draga (NE of Iberia)

Author - Dr. Ortí, López-Bultó, Universitat Autònoma de Barcelona, Barcelona, Spain (Presenting author)

Keywords: Early Neolithic, Iberian Peninsula, Pile-dwelling

Presentation Preference - Oral

La Draga is the only Neolithic pile-dwelling site of the Iberian Peninsula. It is located on the shore of the Banyoles Lake (Girona, Spain) in the North-east of the Iberian Peninsula. The site was occupied during early Neolithic (5300-4900 cal BC). The remains of wood recovered at the site have been studied with the objective of characterizing the wood management process: obtaining of raw material, woodworking technology and the use as tools or construction elements. All this process is usually hidden for archaeologist, but its economic and social implications are of great relevance. The analysis of wood elements had been carried out involving a wide range of different methodologies: dendrology, description of morphology, experimentation, tool-marks, use-wear and 3D modeling.

In this work are summarized the result of the analyses of the architectural elements. We outline the main characteristics of the building process of the wooden constructions at La Draga, from the obtaining of the raw material to its use for architecture, through its elaboration process.

The analysis of architectural elements (beams, posts, planks, framework, etc.) show in one hand the predominance of certain species of raw material, season of obtaining, diameters and supports selected. In the other hand it has been spotted certain predominance on the elaboration process. Finally, a few master lines of the construction structure have been spotted.

TH6-11 Abstract 09
Dry land and lakeside settlements in the region of Four Lakes at Amindeon Basin (Greece)

Author - Dr. Chrysochatou, Panikos, Greek Ministry of Culture and Sports, Floreana, Antiquities of Amindeon, Florina, Greece (Presenting author)

Keywords: Western Macedonia, Presentation Preference - Oral

The surveys and excavations of the last years in Amindeon region conducted by Florina Ephorate of Antiquities, resulted in the discovery of several prehistoric dry land and lakeside settlements dated from the late 7th to the late 2nd mil. BC. Some 31 new habitations were spotted in an overall area of approximately 550 hectares, from which 15 lakes were partially or totally excavated, covering an area of 25 hectares.

From the preliminary overall approach of the excavational data so far yielded, the development of a unique culture in the region is documented, with an active contribution - especially during the earlier phases - to the neolithisation of Balkans, as part of the basic axes of populations and ideas mobility from the southeastern Balkans towards the central and northernEurope.

The location of the settlements confirms the special relationship that local neolithic communities developed with wetland environment, an interaction sustained with an impressive adaptive capacity throughout prehistory. Even during Early and Middle Neolithic periods (mid of 7th - mid 6th mil. B.C.), as documented by the excavational data from the settlements Anargirhi XI and Anargirhi XIII and XIIa - although some basic choices regarding the construction and organization of habitations' space refer to dry land occupation - the proximity of those settlements to the adjacent marshes necessitate the adaption of building technologies similar to pila dwellings. At late 6th mil. B.C. the occupation of the lakes and marshes' shores is intensified, resulting the establishment of several lakeside settlements. The most recent partial or total excavation of some of these and the investigation of extended destruction layers, numerous structural elements and artifacts of various organic materials, yielded new data to the prehistoric research of the region. The preliminary study of the evidence from the lowest waterlogged layers of Limnochori II, Anargirhi IXa and IXb refers to dwellings built on water or by the shores, with a wide range of construction techniques exploited for flooding, walking, roofing etc. Especially the on-going large scale rescue excavation at Anargirhi IXb has so far yielded some impressive wooden structures referring to an organized communication and/or defense system of palisades and trackways connecting the settlement to the opposite lakeshore. All these significant evidence referring to the diachronic intra-settlement spatial organization, the form, structure and internal arrangement of the houses, together with thousands of clay, stone, wooden tools related to the productive, gathering and domestic activities, as well as some unique artifacts and ornaments related to the variety of ideologic means of expression and orientations of the local prehistoric communities, formulate a unique data set for the research of pile dwellings in Southeastern Europe and beyond.

TH6-11 Abstract 10
Ups and downs. Studying structural wood from the prehistoric lakeside dwelling Anargirhi IXb (Greece)

Author - PhD Candidate Giagkoulis, Tryfon, University of Bern, Florina, Greece (Presenting author)

Keywords: Architecture, structural wood, Prehistoric lakeside dwelling Anargirhi IXb, Western Macedonia, Greece, Presentation Preference - Oral

The Rescue Excavations Project of Florina's Ephorate of Antiquities at the coalingine zone of Public Power Corporation S.A. - Hellas (Amindeon, Western Macedonia, Greece) has so far yielded substantial new evidence for the cultural development - from Early Neolithic to Late Bronze Age - of this region characterized by the presence of four lakes. Among the numerous finds there is a considerable great number of wooden elements belonging to structures preserved in the lower waterlogged deposits of several prehistoric settlements. Anargirhi IXb is a settlement inhabited since the early 5th millennium BC, was oval in shape and approximately 2.8 hectares in size, in the central part of which the archaeological layers are almost 4 m thick. According to the so far unearthed evidences, the earliest occupation's structures were built in immediate spatial relation to water with matching building choices adopted by the Neolithic settlers, while during the subsequent Neolithic periods (c. 4700-3300/3200 BC) the settlement became a dryland site characterized by successive layers of burnt structures. The large scale project of the last three years has resulted the completion of the excavational research of the cultural deposits at the periphery of the settlement, covering an area of approximately 7.000 m².

The study of the various construction techniques implemented by the neolithic builders, especially concerning the exploitation of wood as raw material in several related tasks, is based mainly on extensive sampling of the structural elements preserved in the settlement's waterlogged layers, as well as on the data set derived from the detailed documentation of finds and findings and their spatial integration in the excavational grid with the use of GIS tools. Although the study is still in an early stage, the processing of data in connection with the categorization of the wooden elements in different types according to their preservation, in-layer arrangement, physical and technical features etc. provide useful information concerning the construction and organization of space at the periphery of the prehistoric occupation. Yet, the large scale of the excavation, some particular differentiations in...
A research project focusing on Lake Degersée in Southern Germany revealed settlement activity and land use in the hinterland of Lake Constance older than the onset of the pile-dwelling period at Lake Constance in the 40th century BC. The outcomes of recent archaeological and palynological prospections suggest new settlement sites and human impact dating back to the 5th millennium (see contribution of Mainberger, this session). Within the tri-national project ‘Beyond Lake Villages – BELAVI’ palaeoenvironmental on-site and off-site data from the Western Altgäu region are synthesised with archaeological records. The chronological basis and with it the relation to regional and over-regional vegetation and climatic records is established by high-resolution pollen, charcoal and sedimentary records on annually laminated lake sediments, dendrochronology, and AMS radiocarbon dating.

With regard to the results of plant macrofossil and pollen analyses on the cultural layers at Degersee, we expect to provide further evidence of changes in subsistence strategies and landscape management in response to environmental and climatic changes throughout the Neolithic period.

Dendrochronology provides information on woodland management of settlers at the periphery of Lake Constance. Main construction timber at Degersée comes from ash trees, and tree ring patterns show a cyclic settlement activity with repeated usage of small woodland plots with intermittent falls. Wood chars from cultural layers complement the spectrum of potentially selected construction timber, to gain a more complete picture of wood resource usage. Geoarchaeological investigations look into land use impacts, namely erosion, and together with the taxonomic analysis and dating of embedded charcoal can give further chronological as well as information on prehistoric vegetation cover.

**TH6-11 Abstract 11**

**Wet, Wet, Wet: Neolithic wetland and lakeside settlements in the Balkans**

**Author:** Dr. Naumov, Gozoo, Museum of Macedonia, Skopje, Macedonia (Presenting author)

**Keywords:** Balkans, Pile dwellings, pottery and human representations

**Presentation Preference:** Oral

The Balkans is known as the first outcrop of Neolithic societies that introduced the agriculture on the European continent. There is a abundance of publications and discussions on the ‘dryland’ settlements and their communities in this region, but there is not much on sites established within marshes and on lakeshores. Few of them were excavated, but their significant role in the modification of environment and incorporation of farming were neglected. Besides their specific features pile dwellings were rarely studied through the potentials of wetland archaeology and although this discipline is one of the most advantageous directions in understanding of the past landscapes it is still modestly introduced in the Balkans. There are number of lakeside settlements and prehistoric villages in marshy areas, but they are not thoroughly explored in relation to the environment, climate and more complex social networks.

Nevertheless, the excavations so far provided elementary information on the material culture and chronology of these sites and indicated the density of settlements established on lake shores, river beds and falls within marshes. Pile dwellings were common in the Neolithic to Bronze Age periods, but recent restorations of villages on the shores of Lake Ohrid, Lake Prespa and Lake Dojran, but recent restorations of villages on the shores of Lake Ohrid, Lake Prespa and Lake Dojran, Pelagonia valley indicate such constructions on the periphery of fall-sites in wetlands. The main focus in this paper will be on the Neolithic settlements in Lake Ohrid basin and Pelagonia, but a broad-spectrum overview of similar sites in the Balkans will be presented in order to emphasise the thorough networks of farming societies that inhabited wetlands and lakes.

**TH6-11 Abstract 12**

**Live and survive in prehistory on northern shore of Ohrid lake**

**Author:** Todoroska, Valentina, NU Museum Nikola Nezlobinski Struga, Macedonia (Presenting author)

**Keywords:** pile dwellings, tools

**Presentation Preference:** Oral

Aim of this presentation is to represent the pile dwelling settlements situated in northern part of Ohrid Lake. Valuable archaeological findings in few of them, located in part of the lake, indicates on fact that we can talk about pile dwelling settlements which existed in early prehistory: late Neolithic, Eneolithic also late Bronze and Iron Age. A huge concentration of pottery and tools will help us to complete the picture of this region in prehistory. Especially, focus will be given on tools used by people who lived in these regions and help them to survive and live traces of their existence.

**Presentation Preference:** Oral

A research project focusing on Lake Degersée in Southern Germany revealed settlement activity and land use in the hinterland of Lake Constance older than the onset of the pile-dwelling period at Lake Constance in the 40th century BC. The outcomes of recent archaeological and palynological prospections suggest new settlement sites and human impact dating back to the 5th millennium (see contribution of Mainberger, this session). Within the tri-national project ‘Beyond Lake Villages – BELAVI’ palaeoenvironmental on-site and off-site data from the Western Altgäu region are synthesised with archaeological records. The chronological basis and with it the relation to regional and over-regional vegetation and climatic records is established by high-resolution pollen, charcoal and sedimentary records on annually laminated lake sediments, dendrochronology, and AMS radiocarbon dating.

With regard to the results of plant macrofossil and pollen analyses on the cultural layers at Degersee, we expect to provide further evidence of changes in subsistence strategies and landscape management in response to environmental and climatic changes throughout the Neolithic period.

Dendrochronology provides information on woodland management of settlers at the periphery of Lake Constance. Main construction timber at Degersée comes from ash trees, and tree ring patterns show a cyclic settlement activity with repeated usage of small woodland plots with intermittent falls. Wood chars from cultural layers complement the spectrum of potentially selected construction timber, to gain a more complete picture of wood resource usage. Geoarchaeological investigations look into land use impacts, namely erosion, and together with the taxonomic analysis and dating of embedded charcoal can give further chronological as well as information on prehistoric vegetation cover.

**TH6-11 Abstract 14**

**The Neolithic Landscape of Westallgäu Region – first results of BELAVI in Southern Germany**

**Author:** Dr. Mainberger, Martin, Landesamt f. Denkmalfmg Baden-Württemberg, Staufen, Germany (Presenting author)

**Keywords:** Cultural landscape vs aquatic landscape, lake shore settlements, Neolithic

**Presentation Preference:** Oral

Precisely dated, laminated lake sediments contain an amazing wealth of archaeological background data. If their palaeoenvironmental, palaeoeconomic and palaeoecological information can be exactly paralleled to waterlogged archaeological evidence from lake shore sites, a database on human activities in landscapes far beyond the lake shores is generated. This is the core outcome of a research project completed in 2010, focusing on the small Degersée Lake in South Western Germany. The Degersée project triggered not only a whole series of new discoveries, but also the design of the tri-national ‘Beyond Lake Villages – BELAVI’ – Project (BELAVI), which started in 2015. The German working group focuses on the Stone Age of Western Allgäu, a pre-alpine region between Lake Constance and the European Watershed between Rhine and Danube River systems. Topographic and hydrographic models illustrate that in the Holocene the landscape was characterized by drumlin rows and moraine belts, and an entanglement of lakes, bogs, lowlands and water courses. The archaeological assessment of the Western Allgäu region is based on a concept of complementary components, with the cultural landscape dominated by farming activities on one hand, and the aquatic landscape with their benefits in respect to foraging, settlement-building, and communication on the other. The presentation will provide with initial results of the GIS - supported landscape analysis and first outcomes of 2015 and 2016 field campaigns.

**Co-author(s):** Haas, Jean Nicolas, University of Innsbruck, Innsbruck, Austria

**Co-author(s):** Taylor, Timothy, University of Vienna, Vienna, Austria

**Presentation Preference:** Oral

Austria’s prehistoric lake village sites have been known for over 150 years. Research in the 19th and 20th century identified a number of prehistoric lacustrine structures, with rich cultural deposits. But research into Austria’s Pfahlbau (pile-dwelling) phenomenon has been characterized by discontinuity and modern transdisciplinary research has been limited often in practice and at a theoretical level. This has begun to change with several new research initiatives focussed on the Salzkammergut region in Upper Austria. This paper presents data analysis from the international project ‘Beyond Lake Villages’ (funded by FWF-DFG-SNF 2015-2018). The Austrian part of the project focuses on the Lake Attersee-Mondsee region, including both large and small bodies of water: bogs, and newly discovered ‘hinterland’ sites. The aim is to characterise lake-landscape interaction in the Neolithic with special focus on the 4th millennium BC. The project goals are to establish a highly resolved Holocene
palaeoenvironmental record for the research area; (ii) to enhance our understanding of landscape in terms of spatial networks (iii) to integrate palaeoenvironmental data sets with archaeological data. The research is conceived at three scales: (1) Micro-regional, to produce an accurate picture of the complete range of surviving archaeological features through intensive field survey; (2) Regional, incorporating LIDAR data and aerial photography to facilitate a systematic understanding of the archaeological landscape; and (3) Macro-regional, providing new socio-cultural, economic and ideological models/hypotheses that can be tested in subsequent transdisciplinary research.

Beyond lake villages. Archaeological and palaeoecological research at Lake Burgäschi! Switzerland

Author - Prof. Dr. Hather, Albert, University of Bern, Bern, Switzerland (Presenting author)
Co-author(s) - Gobet, Erika, Institute of Plant Sciences and Oeschger Centre for Climate Research, Bern, Switzerland
Co-author(s) - Laabs, Julian, Institute of Archaeological Sciences and Oeschger Centre for Climate Research, Bern, Switzerland
Co-author(s) - Rey, Fabian, Institute of Plant Sciences and Oeschger Centre for Climate Research, Bern, Switzerland

In 2015 started the international research project "Beyond lake villages: Studying Neolithic environmental changes and human impact at small lakes in Switzerland, Germany and Austria." (University of Bern in collaboration with Landsdeennikamalt Baden- Württemberg and University of Vienna, funding: SNN-DFG-FWF). Three archaeological and three palaeoecological teams work together on three small lakes on the Northern side of the Alps. The aim is to compare environmental changes and human impact of Neolithic societies. The Swiss study area is Lake Burgäschi, a small water body in the central part of the Swiss Midlands.

Archaeological research started already in 1877 and several major excavation campaigns took place in the 1940ies and 1950ies. Up to now four settlement of the 4th millennium BC areas are known and single finds indicate settlement activities during the 5th and 3rd millennium BC. The presentation gives an overview on former and recent activities in one of the classic find spots of Swiss pile-dwellings research. A special focus will be put on new archaeological and palaeoecological results.

TH6-11 Abstract 17

Above the lakes – Organic finds from Bronze Age mines in the Alps

Author - Reischlauer, Hans, Naturhistorisches Museum Wien, Vienna, Austria (Presenting author)
Co-author(s) - Kowarik, Kerstin, Naturhistorisches Museum Wien, Vienna, Austria

Keywords: Mine, Organic material

Preseentation Preference - Oral

Organic finds fascinate as they convey exceptional insights into prehistoric daily life and work routine. Organic objects make up the bulk (far more than 90%) of material culture in the period from the Stone Age to very recent times (19th cent.).

Aside from underwater and wetland sites organic materials such as wood, fur, skin, leather and textiles have also been preserved in considerable numbers in several alpine mines (e.g. Hallstatt, Mitterberg). Those ancient mining relics are fundamentally different from the objects we know from wetland and underwater sites in terms of taphonomy, functionality and age at burial. Those hot handles, lightning tapers, buckets, mining timber, excrements and so on are remnants of large scale prehistoric production systems. A particular difficulty in dealing with those objects lies in the uncertainty whether they represent highly specialized mining tools or tools commonly used in the settlements as well. Comparison with the organic finds from wetland and underwater sites is essential in the understanding of the finds from the alpine salt and copper mines. In addition the alpine finds present important complementary information in the analysis of organic finds from bog, wetlands and water bodies as certain materials that decay underwater are preserved in the mines. Furthermore the Hallstatt salt mines offer finds from wetland and underwater sites is essential in the understanding of the finds from the alpine salt and copper mines. In addition the alpine finds present important complementary information in the analysis of organic finds from bog, wetlands and water bodies as certain materials that decay underwater are preserved in the mines. Furthermore the Hallstatt salt mines offer large scale prehistoric production systems. A particular difficulty in dealing with those objects lies in the uncertainty whether they represent highly specialized mining tools or tools commonly used in the settlements as well. News from prehistoric lakeside settlements in Austria

Author - MA Pohl, Henrik, Kuratorium Plachbauten, Attersee, Austria (Presenting author)

Keywords: Austria, Neolithic, pile dwellings

Preseentation Preference - Oral

The most recent extensive survey undertaken in Austria and a small but successful study of the prehistoric lakeside settlements took place in the 1970s and 1980s. The inscription on the UNESCO list of World Heritage sites in 2011 provided the crucial impetus to resume the archaeological investigations and the associated protection measures. The Pile Dwellings Curatorship was tasked by the Austrian state authorities with coordinating the work and establishing systems of monitoring the sites. In 2013 a monitoring plan was developed with the aim of maintaining long-term observation and putting in place protection programmes; at the same time, archaeological investigations were mounted at the five Austrian world heritage sites on the list of "prehistoric pile dwellings". Now, three years later, a first up-to-date inventory is available, which will allow us to implement concrete protection measures beginning in 2016. Additionally we have got some new data as a result of our research. A new research programme has been started with an underwater excavation in Lake Attersee in 2015.

