A PC IMPLEMENTATION OF A PID REGULATOR

Kalle Aström and Karl Johan Aström

This report describes an implementation of a PID regulator with graphic display and operator interface based on an Apple II personal computer. The program is intended for laboratory experiments with PID control.

1. INTRODUCTION

used educational purposes. Its main use is as a laboratory tool. The PC serves two point, the measured variable and the control variable are displayed using the extensively for the man-machine interaction. The regulator is implemented in main functions: as a regulator and as a recorder. Curves representing the primarily also are on designed regulator paddles game rt describes an implementation of a PID 1 the Apple II [11], [2]. The regulator is graphics and the graphics. The report describes bit mapped computer

given in Chapter 5. The variables are described in Chapter 6. A program listing and a given Chapter The report is organized as follows. An overview of the program is are described in Chapter 3. program describes the program structure. Details about the cross-reference table are given in appendices. , Si algorithm control The Chapter 2.

2. OVERVIEW

to store the signals on disc. To make a hard copy it is necessary to have an Epson printer [5] with a Microbuffer [6] parallel interface. The program is written in Basic [2]. There is also a compiled version. The program runs on an Apple II or an Apple IIe with a Mountain Hardware [4]. It allows manual control and PID variable are displayed in high graphics. It is also possible to make a hard copy of the curves and The important signals i.e. control output. A-D, D-A card [3] and a UTIM timer output and the analog input and point, the measured control using resolution

How to run the program?

To run the program put in the program disc and type:

RUN PID

for the ordinary Applesoft Basic program or

RUN PIDTURBO

for the compiled version.

The main functions

The program which is designed to be self-explanatory is menu controlled. The following options are available

U	ሲ	Ξ	A	H	ល
					file
					in
					signals
	nges	, ,	control	creen	nd output
tion	char	tro	pid	Œ	t a
gurat	eter	1 con.	atic	o ydo	
confi	parame	anua	autom	hardc	store

The program goes to menu mode when it is started. It returns to menu mode

of the screen for menu selection is shown in when a key is pressed. A copy

Figure 1 The screen image for menu selection.

Operator interactions can also be made via the game paddles when the program is running in manual or automatic mode. The reference value can be decreased (increase). adjusted by paddle 0. The control variable is increased or manual mode using paddles 5 (decrease) and paddle 6 (in "apple-buttons" on the Apple IIe may also be used [11].

The different functions are described below:

The slot positions of the clock card, the AD/DA card, and the parallel printer channel numbers for the card are specified in the <u>configuration mode</u>. The channel input and output signals can also be specified in this mode. mode. parameters of the PID regulator may be changed in the parameter The following parameters are available:

	me Ti	Û		it	mit uhigh	d h	val np
gain	on ti	1 tim			it lin		Ш
lator	gratio	vation	deriva	output	output	$\overline{}$	ting
regu	inte			low	high	samp	plot.

The time unit is seconds. Notice that the sampling period must be larger than greater than 0.1 s in the 0.5 s in the normal Applesoft Basic version and greater than 0.1 s in the compiled version. The variables K, Ti, Td, N, ulow, uhigh and h are explained in detail in Chapter 3. The output level is normalized so that one unit corresponds to full output. The variable np controls the plotting. Every np:th sampling interval is plotted.

game buttons Ordinary PID The control variable can be manipulated using the apple keys or mode. the manual as increase-decrease buttons in control is executed in the automatic mode. 0 and

the screen is shown in Fig. 2. A hard copy of the graph on the screen can be obtained using the hard copy mode. There is an option to get either a normal The set point, the measured variable and the control variable are displayed A copy graph as shown below or an enlarged graph. The choice is menu selected. or automat control. on the screen when the program is in manual

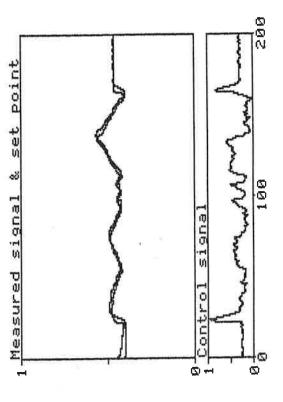

A record of the setpoint yr, the process output y and the process input u can be stored in a file on the disc using the option store. Two hundred samples of the signals are stored in a text file. The program asks for a file name when this mode is activated.

