INTRODUCTION

PAGED is an editor (PAGE Editor), designed to be run from an intelligent terminal with alphanumeric display of the type Beehive B100 (B150). This terminal can be used in a local mode of operation (BLOCK MODE) to perform editing of the text on the screen. Some special features - such as cursor control and insertion or deletion of characters - facilitates the editing. This local editing of the screen contents (below denoted the page) provides the basis of the editing facilities in PAGED. It has some obvious benefits compared to other (line oriented) editors:

- Cursor control is easy to learn and natural to use; no special commands are needed to arrive at the desired location in the text.
- The effects of the editing can be monitored continuously on the screen.
- Changes are always made in a known environment; this is particularly useful when editing documents.

Since the terminal is used in BLOCK MODE, it is normally not communicating with the computer. Therefore, special function keys are used to control the actions of PAGED, such as opening and closing of files, advancing in files etc. Both the editing on the screen and the use of function keys are described in the following.

GENERAL

Screen_layout

The screen consists of 24 lines with 80 characters. Only 23 lines are used in a normal fashion in the editing. The last line is called the command line and is used to give additional information for the functions and for error messages. The command line has the following initial appearance.

```
.....!.....!.....!.....!.....!.....!.....!.....!
```

Every line is ended with a special character, '|', to indicate right margin. Desired location of this margin is specified when opening the files; the page width is maximum 79 characters.

The end of the lines are normally filled with spaces when written on the screen. However, this slows down the editor when reading or writing a page. For that reason there is a special option /NULL in the file specification command which tells PAGED to end the lines with NULLs. Special care must be taken when using this option and the cursor control keys because the nulls are not transmitted to the file even if they appear as spaces on the screen. The function VERIFY can be used to check the layout of the page.

To indicate an empty line, the following convention is used: the line is beginning with a period, followed by spaces or nulls.

Input_file_format

The specified page width on the screen cannot be exceeded. Those lines in the input file that are too long for the page width are therefore normally split up. Exceptions, see below.

Two characters are converted when read from the input file. Form feed is converted into a new line containing '.\$' (cf. output file format) and TAB is converted into the correct number of spaces.

Exceptions: The above conversions of the input file are not used when parts of the input file are directly transferred to the output file, i.e. when either of the functions TOP, TURN, CLOSE or EXIT is used.

Output_file_format

A line on the screen which consists of the string '.\$' is converted into form feed when transferred to the output file (cf. input file format). If the option /TAB is specified in the file specification line then sequences of spaces are if possible converted to TABs before output. The size of the output file can sometimes be reduced in that way. Besides this, the output file looks as the input file or the screen with blanks at the end of each line deleted.

OPERATION

Start-up

PAGED is started in the usual fashion, i.e. the following command is entered in response to the period written by the monitor:

```
R PAGED (return)
```

PAGED then tells you to set the switch on rear in BLOCK MODE (marked B), writes a prompting character '#' and waits for a file specification. See OPEN.

Using_function_keys

The function keys control the actions of PAGED. Some rules are common for all functions:

- The function key should have a fairly quick push; if you let your finger "rest" on the key, the actions are delayed by a few seconds.
- PAGED announces that the function is completed by positioning the cursor at the upper left corner (at home). Exceptions: LOCATE and TAB.
- Some functions can be controlled with a command line on the bottom. The characters . i + and space are ignored at the end of the command line. Exception: SETTAB.
- Most functions are illegal if the files have not been opened. Exceptions: OPEN and EXIT.

The different functions are described in detail below. They are ordered and denoted in the same way as on the label, which should be placed around the function keys.

OPEN

Opens the files: The key is pressed when the file specification command has been written on the display after the prompting character '#'. The most complete form of the command is

```
<output file> = <input file> [<options>]
```

where [] denotes optional argument. The form

```
<output file> = [<options>]
```

is used when there is no input file (creating a new file) and the short form

```
<output file> [<options>]
```

is used when the input and output files have the

same name.

The file specifications are the standard ones in the RT-11 operating system. The file extension is blank by default.

The following options are available:

/<page width>

Sets the page width for the terminal. Default value of <page width> is 79.

/NULL or /null

Indicates that the lines should be ended with "null"s instead of spaces. This speeds up reading and writing of the screen but causes problems in some cases when using cursor control keys.