TH6-11 Abstract 19

Wet worlds in context–The Bronze Age pit dwelling of Must Farm in the East Anglian Fens (UK)

Author - Huisman, Floor, Durham University, Durham, United Kingdom (Presenting author)

Keywords: Contextualising wetland living, East Anglian Fens, Must Farm pile-dwelling

Preseentation Preference - Oral

The recent discovery of the Bronze Age site of Must Farm in the former wetlands of the East Anglian Fens opens up a new chapter in pile-dwelling research in the UK. Older than the artificial Iron Age islands known as 'crannogs' found in Scotland and Ireland, Must Farm consisted of typical Bronze Age roundhouses built on stilts above a former channel of the river Nene. Burnt down at the end of its lifespan this site has been extraordinarily well-preserved. Consequently, Must Farm (dubbed the 'Pompeii of Britain'), provides an unprecedented snapshot of later Bronze Age life and human-livestock interaction in the Fens. Moreover, the discovery of this wetland settlement in the 'deep fens' beyond the fen edge requires a reconsideration of the later prehistoric Fenland narrative.

Although the extraordinary findings from Must Farm are important in their own right, it is crucial that this site is placed within its wider spatial and temporal context. This is also true for other pile-dwellings in Europe. To some extent, all pile-dwellings are 'unique' (mostly due to their wet location and the level of preservation at many of these sites), but they should not be studied in isolation. Indeed, to better understanding pile-dwellings, they must be compared with other types of wetland settlements. More importantly, nearby dryland settlements areas should also be considered. Only then can we study the origin of pile-dwellings, better understand their inhabitants' lifeways and their interactions with the environment. This paper will discuss these issues by introducing Must Farm and placing this site in its wider regional, national and international context.

TH6-11 Abstract 20

Sailing the lakes of the Alps.
Notes on the prehistoric navigation and boats

Author - Tiberti, Francesco, Università Aix-Marseille 1, Arenzano, Italy (Presenting author)

Keywords: Boats, Lakes, Monolyx

Preseentation Preference - Oral

The aim of this paper is to propose a new framework to deal with the topic of ancient monolyxes and canoes that have been found in great number in different prehistoric sites of the Alpine region, and particularly to deal with those pertaining to pile dwelling sites.

Usually considered simple boats, essentially in use for fishing and for short travels on water; these objects have not been studied in the same way around the Alps. Their knowledge is in fact not homogenous and is essentially linked to single experiences and researches, held by singular scholars, often isolated.

Far from wanting to exhaust the topic, the main aim of the proposed framework is in fact to overflow the often-overestimated idea of a sort of primitivism of these ancient ships, as well as to propose a new and more complex interpretation of their forms and features.

To do this, the paper first tries to examine why the analysis of these boats appears to be usually conditioned by the ethnological interpretation of the "modern primitive monolyxes" in use in some technologically regressed regions of Africa, Asia or Oceania.

After doing this, in the second part, the author considers the relationship between man and water in lacustrine environment

Co-author(s) - Regert, M., (1) Univ. Sophia Antipolis, CNRS, CEPM UMR 7264, 06300 Nice, France

Keywords: Dairy products, Organic residues, Pottery use

Presentation Preference - Oral

Traditionally, pottery use has been discussed through morphological characteristics and mechanistic properties of the vessels (Rice 1987) but amorphous organic residues analysis has also greatly contributed to understand exploitation of natural resources during the Neolithic (Evershed 2008). Nevertheless these methodologic are rarely combined due to the high fragmentation of pottery and to the impossibility to link ceramic content with specific sites. At the site of Clairvaux XIV (Middle Neolithic, NMB - 39e-37e century BC), the large and diverse corpus of ceramic vessels (377 vessels with restituted profiles) combined to aronic condition favoring lipid preservation offers a unique opportunity to investigate the use of pottery to better understand lake dwelling Neolithic society (Pétrequin et Pétrequin 2015).

The corpus was first classified based on morphological and morphometric criteria. Chemical analysis of the lipids present in these sherd was conducted on non-volatized surface residues were then carried out using an analytical strategy combining chromatographic (HT GC), spectrometric (HT GC-MS, NanoESI MS and MS/MS – Mirabaud et al. 2007) and isotopic (GC-C-IRMS) techniques. The data obtained on 95 pottery conducted to: (i) the identification of a broad diversity of commodities processed in the vessels, mainly from animal origin, (ii) the establishment of clear relationships between content, traces of cooking, shape and volumes of the vessels.

This study highlights some characteristic consumption pattern of the Neolithic people living at Clairvaux XIV in the first half of 4th millennium BC. First, a clear difference is observed between cooking pots and serving vessels. Dairy substances were investigated for layer 13 and 53 large-volume and 33 small-volume samples for layer 14. This allowed the recovery and interpretation of cultural remains or functions of pile dwellings?

TH6-11 Abstract 22

Micro-economic and socio-cultural networks in lakeside settlements

Author - MA Spring, Markus, Zürich University, Oetwil am See, Switzerland (Presenting author)

Keywords: Neolithic Bronze Age, Network analysis, Settlement archaeology

Presentation Preference - Oral

Urban morphologists are investigating the ‘genetic code of cities’, laws according to which modern cities emerged and grew. They have identified socio-economic processes that activate the act of building which in turn shapes urban space. The emergence of spatial pattern is seen as determined for the evolution of configurational networks. These networks, together with spatial ability of ‘natural movement’, the flow of people to meet and interact, have a significant impact of modes and uses in modern cities. Interaction through micro-economically motivated ground networks encourages the emergence of ‘generative’ lands, uses, such as real, movement-poor socio-culturally influenced background networks ‘conservative’ residential areas.

Lakeside settlements, on the other hand, are – quite similar to space stations – built for human habitation basically hostile environments. Swamp-borne diseases posed constant health risks. And fluctuating water levels and occasional flooding asked for structural solutions to still allow human activities and interactions despite adverse conditions.

The paper takes up the idea of the ‘genetic code of cities’ to look into network patterns of Neolithic and Bronze Age lakeside settlements. It explores the influences these specifically designed structural solutions required for life at, on, in or above water and marshlands had on human movement and interactions. Did these settlements under such environmental conditions follow the same spatial growth laws as modern cities? And, can such micro-economic and socio-cultural network analysis be a tool for interpreting cultural remains or functions of pile dwellings?

TH6-11 Abstract 23

A new look to late Neolithic plant economy from the site of Parkhaus Opéra (Zürich, Switzerland)

Author - Steiner, Bigna, IPAS (Integrative Prehistoric and Archaeological Science), Basel, Switzerland
Co-author(s) - Anton, Ferran, IPAS (Integrative Prehistoric and Archaeological Science), Basel, Switzerland
Co-author(s) - Kühn, Marti, IPAS (Integrative Prehistoric and Archaeological Science), Basel, Switzerland
Co-author(s) - Bleicher, Niels, Centre for Underwater Archaeology and Dendrochronology, Zürich, Switzerland
Co-author(s) - Jacquemont, Stéphanie, IPAS (Integrative Prehistoric and Archaeological Science), Basel, Switzerland

Keywords: archaeobotany, GIS, sampling strategies

Presentation Preference - Oral

Archaeobotanical research in the Alpine Forolands has a long tradition. Abundant quality data have been produced since the seventies of the XIXth century. The Horgen period (ca. 3400 – 2900 cal BC) has been particularly well investigated, especially since the excavation of Arbon Bleiche 3. It was after this project that researchers realized that the representative sampling of lakeshore settlements with paleo-economic aims (e.g. characterizing past agriculture and gathering practices, as well as diet) was only possible through the systematically-taken surface samples of large volume (ca. 5 L).

With an optimal sampling strategy was conducted at the recently excavated late Neolithic layers of the site of Zürich- Parkhaus Opéra. Layers 13 and 14 date to the years around -3160 BC and -3090 BC respectively. Layer 13 was preserved over a surface of 3000 m². Layer 14 was documented in more or less good preservation in a smaller area of around 1000 m². A systematic sampling strategy was conducted and a new method of analysis was developed for the analysis of large-volume samples.

These large samples were subsampled before sieving, producing one large-volume (sieved with 8 and 2 mm sieve fractions, for the recovery of large-sized seeds and fruits) and one small-volume sample (sieved with 2 and 0.35 mm sieve fractions, for the recovery of the small-sized grains). Around 250 large-volume samples (ca. 5 L) and ca. 120 small-volume samples (ca. 0.3 L) were investigated for layer 13 and 53 large-volume and 33 small-volume samples for layer 14. This allowed the recovery and identification of over 200/100 plant remains for layer 13 and around 49'000 for layer 14. The data were evaluated on the basis of density (remains per litre of sediment) and ubiquity (percentage of samples in which a type of remain is present), as well as through qualitative evaluations of the spatial distribution of the concentration of remains at the site.

The large-scale sampling strategy applied allowed some new observations concerning taphonomy and economic activities taking place at the settlement. The distribution and diversity of plant remains found in our samples seem to show connections to several formation processes and routes of entry that we are trying to disentangle (lake action, animal dung, areas of accumulation of rubbish, etc.). In addition to this, a better evaluation of the role of some of the main crops like barley and pea, as well as the most relevant gathered plants, was possible, thanks to all these methodological improvements. Our aim with this presentation is to propose our strategy as an optimum for paleo-economic evaluations of large-scale excavations in wetland settlements.

TH6-11 Abstract 24

**Settlement dynamics and mobility in Late Neolithic Southwest Germany**

Author: Kaiser, Mirjam, University Freiburg, Freiburg, Germany (Presenting author)

Keywords: Late Neolithic, pile dwellings, settlement system

Presentation Preference: Oral

The pile dwelling site Bachwiesen I (Bad Buchau, Kr. Biberach) located at the Federeisen fen in Baden-Württemberg, excavated in the years 2005 and 2011, can be assigned to the Late Neolithic Schussenried Culture between ~ 4000 and 3800 BC. The site itself is dated by dendrochronology around 3970 BC.

The objective is to model a settlement system during the Late Neolithic by comparing the features, the corpus of finds and the results of natural scientific analysis of this settlement with other known settlements. The main source of information of this comparison are the known wetland sites.

To understand the possibilities and limits of such a model it is crucial to discuss which aspects of life are not traced in the archaeological record and are forced to remain in the dark. Nevertheless important factors of how life is functioning among human groups can be hidden there. E.g.: Little do we know about what happened on the mineral soil during the same time. In a first step a comparison of settlement structures, their duration, subsistence strategy, management of resources and the distribution of material culture characteristics in Upper Swabia will be made. In a second step the comparison will be enhanced down to Lake Constance in the South and up to the Neckar area in the North.

Such a model gives an important opportunity to address specific questions in order to get to a closer understanding of the way of life of past peoples. How are the humans adapted to their surroundings? How do they move? What is the impact of settlement dynamics and the associated degree of mobility on the culture of the peoples and their interaction with each other? How can we assess migration? Do we have to re-evaluate the Schussenried Culture?

The presentation will give an insight in the current state of this PhD project and discuss the preliminary results.

TH6-11 Abstract 25

**Bronze Age pile dwellings in Northern Italy: chronology, environment and architectural features**

Author: Dr. Balboni, Marco, Museo Archeologico della Valle Sabbia, Gavardo, Italy

Co-author(s): Mangani, Claudia, Museo archeologico G. Rambotti, Desenzano del Garda, Italy (Presenting author)

Co-author(s): Martinelli, Nicoletta, Dendrodata sas, Verona, Italy

Keywords: Cultural interactions, northern Italy, pile dwellings

Presentation Preference: Oral

In northern Italy the widest spread of pile-dwellings took place between the 22nd and the 15th century B.C., during Early and Middle Bronze Age and endured till the first phase of Late Bronze Age (13th century), with a considerable difference with situation in the North and its morainic amphitheatre, but also in the lakes of the inner areas of the Barici and Euganean hills. This period is therefore characterized by strong cultural changes and radical reorganization of settlement patterns and socio-economic systems. Some recent excavations allows us to follow the technological and cultural evolution of the communities living in the area and to identify the development of the architectural techniques. The findings show long distance interactions and cultural relationships with Western, Central and Eastern Europe. Interesting is the connection between Varese lake and Swiss plateau and between the Garda lake and the Darabba basin. In the pile-dwelling villages the extraordinary preservation of organic remains concerns not only wooden structures, but even a lot of tools made with perishable materials. Thanks to those we can build a true-to-life reconstruction of these communities. The study of the finds and the data obtained from multidisciplinary researches show us an economy based on a settled down agriculture and breeding farming. Craftsmanship becomes more organized and integrated in the communities only starting from Middle Bronze Age. Subsistence economy mainly bases on cereals agriculture, hunting and fishing constitute a part of the diet, integrated with harvesting of spontaneous fruits. The abundance of cornels, hazelnuts and acorns shows how the inhabitants of the pile-dwellings intensively exploited the areas around the villages.

TH6-11 Abstract 26

**Osseous artifacts from the prehistoric lakeside settlements of Amideon, Western Macedonia, Greece**

Author: PhD Candidate Arabatzis, Christopher, Institute of Archaeological Sciences, University of Bern, Amsatakoipi, Thessaloniki, Greece (Presenting author)

Keywords: Greece, osseous technology, Western Macedonia

Presentation Preference: Poster

In the last decade the intensive rescue excavations of the Archaeological Service of Florina unearthed a great number of prehistoric settlements close to the four lakes of the Amideon basin that date back from Greek Early Neolithic (c. 6850-5800 BC) to Greek Middle Bronze Age (c. 2200/2100-1800/1000 BC).

The excavation of these sites yielded an impressive and diverse assemblage (more than 4000) of bone and antler artifacts which shows that, as in the prehistoric lakeside settlements of Central Europe, the osseous artifacts played an important role in the everyday activities of the inhabitants of the wetland sites of the region. In this short paper, there will be an attempt to present the osseous artifacts of some of these settlements.

TH6-11 Abstract 27

**Cultural layer formation, production and dwelling areas on pile-settlements of Upper Dvina region**

Author: Maziukiewicz, Andrzej, The State Hermitage Museum, Saint-Petersburg, Russian Federation

Co-author(s): Kittel, Peter, Lodz University, Lodz, Poland

Co-author(s): Dobrovina, Ekaterina, The State Hermitage Museum, Saint-Petersburg, Russian Federation (Presenting author)

Co-author(s): Maistret, Yolaine, UMR 8215, Université de Paris 1-CNRS, Paris, France

Co-author(s): Zaiceva, Ganna, Institute for the history of material culture of RAS, Saint-Petersburg, Russian Federation

Presentation Preference: Poster

Different processes, conditions and milieu of cultural layers’ formation were described on Neolithic pile dwellings sites excavated in Upper Dvina region. The site Serkaia II (remnants of pile dwelling settlement from the 3rd mil BC) is situated in the floor of a Holocene post-lake basin and archaeological structures occur within coarsely-detritus gyttja at the depthness of approx. 80-150 cm b.g.l. Although any sediments synchronous to the time of pile-dwelling settlement existence were not revealed - the conclusion based on the analysis of sediments in trenches and a hand auger coring at the site area and immediate surrounding and radiocarbon dating of organic deposits and different ancient artefacts and constructions’ remnants. It testifies that the site was established on the open surface not covered constantly by water. It is an important observation for understanding cultural layers’ formation and process of cultural remains deposition, as well as depositional processes of sedimentation on this place. Several zones with artifacts and ecofacts in situ were uncovered at the site - they were: nuts, fish bones, shells and other materials, not mixed, which occasionally and intentionally were accumulated in pits or garbage heaps, nearby preserved remains of dwellings. They could be interpreted as open production areas. Inside the remains of wooden constructions, sandy platforms for fire-places were recorded - remains of all year production areas, which were deposited in another manner. We could also suppose a much higher erosion of the upper cultural layer, where material was admixed by environmental factors during millenia changes (Lake’s regressions/ transgressions) in the process of its deposition. Here we can trace clay penetration and materials accumulation around wooden piles, fragmentarily of artifacts, and homogenous distribution of material within the cultural layer.

Other particular layers and other organic remains were uncovered at the site Serkaia I, with fishing constructions synchronous to Neolithic pile-dwellings. Thin interlamination, fulfilled with small branches, leaves, and reed remains were uncovered, which were deposited in the zone of ancient lake shore line. Accumulation of branches is recorded in the marginal part of the Serkaia II site, also in the buried lake shore zone.

TH6-11 Abstract 28

**Geophysical prospection of submerged Neolithic settlements in Lake Sennitca (Pskov Obl., NW Russia)**

Author: Dr. Lorenz, Sebastian, University of Greifswald, Greifswald, Germany (Presenting author)

Co-author(s): Prof. Dr. Faustinober, Joerg, Bavarian State Dept of Monuments and Sites, Munich, Germany

Co-author(s): Hansen, Roberto, University of Greifswald, Greifswald, Germany

Co-author(s): Dr. Maziukiewicz, Andrzej, The State Hermitage museum, Saint Petersburg, Russian Federation

Co-author(s): Dr. Dobrovina, Ekaterina, The State Hermitage museum, Saint Petersburg, Russian Federation

Keywords: geophysics, Neolithic, Sennitca

Presentation Preference: Poster

First archaeological sites on the bottom of Lake Sennitca (13 km2, 148 m a.s.l.), located in NW Russia on the border with Belarusia were uncovered in the 1970s. These lacustrine sites, dated to the 4th-3rd mil BC, were located along the shorelines of small lake basins and rivers distributed on the recent lake bottom. They comprise the first settlements of LBK communities in this region, prehistoric pile-dwellings, and the easternmost megalithic construction of the 3rd mil BC known so far in Europe. Lots of unique
artifacts were found here, among which a wooden Neolithic ski, wooden zoomorphic figures, bone flutes etc. However, during last 20 years the cultural layer on the bottom of the lake was either destroyed due to lake-level drawdown or buried under modern lake sediments. Another particular feature of this lake is its zero visibility caused by shallow bathymetry and high nutrient loads which makes any common archaeological prospection even more difficult.

In order to find further traces of archaeological constructions and cultural layers a range of remote sensing and geophysical methods, both underwater and on the peat bog shore were applied. For magnetic prospections on the peat bog shore of the lake we applied the highly sensitive total field caesium-magnetometer ($\pm 0.01 \text{ nT}$) in a variometer configuration. Combined with a high spatial resolution (sampling rate of 12.5 x 25 cm) the results allow us also to detect the weak magnetic signals of archaeological structures of wooden constructions such as rows of post or parts of post-build houses, fish-traps, but also very clearly the traces of paleochannels and the typical strong magnetic anomalies which could be ascribed to ancient fireplaces or kilns.