3. THE CONTROL ALGORITHM

¥ control algorithm is a digital implementation of the PID-algorithm. brief description is given in this Chapter. More details are found in [7]. algorithm is in principle described by the operator: The

$$G(p) = K \left[1 + \frac{1}{T_1 p} + \frac{pT_d}{1 + pT_d/N} \right]$$
 (3.1)

where p=d/dt is the differential operator. Let r denote the set point, y the measured output and e denote the error. Then

Sample of screen output in manual or automatic control. Figure 2

$$\mathbf{s} = \mathbf{r} - \mathbf{y} \tag{3}$$

ŝ

The proportional term is then implemented as

The integral term is implemented by the following discrete approximation

$$I(t+h) = I(t) + \frac{K}{T_1} e(t)$$
 (3.4)

where h is the sampling period.

The derivative term is approximated as follows:

$$K \frac{pT_d}{1 + pT_d/N} = K \frac{pT_d + N - N}{1 + pT_d/N} = K N \left[1 - \frac{1}{1 + pT_d/N} \right]$$

пo operates on the output and not Notice that the derivative action operates on the or control error. The derivative term is formed as follows:

$$D = K N (- y - z)$$
 (3.5)

where

$$z(t) = \frac{1}{1 + pT_d/N} (-y(t))$$
 (3.6)

Notice the minus sign because of the definition (3.1) of the error. Rewriting (3.6) as a differential equation we get

$$(T_d/N) \frac{dz(t)}{dt} + z(t) = -y(t)$$

Approximating the derivative by a backward difference we get

$$(T_d/N) \frac{z(t) - z(t-h)}{h} + z(t) = -y(t)$$

Solving for z(t) we get

$$z(t) = -\frac{T_d}{Nh + T_d} z(t-h) - \frac{Nh}{Nh + T_d} y(t)$$
 (3.7)

Notice this difference equation is stable for all sampling periods because the number T $_{\rm d}$ /(Nh + T $_{\rm d}$) is always less than one.

The equation (3.7) can be written as

$$z(t) = z(t-h) - \frac{Nh}{Nh + T_d} [y(t) + z(t-h)]$$
 (3.8)

Summarizing the control signal is thus given by

$$u(t) = P + I + D$$

(3.9)

where P, I and D are given by (3.3), (3.4) and (3.5).

4. PROGRAM STRUCTURE

A description of the main structure of the program is given in this Chapter. The descriptions refers to the program listing in Appendix A.

part of the program that is used most frequently is put in the are used to structure the code since this is the only structuring subroutines was sacrificed for beginning of the program. This speeds up the execution. of the The logic order mechanism in Basic. Subroutines The

The main program

The main program is on lines 200 to 370. It loops through the operation test for keypress and execution of menu commands.

the contents of this cell is 0 if no key has been pressed and 1 if a key has been pressed. The code on lines 270 and 280 interrogates the first bit of cell # 16 384. The contents of this cell is also used for menu selection. The code on cell to the variable XX. The menu Apple II has a The first the keyboard has been pressed. subroutine for initialization is invoked on line 230. line 280 transfers the contents of the selection is then made on lines 300 to 360. # -16 384 which indicates if 280

The code on line 300 is straightforward. In the code for manual control: line 310, automatic control: line 320, and hard copy: line 330, there are several "pokes" to control the switches for controlling the screen modes. These switches are described in the Apple II reference manual [1].

The instruction POKE UA,0 on line 340 sets the output to zero before quitting. The variable UA is the address to the output signal.

Subroutines

The program has the following subroutines:

Automatic	20- 30
Connections	600- 740
First page	100- 190
Hard copy	2000-2670
Initialize	400- 590
Manual	1300-1500
New parameters	800- 940
Pid	39- 67
Plot	70- 82
Print parameters	1000-1090
Store	3000-3220
Transform parameters	1100-1280
Wait	31- 38

The structure of the program and the relations between the procedures are given in "pidgeon Pascal" in Listing 1.