/TAB or /tab

Indicates that multiple spaces in the text should be converted to tabs when possible before the text is outputted on the file.

The options can be given in any order.

Examples: DX1:FIL2.PAS=DX1:FIL1.PAS

DX1:FIL.DOC[30]/60

([30] means that 30 blocks are allocated)
new.tst= /70 /tab /null

Note:

If the size of the output file is not specified (as in the first example above) or if the largest available area is requested (size=-1), PAGED tests if the allocated area exceeds the size of the input file by 25 blocks (corresponds to 12800 characters). If not so, an error message is given and retyping of the command can be done.

When the files have been opened, the screen will be filled with empty lines, the three first lines from the input file and the command line. It is then possible to start editing on the screen, or to use some other function key.

TOP

Positions the page at the beginning of the file: The screen contents and the rest of the input file are transferred to the output file and the files are closed. New files are then opened with the former output file as new input file. The first three lines of the input file appear on the screen.

Note:

No test is made on allocated area when reopening the files. The largest available area is allocated.

BOTTOM

Positions the page at the end of the file: The last 10 lines in the input file appears on the screen.

Note:

BOTTOM is legal only if an input file exists.

TURN

Advances through the file: The position of the page is advanced a desired number of lines. Default is 20 lines. If a different number is desired, a command can be written on the last line as follows.

Command:

```
n      Advance n lines.
$n     Advance n lines and change the default number
       of lines to n.
```

Note:

If TURN advances beyond the end of the input file, the screen will be filled with empty lines.

LOCATE

Advances through the rest of the file (not including the current page) until a specified string is found: The string should be written on the bottom line, see below. If the string is found, the page is chosen so that the string appears on line no. N with the cursor positioned at the string. Default value for N is 10.

Command:

```
string Look for the string 'string' and use
        default value of N.
string$n Look for the string 'string' and change
        default value of N to n.
```

Note:

The string must not contain '\$'. If the string is not found, the screen will contain the N last lines in the file and additional empty lines. The cursor is positioned at Home position. LOCATE is legal only if an input file exists.

CONVERT

Replaces a specified string with another one throughout the file: The two strings are written on the bottom line, see below. The page is at the end of the file when CONVERT is completed.

Command: /string1/string2/ String2 replaces string1, '/' can be replaced by any other character, not present in string1 or string2.

Note: Lines that are changed are displayed on the screen. After completion, CONVERT fills the screen with empty lines. CONVERT is legal only if an input file exists.

INS/DEL

Inserts lines and deletes line feeds on the screen: The screen is read and rewritten with the following conventions. Every insert character (default ',') is converted into carriage return/line feed and every delete character (default '\') at the end of a line (spaces excluded) converts the succeeding carriage return/line feed into a blank. If the resulting page has too many lines (more than 23) some of the first lines of the page will be transferred to the output file. The insert and delete characters can be redefined by a command as follows.

Command: \$AB The character 'A' is used for insertion, 'B' for deletion (from now on).

Note: If the delete character is used so that the concatenated lines exceed the page width, they will be split up in the ordinary way.

VERIFY

Verifies the page: The screen contents is read and rewritten with empty lines collected at the end of the page. Can be used to distinguish empty locations (nulls) from spaces or to update the internal buffer (see RECOVER). Furthermore, the end of the lines are filled with spaces even if the option /NULL is used.

SETTAB

Reads tab positions: The tab positions are marked with + signs on the command line.

Command: Example:

```
.....+!.....+.....+.....!.....+.....!.....
```

TAB

Writes spaces from the current cursor position up to the next tab position.

RECOVER

Writes the contents of the internal buffer on the screen. The buffer contains a copy of the page from the last time a function key (except TAB) was used. Can be used to recover after having accidentally erased the contents of the screen by pressing EOS (end of screen) or to cancel editing performed on the screen since the last function.

CLOSE

Closes the files: Transfers the screen contents and the rest of the input file to the output file and closes the files. A prompting character ('*') is written on the display and a new file specification command can be given.

EXIT

Closes the files and terminates the program.

Note:

Reset the switch on rear.

CANCEL

Closes the input file only: All editing performed is thus without effect. PAGED is terminated.

Editing_on_the_display

The basic editing is performed on the text shown on the display. Some special keys on the terminal facilitates this editing. A short description of these is given below. Additional information is available in the Operator Manual for the terminal.