Supplementing the archaeological underwater surveys three sites in the littoral fringe have been investigated by dense side scan sonar tracks with varying frequencies (80/200 kHz). The sonar mapping revealed details in lake bottom morphology, which is is recently enveloped by soft sediments as well as the precise distribution of ancient stone and wooden constructions on the site. These prospections not only allowed us to reconstruct in details paleolandscape, precise distribution of ancient stone and wooden constructions on the sites and to define and to locate the places for further excavations but moreover provides us a comprehensive approach to the site.

**TH6-12 Abstract 01**

**Ritual continuity and changing monuments in the southern Sperrin Mountains, Northern Ireland**

Author: Dr. Brogan, Cabrina, Queen's University Belfast, Belfast, United Kingdom (Presenting author)

Keywords: Neolithic; Bronze Age transition, Northern Ireland, Ritual landscapes

**Presentation Preference:** Oral

This paper argues that there was a surprising degree of spatial stability between Neolithic and Bronze Age ritual landscapes in Northern Ireland despite substantial changes in funerary/ritual practices. Taking the southern Sperrin Mountains as a case-study, it is shown that Bronze Age ritual activity tended to occur within established Neolithic ritual landscapes. The conclusion of this paper discusses some of the possible reasons behind this stability including functional, ritual and political reasons.

The Sperrin Mountains form the largest mountain range in Northern Ireland, stretching across the north-west of the country. Glacial activity during the last ice-age has created a landscape of rolling mountains cut by deep glens. Today the upper slopes of the mountains are largely uninhabited as the spread of blanket peat has pushed settlement down into the foothills, with the often barren and windswept uplands reserved for the seasonal grazing of cattle. It would, however, appear that these mountains were not always so desolate.

During the course of the Irish Neolithic substantial anthropogenic changes occurred, as people began farming the land and constructing megalithic tombs in which to bury their dead. These tombs are often regarded as being linked to ideas of ancestor veneration, where the remains of the deceased symbolically tied the community to the land they had invested in. Landscape analysis of the Sperrin region reveals particularly high concentrations of Neolithic burial activity, suggesting that this may have been perceived as a ritual landscape.

The advent of the Bronze Age sees profound cultural changes throughout Ireland and evidence from a recent genetic study has even indicated that there was a significant migration of people into Ireland (Cassidy et al. 2006). Within the funerary/ritual sphere, megalithic burials are gradually abandoned as burial within cist and pits becomes more prevalent and new ritual features are introduced.
structures in the form of stone circles and alignments emerge. These dramatic shifts in culture, and possibly even population, speak of change and discontinuity. Analysis of funerary ritual sites within the Sperrin Mountains, however, suggests that, despite these dramatic cultural changes, there is a remarkable degree of spatial continuity between the Neolithic and Bronze Age ritual landscapes. While the face of ritual may have changed, the overall evidence indicates that the perceived ritual significance of the land endured.

TH6-12 Abstract 02
Viking-Age landscapes in the longue durée: change, continuity, and perceptions of place

Author - Dr. Leonard, Alison, University of Cambridge, Cambridge, United Kingdom (Presenting author)

Keywords: Landscape, Portable material culture, Viking Age

Presentation Preference - Oral

It is no simple task to assign dates to a landscape. In England, however, metal-detected artefacts recovered from rural contexts provide valuable benchmarks that bring chronological narratives of settlement and activity to light. This can be used to highlight specific ‘momenst of crisis’ within narrow timescales, such as the reduced circulation of coins in certain parts of England during the early Viking Age. When viewed from the perspective of the long durée on the other hand, it often illustrates that despite centuries of political change and large-scale migration, many places were continuously selected for.

Through case studies in eastern and midland England, this paper explores instances of change and continuity in the rural landscape. Looking backwards and forwards from the Viking Age, when visible shifts in settlement would be anticipated, the evidence reveals notable patterns and curious anomalies. Prominent to Roman roads, for example, is a trail that is then the case studies, but why does treatment of other Romano-British structural remains appear to differ so widely? Drawing upon a range of supporting evidence such as place-names and environmental data, and looking at the artefactual and landscape evidence within a number of shifting chronological frames, it is suggested that certain discontinuities and continuities can be explained with reference to the evolving agrarian economy. Conversely, the influence of antecedent features such as barrows and structural remains, on subsequent communities requires alternative explanations. It is suggested that in these cases, their integration or avoidance was contingent upon the ways in which communal memories and local perceptions of place were transferred.

TH6-12 Abstract 03
The way to the shore: why going to the beach may be not as straightforward as you might think

Author - Johnson, Andrew, Manx National Heritage, Douglas, Isle of Man (Presenting author)

Keywords: coastal landing places, Isle of Man, old rights of way

Presentation Preference - Oral

Although modern ports and harbours dominate how we relate to the sea and to associated maritime activities and industries in the present, technological and scalar differences resulted in alternative responses to these activities in other eras. Seven modern harbours dominate the 150 km coastline of the Isle of Man, but these represent only a small proportion of the 15 harbours that were in use in the Viking Age. While we know about these from literary sources, we have little indication of which ones were in use in the medieval period. This paper explores the question of change and continuity in coastal landing places and the suitability of these places for settled activity in the past, looking at the Viking Age in particular.

Some landing places were naturally usable, but others show evidence for the adaptation of the intertidal shore and other significant activities designed to improve safety or ease of use. It is sometimes possible to glean from this the reasons the landing places were exploited: fishing and the collection of seaweed as marans are amongst the most obvious uses.

The character and status of the ways to the shore are similarly significant in betraying their former purpose. Some survive only as footpaths, some as tracks leading to individual farms, and others have been transformed into public highways. In this respect, map regression techniques, particularly when allied with GIS, provide a powerful means of gathering and presenting the information.

TH6-12 Abstract 04
Multidisciplinary data-crossing about settlement and land-use in Jura mountains (5th-17th c.)

Author - PhD student Chevassu, Valentin, MSHE Ledoux / Université de Bourgogne-Franche-Comté, BESANCON, France (Presenting author)

Co-author(s) - Gauthier, Emile, UMR 6249 Laboratoire Chrono-Environnement, BESANCON, France

Keywords: Landscape, portable artefacts, GIS analysis

Presentation Preference - Oral

In 1962, the American historian R. Emery (p. 5) defined the French 13th century as “the golden age of the [mendicant] friar”, a hypothesis developed later by the French historian J. Le Goff (1968) in a programme dealing with the relationships between Mendicant Orders and medieval cities. Archaeological and historical surveys and research studies in other particularly in Brittany (Martin, 1979) or in Alsace and Lorraine (1985) since provided numerous and varied clues allowing a renewal of the problems linked to the settlement and building of mendicant convents. Recent historical and archaeological analyses concerning the north (Volf, 2003) or the south of France (Caby, 2012) enabled to improve the knowledge on the different ways the Mendicants could settle in towns in terms of political, ecclesiastical or material support and integrated spatially and institutionally the city.

Nonetheless, the questions of natural constraints, of a pre-established “urban” landscape in the vicinity of the mendicant convents still remains difficult to answer in most cases.

This paper aims at putting emphasis on the phenomena of change and continuity in the settlement of Mendicant Orders in urban spaces through the example of the cities in the diocese of Clermont (Auvergne, centre of France) during the 13th-15th centuries. This is a multidisciplinary approach based on a cross-checking of archaeological, architectural and historical data. It focuses on the reasons why the Mendicants decided to install in specific places in close to the city, particularly for political, economical and social reasons but also due to topographical constraints. It also demonstrates the prevailing reasons for settlement could change according to periods, cities and established urban landscape (e. g. re-use of religious buildings). Thus, this paper sheds light on the study of long-term religious urban landscape in medieval cities.

TH6-12 Abstract 06
Can humans change their spots? Site location patterns in Mid-to-Upper Paleolithic Cantabrian Spain
Author: Javier Oroño, University of the Basque Country, Vitoria-Gasteiz, Spain (Presenting author)
Keywords: Late Middle/Early Upper Paleolithic, Settlement patterns, GIS, Spanish Cantabrian region
Presentation Preference - Oral
Research on the European Middle-to-Upper Paleolithic transition has mainly been devoted to issues of long-standing interest like human anatomy, artifact technology, economic strategies, symbolism or, more recently, genetics. By contrast, other aspects of the archaeological record still require further attention, particularly research on landscape perception and use. As a result, very little is actually known on the decisions and conditions that led Late Middle Paleolithic and Early Upper Paleolithic human groups to settle and move back and forth across the geography in this paper, a pilot approach to investigate this issue, we aim to explore how settlement patterns changed or persisted in a quite constrained and archaeologically rich area, the Cantabrian region (Northern Spain). To this end, locational analysis has been undertaken on a total sample of 94 sites showing human use in a time-lapse spanning more than twenty millennia (ca. 45 to 22 ky B.P.) – coincident with the so-called Late Mousterian, Chatelperronian, Aurignacian and Gravettian cultures. The study integrates the spatial analysis of different variables relating to factors like topography, geology, hydrography and habitability that are examined and calculated with the help of modern tools, mainly GIS. Results are statistically treated and compared with other archaeological and environmental data, showing a complex mosaic where divergences in settlement patterns through time can sometimes be evident or not, depending on the variables analyzed, and may reveal different – and not necessarily evolutionary – strategies for the peopling of a changing environment. After all, landscape use has always been about decision-making.

TH6-12 Abstract 07
The structuring of the Adriatic littoral landscape between Atria and Altinum during Roman times
Author: Dr. Matteazzi Michele, Catania Institute of Classical Archaeology, Vicenza, Italy (Presenting author)
Keywords: Landscape Archaeology, Roman Archaeology, Roman Venetia
Presentation Preference - Oral
The Upper Adriatic littoral zone stretching between the ancient centers of Altinum and Atria (Addio) is a low plain continually redrawn, until the modern age, by an extremely complex hydrographic system, of which rivers Po, Brenta, Adige and Bacchiglione are the main agents; but that also includes a numerous series of canals, drains and ditches that until the excess waters to avoid swamping. To all this great mass of water, which has always been a highly destabilizing factor for the plain itself, we must also add the other high morphological variability component of the landscape, i.e. the southern basin of the Venice Lagoon, where the hydrographic system goes (and went) to run out, and that, since ancient times, has offered those harbour areas that were crucial for the economic development of the territory.

If today the relationship between landscape and water looks very tight, we know that was the condition also during Roman times, when classical sources tell us that here was the northermmost part of the great delta of the river Po that (reached Ravenna, to the South, and Altinum, to the North) and, above all, the zone (located to the East of the municipium of Atria) where the river itself flowed to the sea with more branches, a wide marshland called Septim Maria (i.e. “the seven seas”). Furthermore, we know that in this stretch of plain the river Athesis (Addio), Mediacus (Brenta), Retano (Bacchiglione) and Togisbonus (Bovolenta channel) flowed and mingled their waters with Po ones; tappeae with fossae (i.e. canals) Crozia and Philatina, two artificial waterways that formed part of an inland waterways route that linked Ravenna and Altinum: the existence of such a route is proved by numerous sources, among them the Itinerarium Antoninii.

This fluvial route was also followed by a terrestrial one remembered by Tabula Peutingeriana, which also mentions the main stations which marked its track: this road was a coastal itinerary parallel to the innermost one followed by the Via Popilia, a consular road built in 132 BC as a direct connection between Ariminum (Rimini) and Aquileia linking all the important port centers of the Upper Adriatic coast such as Ravenna, Atria and Atinum.

Therefore, Paying attention to all these elements, the paper aims to investigate the complex relationship man-landscape, which was established in the area during the Roman period ranging from 3rd century BC and 6th century AD). In this landscape archaeological approach and through an integrated reading of all the available archaeological, historical and paleoenvironmental data, the final goal we want to reach is double: on the one hand, to identify the environmental factors that both favoured and conditioned the Roman occupation of the territory; on the other hand, to come to a better understanding of the forms this occupation took, and of its actual effects on the natural environment.

TH6-12 Abstract 08
Where did all the power go? The rise and fall of the big harbour town of Aquileia
Author: Michelis Lucia, University of Edinburgh, Edinburgh, United Kingdom (Presenting author)
Keywords: Aquileia, discontinuity, Late Antiquity
Presentation Preference - Oral
The aim of this presentation is to track the rise and fall of the harbour town of Aquileia. The town, founded in 181 BC around 10 km away from the Adriatic sea on a meander of the Natiso river, stands as a perfect example of a once really strong and powerful town that fell into nothing after the end of the Roman Empire.

The socio-economic status of the city reaches its peak starting from the Therarchic period: as a matter of fact with the Docielian and Constantinian reformations she received officially the title of capital of the Veneti at Histia region. Moreover, her proximity with the newly Imperial Capital (Mediolanum) put her in a political circuit of primary importance; providing her a role of cultural and administrative complementarity in respect of the capital. Her new role granted her a primary importance spot within the imperial agenda, firstly in relation with the Danubian times patrol but most of all as a bridge-head for northern and eastern trade routes. This prosperity echoes in the urbanistic evolution both from the point of view of public and private dwellings.

Two centuries after, all of this was not there anymore and the town itself was reduced to a third of its original size. Moreover the new city wall (at the half of the VI Century AD) excluded not only the forum but also the harbour that was the symbol of its past role.

How did it happen? Clearly the temptation of giving all the blame to the barbaric invasions and mainly to the supposed conquest of the town by Attila (5HS AD) is strong, but with this paper I will go beyond these single events trying to track those long durée factors that lead one of the greatest Italian cities of late antiquity to become little more than a village. Even its own name was recalled in the sources just in relation with its diocese or as a moment of the unpredictability of fortune. These factors have been both natural (mainly the decrease in the flow rate of the river Natiso) and antropic (mainly the changes in the power balance of the Roman Empire, the transfer of the capital to Ravenna in 402 AD).

TH6-12 Abstract 09
“The rivers promised not to deluge the country”: the Arno and Serchio lower valleys
Author: Prof. Pasquincol, Marcella, University of Pisa, Pisa, Italy (Presenting author)
Keywords: coastal progradation, North Etruria, Water management
Presentation Preference - Oral
In North Western Tuscany (ancient Etruria) landscape dynamic transformations, due both to natural and antropic factors, and phenomena of persistency, resilience andlongue durée are studied in a long-term perspective. In this district multidisciplinary researches provide evidence of coastal progradation and erosion, palaeoenvironmental changes, water management practices, rural and urban landscapes, manufacturing activities. Significantly, the complex hydrogeological evolution of the Pisa-Lucca territory and the long term human actions aimed at optimizing the rivers regime were already perceived by the ancients, as documented by Strabo after his sources (S.25, 2220.). In the Roman late Republican period the critical phases are to be connected with protracted intense rainfalls and with the impact of antropic activities on the territory (e.g. the Roman colonization in the 2nd and 1st cent. B.C., the upheaval or collapse of the countryside drainage systems, etc.).

In a period characterized by sea level rising and by the absence of drastic climatic changes, the coastal evolution was most probably driven by antropic causes. Among these, the main elements were the construction of new towns and settlements, deforestation and increased agricultural and manufacturing activities connected with the deduction of coloniae in the early 2nd cent. B.C. and in the late 1st cent. B.C., in particular with the organization of their territories (pensulari and land allotments). The continuous natural transformation of the
illuminated and the hydrologic evolution affected the North Western Etruria sea- and river ports and landing places scattered along the coastline in Antiquity and in the Middle ages. The Roman road network was constructed on stable soils in the coastal strip and in the main river valleys in the frame of a strategic plan. A post-medieval interesting case study is the coastal plain NW of Piša. Here since the 15th Century several plans aimed to reclaiming a large swampland South of the Masaccassocii lake were made but not achieved. In 1653 an attempt was made by the Dutch Van der Strecht, who built a few windmills in order to raise the coastline in Antiquity and in the Middle ages. The Roman road network was constructed on stable soils in the coastal strip and in the main river valleys in the frame of a strategic plan. The most important road in the province, connecting Narona with Salonica, the capital of the province, crossed through the valley as it offered the most convenient route. A Roman garrison ensured the safety of this road, the defence of Narona against indigenous tribes resisting the Roman expansion, and helped resolve conflicts between the quickly Romanizing farmers in the valley and the more traditional mountainous landscape could be achieved in one of two ways: by resorting to inhabitation of naturally defensive places or by the construction of canals to deviate flood waters.

The paper analyses the changes in settlement brought about by the Roman occupation of the Trebiţa valley river and its surrounding highlands and mountain ranges, a geographically well- defined microregion which today constitutes the modern community of Lubuški in West Herzegovina. The lay of the land, just a mountain range from the sea coast and with good connections through river valleys and passes with the highlands inland, is such that throughout its history it was the border and contact zone of different cultural, economic and political entities and systems. In antiquity this area was the close hinterland of Narona, a major city of the region. Not only was it important for the subsistence of the city’s population due to the rich agricultural land and the pastures in the highlands, but it also played an important strategic role. The most important road in the province, connecting Narona with Salonica, the capital of the province, crossed through the valley as it offered the most convenient route. A Roman garrison ensured the safety of this road, the defence of Narona against indigenous tribes resisting the Roman expansion, and helped resolve conflicts between the quickly Romanizing farmers in the valley and the more traditional mountainous landscapes of the highlands.

A non-invasive archaeological landscape project conducted in the area proved that a most close correlation exists in the area between the level of development of the economy, the level of perceived safety and the locations of settlements. The advent of Roman rule, which brought about pacification of the province and economic prosperity, resulted in a gradual shift from the traditional well-defended hillforts located on peaks to settlement in the valleys, with a local centre emerging in the valley around the major military installation, not only the safest place, but also the largest market in the area. On the other hand, in Late Antiquity the military presence was much weaker, and the safety of the regional system was threatened from the outside. In reaction the settlement seems to disperse and move to the naturally defensible places. A parallel to those cyclical developments can be observed also in the medieval and early modern periods. It appears that the choices of places for settlement and of the main economic activities of the population of the region were dependent on the perceptions of safety, which in this difficult, mountainous landscape could be achieved in one of two ways: by resorting to inhabitation of naturally defensive places or by the participation of peacekeeping forces, demanding both an economical and political outside involvement, but giving the possibility for much more intensive local economic development.

**Co-author(s):** Przybyła, Marcin, Jagiellonian University in Cracow, Kraków, Poland

**Keywords:** Bronze and Early Iron Age, cultural diversity, cultural transmission

**Presentation Preference - Oral**

In our paper we want to show the methodology and preliminary results of the ongoing project addressing the question when, in what circumstances, the culture of past societies was determined by such factors as vertical (inter-generational) and horizontal (inter-population) transmission of cultural attributes, and when the decisive role was played by the adaptation to local environment. Several well-investigated settlement regions in southern Poland, intensively occupied for a long time and representing various ecological and bioclimatic zones and landscapes (Western Malopolska Loess Upland, the upper Vistula valley, the Carpathian Forestland, and the West Carpathians), were chosen to test the role of these factors.

