Libyan Journal of Medicine among top journals in African and Arab countries

African and Arab academic and research institutions contribute modestly to the international biomedical literature. Inadequate research funding and limited national, regional and international collaboration are important factors contributing to this deficiency. Furthermore, only few regional journals are covered by major indexing systems such as MEDLINE (Index Medicus), which hampers the international dissemination of research results obtained in African and Arab nations.

To increase the international visibility of regional research data, *Libyan Journal of Medicine* (LJM) was established in 2006 as an open access journal. Since then, its scientific status has steadily improved. In addition to the less selective databases, it is currently indexed in the most prestigious citations databases: Embase, Scopus, Thomson's Science Citation Index, PubMed Central, and MEDLINE. In a relatively short time, it has gained a promising record of citations compared to its peers (Table 1). LJM has a 2-year impact factor of 0.29 and a Google scholar H5-index for the articles published in the last 5 years of 9. Both of these sit at the median of the selected 31 general medicine journals from Arab and African nations listed in Scopus (Table 1). Moreover, a substantial number of its research articles are characterized by international collaborations, ranking third among the listed journals.

In 2012, the journal received 250 manuscript submissions, of which only the scientifically most qualified were published: only 15% of the submitted papers were selected for publication. We are thankful to the enormous

services provided by our editors, reviewers, and publisher, whose cooperation has enabled LJM to become a well-established and respected channel for publishing research of both regional and international interest from various parts of the world. LJM will continue its policy of publishing only high-quality research that makes significant contributions to the body of knowledge. The editors are keen on attracting even more high-quality papers from regional research groups. To that end, raising the efficiency of the peer review process, expanding the editorial board, and broadening the editors' collective expertise are essential steps. We have already embarked on that road.