Note: The position in the upper left corner of the display is denoted the Home position.

Causes the cursor to move one step upwards. If on the first line, the cursor will move to the last line (useful to reach the command line from home position).

Causes the cursor to move one step downwards. If on the last line, the cursor will move to the first line.

Causes the cursor to move one step to the left. If in the first column, the cursor will move to the last column on the line above. If in Home position, the cursor will move to the last column on the last line.

Causes the cursor to move one step to the right. If in the last column, the cursor will move to the first column on the line below, or - if on the last line - it will move to the Home position.

Delete character. Causes the text to the right of the cursor and on the same line to be shifted one position to the left. The character under the cursor will be deleted.

Insert character is an alternate action key. Any character entered while in this mode will be inserted under the cursor while all characters starting at the cursor and extending to the end of the line will shift one position to the right. The last character will be lost.

**FMT
TAB** Format tab. Moves the cursor to the first position on the next line.

**CLEAR
HOME** Shifted: The entire screen is erased.
Unshifted: Moves the cursor to the Home position.

**ALPHA
LOCK** An alternate action key that locks the terminal in an upper case mode.

EOS End of screen. Causes the text to be erased from the cursor position to the end of the screen.

EOL End of line. Causes the text to be erased from the cursor position to the end of the line.

Note: When EOS or EOL is used, the screen will contain nulls. There is no way to distinguish between nulls and spaces on the screen. See however VERIFY.

IMPLEMENTATION

PAGED is programmed in PASCAL. Thanks to suitable data structures and easy character handling PASCAL has proved to be well suited for the purpose. The program consists of a main program and some external procedures to control the terminal. A short description of the program is given below.

Data_structures

The global data declarations are as follows:

```
Const version=5;
      esc=33B; cr=15B; lf=12B; stroke=174B; backsl=134B;
      ff=14B; ht=11B;
      bufsize=2000;           {size of text buffer buff}
      pardelim='$';          {delimiter for command strings}
```

```
Type lbuff=array[1..82] of char;
```

```
Var buff:array[1..bufsize] of char;      {text buffer}
    line, comline, string1, string2: lbuff;
    first, last, nchar, ncol, lenin, lenout: integer;
    length1, length2, defturn, deflocate: integer;
    filesopen, infilepresent, exitrequest, OK, newdef,
    formfeed: boolean;
    insert, delete: character;
    infile, outfile: text;
    inname, outname: array[1..14] of char;
    fillwithnulls, inserttab: boolean;
```

A few comments will be given. The internal representation of the page is the array BUFF. This array is used in a cyclic manner e.g. when performing LOCATE. The variables FIRST and LAST are used to point at the page limits in the array. A line is stored in the array with ending blanks deleted and a line feed as terminator.

The type LBUFF is used for variables representing just one line. The variable PARDELIM defines the character that indicates new default values for parameters of certain functions. See TURN, LOCATE and INS/DEL.

External_procedures

The external procedures used in PAGED are available as library routines at the department. They are all used to control the terminal, e.g. to read function key number, to position the cursor etc. The procedures are described in Andersson (1979).

Main_program

The main program is listed in the appendix. It has the following over-all structure:

```

Program PAGED;
{Global data declarations}
{External procedure declarations}
{Procedures for text line handling}
Procedure ScreenToLine; {reads a line from the screen}
Procedure LineToScreen; {writes a line on the screen}
Procedure EmptyLines;  {writes empty lines on the screen}
Procedure WritecomLine; {writes bottom line on the screen}
Procedure FileToLine;  {reads a line from input file}
Procedure LineToFile;  {writes a line on output file}
Procedure FileToFile;  {transfers lines from input file to
output file}
Procedure LineToBuff;  {puts a line in the buffer}
Procedure BuffToLine;  {gets a line from the buffer}
Procedure BuffToFile;  {transfers lines from buffer to
output file}
Procedure ScreenToBuff; {reads the screen into the buffer}
Procedure BuffToScreen; {writes buffer contents on the
screen}
{Initialization and error message procedures}
Procedure Prompt;      {writes prompting character}
Procedure InitcomLine; {initializes command line buffer}
Procedure Initialize;  {initializes screen and buffer}
Procedure Writefirstlines; {writes beginning of file
on the screen}
Procedure Errmess;
{Command decoding procedures}
Procedure Integ;      {reads an integer}
Procedure ReadcomLine; {reads the bottom command line}
Procedure Cominteg;   {decodes an integer in a command}
Procedure Splitcommand; {decodes the file specification
command}
{Miscellaneous routines}
Procedure Match;      {tests occurrence of string
in a line}
Procedure Copyandclose; {copies input file to output file
and closes the files}
{Procedures for function keys}
Procedure Open;
Procedure Top;
Procedure Turn;