We apply the comparative method (using standardised data and a set of ‘middle range’ theories) to analyse similarities and differences. The list of variables we included contains: time (the pace and synchronicity of change in past social space), space (communication factors in inter-population transmission), environment, with its natural and anthropogenic transformations in time, stylistic diversity in manufacturing traditions, organisation of settlement area (at the site and micro-region levels), access to resources, and social hierarchies and relationships. The data are examined using statistical tools, e.g. multidimensional techniques of data exploration, and – in case of stylistic studies – compared with the phylogenetic model. The next stage must cover establishing the nature of identified correlations and identification of potential causal relations.

This way we will explore whether cultural diversity is similar - as proposed by the culture-Historical school, recently supported by many evolutionaryists – to biodiversity and develops through branching of traditions inherited between generations with only slight modifications (so that we can speak of an ‘essence’ of cultural tradition, typical of certain groups in long cycles of historic processes)? Or perhaps is the decisive role played by diffusion - blending of cultural traditions as a result of unique historical events, and the horizontal transmission of patterns within ‘network society’? Or, finally, does the diversity of culture result from tight adaptation to local ecological niche, as adaptationists propose?

**TH6-12 Abstract 12**

Pastoral Nomads’ Use of the Semi-Arid Syrian Landscape

**c. 1810-1760 BCE: A GIS Projection**

**Author:** PhD Josephson Hesse, Kristina, Uppsala University, Uppsala, Sweden (Presenting author)

**Keywords:** GIS, SB Syria-Mesopotamia, Pastoral Nomads

**Presentation Preference - Oral**

Hundreds of Akkadian clay tablets, derived from archaeological excavations at the palace of Mani by the Upright, clarify the strong integration between mobile tribes and city-states in Syria-Mesopotamia during the Old Babylonian period (c. 1810-1760 BCE). My project aims to illuminate the social and economic dynamics between pastoral nomads and settled people in this period, with the focus on the former, based on the economics of food producing, exchange, trade, trade routes, such as caravanserai and mercenary. Not only are the connections between these groups of people essential, but also their ways of interacting with the surrounding environments.

The paper deals with the first step of methodology of network studies in this project, which is to map known sites into GIS together with trade routes, landscape features, suggested tribal territories, natural resources, and some remains (e.g. systems of cars, corrals, kites) registered in the Syria-Norwegian Palmyrena project that I have been a part of. The structured location of several hundred Bronze Age caravanserais, distributed on strategic hillocks and water outlets, in the mountain range outside the ancient trading centre of Palmyra in Syria, indicates that in addition to have been burial chambers these caravanserais were secondary used as landmarks of territories and routes for trade and migration of pastaslistics with their flocks. The landscape image will constitute the base for my further studies of networks and descriptive connections or relationships between people and tribes with places, trade routes, migration patterns etc.

**TH6-12 Abstract 13**

Road caravanserais of the Medieval Middle East: landscape, architecture and patronage

**Author:** Ass. prof. Tavernari, Cinzia, Abdullah Gul University, Kayseri, Turkey (Presenting author)

**Keywords:** caravanserais, landscape, patronage, architecture

**Presentation Preference - Oral**

In the Islamic world, caravanserais have been faithfully serving travelers, traders and pilgrims for many centuries, sometimes functioning as stopovers until the beginning of the 20th century. The impressive geographical and temporal diffusion of this institution, original to the Islamic world, clearly shows that caravanserais fulfilled a key role in society, in relation both to the physical act of travelling and to the notion of travel as the expression of cultural values. For different reasons tied to religion, knowledge and also trade, travel and travellers have always been important issues for the Islamic civilization but it would be misleading to consider road caravanserais only as way stations for travelers. Road caravanserais were in fact a multifactorial institution, the centre of a variety of functions that linked together religious, political and cultural motivations. Yet it is striking to observe that until now road caravanserais have been poorly studied from a comprehensive point of view and are consequently till insufficiently understood. For example, although well know elements of several oriental caravanserais, one of their characteristic features, the relationship of road caravanserais to the landscape they have been built in has not been studied thoroughly.
The contemporary landscape organization keeps different remains of this situation in the lineaments, in the parcelling of the territory, and in the road network. It also shows us that the «colonization» by the Roman Empire keeps a part of the former forms when it is in accordance to the new one.

Since the middle of the twentieth century, most of the testimonies of this very organized frontier have disappeared. Because of its originality, it’s now time to look at its last remains as a huge historical monument which needs to be kept for national memory of Romania.

This good use of the territory, and its associated organization, has crossed the times until the human kind modify natural landscapes. How did the construction of such buildings transform the landscape and its perception by its hosts, the inhabitants but also their patrons?

The contemporary landscape organization keeps different remains of this situation in the lineaments, in the parcelling of the territory, and in the road network. It also shows us that the «colonization» by the Roman Empire keeps a part of the former forms when it is in accordance to the new one.

Since the middle of the twentieth century, most of the testimonies of this very organized frontier have disappeared. Because of its originality, it’s now time to look at its last remains as a huge historical monument which needs to be kept for national memory of Romania.

How did the construction of such buildings transform the landscape and its perception by its hosts, the inhabitants but also their patrons?

I will attempt a broad contextual comprehension of this question by considering if and how road caravanserais engaged in binding together the landscape and creating a distinctive cultural landscape. My approach wishes to inform the understanding of the ways in which different road caravanserais’ construction programs can shed light on how landscape, patronage and power were practiced within different Middle East contexts. In this presentation, in fact, I will compare medieval Anatólia and medina Syria and I will investigate how the construction of road caravanserais changed the landscape in these two regions. Did it change in the same way? What are the similarities and differences?

**TH6-12 Abstract 14**

**It’s always the same old story... or not?**

The ‘changing’ landscape of Cappadocia (Turkey)

**Author** - Dr. Turchetto, Jacopo, University of Padova, Padova, Italy (Presenting author)

**Keywords:** Cappadocia, Turkey, Local scale vs. macro-regional scale; Road networks and settlements’ patterns

**Presentation Preference** - Oral

During the course of the centuries, and especially from the Greco-Roman period to the Seljuk times, Cappadocia represented one of the most important hubs and crossing-points of the Anatolian peninsula. Within that chronological framework, it acted as a cultural, economic and political bridge between East and West of both the classical and the medieval world. For those reasons, taking into consideration the interactions occurred between man (with different needs in different periods) and the landscape (which remained almost the same through time), Cappadocia offers a great variety of ‘food for thought’. In this paper, I will focus on three different geographical sectors of Cappadocia, each one characterised by its own specific natural features: a) the semi-flat belt between Colonia Archelais/Aksaray and Caesarea/Kayseri, next to the course of the Kızılırma river, b) the area comprised between Colonia Archelais/Aksaray and Tyana/Kemersher, with the volcanic groups of the Melendiz Dağlar, Hasan Dağ and Gölbaşı Dağ, and the fertile plain surrounding them; c) the mountainous area between Tyana/Kayseri and Afyonerta, at the foot of the Taurus chain.

In this context, archaeological and topographical evidences point towards the existence of settlements’ choices and itinerary patterns of longue durée. However, when examining the matter at a more local scale, what clearly emerges is that (in certain areas, at least) some changes took place through time. Towns or villages were abandoned and replaced by other ones; stretches of routes were no more maintained and fell into desuse; previously exploited areas were for more favourable regions.

Trying to recognise those changes and understand the different reasons (of cultural, economic, political, military nature) which subtended them will allow to better appreciate the historical evolution of the Cappadocian landscape and the role it played during the course of the centuries.

Archeogeography of a border: the roman Limes system in south Romania (frontier, roads, landscape)

**Author** - Fajon, Philippe, Ministère de la Culture, Rouen, France (Presenting author)

**Keywords:** archeogeography, longue durée, roman times, south Romania, Ot valley

**Presentation Preference** - Oral

How to consider the meaning of « border » in archeogeography? (beyond the joke about the title of the session) First, it’s useful to consider the different criteria of the limit between 2 territories, based on the thoughts of sociologists and philosophers. Before to be geographica evidence, frontiers and associated road networks are first, an intellectual constructions of societies, second, a mark of the politics, and third a sign for populations. Therefore, this analysis allows to consider the frontier as a archeogeographical concept because of its « longue durée » meaning.

In the territory of the actual Romania, after the Trajan conquest, at the very beginning of the second century A.D., the new limit of the Romain Empire is on the northern side of the Danube. In the Wallachian plain, archaeologists consider two different limits named Limes Alunum and Limes Transalutanus. The first one is on the western bank of the Ot river, the second one is on the eastern plateau in the Boian plain. These two limits may represent a chronological distinction, a functional difference, or both. The Danube is also part of the Limes Transalutanus.

Using in the same time many data from different sources (topography, geology, hydrology, morphology, toponomy, village and road network, archaeological settlements’), we try to explain that none of these proposals is the right one. It’s necessary to consider both Limes as a complex system, with a triple function: to create a virtual space between Roman Empire and foreign country, to put a physical limit in a dominant situation, and to organize trade and circulation behind and along the border.

In this case, this organization is in full adequation with all the contraints. The territory of this sector is very specific, including a wide valley with a quite regular slope in the West and a high cliff in the East, before the plateau. The valley is occupied with wetlands and marshes.

This paper seeks to examine the impact that the relationship between the communities that lived in these settlements, and the water systems that they used, had on the urban development of these sites. Does the change or continuity that is displayed through the sites urban development reflect this dynamic relationship? Through examining how water has impacted communities decisions regarding their settlements across Europe on a broader scale, wider trends during this period can be identified and understood alongside regional variation to enable a more complex understanding of the nature of the relationships between Early Medieval communities and their landscapes.

Redistributing of Ancient Grave Stones in Antioch on the Orontes according to their Provenance

**Author** - Güven, Evrim, Buca/Izmir, Turkey (Presenting author)

**Keywords:** Antioch on the Orontes, cemeteries, grave stones

**Presentation Preference** - Oral

The contours of the city of Antioch on the Orontes are revealed in the ancient writings and the excavations conducted on the initiative of Princeton University throughout the 1930s. The grave stones that remained from the Antiquity can provide us with precious data concerning the urban outlines in ascertaining the information we presently have at hand.

Nonetheless, we must above all be aware that the grave stones are most often fortuitous finds detached from their original place whose provenance is unidentified. In addition, they are usually acquired by institutions or individual collectors via purchase, donation or confiscation. Therefore, none of the researches executed throughout XXth century has offered a veritable comparative approach between the extant knowledge and the concentration of their find spots, although it may have helped us in mapping out the city.

With this objective in mind, we attempted to find the exact provenances of (around 250) grave stones, as much as possible, within the frame of our doctoral research, in the inventory records of museums (Aratyaka Arkeoloji Müzesi, İstanbul Arkeoloji Müzesi, Müzesi du Louvre, Princeton University Art Museum, Worcester Art Museum) and of a local private collection (Övalı Çeşme Köşk). Furthermore, we examined reports, diaries, field notebooks, maps, plans, drawings and sketches of the aforementioned excavations in the Visual Resources Collection of the Department of Art and Archaeology of Princeton University. We have thus been able to draw the topographical context to which the grave stones originally belong.

In this paper, we will present main results of our study concerning the grave stones that we led in pursuance of delineating the city limits. We will demonstrate by using visual materials how they concentrated in periphery of Antioch on the Orontes.
TH6-12 Abstract 18
The landscape of iron production – from prehistory to the Early Modern Period in present-day Latvia

Author: Dita, Auzina, University of Latvia, Riga, Latvia (Presenting author)
Co-author(s): Kalinov, Mārtiņš, University of Latvia, Riga, Latvia
Keywords: Medieval and post-medieval period, landscape
Presentation Preference: Poster

This poster will focus on urbanisation in the Central Balkan provinces and how it changed during Late Antiquity, which is also the topic of my doctoral research. The region had a crucial strategic position for the Empire, enabled by central location and good connectivity through natural passages and major roads. The good communication network also enabled a highly-developed trade system and exploitation of resources, especially ore deposits. Its cities were hubs of political and economic power, as well as cultural and ecclesiastical centres.

An older theory, still held in regional scholarship, is that the marauding raids of the various barbarian groups had a devastating effect on Late Antique urbanization. While I agree that raiding had a negative impact on cities, I rather see the raids as factors of transformation which prompted the cities to become more militarized and actively involved in the imperial defence. Cities were given stronger fortifications and military edifices, such as annona storage houses, and new cities emerged. I will use one case study on these newly emerging cities (the unnamed city at the site of Kozhuh in the Republic of Macedonia) to challenge the notion of dying Late Antique urbanisation and I will try to elaborate more on the issues that kept regional scholarship clinging to this notion and lagging greatly behind the more developed international scholarship on Late Antiquity and Late Antique urbanisation.

TH6-12 Abstract 19
Warfare and Urban Transformation in Late Antique Central Balkans

Author: Jelena, Jaric, Oxford, United Kingdom (Presenting author)
Keywords: Late Antiquity, Transformation, Urbanism
Presentation Preference: Poster

This paper will explore agency in iron production and its landscape, as well as changes in landscape-production agency will be analysed.

TH6-12 Abstract 20
Medieval and post-medieval village of Zasavje

Author: Murko, Miha, Institute for the Protection of Cultural Heritage of Slovenia, Ljubljana, Slovenia (Presenting author)
Co-author(s): Beavec, Uroš, Institute for the Protection of Cultural Heritage of Slovenia, Novo mesto, Slovenia
Co-author(s): Nastab, Barbara, Institute for the Protection of Cultural Heritage of Slovenia, Ljubljana, Slovenia
Co-author(s): Rutar, Gašper, Institute for the Protection of Cultural Heritage of Slovenia, Ljubljana, Slovenia
Co-author(s): Bavec, Uroš, Institute for the Protection of Cultural Heritage of Slovenia, Novo mesto, Slovenia
Keywords: Šmarje (southern Slovenia), flood, medieval, post medieval
Presentation Preference: Poster

In the vicinity of city Brežice (southern Slovenia) Institute for the Protection of Cultural Heritage of Slovenia, Centre for Preventive archaeology is carrying out a large-scale archaeological project as a new Hydroelectric power plant is being built on the Sava River. A number of archaeological sites are under threat of being destroyed by different infrastructural building works and by flooding of huge areas in order to make the accumulation lake. Archaeological research of the area, started in 2008, is still not finished.

On the right bank of the Sava River, east of the village Križa where there used to be an area of late medieval and post medieval village of Zasave, which existed until 1781 when extensive flooding destroyed the old village. After the floods only a few farms were set anew in the vicinity, and until the beginning of 20th century the area was completely abandoned and became agricultural farmland.

The Sava River is a typical Alpine river. Water levels can rise fairly high because of melting snow and seasonal spring rains. It can still cause major flooding in the event of a so-called one-hundred-year flood. Flooding of the area did not stop until the second half of 19th and the first half of 20th century when the Sava River was regulated. Many of the abandoned river channels can still be seen in the landscape. In 2018 the analysis of LiDAR data and geological survey were made as part of preliminary research of the area. Investigations led to the conclusion that the area has been heavily transformed and that not many remains of medieval and post-medieval buildings could be preserved in situ. Architectural remains of buildings were literary erased from the face of the earth due to massive water erosion that destroyed predominantly wooden architecture.

In 2009 extensive and intensive archaeological field surveys took place in the area. In 2014 and 2015 also trial trenching of 25,3ha in the eastern part and smaller archeological excavations in the western part of potential medieval village area were carried out. Archaeological research in the area revealed that only few farm houses were not completely destroyed during flooding and meandering of the river channels. Many river channels were also identified during excavations. A few of them were regulated and were used for communication by the residents of the village, as the channels’ banks were fortified with limestones slabs.

Archaeological research in the area is still being carried out thus final evaluation and interpretation of the identified archaeological structures will be done only after the fieldworks are finished and then all data will be put together and compared with historical and geological data.

TH6-12 Abstract 21
Phenomenon of Medieval and Post-medieval Rural Settlement Abandonment: Can We Observe Continuity?

Author: Dr. Holota, Lukáš, University of Exeter, Exeter, United Kingdom (Presenting author)
Keywords: Abandonment, Medieval and post-medieval period, Rural settlement
Presentation Preference: Poster

The abandonment of rural settlement (desertion and shrinkage) is documented over the majority of European countries, especially between the 14th and 17th centuries. In some areas, desertion affected more than half of all settlement units and significantly influenced the character and shape of today’s landscape. Despite considerable attention being paid to medieval settlements within several disciplines (history, historical economy, historical geography, historical demography, natural sciences and archaeology as well) the process of abandonment still remains poorly understood. On the contrary, a large number of reasons for settlement abandonment have been suggested across Europe, both cultural and environmental. In addition to various war events, demographic decline or unfavourable economic development, the human impact on the environment and changes in natural factors (deforestation, soil erosion, drying up of streams or an increase in flooding, climatic deterioration) have been supposed. A general idea of a ‘retreat of the margins’ is spread across European countries.

The paper evaluates the conventional concept of abandonment in marginal areas regarding their natural characteristics and tries to discuss the role of natural conditions in shaping of human communities together with their impact in wider transformations of land-use and the emergence of the countryside as a whole. Although the process clearly evolves the considerable change, systematic study in large-scale level has obtained remarkable evidence of continuity as well – 1) some settlements situated in positions originally regarded as marginal were not deserted at all; 2) some settlements survived in shriveled forms or in close proximity of deserted sites; 3) there is also increasing evidence of multiple exploitation or utilisation in original settlement areas after settlement desertion (continuity in land-use, field systems, network patterns etc.). Thus, cases of total abandonment as well as an entire retreat from the land are very rare. Although the examples across Europe are included, the paper focuses on Central Europe (esp. the Czech Republic) and England, where the long-term interdisciplinary research concerning deserted settlement and large collections of data gathered and evaluated by the author, enable deeper conclusions.

TH6-12 Abstract 22
Up and down: Models of landscape use in Middle-Late Bronze Age. A study case from Eastern Romania

Author: Prof. Bolohan, Neculai, Alexandru Ioan Cuza University of Iasi, Iasi, Romania (Presenting author)
Keywords: landscape, Middle-Late Bronze Age, patterns
Presentation Preference: Poster

The Middle Bronze Age is represented by Costișa and Monteoru cultures and the Late Bronze Age is represented by Noua culture. For the case under study in the workspace it stands out the different way of using the landscape. This change is due to both natural factors and human factor.