Detailed descriptions of the subroutines are given in the next Chapter.

5. SUBROUTINES

This Chapter describes the different subroutines in alphabetical order.

Automatic

This subroutine consists of the lines 20-30. It uses three subroutines wait, pid and plot.

the 23 resets a pointer (TS) by reading the current time (in seconds and read the keyboard.) When a key is pressed line 28 clears the keyboard strobe econds) and adding the sampling period TT. The rest of t is a loop from line 24 to line 27 which goes on calling t wait, pid and plot until a key is pressed. (The pokes in line before the program returns to the menu. seconds) IS subroutines subroutine of

Connections

This subroutine which handles all input and output connections begins at line 600 and ends at line 740. It does not use any other subroutines.

any to ensure that 20 writing done by this subroutine will not disturb the menu. of the screen window to line sets the top Line 630

UCH and SPR which define the connections. The subroutine uses a string input so that the program will not crash if the user types a literal by mistake. The user The lines 640-680 asks for the new values of the variables SCLOC, SAD, YCH, string input also makes it possible to keep the default values when the types <return> instead of a number.

- D/A card, and SPR for the printer card at lines 690 through 710. numbers YCH for the analog input and UCH for the analog output on lines 660 and 670. Notice that the Mountain Hardware card has The subroutine changes the base addresses, SCLOC for the clock card, 12 analog inputs and 12 analog outputs. the A/D - D/A card, are also set on lines The channel

The subroutine finally clears the four lowest lines of text and restores the normal screen window.

subroutine consists of the lines 100 to 180. It prints the program name and logo. This

Hard copy

of four parts, an initializing part (2030-2170), a curve adjust to eliminate a possible gap in the curves (2180-2300), a screen dump (2310-2480) and a curve This is a subroutine for dumping the graphic screen to the printer. It consists curve adjust to eliminate (2030-2170), a adjust to restore the graph (2490-2670).

2050-2110. The execution can be aborted by typing <esc>. There is a choice of a small picture suitable for a report or a larger picture suitable for overhead projection. The code for this is on lines 2120-2140. The string variable GC\$ contains the control code for the printer to adjust size, rotation and position of the screen dump print-out. See the manual for the Microbuffer The initializing part first requests a reconfirmation by the user details. Line 2160 "pokes" to hi-res page two.

plot routine but they use the arrays RT, YT and UT, where the reference, input The two code sequences for curve adjust are almost identical to the and output values are stored.

actual screen dump is done at line 2440. <ctrl-I>+"G" is a special command for dumping graphics followed by the other control characters described earlier. The printer is turned off in line 2460, before the second curve adjusts routine gives slot for the printer (line 2340). It then sends a form feed (chr*(12)) in line 2350. Lines 2360-2420 prints out a headline and the regulator parameters. The screen dump routine begins with an initialization command which

Initialize

This subroutine consists of the lines 400 to 590. It uses the subroutines print parameters: on lines 1000 to 1090, and transform parameters: on lines 1100 to The subroutine initialize first gives default values to the parameters on lines 430 to 480. The graphics page which is stored on disc as SAM2.PIC loaded to memory on line 510.

parameters K, Ti, Td, N, ulow and uhigh do not appear directly in the formula for the PID algorithm. The transformed variables KI, KD, AD, UL and UH are 1100 to Line 520 is a call to the subroutine which prints the parameters. The natural Jo parameters is made in the subroutine transform parameters on lines 1280. This subroutine is called on line 530. The transformation calculations. speed up the to used instead

The code on lines 540 to 557 prints the menu.

The code on line 570 initializes the clock. The variable CADDR contains the address to the clock. Remember that input output on the Apple II is memory mapped. The instruction POKE CCADDR,32 resets the clock and the instruction

POKE CADDR, 16 starts the clock [4].