```

```

Procedure Locate;
Procedure Convert;
Procedure Insdel;
Procedure Verify;
Procedure Settab;
Procedure Tab;
Procedure Recover;
Procedure Closefiles;
Procedure Cexit;
Procedure Cancel;

{Program body}

begin {PAGED}
exitrequest:=false; filesopen:=false; formfeed:=false;
defturn:=20; deflocate:=10; {default values}
insert:=chr(stroke); delete:=chr(backsl);
Clear;
writeln('PAGED version ', version:2);
writeln('Set switch on rear in position block');
Prompt;

repeat
if not filesopen then
case Readfunc of
1: Open;
12: Cexit;
else Errmess(1)
end {case}
else
case Readfunc of
2: Top;
3: if infilepresent then Bottom else Errmess(1);
4: Turn;
5: if infilepresent then Locate else Errmess(1);
6: if infilepresent then Convert else Errmess(1);
7: Insdel;
8: Verify;
9: Settab;
10: Tab;
11: Recover;
12: Closefiles;
13: Cexit;
16: Cancel;
else Errmess(1)
end; {case}
until exitrequest;
end. {PAGED}

```

Readfunc is an external integer function that waits for a function key to be depressed and returns its number. The program should be self-explanatory. Just note that the basic text handling is done line by line. To this end, a set of procedures is available to move one line to or from the different representations in a file, in the text buffer or on the screen. New functions can easily be added by writing a procedure and extending the repeat statement in the program body.

Storage requirement

The total storage requirement for PAGED together with run-time support is about 9500 words on an LSI-11. The Pascal program itself compiles to 5000 words.

APPENDIX
Program Listing

Program PAGED;

{ Page oriented text editor for the Beehive B100 (B150) terminal. The editor is based on editing on the terminal screen with the terminal in block mode.

The function keys control the actions of PAGED. The following functions are implemented:

```

1: OPEN      - opens the files
2: TOP       - advances to the beginning of the file
3: BOTTOM    - advances to the end of the file
4: TURN      - advances a number of lines through the file
5: LOCATE    - advances to a specified string
6: CONVERT   - converts a specified string to a new one throughout
               the file
7: INSDEL    - inserts and deletes lines on the screen
8: VERIFY    - writes a verification of the screen
9: SETTAB    - reads new tab positions
10: TAB      - moves to next tab position
11: RECOVER  - writes a backup copy of the screen
12: CLOSE    - closes the files
13: EXIT     - closes the files and terminates the program
16: CANCEL   - cancels all editing and terminates the program

```

{ EXTERNAL PROCEDURES }
{ ----- }

Function Readfunc:integer; external;
{ Waits for a function key and returns its number. }

Procedure Home; external;
{ Positions the cursor in the upper left corner. }

Procedure Cursor(row,col: integer); external;
{ Positions the cursor at specified location. }

Procedure Getblock(length: integer); external;
{ Reads length lines off the screen so that its contents can be
  decoded by the read statements of Pascal. }

Procedure Getline; external;
{ Reads a line off the screen so that its contents can be decoded by
  the read statements of Pascal. }
Procedure Formon; external;
{ Sets the terminal in format mode. }

Procedure Formoff; external;
{ Takes the terminal out of format mode. }

Procedure Protect; external;
{ Writes a character sequence to indicate protected area. }

Procedure Unprotect; external;
{ Writes a character sequence to indicate end of protected area. }

