Prevalence of Lewy body dementia symptoms and Neuroleptic treatment in nursing homes in Malmö, Sweden

Iris Zahirovic, Carina Wattmo, Lennart Minthon, Elisabet Londos, Clinical Memory Research Unit, Department of Clinical Sciences, Malmö, Lund University, Sweden.

Background:

Dementia of Lewy body (DLB), is a neurocognitive disorder with halmarks as Parkinsorism, vizual haliucinations often with insight, fluctuating alertness and wakefulness, rapid eye movement (REM) sleep behavior disorder (RBD) with wid drasms and violent movements and neuroleptic hypersonstitivity. Nevertheless, DLB is often misdiagnosed and under-recognized.

A diagnosis of DLB is important because of the risk of hypersensitivity for neuroleptic drugs. Moreover, appropriate treatment of symptoms can improve quality of life considerably for both the individual with DLB and their caregivers.

This study aimed to investigate the prevalence of possible DLB symptoms and neuroleptic treatment in elderly care recipients in nursing homes.

Methods:

Information regarding prevalence of symptoms of DLB and concurrent medication was collected in 635 elderly living in 40 nursing homes in Malmö, Sweden during the time period 2012-13.

We used a questionnaire, electronic medication lists and interviewed the nursing staff. In the questionnaire, symptoms representing 4 of the DLB main characteristics were noted as present/absent; Parkinsonism, visual hallucinations, excessive daytime sleepiness and acting out dreams. Neuroleptic treatment was also noted as present or not, as well as the type of drug.

Conclusions:

Symptoms consistent with DLB are common in elderly in nursing homes. Despite the recommendations of avoiding neuroleptic treatment this was a common finding among the studied individuals. To minimise inappropriate medical treatment recognizing symptoms of DLB are important for general practitioners.

► The Questionnaire

THE RESIDENT HAS THE FOLLOWING:	YES	I
Parkinson or Parkinson's like disorder		
Rigidity or stiffness. Tremor. Shuffling walk		
Weak voice		
Balance problems or repeated falls		
Visual hallucinations (seeing things that are not really present)		
Excessive daytime sleepiness		
Acting out dreams during sleep (sometimes violently) Nightmares.		
Antiparkinson medication, for example L-Dopa		
Antipsychotic treatment for example Haloperidol or Risperidon		
Earlier stroke? Brain tumour?		

DLB symptoms in nursing home residents in Malmö, Sweden

DLB symptoms	All elderly N = 590-617 (%)
Parkinson diagnose	37 (6%)
Rigidity	202 (33%)
Weak voice	133 (22%)
Impaired balance	244 (41%)
Visual hallucinations	123 (20%)
Daytime sleepiness	232 (38%)
RBD like sleep disorder	55 (9%)

Results:

Men 160 (25%) women 475 (75%) Mean age 86±7 years

In total 28% had ≥2 of 4 DLB symptoms

Neuroleptic treatment was reported in 22%

Neuroleptic treatment increased significantly (p<0.002) with increasing number of DLB symptoms

9% of the neuroleptics prescribed were of acceptable type such as klozapin and quetiapin
