Service Orchestration with OPC UA in a Graphical Control Language

Alfred Theorin, Johan Hagsund, and Charlotte Johansson
Department of Automatic Control, Lund University, Lund, Sweden

Background

Increasing market demands require highly flexible automation systems. A successful approach to compose flexible software is Service Oriented Architecture (SOA). In this work a convenient way to do SOA service orchestration with OPC Unified Architecture (OPC UA) is presented.

OPC Unified Architecture

OPC UA offers robust and secure communication for distributed systems. It is backward compatible feature-wise with the classic OPC standards and is platform and language independent. It also offers SOA features and more powerful modeling capabilities with types and instances.

The Grafchart Language

Grafchart is a graphical programming language based on the PLC standard language SFC. The basic building blocks are steps (application states) with actions (what to do when) and transitions (how and when to change application state).

Use Case

The OPC UA support was tried out on a physical device in an Industry 4.0 setting. The device consists of a punching machine (1) and a conveyor belt (2). A microcontroller (3) was used to expose the device as variables in an OPC UA server.

Conclusions

The new integrated OPC UA support in JGrafchart is a convenient way to do SOA service orchestration in the automation domain. Both DPWS and OPC UA are required to cope with industrial requirements on device level and now JGrafchart supports both. With an OPC classic adapter, JGrafchart can now also interact with most industrial automation systems.