In fact, we are talking about two totally different behavioral patterns that did not imply the residence in the same place.
Among the factors that affected the dramatic shifts in patterns of living are: deforestation, imposition and acceptance of a macro regional housing model that fits better to the new type of economy, the need for an efficient exploitation of local sources (especially salt). As a consequence, at the transition from the Middle Bronze Age to the Late Bronze Age in Eastern Romania it occurs a major change in the housing model which was represented by fortified settlements (pterodromes, inter alia): the control of some satellite settlements, the control of the access roads, the placing in the proximity important water courses. This model encountered in the all the Sub-Carpathian area will be replaced with a kind of a micro regional swarming model much closer for the cattle breeders communities with new preferences (secondary and tiny watercourses, lowlands, Chernozem soil, solarity, seasonal dwelling structures). These changes are visible at the level of the communication system and transfer of goods, too. Thus, the dominant north-south road in the Middle Bronze Age is replaced with east-west road that seems to dominate the Late Bronze Age. By adding these features can be certified a kind of a territorial exclusion: the Middle Bronze Age communities preferred the area located between the north-south hydrographic axis represented by the Siret River in the east and the Carpathian area in the west. On the other hand, the Late Bronze Age communities seem to avoid the pre-alpine location and preferred the area bounded by the Siret River in the west and the north of the Black Sea in the east.

Through the interconnection of the data obtained from the landscape analysis, the analysis of matriarchy, of the different perceptions for this two types of communities it result that for the area of study was applied a model of a total change. In the seasonal dwelling structures). These changes are visible at the level of the communication system and transfer of goods, too. Thus, the dominant north-south road in the Middle Bronze Age is replaced with east-west road that seems to dominate the Late Bronze Age. By adding these features can be certified a kind of a territorial exclusion: the Middle Bronze Age communities preferred the area located between the north-south hydrographic axis represented by the Siret River in the east and the Carpathian area in the west. On the other hand, the Late Bronze Age communities seem to avoid the pre-alpine location and preferred the area bounded by the Siret River in the west and the north of the Black Sea in the east.

As a consequence, at the transition from the Middle Bronze Age to the Late Bronze Age in Eastern Romania it occurs a major change in the housing model which was represented by fortified settlements (pterodromes, inter alia): the control of some satellite settlements, the control of the access roads, the placing in the proximity important water courses. The presentation provides some interesting answers to these questions und gives the possibility for an intensive discussion. The presentation will focus on the results of my PhD thesis that were submitted to the University of Bremen in 2014. The topics of this research are 110 archeologically excavated institutions mainly from Germany, Britain, Denmark, Sweden and Iceland. All these institutions brought to light knowledge about the inmates and the various types of support they received. The archaeological evidence has been examined against the background of four relevant questions: 1. what kind of caring institutions existed in this area and period of investigation? 2. Who was admitted? 3. Where can one postulate both prophylactic and medical support and how do these institutions differ from others? 4. Which developments and changes can be observed? The presentation provides some interesting answers to these questions and gives the possibility for an intensive discussion.

This paper depicts the impact the bubonic plague had on the medieval monasteries and nunneries in Iceland when it twice struck the country before their closing during the Reformation. The plague had its first outbreak there in 1402-1404 and again nearly a century later in 1494-1495. Inside churchy institutions, such as the monastic ones, the death ratio seems to have been relatively higher than generally in the society but at the same time they did financially grow more than ever before. The explanation may originate in the general aims of monasticism to take care of the sick and even the dead, making their servants more vulnerable.
against the disease. Synchronously, people did trust the very same institutions to scotch the plague, not at least in their constant fear of its return, by doubtless donate more lands and properties to them.

TH6-13 Abstract 03
Surgical treatment at the Danish Cistercian Abbey of Þm - A critical analysis
Author - MA Møllerup, Lene, Museum Standerborg, Standerborg, Denmark (Presenting author)
Keywords - Medieval abbey, Skeletal paleopathology, Surgical treatment
Presentation Preference - Oral
Through eight decades the Cistercian Abbey of Þm, Denmark, has been well known nationally and internationally for its traces of surgical treatments on medieval human bones. The human bones derive from the monastic burial grounds in and around the Abbey run. Most of the bone material was excavated in the period 1933-1936 and followed up with a Danish publication in 1936 and a German publication in 1941, both dealing with the skeletal paleopathology. These publications furthermore argued that the monastery functioned as a hospital in the medieval period 1172-1538 AD, a claim which has since, remained practically undealt with. Modern anthropological analysis is questioning the former interpretation of the human skeletal material. New insights give the basis to reevaluate the role of the Cistercian monks as physicians and surgeons. This paper looks into the alleged surgical treatment on human bones and deals with the question, whether surgery has taken place at the site, as well as the monastery’s role as a medieval hospital.

TH6-13 Abstract 04
Heavy metal: health, medical tradition and cultural exchange in historic Iceland
Author - Walter III, Joe Wallace, Reykjavik, Iceland (Presenting author)
Co-author(s) - Prof. Kristinnsdóttir, Steinar, Department of Archaeology, University of Iceland, Reykjavik, Iceland
Co-author(s) - Decarisa, Natalia, Reykjavik, Iceland
Keywords - disease, osteology, alchemy, heavy metals, culture, Iceland, monastery, hospital, medicine, treatment, syphilis, mercury, paleopathology, ICP-MS
Presentation Preference - Oral
Skriðuklaustur, located in the east of Iceland near the Vatnajökull glacier, operated between AD 1493-1554. As an Augustinian monastery, Skriðuklaustur ran a hospital with sophisticated medical practitioners, providing medicinal and surgical treatments. The specialised medical knowledge, range of medicinal plants and herbs, and evidence of imported objects and food found at the site are indicative of Iceland’s international cultural inclusion in the past. Between 2002-2011, 271 out of 265 individuals were excavated from the site, presenting a vast array of medical conditions including syphilis, tuberculosis, hydatidosis and Paget’s disease, for example. In addition to disease, it is also vital to consider environmental influences on human health as a result of living in a volcanic landscape, the decades after the large volcanic eruption in Veiðivötn in 1477.

In the 13th century, alchemists began to use cinnabar ore (mercury sulfur) as a medicinal elixir as it was believed to impart long life due to its deep red color and philosophical associations with blood and the soul. Towards the end of the 15th century, distillations and fumigations of mercury from cinnabar became widely used to treat syphilis and remained to be the only viable treatment for syphilis until the 20th century. Otherwise, mercury (cinnabar ore) was used as a red colored pigment in scholarly work and during the gilding of metallic objects. Mercury can also be released into air, water and soil through geothermal activity, thereby providing further insight into concepts of mobility, isolation and care in historic Iceland.

TH6-13 Abstract 05
The Archaeology of Zootherapy in Northern Europe
Author - Dr. Miller, Holly, University of Nottingham, Nottingham, United Kingdom (Presenting author)
Keywords - Animal medicines, Medicine, Zootherapy
Presentation Preference - Oral
The World Health Organization (WHO 1993) estimates that about 80% of the world's population rely on zootherapy – the use of non-human animals, their parts and products – as a method of primary health care. In the past the percentage of people who utilised zootherapy was certainly higher, as evidenced by Roman medical texts and Anglo-Saxon leechdoms, which are replete with advice about animals as human medicines. Only in the late modern age has there been any marked decline in animal materia medica, yet archaeological studies of animal-derived medicines are rare. Given how widespread animal-based medicine is in societies past and present, it seems inconceivable that the remnants of zootherapy are not preserved in abundance within the archaeological record.

This paper will review archaeological evidence for animal-based medicines in Northern Europe, discussing the socio-cultural importance of zootherapies in the past. In particular, it will draw on the significance of wild and/or exotic animal species and their medicinal role that is likely to have been due to the wide held, cross-cultural belief that geographical distance is equalled with supernatural distance, and that animals derived from ‘outer realms’ (e.g. the wilderness or far-off lands) are more medicinally potent.

TH6-13 Abstract 06
Curing animals and human with wood tar in the Mediterranean from the Middle Ages to Present

Co-author(s) - Alifirri, Mohamed, Département de Biologie, Université Cadi Ayyad de Marrakech, Marrakech, Morocco
Co-author(s) - Durand, Aline, CNRS UMR 656 CNRS-Université Mars/Rennes, Le Mans, France
Keywords - Ethnomedicine, Pharmacology, wood tar
Presentation Preference - Oral
Wood tar, extracted by dry distillation, has been used in human and veterinary medicine since ancient times. This is particularly the case of tar from conifers (Pinusaceae, Cupressaceae, and Taxodiaceae) in the Mediterranean region, where they are still produced and used for these purposes. Biological and chemical researches conducted on conifer are mostly oriented toward the analysis of essential oil, mainly obtained by the process of plants hydro-distillation. However, the mankind used to care both humans and animals with wood tar. Therefore, ONGUENT project is focused on the investigation of this forgotten chapter of the research. ONGUENT aims to fill this gap by studying medicinal tar in a systemic way, from the plant raw material to the end product and its use, on both sides of the Mediterranean today and in the past, and by assessing their actual medicinal effects, or even toxicity. Our innovative research is embedded in an inter-disciplinary and cross-sectoral frame, crossing the methodologies and perspectives of the humanities and life, material and environmental sciences (history, archaeology; bio-archaeology; Organic chemistry and Phytochemistry, plant biology and molecular biology; pharmacology, toxicology and ecology) carried by a Mediterranean and complementary consortium of scientists. Both diachronic and synchronic, this research takes place in different space-times: medieval and post-medieval Provence (France) on the one hand, and current Atlas and Anatolian mountains (Morocco/Turkey). Through a cross-approach, research is organized into three work packages. The first work packages deals with natural resources, knowledge and know-how used to produce wood tar and the micro-environmental impact of this activity. The second work packages aims at providing a better understanding of wood tar as material, of his biological and chemical composition through the acquisition and analysis of current different plant species’ tars, the development of a reference database, the analysis and chemical characterization of archaeological tar residues, and finally comparison of the molecular spectra of tars and essential oils. The goal of the third package is to study the use of these different sorts of tar in human and veterinary medicine in the past and today, to assess their actual medicinal properties and their possible toxicity. By its retroactive and prospective dimension, this project addresses heuristics issues offering a unique interdisciplinaire dialogue, and tackling both current health, socio-economic, ecological and intangible heritage issues.
It is well known that many treatments for diseases and injuries existed in the later Medieval period (ca. 1050-1550 CE) in Northern Europe. Written records, surgical instruments and other artefacts for wound treatment, medicinal plants and various materials used to treat illnesses have been widely discussed. However, very little evidence of such treatments is readily observable when we analyse the actual recipients of such procedures. Therefore this presentation aims to provide a critical evaluation of potential evidence for treatment found in human skeletal remains from archaeological contexts from Northern European countries, and in particular England. Palaeopathological analyses have established that a range of diseases and injuries are visible on the human skeleton, although the majority of diseases would have only affected the soft tissues. The most commonly observed skeletal lesions include dental disease and trauma. Dental disease in the form of caries and periapical lesions increased in the later Medieval period, especially with the wider availability of sugar and finely milled flour that would have promoted dental caries. However, according to medical treatises removal of infected teeth was largely avoided and it must be speculated that the high percentage of teeth lost ante-mortem in medieval individuals can be attributed to natural causes. Fumigation was one form of treatment for ‘tooth worms’ thought to cause dental caries and potentially such treatment could initiate the upper respiratory tract and, if chronic, could lead toiasiary sinus. Nevertheless, since sinus infections may have a number of different causes and should therefore not be seen as proof for dental treatment. More solid evidence for treatment is found in form of surgical interventions such as trepanations and amputations. Trepanations, or opening of the cranial vault has been practiced for millennia and evidence for successfully healed (and unhealed) trepanations is known from almost every continent. Trepanations would have been performed to treat head injuries, epilepsy or other neurological problems. Despite a high survival rate of ‘patients’ in earlier times, the number of skeletons found with trepanations decreases in the later Medieval period in Northern Europe, attesting that other, probably less invasive treatments for cranial trauma and neurological disorders were favoured. Amputations are rarely seen in human remains and the few known examples from late Medieval England and the rest of northern Europe might be due to the low survival rate of affected individuals. Furthermore, unhealed amputations might not be easily observable and they can potentially be mistaken for post-mortem damage. Lastly, fractures, especially of long bones, when healed with little deformities have been viewed as evidence for fracture treatment. However, it has to be acknowledged that fractures of the lower leg and bone, when affecting only one bone might naturally heal without angulation, even in the absence of treatment. In conjunction with these examples, further evidence for treatment will be discussed and critically evaluated, but it has to be concluded that without additional contextual evidence human skeletal remains are not an unambiguous source of information if we want to infer medical treatment in the past.

most of the observed trauma consisted of well healed lesions with only slight angular deformity and little overlap. Two of the
fractures were healed but ununited, and two were unhealed peri-mortem injuries. Barber-surgeons in many of the locations are
known from historical sources and in the mid-18th century provincial doctors were employed to treat the injured.

TH6-13 Abstract 11
Living on the Edge:
Trauma Patterns in Medieval Vilnius (16-18th c.)

Author - PhD student Kozakale, Justina, Faculty of History, Vilnius University, Vilnius, Lithuania (Presenting author)

Keywords: Trauma, Vilnius

Presentation Preference - Oral

Skeletal remains provide one of the most crucial and direct sources of evidence for the occurrence of violence, work related
activities, and ill-fortune in the past. While fractures are the most common pathological condition, we still struggle with the most
plausible explanations for its cause and presumable outcomes.

Vilnius, the city of diversity, both religious and cultural, serves as an interesting subject for studies of everyday life and its
peculiarities in medieval period. Thus, 5 different objects representing varying social status were selected for investigation of
trauma pattern: Cathedral and Liejyklos street (17-18th c.) - elite members of society, church of The Holy Trinity (17-18th c.) -
clergy, Subačiaus 7 street (16-17th c.) - Vilnius laymen, Mindaugas street (16th c.) - poor.

A total of 109 injured individuals (27.3% of total individual count) were observed among 400 examined males, females,
and non-adults. 82 (29.5%) had only one fracture, while 27 (8.8%) suffered more than one injury. Five cases were recorded
as perimortal – no healing signs suggested an early death. Males correspond to the universal model which indicates their
dependency to a ‘higher-risk’ group: injured males consisted 75.2% of all injured individuals. The most common fractured part
of the skeleton was a rib accounting 30.3% of all injured individuals. Female fractures were characterized by injury to the forearm
and spine area, while the males were predisposed to diverse fracture locations.

Interesting patterns emerged when compared different sites. While Mindaugas street burial ground considered to consist
of poorest part of the town, the fracture rate was surprisingly low compared to those of elite, clergy or ordinary town-dwellers.
Furthermore, latter indicated many of their lesions were a result of higher energy accidents with involvement of a large portions
of body parts. Meanwhile, statistically significant difference was observed between higher-ranking part of society and laymen in
terms of head trauma – the former being more susceptible to it.

Since 2014 the Department of Anthropology at the Wrocław University of Life and Environmental Sciences has been conducted
the research project "Living on the Edge: Archaeology without borders - a Tormersdorf/ Toporów settlement case study",
which approaches archaeological, medical and social science research from a unique angle. Its primary objective is to
investigate life and health conditions of the inhabitants of the site at the end of the Middle Ages and early modern times.

The nature, incidence and intensity of pathological changes observed in the skeletons from the cemetery from the micro-region
Tormersdorf/ Toporów may indicate study group exhibit distinctive features. Variety and occurrence of the pathological
lesions may indicate a low level of hygiene, poor health conditions and long-lasting work overloading of the individuals as well.

One of the objective of the research project is to present complete and interdisciplinary analysis of the historical population,
its culture and environmental interactions on the basis of the Tormersdorf/ Toporów settlement from the late Middle Ages until its
destroying during II World War in 1945.

Accomplishment of the research includes reconstruction of the biological condition of the population based on broadly
approached reconstruction of the health status, including comprehensive analysis of the skeletal lesion.

So far, during two seasons of field work carried out in the micro-region Tormersdorf/Toporów, excavations were conducted
within the relics of the cemetery, located to the northwest of the ruins of the village. During archaeological analysis, only one
phase of use of the cemetery was found, dated on the first half of the XIXth century and from that period 32 adults (24 men and 8
women) were excavated.

Pathological lesions were present in all excavated skeletons. Its intensity was predominantly high. In 26 cases (81%) intertravieal
toesa was visible. Dental caries was present in 20 cases (62.5%) and in 9 cases (28%) periapical lesions were found.
Moreover, degenerative and overload lesions of the spine, injuries and bone fractures were observed as well. An unique case of
the male skeleton in maturus class of age with bilateral amputation of lower thigh was found.

The nature, intensity and incidence of pathological changes found in the skeletons from the cemetery from the micro-region
Tormersdorf/Toporów may indicate study group exhibit distinctive features. Variety and occurrence of the pathological
lesions may indicate a low level of hygiene, poor health conditions and long-lasting work overloading of the individuals as well.

Based on archaeological data, it was established that at the turn of the XIXth century in former Tormersdorf thereoscal care home
(Bröder-undPflegehaus2013AR) was functioning. This allows toesa working hypothesis that the majority (overen) of graves
found in Tormersdorf/Toporów are likely to be associated with burials of the residents of this institution.

TH6-13 Abstract 13
Medieval medical cultures in Sweden – practices
and ideas mirrored in materiality

Author - PhD Bergqvist, Johanna, Lund university, Genarp, Sweden (Presenting author)

Keywords: archaeology, medicine, medieval

Presentation Preference - Poster

Medical practice is formed not primarily by knowledge, but by culturally motivated apprehensions of what disease is, what
causes it and how the body functions. In medieval Sweden (by today’s geographical borders) the monastic orders brought with them a
medical culture with roots in ancient classical and medieval scholastic traditions. This medical culture included its special material
culture, i.a. in the form of surgical instruments and other equipment. These artefacts are encountered when monastic sites are
excavated. A previous assumption within medieval history has been that it was the monasteries which brought medical knowledge
to the North. However, an extensive survey of archaeological findings in Sweden, has revealed that artefacts related to monastic
medical culture did not spread outside the monastic milieu to the surrounding society. This can be interpreted as the result of a
very limid dissemination of the practices and ideas associated with monastic medical culture. In this paper possible explanations
to this, such as clashing medical cultures or paradigms (monastic versus indigenous) and diverse traditions and conditions of
communication of knowledge, are discussed. The content of the paper is based on some of the results of a larger research project,
published as a doctoral thesis in 2013.
Archaeological without borders

TH6-14 Abstract 02
Dealing with identities. Archaeological traces of Muslims and Dimmi-s in the Middle Mark
Author: Bueno, Manu, Université Paris Est-creteil, Paris, France (Presenting author)
Keywords: Archaeology, Ethnicity, Identity
Presentation Preference: Oral

In this paper I deal with the problems derived from the adscription of archaeological staff to Berbers, Muslims and Christians in the north of the Middle Mark of al-Andalus. I present both, the results of archaeological surveys integrating data from the Archaeological and Culture Territorial Service of Soria, Castilla-León, and the analysis of materials preserved in the Numantino Museum (Soria) used in my PhD dissertation. I will pay special attention to concrete sites such as Miño de Medinaceli and Conquexuela. These sites reflect the different powers successively overlapped and the problems concerning the adscription of identifiable bearers in the complex Middle frontier between 8th-11th centuries.

