57	Footnote 11	The modular aspect of this paper uses this idea provided by a co-author of that paper, who is a core member of this project team and co-lead author of Paper 4.	The understanding of disambiguation of context, lab, and experiment is used similarly in the cited paper, which was developed in parallel by Teresa Kampfmann together with PB and DJL. In this paper the modularity aspect refers to the suggested evaluation strategy which was developed independently.
71	Footnote 19	Kampfmann et al. (2022) present a 'modular' separation in Real-world labs – the idea for which was developed during this case reporting scheme process and brought to the Kampfmann paper through PB – a co-lead on our case reporting scheme development paper and contributing author to the Kampfmann paper.	Kampfmann et al. (2022) present a modular evaluation approach for real- world labs, experiments, and interventions. While both papers suggest a deliberate disambiguation of lab and experiments, the suggested evaluation approach was mainly developed by TK. PB and DJL contributed to both papers.