Procedure Clear; external;
{ Clears the screen. }

{-----}

```

```

{ PROCEDURES FOR TEXT LINE HANDLING }
{ ----- }

Procedure ScreenToLine(var line:lbuffer; var nchar:integer);
{ Reads one line from the screen, received by Getblock/Getline/
  Getscreen. Nchar char:s returned in line. }

begin
nchar:=0;
while not eoln do
  begin
  nchar:=nchar+1;
  read(line[nchar]);
  end;
readln;
while (line[nchar]=' ') and (nchar<1) do nchar:=nchar-1;
  { delete trailing spaces }
if (nchar=1) and (line[1]='.') then nchar:=0;
  {indicate if empty line}
end;
{-----}

Procedure LineToScreen(var line:lbuffer; nchar:integer);
{ Writes one line on the screen with protected right margin.
  Nchar char:s are written from line.
  Spaces are inserted, if not /NULL }

var i: integer;
begin
{ The scrolling does not work when getting automatic CR-LF by
  writing in the 80th column, if INST CHAR is depressed.
  Avoid the problem by writing a LF followed by an inversed LF. }
  writeln;
  write(chr(esc),'A');
  {inversed line feed}
  if fillwithnulls then
    begin write(chr(esc)); write('K'); end; { EOL - empty line }
  for i:=1 to nchar do write(line[i]);
  if (nchar=0) then begin write('.'); nchar:=1 end;

  if not fillwithnulls then
    for i:=nchar+1 to ncol do write(' ')
  else
    begin
      i := nchar+1;
      while (i <= ncol) and (i <= nchar+3) do
        begin write(' '); i := i+1; end;
      cursor(23,ncol+1);
    end;
  Protect;
  write(chr(stroke));
  for i:=ncol+2 to 80 do write (' ');
  Unprotect;
end;

```

```

{-----}

Procedure Emptylines(n:integer);
{ Writes n empty lines on the screen. }

var i,j:integer;
begin
  for i:=1 to n do
    begin
      write(chr(esc),'A');
      if fillwithnulls then
        begin write(chr(esc)); write('K'); end; { EOL - empty line }
      write(',');
    end
  if not fillwithnulls then
    for j:=2 to ncol do write(' ');
  else
    cursor(23,ncol+1);
  Protect;
  write(chr(stroke));
  for j:=ncol+2 to 80 do write(' ');
  Unprotect
  end
end;

{-----}

Procedure Writecomline;
{ Writes the bottom line on the screen and positions the cursor at
home. }

var i: integer;
begin
  Cursor(24,1);
  write(chr(esc)); write('K'); { EOL - empty line }

  for i := 1 to ncol do
    write(comline[i]);
  Home
  end;

{-----}

```

```

Procedure FileToLine(var line:lbuffer; var nchar:integer);
{ Reads one line of input file. Nchar (max ncol) char:s are returned
  in line. Tab:s are converted into spaces; form feed is converted
  into '$' on a separate line. }
var i,j,k:integer; ch:char;
begin
  if formfeed then
    {indicate form feed}
  begin
    line[1]:=',';
    line[2]:='$';
    nchar:=2;
    formfeed:=false;
  end {formfeed}
  else
    begin
      i:=1;
      while (not eoln(infile)) and (i<=ncol) and (not formfeed) do
        begin
          read(infile,ch);
          if ch=chr(ht) then
            {tab received-convert to spaces}
          begin
            j:=i+7-(i-1) mod 8;
            for k:=i to j do line[k]:= ' ';
            i:=j+1;
          end
          else if (ch=chr(ff)) then formfeed:=true else {remember ff}
          begin
            line[i]:=ch;
            i:=i+1;
          end
          end;
          nchar:=i-1;
        end
      if (nchar = 0) then
        begin
          if formfeed then
            begin
              line[1] := ','; line[2] := '$';
              nchar := 2;
              formfeed := false;
            end
          else
            begin
              line[1] := ' ';
              nchar := 1;
            end;
          end;
        end
      if nchar>=ncol then nchar:=ncol;
      if eoln(infile) then readln(infile) {move to the next line}
    end;
  end;
end;
{-----}

```

```

Procedure LineToFile(var line:lbuffer; var nchar:integer);
{ Writes one line on output file. Nchar char's are written from line.
  Trailing blanks are deleted. A line containing '$' is converted
  into form feed. }
var i, pos, spaces: integer; ch: char;
begin
  if nchar>0 then
    begin
      while (line[nchar]=' ') and (nchar>1) do nchar:=nchar-1;
    end
  if (nchar=2) and (line[1]='.') and (line[2]='$') then