The settlement of Umayyad’s powers in the north-east of the Middle Frontier is a process quite well established through written Islamic sources: between the 8th and 9th century different Berbers’ identities and the city’s lords were settled in this area, years later, after the nomination of Abd – el Rhamman III (939) as Caliph, this area was rebuilt and became the most active frontier with Christians in al-Andalus between the 10th and 11th century. However, the explicit recognition of these realities raised new questions concerning their chronological and religious-identitarian adscription.

In one hand, the settlement of Berbers in this area, as we have previously shown, is a reality, but their previous identities and the problem of their adscription to this specific material culture. What kind of archaeological staff can we use as cultural markers of this specific ethnicity? What interpretation problems present these indicators in order to identify Berber population? Are they fully assimilated with the Umayyad’s elites? Can we demonstrate the islamiatisation of these populations?

After 944, Medinaazzuq was rebuilt and became the administrative centre of the Middle Mark, while the nearby fortress of Gormaz became the military centre, the starting point for the northern expeditions replacing the Atessa fortress. This area became a sophisticated frontier based entirely in a network of fortress and towers depended on Umayyad power, and the expression of power of the Umayyad Caliphate based on jihād mentality.

However, the new “Muslims’” rulers were not installed over an unhabitied area, terra deserta, but rather over a territory previously politically-disarticulated. The previous indigenous inhabitants were mostly “Christians”. The new power granted them a protected subordinate place in society through the status of dīmim-s or protected people. The traces of these people are almost invisible, mainly rock-cut tombs sites. These ones are not associated with artefactual or osteological remains, thus making it impossible to determine accurate chronologies, so they merit to be integrated in a collective debate.

TH6-14 Abstract 03
From hand to mouth: dietary perspectives on religious minorities in Medieval Portugal
Author: Tozo, Alice, University of York, York, United Kingdom (Presenting author)
Co-author(s): Dr. Alexander, Michelle, University of York, York, United Kingdom
Keywords: Diet, Isotopes, Medieval Portugal
Presentation Preference: Oral

Diet had an important cultural and symbolic meaning in medieval societies. In particular, the preparation and consumption or avoidance of certain foods played a significant part in the construction of identities by social status, age, sex and faith. This is especially intriguing for the multi-faith societies of Medieval Iberia were Christians, Muslims and Jews co-existed during the medieval period. In multi-faith societies co-existence and rulers’ religious tolerance towards minorities are inextricably linked, affecting all aspects of socio-religious life including dietary requirements. This paper addresses debates on socio-religious changes in an understudied area of Portuguese history, applying carbon (13C) and nitrogen (15N) stable isotope analysis to investigate the diets of Islamic and Christian communities in medieval Portugal under shifting religious political control. Stable isotope analysis, which provides direct evidence of the diet of archaeological individuals, has been applied to the skeletal remains of Muslims and Christians from the medieval sites of Beja (9th-12thC AD) and Silves (9th-13thC AD). These sites are notable for the presence of communities of Muslims and Christians that co-existed before and after the Christian conquest. Beja provides the remarkable opportunity to analyse contemporaneous Muslims and Christians living under Muslim rule and buried in the same burial ground. In addition Silves offers an important influence of the Christian conquest onto the economy and lifestyle of the Christian minorities in southern Portugal as well as the effect of the shifting political control on the pre-existing Muslim groups. The combination of the data from these two settings will provide information on the economies and the subsistence strategies put in place by religious minorities as well as shedding light on the development of medieval pluralistic societies under shifting powers and during transitional periods.

In this paper I deal with the problems derived from the adscription of archaeological staff to Berbers, Muslims and Christians in the north of the Middle Mark of al-Andalus. TH6-14 Abstract 04
Archeology and religious identities: the example of the Evora Inquisition court (Portugal)

Author - Magalhães, Bruno M., University of Coimbra, Jovim-Gondomar, Portugal (Presenting author)
Co-author(s) - Santos, Ana Luba, University of Coimbra, Coimbra, Portugal

Keywords: Jewish, Minorities, Persecution
Presentation Preference - Oral

The origins of the Inquisition are related to the power that religion had in Medieval times, representing values as engines of collective lives. As a result, the Catholic Church and the Papacy took over, since the 12th century, the leading role in the fight against heresy. The Inquisition had its origin at that time, and its development through the Catholic world led to its official creation in Portugal in 1386, aiming the surveillance of the ‘purity of faith’, the suppression of heresy, and the discipline of religious beliefs and behaviors, essentially related with the Jewish presence in the Portuguese territory. In 2000/2007 an archeological excavation took place in approximately 12% of the so-called Jail Cleaning Yard, the dump of the Evora Inquisition court. Having as starting point this archaeological excavation, this work aims to discuss several archeological traces on how the Catholic Church developed mechanisms currently understood as radical to deal with the presence of religious minorities. Twelve adult individuals in articulation (3 males, 9 females) were recovered and a minimum number of 16 were identified from a commingled context. The absence of funerary ditches suggests that the bodies were deposited directly in the dump. Moreover, the variability of the orientation and position of the body and limbs, and the absence of grave goods are not in accordance with the procedures of a Catholic burial. These results are underlined by the fact that the individuals were recovered from a location that was not sacred. Also, the manuscripts from the Evora Inquisition allowed the identification of 87 prisoners who died during the period in which the dump had been in use (somewhere between 1658 and 1634), and showed that at least 11 (12.6%) of them were confirmed discarded in the dump, likely because they were charged of Jewishness, heresy and/or apostasy. The archeological traces, as well as the anthropological and historical contexts, are in accordance with the characterization of these individuals as unburied dead, that were not judge by the court of the Portuguese Inquisition and reconciled with the Catholic faith before they died. More than a penalty to the body, this was a punishment to the soul of the deceased. Nevertheless, we will never be certain if these individuals were really Jews, once it could happen that people made their accusations because they were afraid of being accused first. Also, the defendant never knew what crime he was accused or even who made the accusation. From this perspective, the archeological findings have to be interpreted carefully, but also show us the climate of fear created in people’s everyday life. Even so, these individuals show a unique context which can be used in the future to help interpret other burials which do not fit within the usual scope of the Catholic burial rules in Medieval and Modern times.

TH6-14 Abstract 05
Archaeology of the Spanish Civil War: Is new data contributing to a deeper understanding?

Author - Dr. Perez-Juez, Amalia, Boston University, Madrid, Spain (Presenting author)
Co-author(s) - Dr. Morin, J., JUDEA, Madrid, Spain

Keywords: archaeology of conflict, Spanish civil war, trenches
Presentation Preference - Oral

Between 1936 and 1939, Spain was bled out in a Civil War, a prelude of what the whole of Europe would go through only months later. After almost 40 years of dictatorship, and the unanimous yearning to reach a peaceful transition into democracy, archeological research of Civil War sites was all but silenced until just recently. In 2000, our team undertook one of the first excavations of Civil War sites in Spain, “Casas de Murcia”, part of the lines of defenses built by the Republicans to protect Madrid. Trenches, bunkers, machine gun nests, and other features were rapidly built and fiercely occupied for almost three years in order to stop Franco’s armies in his advance towards the capital. The site, which was not subject to protection at the beginning of the 21st century, was completely excavated and researched, and the results were fully published and presented to the public in a temporary exhibition. The enormous amount of information that emerged from that excavation surprised everyone. For researchers, it meant more data to add to the documents and recovering material culture; for the general public, it became a way to reconnect to the landscape that had witnessed part of a family chronicle; for politicians, it was another good media story. No one was to remain indifferent to what an excavation from this time period could yield.

In the fifteen years that have since passed, many things have changed in Spain regarding the Archaeology of the Civil War. Legislation protects the sites, excavations are conducted in a variety places, mass graves have been unearthed and bodies identified, and objects of all kinds have been recovered and restored. But these accomplishments, far from bringing the population closer to understanding this part of history, have re-opened wounds of the Civil War. Legislation protects the sites, excavations are conducted in a variety places, mass graves have been unearthed and bodies identified, and objects of all kinds have been recovered and restored. But these accomplishments, far from bringing the population closer to understanding this part of history, have re-opened wounds of the Civil War. The absence of funerary ditches suggests that the bodies were deposited directly in the dump. TH6-14 Abstract 06
The Fact of the Mother Goddess

Author - PhD Sozer Kolemenoglu, Selma, Marmara university, Istanbul, Turkey (Presenting author)

Keywords: Religion, Art, Archaeology, Mythology, Philosophy
Presentation Preference - Poster

INTRODUCTION-PURPOSE: In this study, we show that the terminological context of the Mother Goddess idols are dealt in the context of mythology, art, archaeology, philosophy and religion. The connections of the effects of the idol wares which the antique individual (the figure) had left on their social structures, were found by means of exploration. The idol message is thought as symbolic evidence and its context is tried to be presented.

MATERIAL-METHOD: The typological phases of the Mother Goddess idol wares in the history of culture, as evidences made of different materials in various museums in Anatolia, were classified. Particularly, the wares which were taken out in the Neolithic period, was tried to be correlated with the archeological narratives, the social events in the world conjunction through philosophy, religion and mythological accumulation. The Mother Goddess wares were evaluated in compliance with the environment which they emerged in rules, principles and style as well as the social structure they addressed to. In describing the human being, we widely observe that he is connected with the mythological legends and holy scripture doctrines. FINDINGS: The role of the semantic integrities in the history of religions and their connections in the holy scriptures, may be needed to be examined. We think that some critical scientific theories in art, religion and archaeology may have correlation with the idols. By taking the interpretations in the holy scriptures and the mythologies, their theses and antitheses were frequently compared. The fixed most important topic was that the observability of whether the abstract symbolic knowledge which is necessary in knowing humanbeing, the sociological ideas realized in the life environment by coming to know the nafs. RESULT: We found out that the conquests which had been realized in different periods of the History of Humanity are hidden in the inner depth of human. The definition of the Pharaoh, Idol (god), (con was observed to be the abstract, emotional gap which made the life harder in the human structure. The concepts such as the Mother Goddess idols and Pharaoh are the explanations of this empty space as signs and symbols. This determination is that by scrutinizing the existence which bear critical meanings beyond time, there may be an explanation of the life prescription of the history of humanity. It is seen that this prescription is the Noble Quran which constituted an important bridge between the past, which sheds light to the future which have been examined throughout the ages, with the future.

ARCHAEOLOGY FOR “CONVIVENCIA. ARCHAEOLOGY AFTER SAINT DENIS”

Thursday, 1 September 2016, 9:00-11:00
Faculty of History, Room 211

Author - Cristián Boza-Calderón. Felipe, Institute of Heritage Sciences (In Choi, CSIC), Santiago de Compostela, Spain (Presenting author)

Co-author(s) - Rosenschen, Salas, National Institute for Preventive Archaeological Research, France

Keywords: coexistence, multiculturalism, terrorism

Presentation Preference - Regular session

It was thought by the EAA Executive Board that, in my role of EAA president, a session should be proposed to discuss members’ reactions about EAA politics as part of our strategic planning. When I was preparing this proposal, we were shocked by the 13-N terrorist attacks in Paris. Then I decided to change the focus of this “presidential” session to explore the contribution of Archaeology to promote “convivencia” among different communities in multicultural environments, an issue that also matters because it deeply relates to the practices that EAA should encourage. The term “convivencia” is used in Spanish because this was the concept developed in medieval Iberian Peninsula to denominate the coexistence, partially cooperative partly conflictual, of Jewish, Muslim and Christian communities (http://www.mpweberin.mogp.de/workshops/ain/Convivencia.html). “Convivencia” means more than living together, it is practicing coexistence between communities and actors in contexts of cultural heterogeneity. Critical accounts of “convivencia” should acknowledge that these actions do occur amidst conflicts and networks that are also crossed by asymmetrical relations of power. The other regard of this session is “Saint Denis”, an area that suffered the 13-N attacks, where the Unité d’archéologie has developed active under the aim of using the archaeological foundations of the town to create a shared identity and neighborhood.

Archaeology, because its relation to materiality, memory and identity, is useful to mediate in these conflicting contexts. It unvails secrets, creates basis for intersubjectivity, promotes dialog between agents and communities, and provides means for public and community activists.

Session aims to explore these capacities and reflect about contradictions inside these practices. We should both consider theoretical approaches and identify good examples of projects that could help to strengthen this application of Archaeology and be helped by our recognition. Cases studies can derive from any sort of cultural heterogeneity and Communities interactions.

TH6-15 Abstract 01

Saint-Denis, Archaeology, territory and citizenship

Author - Director Rodrigues, Nicole, Unité d’archéologie de la ville de Saint-Denis, Saint-Denis, France (Presenting author)

Keywords: Archaeology, Citizenship, Territory

Presentation Preference - Oral

Saint-Denis, one of the major sites of French history is also a suburban town, an area that suffered the 13 November attacks, near the “Stade de France”, the symbol of the growth of the town of the 21st century. Here, the new constructions and urban development have erased the shape of the ancient town.

More than 40 years of urban archaeology allowed us to gather data to understand the mechanism of urban growth from the beginning to present day. In order to place the research in a long term framework, in 1982, the municipality created the archaeological Unit.

The Saint-Denis’ excavations have produced a vast mass of archaeological finds. Archaeology is a concrete discipline, perfectly suited for establish direct contact with general public. The outreach program, “Archaeology, territory and citizenship” is in progress since 1998. The goal of this project is to transform archaeological material into tools of understanding the territory. We are not using monumental remains but finds of daily life, experimental structure and local links, to cross both the know-how of past and present. This project, supported by the European projects, ACE and NEARCh is every time an experiment, because the question of the inhabitants and the invisible towns of Saint-Denis is renewed.

TH6-15 Abstract 02

Dealing First Nations to live with Muslims. A Basque reflection on existence and coexistence

Author - Dr. Escribano-Ruiz, Sergio, University of the Basque Country (UPV/EHU), Vitoria-Gasteiz, Spain (Presenting author)

Co-author(s) - Azkarate, Agustin, University of the Basque Country (UPV/EHU), Vitoria-Gasteiz, Spain

Keywords: Archaeology for “convivencia”

Presentation Preference - Oral

On 23rd October 2015 last, several unidentified persons threw rubbish in the mosque of Llido (Araba). Several days later, a hooded person threatened and insulted those who were congregated inside. Nobody had ever witnessed these kinds of incidents before 13th November in a village that is proud to coexist with one of the largest Saharan communities of the Basque Country. This duality, which links emerging xenophobia with consolidated internationalist activities, represents a recurring ideological structure in the Basque Country. The attachment is greater with respect to oppressed people with whom we empathize and whom we support. Indifference is the prevailing attitude with those groups that are not defined politically. Apathy turns into hate when certain tragic events, intensified by devastating media coverage, at precise times shatter peaceful coexistence.

The Basque Country is also going through other internal processes focused on working peaceful coexistence. The disappearance of ETA and efforts to achieve mutual understanding are today two milestones of the Basque social and political agenda. So much so that in the opening ceremony of the recent debut of Donostia/San Sebastian as European culture capital, the main slogan represented was peaceful coexistence. The concepts of coexistence and culture come together in a programme in which archaeology is not represented. As Basque citizens and archaeologists, we want to avail of the opportunity of debate offered by this session to reflect on the potential of the mediation of archaeology in processes of coexistence and perspective-sharing in our geographical environment.

On outlining one of the characteristics of the Basque idiosyncrasy with respect to the “other”, we found that one of the principal characteristics generating empathy is the identification with a particular condition of this social subject. Therefore, we suggest that one of the paths towards sustainable coexistence is the generation of emotional connections with the peoples under debate. In synthesis, we have to look for cases that enables us to identify oursevles with the “other” societies with whom we coexist or at least obrigate ourselves to understand them. A common denominator could be emigration, a well-represented aspect in the Basque past and which today defines Muslim communities. And one of the most paradigmatic examples of Basque coexistence is the case of fisheries of the North Atlantic, which involved the interaction between Basques, Europeans and Canada’s First Nations. In the proposed paper, we will reflect on the manner in which the socialisation of this example can generate mechanisms of proximity and tolerance between the Basque and Muslim peoples.

TH6-15 Abstract 03

Heritage for convivencia: The Inter-American and Caribbean Cultural Heritage Working Group Meeting

Author - Dr. Majewski, Teresita, Statistical Research, Inc., Tucson, United States of America (Presenting author)

Co-author(s) - Attischo, Jeffrey H, Statistical Research, Inc., Tucson, United States of America

Co-author(s) - Arantes, Antonio A, Departamento de Antropologia UNICAMP, Campinas, Brazil

Keywords: convivencia, cultural heritage, disciplinary heterogeneity

Presentation Preference - Oral

In response to ever-growing threats to intangible and tangible cultural heritage in the region, the Anthropology Department of the State University of Campinas (UNICAMP), Campinas, Brazil, organized and held the inaugural meeting of the Inter-American and Caribbean Cultural Heritage Working Group on August 11-12, 2015, at UNICAMP. The goal of the meeting was to establish a permanent collaborative forum to explore ways to improve practical and theoretical approaches to cultural heritage practice. Representatives from major anthropological and archaeological associations based in the Americas and the Caribbean, the UNICAMP Anthropology Department, and interested individuals discussed how stakeholders should engage with these issues to foster outcomes in the best interest of society. In less than two days of working together, the group drafted a declaration on the need to protect and safeguard cultural heritage in the Americas and the Caribbean and stressed the need for improvements in the theoretical and practical approaches used to develop community-based investigations about and interpretations of cultural heritage.

The declaration is expected to foster increased discussion and collaboration on cultural heritage studies. Created in English, the document has already been translated into Spanish, French, and Portuguese. The group is currently seeking formal approval from each of the professional societies and academic institutions that sent representatives to the inaugural meeting that they will become convening signatories to the declaration. A number have already agreed to “sign on.”

Participants in the working group include anthropologists, cultural anthropologists, and linguists. The development of the “Campinas Declaration” is used as a case study to explore the dynamics of international, heterogeneous disciplinary communities working together successfully to craft a declaration that could be a model for collaboration in heritage studies. The declaration itself was crafted through intensive but brief collaboration that created an intellectual bond among the participants. Whether the working group can become a sustainable network of functioning partners will depend on the willingness of the sponsoring organizations to allow the network to flourish and establish working procedures that allow for its independent operation. If the focus can remain on a joint understanding that threats to cultural heritage, both tangible and intangible, are real and share universal elements, convivencia is distinctively possible. Archaeologists can contribute much to the success of the relationship because of their experience working with stakeholder communities concerned with both intangible and tangible heritage.
TH6-15 Abstract 04

Integrating Archaeology at Vitoria-Gasteiz (Basque Country): terrorism, immigration and peace

Author: Professor Xurxo, Aygun, University of Basque Country, Vitoria-Gasteiz, Spain (Presenting author)
Co-author(s): Garca Rodriguez, Sonia, University of Basque Country, Vitoria-Gasteiz, Spain
Keywords: Archaeology of Contemporary Past, Community Archaeology, Integrating Archaeology
Presentation Preference - Oral

In the late 1950s and early 1960s the small Basque town of Vitoria-Gasteiz became an important industrial center that attracted thousands of immigrants from other Spanish regions. Although it was considered by the franquist regime as a model of ‘social peace,’ the city saw the emergence of armed resistance by ETA and a significant labor unrest. Strikes of 1976 ended in a bloodbath. The crackdown on March 3, 1978 is a milestone for the city’s population. The arrival of democracy in 1978 led to the conversion of Vitoria-Gasteiz in the capital of the Basque Autonomous Community. This region has a nationalist majority claiming independence for the Basque Country or at least converting Spain into a federal state.