Manual

depending on which button is pushed. The control variable U is then increased by UINC on line 1390. The control signal will thus accelerate if the button is pushed continuously. The acceleration will depend on the sampling period. automatic routine, with resetting the pointer TS, used by the clock (line 1330). It then reads the two push-buttons (paddle#5 and paddle#6) in line 1340 This subroutine allows the user to run the process manually. It starts like the pushed continuously. The acceleration will depend on the sampling period. The code on lines 1400 and 1410 limits the computed output U to the interval 1370 is increased or decreased on lines variable UINC (ULOW and UHIGH).

plot subroutine to draw the new points on the graph. The code in lines 1470 and Line 1420 and 1430 generate an analog output by "poking" the output variable to the A/D-D/A card. Line 1440 reads the current input from the process. Line 1450 reads the setpoint from paddle #0 and the line 1460 calls the 1480 reads the keybord and returns to the menue if a key is pressed.

New parameters

subroutine. The only differance is the text and the names of the variables. It This routine consists of the lines 600-740. It is very similar to the connection uses the same input technique as the other routine.

T D

and (3.8) of algorithm described in Chapter 3. The equations (3.2), (3.3), (3.5), approximation discrete-time implements the (3.9) are written as follows: procedure This

```
E = R - Y

Z = Z - AD * (Y + Z)

V = K * E + I + KD * (-Y - Z)

U = sat(V, ulow, uhigh)

I = I + KI * E + AW * (U - V)
```

and the This is the integrator. If the output saturates the integrator is set to a value which correspond to the an output at the saturation limit. This is explained in more transform The saturation function and the term U - V are introduced to avoid windup of KD and KI equations. the subroutine to speed up the scription of the sc in [7]. Notice also that the gain parameters description constant AD have been introduced explained in more detail in the de

The code which implements these equations is given on lines 50 to 55. Notice that the control algorithm is just a small fraction of the whole code.

Plot

are wrapped around because the plotting window has limited size. Part of the old curves are erased to make a clearer graph. When the curves are plotted The curves using the hard copy option the curves are replotted so that the gap vanishes strip recorder. and the present time at the right most edge of the graph. plotting is implemented so that it mimics a

The plot routine starts on line 73 by increasing the variable PR. If the variable is less than PN, which is the variable for the plot frequency, then the routine returns without plotting or updating the arrays.

value of X to be erased. The variable SX is updated in line 75. Line 76 erases the old curves and lines 77 to 79 plots the three signals. The variables Y1, Y2 and Y3 denote old values of the y-coordinates. variable OX denotes the old value of X. Similarly the variable SX contains the wrap-around. and checks for a 74 increases the plot variable X

The three arrays UT, YT and RT are updated on line 80.

Print parameters

This subroutine prints the parameters appearing on the menu. Lines 1030 and 1080 take care of the screen window and the lines 1040-1070 does the printing.

Store

This routine makes it possible to store the 200 last samples on disk. It stores the samples as a standard Apple II text-file. The order is:

```
1'st process output
1'st setpoint
2'nd process output
2'nd process input
2'nd setpoint
3'rd process output
etc ...
```

Line 3030 sets the window and line 3040 clears it. Then line 3050 asks for reconfirmation. Line 3060 and line 3070 take care of the file name. The file is opened in lines 3090-3120 and written in the loop between 3130 and 3180. It uses the pointer X to start writing from the right places in the circular arrays YT, UT and RT. Line 3190 closes the array and the normal window is restored on line 3200 before the routine ends.

Transform parameters

and KI used in the formula This subroutine computes the parameters AD, KD for the PID algorithm.

The constant AD is given by

$$AD = \frac{T_d}{Nh + T_d} \tag{5.1}$$

Compare with equation (3.8) and AW is given by

$$AW = H/TI$$
 (5.2)

The derivative gain KD is given by

$$KD = K N \tag{5.3}$$

See equation (3.5). The integral gain is given by

$$(1 = \frac{Kh}{T_{i}}$$

Compare with equation (3.4).

as integers in algorithm design we always think of the variables as being in the range 0 to 1 for unipoloar signals. The limits ulow and uhigh are thus given in this scale. In the program the measured signals are, however, represented as integers in to loose computational computed. from the speed. The following formula are used to compute the scaled limits: also directly are) to 255. These numbers are obtained The scale is not changed in order not obtained limits control numbers the oť scaled version levels 255. 0 to conversion. the range The

$$LS = ulow * 256$$