In recent years the city has experienced a second wave of migration, with newcomers from the countries of Eastern Europe, Latin America, North Africa and sub-Saharan Africa. With 250,000 inhabitants, the Basque capital has become today in a multicultural urban space. As in the 1960s, it is a challenge to integrate these immigrants. A challenge not without its problems. Despite the effort made by the administration (social support) and civil society (platform ‘Gora Gasteiz’) at urban level they are creating real ghettos. A rejection of initiatives such as the construction of mosques (especially those working-class neighborhoods that had housed the first immigrants of the late twentieth century) has been observed.

At this very reality of globalization, in Vitoria-Gasteiz it is being lived another equally important process. The cessation of armed activity by ETA in 2011 has given way to a period of peace building and collective memory through public policies of memory trying to do justice to the victims of the Franco’s regime (1937-1975), the terrorist group ETA (1954-2011) and State terrorism. Thus, the weight of terror continues to set the social and political agenda of the city in 2016. A purely Spanish terror, for now.

Within this reality, we believe that Archaeology of Contemporary Past is a valid and useful tool to try to consolidate a culture of peace, overcome the traumas of the past and promote a real integration of immigrants. In our communication we show the work of Heritage socialization that we have developed over the past three years: workshops on Archaeology of the Spanish Civil War, guided tours at working-class neighborhoods of Vitoria-Gasteiz, cultural courses about Archaeology of Franquist at community centers. As a case study we will present the example of the district of Coronación, elected by the dictatorship in the early 50 to accommodate Spanish immigrants. Today Coronación welcomes much of the new Maghreb and sub-Saharan immigrants. The European Union is developing here between 2016-2020 a regeneration project of the neighborhood (Smart City). Our Community Archaeology Project aims to recover the material traces of the past, to present the history of the neighborhood and promote the integration of old and new neighbors across the Urban Heritage.

TH6-15 Abstract 05

Uncovering convivencia from the dark depth of modernity: toward intercultural rights to heritage

Author: Orlando Barban, Francesco, Casti Di Lecce, Italy (Presenting author)
Keywords: decolonial theory, indigenous archaeologies, intercultural human rights
Presentation Preference - Oral

In 1492 the last Islamic kingdom in Spain was taken and from the reconquista of Granada began the conquest of the so-called “New World”. Until this year convivencia meant that cultural diversity was managed in a way by which each group with its own material and spiritual references was able to define its own path of development. But after the Spanish conquest the perception of cultural diversity was the justification for the exclusion of “others” and the imposition of a dominant culture which was called “Christian” that it was, and somewhere it still is, a synonymus for “civilized”. In Granada, according to the Italian historian Adriano Prosperi, it was ignited the “seed of intolerance” that would have been the source for the legitimation of European expansion and colonial power throughout the world.

By focusing the attention on the process of modernity as a project for imposing a universal ethic and controlling peoples through theirs racial classification, Latin American decolonal theorists have shown how euro-western powers have been able to shape a world-system characterized by a logic of exclusion/inclusion in which the “Others” were those whose cultural and epistemic difference seemed to be unsustainable with the right way of social relation, cultural practice or economic development. Heritage conservation emerged within the context of imagining the national communities and formalizing imperial powers in XX century. International protection of heritage followed this ambiguous origin and it has been made possible in the second half of XX century thanks to its institutionalization and bureaucratization. Such a regime of heritage practice has reached its highest recognition in the last few decades through the deployment of multicultural policies within the context of the neoliberal affirmation of cultural diversity. But the same politics have made it possible the organisation and visualization of a world indigenous resistance based on the cultural relation between communities and the lands, in which the pre-modernity, that is the pre-colonial tradition, is articulated with the global context and participate in it by a counter-hegemonic use of universal categories such as human rights and heritage conservation.

Archaeology is a methodology but it is also a theoretical source for linking past, present and future. It makes possible to give an alternative account of human rights trope by showing the resistance exercised by whom have suffered those rights as an imposition, and it allows local communities, specialty indigenous communities, to appropriate the universal mean of human rights and articulating it with their own category of thought and experiences. I would like to show how all human rights shall be interconnected and culturalized (this is “thought” from a perspective product of a particular experience) in order to be a real opportunity for social change and development, and so the wherewithal of heritage (inasmuch as it is the material and immaterial legacy of the past) for promoting respect among peoples by the mutual acknowledgement of both identity and difference, without avoiding the misunderstandings by virtue of which a real intercultural project is thinkable and enticing.
EXPERIMENTAL ARCHAEOLOGY: TECHNIQUES AND TECHNOLOGIES

Saturday, 3 September 2016, 14:00-18:30
Faculty of Philology, Room A7

Author - Rinkūta, Virgilija, Vilnius University, Vilnius, Lithuania (Presenting author)
Co-author(s) - Tomsons, Arūnas, Latvian University, Riga, Latvia

Keywords: craft techniques, experimental archaeology, scientific research, education, tourism

Presentation Preference - Regular session

This session proposes presenting research of diverse aspects of experimental archaeology, prehistoric skills and techniques in the scientific research, various forms of education and its use in tourism industry. Main focus is on analysing various craft technologies, their development, and diffusion, as well as detecting ways of cultural interaction. All range of materials and items is welcomed.

TH6-16 Abstract 01
Testing twined clothing in Mesolithic

Author - Rinkūta, Virgilija, Vilnius University, Vilnius, Lithuania (Presenting author)

Keywords: experimental archaeology, Mesolithic, twined clothing

Presentation Preference - Oral

In 2012, it was decided to come back to one of the objects, which had inspired some construction and wearing possibilities of the (re)constructed twined clothing. It was an engraving on the aurochs bone, depicting five anthropomorphic figures, which was found in Ryemarkåsgård settlement (Denmark) and dated back to ~8000 BC. The found two specimens were made of lime bast. They were compared with other extant European twines of similar or close periods. Three pieces of rectangular shape were produced, in order to test some technical and functional questions.

In 2018–2019, some experiments, testing possibilities of (re)constructing twined clothing, were held. They were based on a find from the middle-late Neolithic settlement of Šventoj 3B (Lithuania), dated back to ~4000-2900 BC. The found two specimens were made of lime bast. They were compared with other extant European twines of similar or close periods. Three pieces of rectangular shape were produced, in order to test some technical and functional questions.

Two categories of early Neolithic objects are recognized on the Balkans as having been involved in prehistoric drilling activities: beads and other decorative and prestigious items made of bone, shell, pottery and various minerals, and toolkits of flint micro-borers.

This paper discusses experiments in drilling different materials undertaken with the aim of testing several practical issues. A series of flint micro-borers were produced and used for manual and mechanical drilling (with a pump drill) of various samples and other decorative and prestigious items made of bone, shell, pottery and various minerals, and toolkits of flint micro-borers.

As a result of the conducted experiments many interesting discrepancies in the effectiveness of individual methods were observed. Some of them seem highly effective, while others appear to be useful only in specific aspects or proven completely ineffective. In the course of the speech some of the current ideas regarding the discussed area of prehistoric economy shall be verified basing on the obtained data.

TH6-16 Abstract 03
Research, experimentation and outreach in the early Neolithic site of La Draga (Banyoles-Spain)

Author - Antoni, Palomo, Universitat Autònoma de Barcelona, Bellaterra, Spain (Presenting author)
Co-author(s) - Buch, Montserrat, Arqueòdèc, Banyoles, Spain

Keywords: Eneolithic, Experimental, Pottery

Presentation Preference - Oral

This paper discusses experiments in drilling different materials undertaken with the aim of testing several practical issues. A series of flint micro-borers were produced and used for manual and mechanical drilling (with a pump drill) of various samples and other decorative and prestigious items made of bone, shell, pottery and various minerals, and toolkits of flint micro-borers.

In this paper, we will present the results of five-year Experimental Archaeology Project on making Eneolithic pottery, based on our research in the Kojđadermen–Gumëshli–Kararanovî VI tell settlement from Suban-Malu Rou, south-east Romania. In our work, we have experimented with different hand-making techniques such as building the vessels from one lump of clay, cooling and also moulding. Experimenting with the moulding technique came as a necessity in our effort to understand the presence of large and shallow plate-like vessels (sometimes larger than 50 cm in diameter), in the pottery assemblages characteristic of these past communities. To understand better the making pots process, we have also tested a series of hypotheses regarding the types of clay, temper, modeling, burnishing, decorating, drying and firing.

Our work is backed up by potographic and chemical analysis which not only helped us identify the local clay source as the raw material used by the Eneolithic potters but also gave us a more precise recipe for the mixture of clay and temper. The data collected over these years now help us to refine observations when studying new assemblages, thus leading to a better understanding of the pottery resulted from the excavation, and the people who made it.

This work was performed through the Partnerships in Priority Areas Program - PN II, developed with the support of MEN - UEFISCEDI, project no. PN-II-PT-PCCA-2013-4-2352.

TH6-16 Abstract 06
Experimental studies on ceramic provenance from southern ibera
Author - Dr. Krueger, Michal, Adam Mickiewicz University in Poznan, Poznan, Poland (Presenting author)
Co-author(s) - Bartkowiak, Maria, Adam Mickiewicz University in Poznan, Poznan, Poland
Keywords: archaeometry, experimental archaeology, pottery
Presentation Preference - Oral

The undertaken research addresses a problem of provenance of ceramic assemblages from southern part of Iberian Peninsula in the early Iron Age, particularly differentiation between local and foreign origin of so-called Tartessian pottery through experimental studies. This investigation took into consideration mainly the technological aspects of pottery production and focused on both different applied techniques (hand-made and wheel-made) and the morphological and typological diversity of analysed assemblages. The proposed paper makes an attempt to examine the Tartessian ceramics not from a traditional typological posture seeking the chronological sequences; the dominant approach used in this research is based on archaeometric up-to-date methodology, and thereby shed a light of these, still relatively weak recognized aspects in the study of the Iron Age pottery from the south-eastern Iberian Peninsula. To achieve this goal a non-invasive X-ray spectromer has been used in order to determine the chemical differences between ceramics from the local sites of Lower Guadalquivir region. The integral part of this study is an experimental examination of clay pastes of sherds, samples of local clay sources and raw material obtained from sites surroundings in order recognize the processes of forming the particular types of vessels and establish the condition and temperature of the firing. All analyzed potsherds and clay samples with various added inclusions were fired in oxidizing atmosphere at several temperatures increasing gradually, starting from 600°C and ending at 1200°C. The phytochemical properties of samples were measured after raising the temperature up every 50°C, their radical changes enables a determination of original firing temperature of prehistoric vessels and possible provenance of clay sources.

TH6-16 Abstract 07
The swatch of antiques bronzes
Author - PhD student Devogelaere, Jonathan, Aix-Marseille Université, Aix-en-Provence, France (Presenting author)
Keywords: antiques bronzes, Colours, Swatch
Presentation Preference - Oral

As part of my thesis, entitled "The colours of bronze ceremonial furniture in the Graeco-Roman world, 200 BCE – 200 CE: from technical characterization to symbolic values", I have developed an experimental archaeology project to create a swatch of the variegated colours of antiques bronzes, and to restore the original colours of Graeco-Roman bronze furniture. I intend to change the presumed image of ancient bronze as green, lacking rather for evidence of polychromy and a spectrum of copper alloys. This swatch combines the technical processes of the lost wax method and the addition of polychrome bronze surfaces (via patina and inlay). I intend to use this study as a repository both for my research and for other studies related to bronze production.

Bronze is an alloy of copper and tin, lead may also be added. The objects examined in this study have a variable percentage of metals, and because of this the colour of the alloy differs. The colour of the alloy can be maintained by polishing but it is also possible to give a patina to the surface of the bronze with a reagent. Other metals and alloys (copper, silver, gold, Cortillian bronze) can be inlaid by damascene or by plating to create polychrome decorations. Unfortunately, the archaeological material in copper alloys suffers the effects of time and deposition, which may lead to corrosion and discoloration of the surface, often green or brown. Archaeological bronzes also may suffer from overly aggressive restorations which scour the original surfaces or cover them with a layer of paint imitating green corrosion.

The platelet samples of swatch have been analysed to determine their elemental composition and their patina, so as to compare them to the archaeological material. Initial results suggests that the colours of bronze luxury furniture very greatly, and that the spectrum of colours is a product of the composition of bronze alloy and the techniques used in finishing the surface, either polishing or patina application.

TH6-16 Abstract 08
A Romano-British glass bracelet: rediscovering a technique
Author - Dr. Ileva, Tatiana, Newcas University, Newcas upon Tyne, United Kingdom (Presenting author)
Keywords: glass bracelet, Roman British, technique
Presentation Preference - Oral

The paper will discuss the production technique of the seamless Romano-British glass bracelets that has been reconstructed by working with the modern glassmakers and through the close inspection of the British glass bracelet fragments. The production of the rigid annular objects composed of coloured glass in Britain is dated to the mid-1st century AD, starting with the Roman invasion in AD 43. Prior to that, Britain had no history of glass breacle bracelet production, yet the late Iron Age Continental glass bracelets were being attested throughout Britain, albeit on a smaller scale. The close inspection of the fragments by the author had hinted at the possibility that the Roman-period British glass bracelets have been produced in the similar manner as some of the La Tène Continental bracelet types. This has been confirmed by the experiments conducted by the author with the experienced glassmaker, who specialises in making historical beads and pendants. Further experiments shed light on the production and application of the decorative features to bracelets. Most British annulars have either twisted cord decorations or badges with curved terminals. The common theoretical opinion is that cords and trails were marvered flash, e.g. by rolling a hot glass bracelet on a flat surface. This idea has been contested by the experiments, which indicated a simpler way of applying a decoration, further confirmed by the analysis of the fragments. The paper will present these findings and discuss how the experimental archaeology provides us with the clues about the points of interaction between craftspeople of Continental and British origin in the late Iron Age and Roman European Northwest.

TH6-16 Abstract 09
Teaching Experimental Archaeology at Vilnius University
Author - Rimikis, Virginija, Vilnius University, Vilnius, Lithuania (Presenting author)
Co-author(s) - Lucheshnas, Aleksiejus, Vilnius University, Vilnius, Lithuania (Presenting author)
Keywords: experimental archaeology, higher education, teaching
Presentation Preference - Oral

Vilnius University is the oldest institution of higher education in Lithuania, founded in 1579. Since 1940’s, the teaching of archaeology has started. At present, at the Department of Archaeology of the Faculty of History, the studies of archaeology are organized in three cycles: undergraduate, graduate and post-graduate.

Teaching of experimental archaeology for students of archaeology was started more than ten years ago. Students get acquainted with some basics of experimental archaeology during the first year of their undergraduate studies. A full course of experimental archaeology (6 ECTS credits) is taught during the first year of archaeology graduate’s programme. The course consists of theory of experimental archaeology, discussions and numerous workshops. The workshops are lead by experimental archaeologists and ancient technology experts, in cooperation with craft and experimental archaeology organizations (workshop gallery “Amatų gildija”, workshop-living museum “Senųjų amatų dirbtuvės”, club for craft reconstruction “Dvaro meistrai”, museum gallery “Amatų gildija”, workshop-living museum “Senujų amatų dibutvės”, club for craft reconstruction “Dvaro meistrai”, experimental archaeology club “Palajota”), as well as some museums (Archaeological and Historical Museum of Kogy studio, Pärnu, Air Museum of Lithuania at Rumškė, the). The studies period varies from Stone Age to Late Middle Ages, so thus wide is the range of materials: bone/antler, flint, stone, fibres, plants, textiles, leather, food, non-ferrous metals, ceramics, etc. The course ends up with an exam, which contains a presentation of a particular committed experimental archaeological experiment. All students do very each year, according to the interests of the students, and usually are related with their MA theses. Usually, this course is chosen by a group of 8-15 students.

As a result, students get both theoretical knowledge and some basic practical skills for using experimental archaeology as a research method in their MA theses or, later, in their doctoral dissertations. Also they use their skills at their work as ancient technologists and educators at living archaeology events and historical museums.
Microwear analysis on early medieval combs

Six years of experimental traseology at Klaipėda University: accomplishments and future prospects

The restructuring of the Artefact Study

New insights into the Eneolithic architecture based on the experimental archaeology

Neolithic Painted Pottery in Lumea Noua Site (Romania). Manufacturing Technology Experimentation

The method will be developed to ‘read’ and detect these production techniques and use wear markers of the combs. The aim is to develop a technique that, combined with typological, scientific and context-based research, can investigate in how far these combs reflect aspects of identity.

The method contains three stages. First, starting from a functional hypothesis, an experimental program is established. In this stage combs are processed respecting both the type of raw materials and technical transformation sequences. Secondly, usage was not conducted yet.

The presentation is dedicated to main stages of the development of experimental approach and applying its methodology in the archaeology of Latvia. Presentation examines main stages of development of the scientific thought and various expressions both in reconstructive experiments and interpretations, both in future possibilities of using it in future scientific research as well as a powerful tool in education of archaeology students and tourism.

Keywords: experimental work, Middle Neolithic, single-chambered kiln

Presentation Preference - Poster

Among the wide variety of decoration techniques discovered at the Alba Iulia-Lumea Noua site (Transylvania, Romania), a specific painted decoration to the present state of research the only technique that can be definitely attributed to the small middle Neolithic communities called Lumea Noua cultural group. Being the only material evidence that could lead to the configuration of this cultural aspect for the moment, various archaeometric analysis were made on a large number of samples, in order to extract all the informations regarding the technology that has been used to produce such painted decorations. Based on the material analysis, this paper represent an experimental foray into the manufacturing and firing of painted pottery, that we know so little about, in the Transylvanian Middle Neolithic.

The starting point was a detailed analysis of typical installation discovered in the painted pottery cultural areas that have evolved in the Transylvanian territory. We selected a single-chambered kiln type, which could have been used for the mentioned goal. We conducted several experiments in order to understand better how these kilns were constructed and we have tested the functioning system of the device.

The experimental results are a clear indicator of the presence of skilled potters and they could also change the traditional archaeological approach that links the quality of the pots with the elaborate installation for firing Neolithic pottery.

TH6-16 Abstract 16

Flint awls: theory and practice

Author - PhD Student Slah, Gvidas, Klaipėda University, Klaipėda, Lithuania (Presenting author)

Keywords: Flint awls, Mesolithic and Neolithic, Tracology

Presentation Preference - Poster

It is known that flint awls are not a common phenomenon in Stone Age inventory. This material has not have a separate sub-group in East Baltic region so far. Nevertheless, there were carried out several classification works: experimental and tracological results in order to represent the data of this research. The material was collected from Lithuanian settlements of Stone Age, which is divided into mesolithic and neolithic time-period. In addition, there were made several copies of mentioned material and complete experiments by using different kinds of animals’ skin: bison, deer, roe deer, beaver and mink. Skins and furs, experimentally were chosen according to fauna of Mesolithic period. However, mink is also, a suitable example according to group of small mammals, for instance, martens. This is the evidence not only of fauna of that particular time-period, but, also, shows the thickness of different animals’ skin. Also, attention was paid to the functionality of flint awls utilization in different time-period according to the research process. The experiments were tested by using flayed furs, which were strict, full of vegetal tannin and prepared skin. According to the data, it might be considered the effectiveness of flint material usage. Also, it has been established, which edges felt the biggest pressure during the process and which were worn out. After the research, it has been created the technological database, which are orientated to specifically one material analysis.

TH6-16 Abstract 17

Expense vs. Effect: An analysis of selected variables that affect the production of cost surfaces

Author - Cawsel, Edward, Durham University, Durham, United Kingdom (Presenting author)

Keywords: Cost Surface, GIS, Site Catchment analysis

Presentation Preference - Poster

Cost Surfaces Analysis has become a common, if sometimes controversial, tool within archaeological study. Today, there are numerous GIS packages that allow the creation of cost surfaces and least cost paths at the ‘push of a button’ (ArcGIS, QRA55, Idrisi). However, this is often at the detriment of hiding the technicalities of the program’s method, which may not always be ideal for archaeological research. As such it is often advised that these pre-prepared systems should not be overly relied on (Herzog, 2013, 164, Rademaker et al. 2012, 38). Yet, there are few papers dedicated to assessing the effects of varying any of the modifiable parameters available to each program, and therefore few guides in selecting an appropriate methodology. Those that do focus only on a limited selection of variables (Gietl et al 2008, Magyari-Széki 2013, 184, Rademaker et al. 2012, 38). Yet, there are few papers dedicated to assessing the effects of varying any of the modifiable parameters available to each program, and therefore few guides in selecting an appropriate methodology. Those that do focus only on a limited selection of variables (Gietl et al 2008, Magyari-Széki 2013, 184, Rademaker et al. 2012, 38). TH6-17 COMMITTEE ON PROFESSIONAL ASSOCIATIONS

Friday, 2 September 2016, 14:00-16:00
Faculty of Philology, Room K. Donelaičio

Author - Spörer, Mark, Saxion University, Amsterdam (Presenting author)
Co-author(s) - Wait, Gerard, Nexus Heritage, United Kingdom
Co-author (s) - Hinton, Peter, Chartered Institute of Field Archaeologists, United Kingdom

Keywords: Committee Meeting, Professional, Associations
Presentation Preference - Committee / Working Party meeting

The Committee on Professional Associations meets annually during the EAA Conference. It will reflect on the developments in the past year. Members will present on the situation in their countries and organisations. The committee sees a great potential for Professional Organizations to improve the place and recognition of archaeologists in society by promoting professional conduct and behaviour in the different countries and Europe as a whole. Furthermore it sees a role for these organizations to take on an advocacy role to enlarge the awareness of the values that are inherently connected and make cultural heritage. It aims to work in close cooperation with the board of EAA and therefore to further the aims of this organisation. During the committee meeting in Glasgow it looked for possibilities to stimulate the growth of Professional Organisations within European Archaeology. This exchange of ideas and experiences will be continued during this meeting.

TH6-17 Abstract 01
The Institute of Archaeologists of Ireland: An update on our Activities

Author - Dr. Bonsall, James, Institute of Archaeologists of Ireland, Dublin, Ireland (Presenting author)
Co-author(s) - MacDonagh, Michael, Institute of Archaeologists of Ireland, Dublin, Ireland
Co-author(s) - Sullivan, Eoin, Institute of Archaeologists of Ireland, Dublin, Ireland

Keywords: Advocacy, Ireland, Professional
Presentation Preference - Oral

The Institute of Archaeologists of Ireland (IAI) is the representative organisation for archaeologists throughout the island of Ireland. The aim of the IAI, through the representation of our members, is to advance and strengthen the profession of archaeology in Ireland and membership is open to professional archaeologists working in either Ireland or Northern Ireland. The IAI’s cross-border agenda necessitates engagement with two legislative frameworks as well as two curatorial bodies and a range of interested cross-border groups.

The archaeological profession in Ireland suffered a substantial setback during the recent economic recession. As the economic slump began to impact on the development sector, archaeologists were amongst the first in the chain of pre-development workers to feel the downturn, with loss of projects, employment and wage decreases. Since 2008, the IAI has consistently tried to maintain professional standards amongst our workforce by holding regular Continuous Professional Development (CPD) events which reflect our core principles. The Institute maintains that a vibrant and sustainable archaeological profession actively contributes to the protection of our rich archaeological resource, which in turn contributes to the social and economic well-being of the entire community, driving tourism, social cohesion and local pride. To achieve our aim and vision, we are committed to a range of long-term measures, one of which includes the facilitation of CPD for our members and for non-members. CPD activity is monitored annually by the IAI via an easy-to-use CPD Record.

Over the last year the IAI has:
- Produced and funded our regular annual Journal of Irish Archaeology and bi-annual newsletters Carried out a wide-ranging membership consultation on the direction of the Institute as the profession seeks to recover from recession impact
- Initiated an internal strategic three-year plan for the Institute
- Supported and been a key partner in the all-island Archaeology 2025 strategy review of the archaeology sector
- Represented our members views to government and public agencies
- In addition to our own Annual Conferences, the IAI held our 3rd annual Archaeofest heritage outreach event for the public in the centre of Dublin, which celebrated the work of archaeologists across Ireland and Northern Ireland
- Hosted and organised a variety of CPD events

TH6-17 Abstract 02
Professional archaeology without borders

Author - Peter, Hinton, Chartered Institute of Archaeologists, Reading, United Kingdom (Presenting author)
Co-author(s) - Wait, Gerry, Chartered Institute of Archaeologists, Reading, United Kingdom

Keywords: Association, CIfA, Professional
Presentation Preference - Oral

Archaeology should be without borders, and professional archaeology must be without borders. Professionalism depends on an individual’s commitment and accountability to an ethical code, and that involves more than just complying with relevant national legislation. The professional is therefore an international phenomenon. In many disciplines, professional institutes have members in many countries – and professional bodies are either multinational or work in strategic partnerships across borders. Archaeology is no different. Over the last year, the Chartered Institute for Archaeologists has been in discussion with other professional associations for archaeologists and other organisations with an interest in professionalism. This paper will report on some of the ideas and plans, and will ask session participants what they would like to see.

TH6-17 Abstract 03
Professionalising archaeology in Europe – 2016: a year of progress

Author - Dr. Wait, Gerry, Witney, United Kingdom (Presenting author)
Co-author(s) - Hinton, Peter, Chartered Institute for Archaeologists, Reading, United Kingdom

Keywords: Archaeologists, Foresight and Horizon Scanning; the future of the Partnerships, Professional associations
Presentation Preference - Oral

Do people join organisations as members anymore? Do they support campaigns and movements on a topic-by-topic basis, depending on electronic media to collaborate? If present social trends continue, membership of associations generally will continue to fall, with many either running out of money and ceasing to be effective and influential, or urgently needing to find new purposes. Professional associations are different, probably because membership is the price of professional recognition.

Since the EAA meeting in Glasgow in 2015, the Chartered Institute for Archaeologists has been in discussion with professional associations for archaeologists in Europe and beyond, and other organisations that have identified a need for a professional association for archaeology in their country. This paper will report on some of the models for cooperation, collaboration or formal partnership under consideration, and will explore both the opportunities and difficulties of professionalising across borders.

Subject to the meeting organisers’ timetable, CIfA hopes to be able to invite participants in this session to an informal reception at which stronger partnerships can be made.
Following the Brexit referendum, and the development of trends towards criticism of the ‘European (union) Project’, the Executive Board of the EAA decided it must create time at the Vilnius Annual Meeting for a Round Table. The Round Table will discuss and examine the potential impacts of the Brexit vote for European archaeology, for EAA members generally and especially for our UK colleagues, whom we always hold in the highest regard.

We felt that urgent reflection on this matter was required, because it directly affects the EAA profile and its founding principles. The idea is not to precipitate or hurry. We need to pause, reflect and to look forward with confidence. Remembering that all societies are composed of individuals and what they create, it is a time to bring to mind that inclusivity, solidarity and friendship build understanding and trust. Trust encourages integration and unity of purpose.

One of the main focuses of the Round Table will address how we can foster cooperation, define how cooperation can strengthen links and create supportive networks and define how those links and networks can produce enduring engagement and achievement. Archaeologists generally, and especially those within the EAA, have demonstrated a significant capacity to work creatively across borders and archaeologists (our members) have demonstrated the great value of fostering international, open endeavor and communities. We in the EAA are even more committed to this focus now. We will maintain our enthusiasm for imagining a more inclusive, solidary and stronger Europe and a more representative EAA in that context.

The aim of the Round Table will be to make room for the collective consideration of how EAA should react and respond. Discussion will aim to define how to position the EAA in this new and complex cultural, social and political environment, recognizing that recent events in the UK are reflective of more widespread processes in European societies that we must recognize. This is a moment when an organization such as ours needs to establish and align its position with clarity, drawing on the very significant intellectual capital of its members. We look forward to this important discussion at Vilnius. We look forward to keep our founding endeavor and communities. We in the EAA are even more committed to this focus now. We will maintain our enthusiasm for imagining a more inclusive, solidary and stronger Europe and a more representative EAA in that context.

The distribution of Spondylus gaederopus, a shell from the Mediterranean Sea, is one of the earliest examples for long distance exchange in Europe and is associated with the process of Neolithisation during the late 6th Millennium BC. Artefacts made of Spondylus can be found throughout Europe, from Greece to Central Germany and from the Ukraine to the Parisian Basin. Although the shell has been in the focus of prehistoric archaeology for nearly 130 years, there is still an ongoing debate about the sources, meanings and modes of exchange.

The distribution is often mentioned as a prestige good or gift exchange par excellence, but we have to be aware of a premature categorisation. Not only Polanyi’s trichotomy of reciprocity, redistribution and market exchange can be applied to this case study, but also alternative models from economics, anthropology or sociology need to be taken into account. In this case study, modern economic theories shall be applied to Spondylus exchange during the second half of the 6th Millennium BC and combined with statistical methods.

The earliest appearance of agriculture in Lithuania. Myths and reality

Author - PhD student Grikpėdis, Mindaugas, Vilnius university, Vilnius, Lithuania (Presenting author)
Co-author(s) - Motuzaitė Matuzevičiūtė Kaen, Giedrė, Vilnius university, Vilnius, Lithuania
Keywords: archaeobotany, AMS, farming, Neolithic
Presentation Preference - Oral

Easiest evidence of agriculture in Lithuania are coming from the Cerealia type pollen records that are attributed to the 5-4th millennium BC layers. However, the Cerealia type pollen count are very scarce and increase in number only by the Late Neolithic at ca. 3rd millennium BC. During this time macro botanical remains of cultural plants have been reported for the first time at the Late Neolithic settlements of western Lithuania along with various tools that are associated with agricultural activities. However, none of the cereal grains have been directly radiocarbon dated to precisely attribute them to the associated archaeological layers. The chronology of the grains of cultural plants found in Lithuanian Neolithic settlements was a priori based on the typological dating of the artefacts found in the same contexts.

In this presentation we report the re-evaluation of our current state of knowledge regarding the beginnings of agriculture in Lithuania. In our opinion, pollen data should be interpreted with caution while interpreting the beginnings of agriculture in the east Baltics. As the most reliable indicator of agriculture must be macro botanical remains of cultural plants and their direct dating using AMS, we present the newest dating results of cereal grains from the Neolithic Lithuanian settlements. The dating results gives a new perspectives on the chronology of the earliest agriculture in Lithuania pointing toward re-evaluation the chronologies and the geographical origins of the early farming in the northern regions of the east European.
Any scientific study requires data from outside the researcher’s precise field of work. Archaeology amongst the scientific disciplines most frequently calling upon a multitude of other disciplines, both scientific ones and crafts. In this way, zoology has enabled archaeology to consider skeletal remains through a different light in archaeozoology: botany has enabled the use of plants and pollen in analyses; and experimental testing has improved through contact with various craftspeople. The same interdisciplinary has been applied to images with the iconological approach. This has created an approach involving identification using biological, geographical and chronological criteria, integration of dimensions such as ethology (animal behavior) into image comprehension, and classical and logical description. This presentation shows how iconology can be useful to archaeology through examples covering:

- Canine farming techniques in pre-pharaonic times in Egypt from the 5th millennium BCE and subsurface farming in the Middle-East during the 1st millennium BCE.
- Technicians’ (farmers’) movement between the Middle-East and Egypt during the 5th millennium BCE.

The use of animals by political and religious powers and communities of craftspeople indifferently during the Bronze Age using feline and bovine analysis.

GS Abstract 04
Natural factors in early metallurgical production in Egypt and southern Levant

Author: MA Blakobrzačka, Daria, Jagielloanian University in Cracow, Cracow, Poland (Presenting author)
Keywords: copper metallurgy, Egypt and southern Levant, environment
Presentation Preference - Oral!

The origins of copper metallurgy in ancient Egypt and southern Levant is a subject which always has been in the scope of scientific interest. According to current knowledge it may be traced back to the Chalcolithic period and the Early Bronze Age. In the past, many scientists have put great effort to recreate its general picture. Recently more data have been gained which is useful in reconstructing this branch of craft. In the light of evidences objects made from copper might have been considered by ancient societis as one of the most valuable goods. Moreover, it can not be ruled out that this material might have special symbolic meaning. Undoubtedly, environmental conditions played an essential role in shaping the picture of mining and metallurgical activities. They were responsible for the way ancient communities organized particular stages of metallurgical production. Due to similar landscape features the same pattern of production has been formed in areas of Egypt and southern Levant. This paper should shed light on the subject of copper metallurgy during the Chalcolithic period and the Early Bronze Age in areas of Egypt and southern Levant. Importance of crucial natural factors which determined evolution of mentioned craft as well as particularstages of production which depended on them will be presented.

GS Abstract 05
Mosaics of Ulpiana

Author: Assoc. Prof. Dr. Gökten Kaya, Haluk, Mimar Sinan Fine Arts University Istanbul, Istanbul, Turkey (Presenting author)
Keywords: Early Christianity, Mosaics, Roman
Presentation Preference - Oral

Archaeological excavations of Ulpiana begun in 1953 and continued with intervals in the following decades. During these excavations, trapezoidal city walls and gates on it; cemeteries in North and West; urban villas and simple houses; workshops; military installation outside the city; three Early Christian churches and a baptistery were discovered. During early years of excavations, mosaics were discovered at two different locations. At the church on the Northern cemetery and a Roman villa. The latter is believed to be a church by some scholars. In 2012 excavations under my direction brought out to light an Early Christian church which was dedicated to Saints Florus and Laurus, who were martyred at Ulpiana. Inside this church mosaics were discovered in 2013. They were unearthed until 2015.

Other than the newest series of excavations, discovery of the mosaics discovered earlier at Ulpiana is unknown. This work intends to shed light on all the mosaics discovered at Ulpiana and compare them in style, material and technique. All the mosaics have geometrical patterns. The only exception is the three bird figures. Dedicatey inscriptions in Latin were found in the church on Northern cemetery and church of Saints Florus and Laurus. Limited colour scheme on tesserae and only a handful patterns may be taken as an indication of local workshop. In order to support this theory, laboratory analysis were made on the tesserae found in the later series of excavations. Mosaics, which were discovered in early years of excavations and the early 1970s. But, with the help of technical analysis and sources it may be safe to assume that all of the mosaics discovered in Ulpiana were made in mid-4th century. Comparison of mosaics regionally and globally may provide further information on similarities and differences in technique and choice of patterns. By doing so we may obtain data which could help us understand movement of workforce and popular design and techniques. Our work is the first step of our larger project, namely, Corpus of mosaics of Kosovo.

GS Abstract 07
Celtic cart graves from Brežice

Author: Mico, Miha Institute for the Protection of Cultural Heritage of Slovenia, Ljubljana, Slovenia (Presenting author)
Co-author(s) - Bavec, Uroš, Institute for the Protection of Cultural Heritage of Slovenia, Nova mesto, Slovenia
Co-author(s) - Nadabath, Barbara, Institute for the Protection of Cultural Heritage of Slovenia, Ljubljana, Slovenia
Co-author(s) - Černe, Mija, Institute for the Protection of Cultural Heritage of Slovenia, Ljubljana, Slovenia
Keywords: Brežice (southern Slovenia), celtic cart, late Iron Age cemetery
Presentation Preference - Poster

The site is well known in Slovenia and is renowned for its wealthy grave inventory, especially weapons and parts of Celtic uniaxial cart that were found in the graves. Investigations of the archaeological site began in 1948 when during building works for a new veterinary station some parts of weapons and late iron Age pottery were found. Later more graves were identified during various infrastructural ground works. In 1981 first methodological archaeological investigations of the site begun under the supervision of Mila Guštin (first archaeology curator in Posavski museum in Brežice). During 1982 he and his team excavated 58 graves. In 1997, another 10 graves were excavated west of the veterinary station. Until 2014/2015 excavation all together 73 graves were identified in cemetery. Archaeological excavations in 2014/2015 identified 37 new graves. All 37 of them were cremation graves (the same as 73 previously excavated). Only 9 graves were preserved intact, majority of them were partly or totally destroyed by modern interventions. 17 graves were just partly disturbed as all the grave goods were found in situ and others were preserved in fragments. Graves were simple burial pits, without constructions made from stone or wood. Burial pits contained different grave goods, such as: ceramic vessels, iron weapons, fibulae, glass beads, rings etc. Grave 38 contained parts of cart represented as crushed during burial ritual iron wheel alloy.

Chronologically, the graves can be dated in Middle and Late La Tene period (L.C. D). Majority of metal artefacts are still undergoing conservation process, thus final chronological and typological evaluation and interpretation of excavated artefacts will be done after all the conservation works finished.
